Important notice

The present document can be downloaded from:
<https://www.etsi.org/standards-search>

The present document may be made available in electronic versions and/or in print. The content of any electronic and/or print versions of the present document shall not be modified without the prior written authorization of ETSI. In case of any existing or perceived difference in contents between such versions and/or in print, the prevailing version of an ETSI deliverable is the one made publicly available in PDF format at www.etsi.org/deliver.

Users of the present document should be aware that the document may be subject to revision or change of status.

Information on the current status of this and other ETSI documents is available at
<https://portal.etsi.org/TB/ETSIDeliverableStatus.aspx>

If you find errors in the present document, please send your comment to one of the following services:
<https://portal.etsi.org/People/CommitteeSupportStaff.aspx>

If you find a security vulnerability in the present document, please report it through our
Coordinated Vulnerability Disclosure Program:
<https://www.etsi.org/standards/coordinated-vulnerability-disclosure>

Notice of disclaimer & limitation of liability

The information provided in the present deliverable is directed solely to professionals who have the appropriate degree of experience to understand and interpret its content in accordance with generally accepted engineering or other professional standard and applicable regulations.

No recommendation as to products and services or vendors is made or should be implied.

No representation or warranty is made that this deliverable is technically accurate or sufficient or conforms to any law and/or governmental rule and/or regulation and further, no representation or warranty is made of merchantability or fitness for any particular purpose or against infringement of intellectual property rights.

In no event shall ETSI be held liable for loss of profits or any other incidental or consequential damages.

Any software contained in this deliverable is provided "AS IS" with no warranties, express or implied, including but not limited to, the warranties of merchantability, fitness for a particular purpose and non-infringement of intellectual property rights and ETSI shall not be held liable in any event for any damages whatsoever (including, without limitation, damages for loss of profits, business interruption, loss of information, or any other pecuniary loss) arising out of or related to the use or inability to use the software.

Copyright Notification

No part may be reproduced or utilized in any form or by any means, electronic or mechanical, including photocopying and microfilm except as authorized by written permission of ETSI.

The content of the PDF version shall not be modified without the written authorization of ETSI.

The copyright and the foregoing restriction extend to reproduction in all media.

Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, PLUGTESTS™, UMTS™ and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™** and **LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under <https://webapp.etsi.org/key/queryform.asp>.

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

5.2.2.34	Actions upon reception of <i>SystemInformationBlockPos</i>	73
5.2.2.35	Actions upon reception of <i>SystemInformationBlockType27</i>	74
5.2.2.36	Actions upon reception of <i>SystemInformationBlockType28</i>	74
5.2.2.37	Actions upon reception of <i>SystemInformationBlockType29</i>	74
5.2.2.38	Actions upon reception of <i>SystemInformationBlockType30</i>	74
5.2.2.39	Actions upon reception of <i>SystemInformationBlockType31</i>	74
5.2.2.40	Actions upon reception of <i>SystemInformationBlockType32</i>	74
5.2.2.41	Actions upon reception of <i>SystemInformationBlockType33</i>	74
5.2.3	Acquisition of an SI message.....	74
5.2.3a	Acquisition of an SI message by BL UE or UE in CE or a NB-IoT UE.....	75
5.2.3b	Acquisition of an SI message from MBMS-dedicated cell.....	76
5.3	Connection control	77
5.3.1	Introduction.....	77
5.3.1.1	RRC connection control.....	77
5.3.1.2	Security	79
5.3.1.2a	RN security	81
5.3.1.3	Connected mode mobility	81
5.3.1.4	Connection control in NB-IoT	82
5.3.2	Paging	83
5.3.2.1	General	83
5.3.2.2	Initiation	84
5.3.2.3	Reception of the <i>Paging</i> message by the UE	84
5.3.3	RRC connection establishment	86
5.3.3.1	General	86
5.3.3.1a	Conditions for establishing RRC Connection for sidelink communication/ discovery/ V2X sidelink communication/ NR sidelink communication	89
5.3.3.1b	Conditions for initiating EDT	90
5.3.3.1c	Conditions for initiating transmission using PUR.....	91
5.3.3.1d	Condition for establishing RRC Connection in NTN.....	91
5.3.3.2	Initiation	91
5.3.3.3	Actions related to transmission of <i>RRCConnectionRequest</i> message	99
5.3.3.3a	Actions related to transmission of <i>RRCConnectionResumeRequest</i> message.....	100
5.3.3.3b	Actions related to transmission of <i>RRCEarlyDataRequest</i> message.....	104
5.3.3.3c	UE actions upon receiving EDT fallback indication from lower layers.....	104
5.3.3.3d	Reception of the <i>RRCConnectionSetup</i> by the UE.....	105
5.3.3.3e	Reception of the <i>RRCConnectionResume</i> by the UE	111
5.3.3.3f	Reception of the <i>RRCEarlyDataComplete</i> by the UE.....	116
5.3.3.3g	Cell re-selection or cell selection while T300, T302, T303, T305, T306, T308 or T309 is running....	118
5.3.3.3h	T300 expiry	118
5.3.3.3i	T302, T303, T305, T306, or T308 expiry or stop	120
5.3.3.3j	Reception of the <i>RRCConnectionReject</i> by the UE	121
5.3.3.3k	Abortion of RRC connection establishment.....	122
5.3.3.3l	Abortion of early security reactivation.....	122
5.3.3.3m	Handling of SSAC related parameters	123
5.3.3.3n	Access barring check.....	124

5.3.3.12	EAB check	124
5.3.3.13	Access barring check for ACDC.....	126
5.3.3.14	Access Barring check for NB-IoT.....	126
5.3.3.15	Failure to deliver NAS information in RRCConnectionSetupComplete message	128
5.3.3.16	Integrity check failure from lower layers while T300 is running.....	128
5.3.3.17	Inability to comply with <i>RRCConnectionResume</i>	128
5.3.3.18	Early security reactivation.....	129
5.3.3.19	Timing alignment validation for transmission using PUR	129
5.3.3.20	Maintenance of PUR occasions.....	129
5.3.3.21	UE actions upon indication of out-of-date GNSS position	130
5.3.3.22	Void.....	131
5.3.3.23	UE actions upon detecting discontinuous coverage	131
5.3.4	Initial security activation	131
5.3.4.1	General	131
5.3.4.2	Initiation	131
5.3.4.3	Reception of the <i>SecurityModeCommand</i> by the UE	132
5.3.5	RRC connection reconfiguration	133
5.3.5.1	General	133
5.3.5.2	Initiation	133
5.3.5.3	Reception of an <i>RRCConnectionReconfiguration</i> not including the <i>mobilityControlInfo</i> by the UE	134
5.3.5.4	Reception of an <i>RRCConnectionReconfiguration</i> including the <i>mobilityControlInfo</i> by the UE (handover)	137
5.3.5.5	Reconfiguration failure	145
5.3.5.6	T304 expiry (handover failure)	146
5.3.5.7	Void.....	148
5.3.5.7a	T307 expiry (SCG change failure)	148
5.3.5.8	Radio Configuration involving full configuration option.....	148
5.3.5.9	Conditional reconfiguration	151
5.3.5.9.1	General	151
5.3.5.9.2	Conditional reconfiguration removal.....	151
5.3.5.9.3	Conditional reconfiguration addition/modification	151
5.3.5.9.4	Conditional reconfiguration evaluation	152
5.3.5.9.5	Conditional reconfiguration execution	153
5.3.5.9.6	VarConditionalReconfiguration remove.....	153
5.3.5.9.7	VarConditionalReconfiguration CPC remove	153
5.3.6	Counter check	154
5.3.6.1	General	154
5.3.6.2	Initiation	154
5.3.6.3	Reception of the <i>CounterCheck</i> message by the UE	154
5.3.7	RRC connection re-establishment.....	155
5.3.7.1	General	155
5.3.7.1a	Condition for re-establishing RRC Connection in NTN	156
5.3.7.2	Initiation	156
5.3.7.3	Actions following cell selection while T311 is running.....	158
5.3.7.4	Actions related to transmission of <i>RRCConnectionReestablishmentRequest</i> message	160
5.3.7.5	Reception of the <i>RRCConnectionReestablishment</i> by the UE	162
5.3.7.6	T311 expiry	165
5.3.7.7	T301 expiry or selected cell no longer suitable.....	165
5.3.7.8	Reception of <i>RRCConnectionReestablishmentReject</i> by the UE	166
5.3.8	RRC connection release	166
5.3.8.1	General	166
5.3.8.2	Initiation	166
5.3.8.3	Reception of the <i>RRCConnectionRelease</i> by the UE	166
5.3.8.4	T320 expiry	170
5.3.8.5	T322 expiry or stop	170
5.3.8.6	UE actions upon receiving the expiry of <i>DataInactivityTimer</i>	170
5.3.8.7	UE actions upon entering RRC_INACTIVE	171
5.3.8.8	T323 expiry	172
5.3.9	RRC connection release requested by upper layers	172
5.3.9.1	General	172
5.3.9.2	Initiation	172

5.3.10	Radio resource configuration	172
5.3.10.0	General	172
5.3.10.1	SRB addition/ modification	173
5.3.10.1a	SCG RLC bearer addition or reconfiguration for SRBs	174
5.3.10.2	DRB release	175
5.3.10.3	DRB addition/ modification	176
5.3.10.3a1	DC specific DRB addition or reconfiguration	178
5.3.10.3a2	LWA specific DRB addition or reconfiguration	180
5.3.10.3a3	LWIP specific DRB addition or reconfiguration	181
5.3.10.3a4	SCG RLC bearer addition or reconfiguration for DRBs in NE-DC	182
5.3.10.3a	SCell release	182
5.3.10.3b	SCell addition/ modification	183
5.3.10.3c	PSCell addition or modification	183
5.3.10.3d	SCell group release	184
5.3.10.3e	SCell group addition/ modification	184
5.3.10.4	MAC main reconfiguration	184
5.3.10.5	Semi-persistent scheduling reconfiguration	185
5.3.10.6	Physical channel reconfiguration	185
5.3.10.7	Radio Link Failure Timers and Constants reconfiguration	186
5.3.10.8	Time domain measurement resource restriction for serving cell	187
5.3.10.9	Other configuration	187
5.3.10.10	SCG reconfiguration	190
5.3.10.11	SCG dedicated resource configuration	192
5.3.10.12	Reconfiguration SCG or split DRB by drb-ToAddModList	193
5.3.10.13	Neighbour cell information reconfiguration	193
5.3.10.14	Void	193
5.3.10.15	Sidelink dedicated configuration	193
5.3.10.15a	V2X sidelink Communication dedicated configuration	195
5.3.10.16	T370 expiry	195
5.3.10.17	SRB release	195
5.3.10.18	Scheduling Request Configuration for NB-IoT	196
5.3.10.19	NE-DC release	196
5.3.11	Radio link failure related actions	196
5.3.11.1	Detection of physical layer problems in RRC_CONNECTED	196
5.3.11.1a	Early detection of physical layer problems in RRC_CONNECTED	197
5.3.11.1b	Detection of physical layer improvements in RRC_CONNECTED	197
5.3.11.2	Recovery of physical layer problems	197
5.3.11.2a	Recovery of early detection of physical layer problems	197
5.3.11.2b	Cancellation of physical layer improvements in RRC_CONNECTED	197
5.3.11.3	Detection of radio link failure	197
5.3.11.3a	Detection of early-out-of-sync event	201
5.3.11.3b	Detection of early-in-sync event	201
5.3.12	UE actions upon leaving RRC_CONNECTED or RRC_INACTIVE	201
5.3.13	UE actions upon PUCCH/ SPUCC/ SRS release request	204
5.3.13a	UE actions upon SR release request for NB-IoT	204
5.3.13b	UE actions upon PUR release request	204
5.3.14	Proximity indication	205
5.3.14.1	General	205
5.3.14.2	Initiation	205
5.3.14.3	Actions related to transmission of <i>ProximityIndication</i> message	205
5.3.15	Void	206
5.3.16	Unified Access Control	206
5.3.16.1	General	206
5.3.16.2	Initiation	206
5.3.16.3	Void	209
5.3.16.4	T302, T309 expiry or stop (Barring alleviation)	209
5.3.16.5	Access barring check	210
5.3.17	RAN notification area update	211
5.3.17.1	General	211
5.3.17.2	Initiation	211
5.3.17.3	Inter RAT cell reselection or CN type change	211
5.3.18	T317 expiry	212

5.4	Inter-RAT mobility.....	212
5.4.1	Introduction.....	212
5.4.2	Handover to E-UTRA.....	213
5.4.2.1	General.....	213
5.4.2.2	Initiation.....	213
5.4.2.3	Reception of the <i>RRCConnectionReconfiguration</i> by the UE.....	213
5.4.2.4	Reconfiguration failure	217
5.4.2.5	T304 expiry (handover to E-UTRA failure).....	217
5.4.3	Mobility from E-UTRA.....	217
5.4.3.1	General.....	217
5.4.3.2	Initiation.....	218
5.4.3.3	Reception of the <i>MobilityFromEUTRACommand</i> by the UE	218
5.4.3.4	Successful completion of the mobility from E-UTRA.....	220
5.4.3.5	Mobility from E-UTRA failure.....	220
5.4.4	Handover from E-UTRA preparation request (CDMA2000)	221
5.4.4.1	General.....	221
5.4.4.2	Initiation.....	221
5.4.4.3	Reception of the <i>HandoverFromEUTRAPreparationRequest</i> by the UE	222
5.4.5	UL handover preparation transfer (CDMA2000)	222
5.4.5.1	General.....	222
5.4.5.2	Initiation.....	222
5.4.5.3	Actions related to transmission of the <i>ULHandoverPreparationTransfer</i> message.....	222
5.4.5.4	Failure to deliver the <i>ULHandoverPreparationTransfer</i> message.....	223
5.4.6	Inter-RAT cell change order to E-UTRAN.....	223
5.4.6.1	General.....	223
5.4.6.2	Initiation.....	223
5.4.6.3	UE fails to complete an inter-RAT cell change order	223
5.5	Measurements.....	223
5.5.1	Introduction.....	223
5.5.2	Measurement configuration	226
5.5.2.1	General.....	226
5.5.2.2	Measurement identity removal.....	227
5.5.2.2a	Measurement identity autonomous removal	227
5.5.2.3	Measurement identity addition/ modification	228
5.5.2.4	Measurement object removal	229
5.5.2.5	Measurement object addition/ modification.....	229
5.5.2.6	Reporting configuration removal	232
5.5.2.7	Reporting configuration addition/ modification.....	232
5.5.2.8	Quantity configuration	233
5.5.2.9	Measurement gap configuration.....	233
5.5.2.9a	Measurement gap configuration for RSTD measurements with dense PRS configuration	234
5.5.2.10	Discovery signals measurement timing configuration	235
5.5.2.11	RSSI measurement timing configuration	235
5.5.2.12	Measurement gap sharing configuration	235
5.5.2.13	NR measurement timing configuration	236
5.5.3	Performing measurements	236
5.5.3.1	General.....	236
5.5.3.2	Layer 3 filtering	241
5.5.3.3	Derivation of NR cell quality	242
5.5.3.4	Derivation of NR beam quality	242
5.5.4	Measurement report triggering	242
5.5.4.1	General.....	242
5.5.4.2	Event A1 (Serving becomes better than threshold).....	249
5.5.4.3	Event A2 (Serving becomes worse than threshold)	249
5.5.4.4	Event A3 (Neighbour becomes offset better than PCell/ PSCell)	250
5.5.4.5	Event A4 (Neighbour becomes better than threshold)	251
5.5.4.6	Event A5 (PCell/ PSCell becomes worse than threshold1 and neighbour becomes better than threshold2)	251
5.5.4.6a	Event A6 (Neighbour becomes offset better than SCell)	252
5.5.4.7	Event B1 (Inter RAT neighbour becomes better than threshold).....	253
5.5.4.8	Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2)	253

5.5.4.9	Event C1 (CSI-RS resource becomes better than threshold).....	254
5.5.4.10	Event C2 (CSI-RS resource becomes offset better than reference CSI-RS resource).....	255
5.5.4.11	Event W1 (WLAN becomes better than a threshold).....	255
5.5.4.12	Event W2 (All WLAN inside WLAN mobility set becomes worse than threshold1 and a WLAN outside WLAN mobility set becomes better than threshold2)	256
5.5.4.13	Event W3 (All WLAN inside WLAN mobility set becomes worse than a threshold).....	257

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document specifies the Radio Resource Control protocol for the radio interface between UE and E-UTRAN as well as for the radio interface between RN and E-UTRAN.

The scope of the present document also includes:

- the radio related information transported in a transparent container between source eNB and target eNB upon inter eNB handover;
- the radio related information transported in a transparent container between a source or target eNB and another system upon inter RAT handover.

The RRC protocol is also used to configure the radio interface between an IAB-node and its parent nodes as specified in TS 38.300 [106].

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

A2X communication: A communication to support A2X services leveraging PC5 reference points, as defined in TS 23.256 [115]. A2X services are realized by various types of A2X applications, e.g., BRID or DAA.

Aerial UE: UE performing Aerial UE communication, as defined in TS 36.300 [9], clause 23.17 and TS 23.256 [115].

Anchor carrier: In NB-IoT, a carrier where the UE assumes that NPSS/NSSS/NPBCH/SIB-NB for FDD or NPSS/NSSS/NPBCH for TDD are transmitted.

Bandwidth Reduced: Refers to operation in downlink and uplink with a limited channel bandwidth of 6 PRBs.

CEIL: Mathematical function used to 'round up' i.e. to the nearest integer having a higher or equal value.

Cellular IoT EPS Optimisation: Provides improved support of small data transfer, as defined in TS 24.301 [35].

Commercial Mobile Alert System: Public Warning System that delivers *Warning Notifications* provided by *Warning Notification Providers* to CMAS capable UEs.

Common access barring parameters: The common access barring parameters refer to the access class barring parameters that are broadcast in *SystemInformationBlockType2* outside the list of PLMN specific parameters (i.e. in *ac-BarringPerPLMN-List*).

Control plane CIoT 5GS optimisation: Enables support of efficient transport of user data (IP, Ethernet or unstructured) or SMS messages over control plane via the AMF without triggering data radio bearer establishment, as defined in TS 24.501 [95].

Control plane CIoT EPS optimisation: Enables support of efficient transport of user data (IP, non-IP or SMS) over control plane via the MME without triggering data radio bearer establishment, as defined in TS 24.301 [35].

Control plane EDT: Early Data Transmission used with the Control plane CIoT EPS optimisation or Control plane CIoT 5GS optimisation.

Coverage-based paging: In NB-IoT allows UE to use paging carriers configured for lower levels of coverage enhancement than maximum coverage supported in the cell as described in TS 36.300 [9].

CSG member cell: A cell broadcasting the identity of the selected PLMN, registered PLMN or equivalent PLMN and for which the Permitted CSG list of the UE includes an entry comprising cell's CSG ID and the respective PLMN identity.

DAPS bearer: A bearer whose radio protocols are located in both the source eNB and the target eNB during a DAPS handover to use both source eNB and target eNB resources.

Dual Connectivity: A UE in RRC_CONNECTED is configured with Dual Connectivity when configured with a Master and a Secondary Cell Group.

Early Data Transmission: Allows one uplink data transmission optionally followed by one downlink data transmission during the random access procedure as specified in TS 36.300 [9]. The S1 connection is established or resumed upon reception of the uplink data and may be released or suspended along with the transmission of the downlink data. Early data transmission refers to both CP-EDT and UP-EDT.

Early Security Reactivation: Re-activation of AS security prior to the transmission of *RRCConnectionResumeRequest* message when a UE is provided with an NCC value during suspension.

Ephemeris: A set of parameters that describe the movement of an NTN node over time.

E-UTRA-NR Dual Connectivity: A form of dual connectivity in which a UE in RRC_CONNECTED is configured with MCG cells using E-UTRA and SCG cells using NR as defined in TS 37.340 [81].

EU-Alert: Public Warning System that delivers Warning Notifications provided by Warning Notification Providers using the same AS mechanisms as defined for CMAS.

Field: The individual contents of an information element are referred as fields.

FLOOR: Mathematical function used to 'round down' i.e. to the nearest integer having a lower or equal value.

FR1: Frequency range 1 as defined in clause 5.1 of TS 38.101-1 [85].

FR2: Frequency range 2 as defined in clause 5.1 of TS 38.101-2 [100].

Geosynchronous Orbit: Earth-centred orbit at approximately 35,786 kilometres in altitude above Earth's surface and synchronised with Earth's rotation. A geostationary orbit is a non-inclined geosynchronous orbit, i.e. in the Earth's equator plane.

Information element: A structural element containing a single or multiple fields is referred as information element.

Korean Public Alert System (KPAS): Public Warning System that delivers Warning Notifications provided by Warning Notification Providers using the same AS mechanisms as defined for CMAS.

Master Cell Group: For a UE not configured with DC, the MCG comprises all serving cells. For a UE configured with DC, the MCG concerns a subset of the serving cells comprising of the PCell and zero or more secondary cells.

Mixed Operation Mode: In NB-IoT FDD, multi-carrier operation where the anchor carrier is in standalone mode while the non-anchor carrier is in inband or guardband mode, and vice versa. See TS 36.300 [9].

MBMS service: MBMS bearer service as defined in TS 23.246 [56] (i.e. provided via an MRB or an SC-MRB).

NB-IoT: NB-IoT allows access to network services via E-UTRA with a channel bandwidth limited to 200 kHz.

NB-IoT UE: A UE that uses NB-IoT.

NCSG: Network controlled small gap as defined in TS 36.133 [16].

Non-geosynchronous orbit: Earth-centred orbit with an orbital period that does not match Earth's rotation on its axis. This includes Low Earth Orbit (LEO) and Medium Earth Orbit (MEO).

Non-terrestrial networks: An E-UTRAN consisting of eNBs, which provide non-terrestrial LTE access to UEs by means of an NTN payload embarked on a space-borne NTN vehicle and an NTN Gateway.

NR-E-UTRA Dual Connectivity (NE-DC): A form of dual connectivity in which a UE in RRC_CONNECTED is configured with MCG cells using NR and SCG cells using E-UTRA as defined in TS 37.340 [81].

Non-anchor carrier: In NB-IoT, a carrier where the UE does not assume that NPSS/NSSS/NPBCH/SIB-NB for FDD or NPSS/NSSS/NPBCH for TDD are transmitted.

NR Carrier Frequency: Frequency referring to the position of resource element RE=#0 (subcarrier #0) of resource block RB#10 of the SS block.

NR sidelink communication: AS functionality enabling at least V2X Communication as defined in TS 23.287 [104] and/or A2X Communication as defined in TS 23.256 [115], between two or more nearby UEs, using NR technology but not traversing any network node.

Primary Cell: The cell, operating on the primary frequency, in which the UE either performs the initial connection establishment procedure or initiates the connection re-establishment procedure, or the cell indicated as the primary cell in the handover procedure.

Primary Secondary Cell: The SCG cell in which the UE is instructed to perform random access or initial PUSCH transmission if random access procedure is skipped when performing the SCG change procedure.

Primary Timing Advance Group: Timing Advance Group containing the PCell or the PSCell.

PUCCH SCell: An SCell configured with PUCCH.

Quasi-earth fixed cell: An NTN cell fixed with respect to a certain geographic area on the earth during a certain time duration. This can be provided by beam(s) covering one geographic area for a finite period and a different geographic area during another period (e.g., the case of NGSO satellites generating steerable beams).

RLC bearer configuration: The lower layer part of the radio bearer configuration comprising the RLC and logical channel configurations.

Satellite: A space-borne vehicle orbiting the Earth that carries the NTN payload.

Secondary Cell: A cell, operating on a secondary frequency, which may be configured once an RRC connection is established and which may be used to provide additional radio resources. Except for the case of (NG)EN-DC, the PSCell is considered to be an SCell.

Secondary Cell Group: For a UE configured with DC, the subset of serving cells not part of the MCG, i.e. comprising of the PSCell and zero or more other secondary cells.

Secondary Timing Advance Group: Timing Advance Group neither containing the PCell nor the PSCell. A secondary timing advance group contains at least one cell with configured uplink.

Serving Cell: For a UE in RRC_CONNECTED not configured with CA/ DC there is only one serving cell comprising of the primary cell. For a UE in RRC_CONNECTED configured with CA/ DC the term 'serving cells' is used to denote the set of one or more cells comprising of the primary cell and all secondary cells.

Sidelink: UE to UE interface for sidelink communication, V2X sidelink communication, A2X sidelink communication and sidelink discovery. The sidelink corresponds to the PC5 interface as defined in TS 23.303 [68].

Sidelink communication: AS functionality enabling ProSe Direct Communication as defined in TS 23.303 [68], between two or more nearby UEs, using E-UTRA technology but not traversing any network node. In this version, the terminology "sidelink communication" without "V2X" or "A2X" prefix only concerns PS unless specifically stated otherwise.

Sidelink discovery: AS functionality enabling ProSe Direct Discovery as defined in TS 23.303 [68], using E-UTRA technology but not traversing any network node.

Sidelink operation: Includes sidelink communication, V2X sidelink communication, A2X sidelink communication and sidelink discovery.

Split SRB: in MR-DC, an SRB between the MN and the UE, allowing selection of either the direct path or the path via the SN as well as duplication of RRC PDUs across both paths as defined in TS 37.340 [81].

Timing Advance Group: A group of serving cells that is configured by RRC and that, for the cells with an UL configured, use the same timing reference cell and the same Timing Advance value. A Timing Advance Group only includes cells of the same cell group i.e. it either includes MCG cells or SCG cells.

Transmission using PUR: Allows one uplink data transmission using preconfigured uplink resource from RRC_IDLE mode as specified in TS 36.300 [9]. Transmission using PUR refers to both CP transmission using PUR and UP transmission using PUR.

UE Inactive AS Context: UE Inactive AS Context is stored when the connection is suspended and restored when the connection is resumed. It includes information as defined in clause 5.3.8.7.

UE in CE: Refers to a UE that is capable of using coverage enhancement, and requires coverage enhancement mode to access a cell or is configured in a coverage enhancement mode.

User plane CIoT 5GS optimisation: Enables support for change from 5GMM-IDLE mode to 5GMM-CONNECTED mode without the need for using the Service Request procedure, as defined in TS 24.501 [95].

User plane CIoT EPS optimisation: Enables support for change from EMM-IDLE mode to EMM-CONNECTED mode without the need for using the Service Request procedure, as defined in TS 24.301 [35].

User plane EDT: Early Data Transmission used with the User plane CIoT EPS optimisation or User plane CIoT 5GS optimisation.

V2X sidelink communication: AS functionality enabling V2X Communication as defined in TS 23.285 [78], between nearby UEs, using E-UTRA technology but not traversing any network node.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1], TS 36.300 [9] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1] or TS 36.300 [9].

1xRTT	CDMA2000 1x Radio Transmission Technology
A2X	Aircraft-to-Everything
AB	Access Barring
ACDC	Application specific Congestion control for Data Communication
ACK	Acknowledgement
AILC	Assistance Information bit for Local Cache
AM	Acknowledged Mode
ANDSF	Access Network Discovery and Selection Function
ARQ	Automatic Repeat Request
AS	Access Stratum
ASN.1	Abstract Syntax Notation One
AUL	Autonomous Uplink
BCCH	Broadcast Control Channel
BCD	Binary Coded Decimal
BCH	Broadcast Channel
BL	Bandwidth reduced Low complexity
BLER	Block Error Rate
BR	Bandwidth Reduced
BR-BCCH	Bandwidth Reduced Broadcast Control Channel
BRID	Broadcast Remote Identification
CA	Carrier Aggregation
CAS	Cell Acquisition Subframes
CBP	Coverage-Based Paging
CBR	Channel Busy Ratio
CCCH	Common Control Channel
CCO	Cell Change Order
CE	Coverage Enhancement
CFI	Control Format Indicator
CG	Cell Group
CHO	Conditional Handover
CIoT	Cellular IoT
CMAS	Commercial Mobile Alert Service
CP	Control Plane
CPA	Conditional PSCell Addition
CPC	Conditional PSCell Change
CP-EDT	Control Plane EDT
C-RNTI	Cell RNTI
CRS	Cell-specific Reference Signal
CSFB	CS fallback
CSG	Closed Subscriber Group
CSI	Channel State Information
DAA	Detect And Avoid
DAPS	Dual Active Protocol Stack
DC	Dual Connectivity
DCCH	Dedicated Control Channel
DCI	Downlink Control Information
DCN	Dedicated Core Networks
DFN	Direct Frame Number
DL	Downlink
DL-SCH	Downlink Shared Channel
DRB	(user) Data Radio Bearer
DRX	Discontinuous Reception
DTCH	Dedicated Traffic Channel
EAB	Extended Access Barring
ECEF	Earth-Centred, Earth-Fixed

ECI	Earth-Centered Inertial
eDRX	Extended DRX
EDT	Early Data Transmission
EHPLMN	Equivalent Home Public Land Mobile Network
eIMTA	Enhanced Interference Management and Traffic Adaptation
ENB	Evolved Node B
EN-DC	E-UTRA NR Dual Connectivity with E-UTRAN connected to EPC
EPC	Evolved Packet Core
EPDCCH	Enhanced Physical Downlink Control Channel
EPS	Evolved Packet System
ETWS	Earthquake and Tsunami Warning System
E-UTRA	Evolved Universal Terrestrial Radio Access
E-UTRA/5GC	E-UTRA connected to 5GC
E-UTRA/EPC	E-UTRA connected to EPC
E-UTRAN	Evolved Universal Terrestrial Radio Access Network
FDD	Frequency Division Duplex
FFS	For Further Study
GERAN	GSM/EDGE Radio Access Network
GNSS	Global Navigation Satellite System
G-RNTI	Group RNTI
GSM	Global System for Mobile Communications
GSO	Geosynchronous Orbit
GWUS	Group Wake Up Signal
HARQ	Hybrid Automatic Repeat Request
HFN	Hyper Frame Number
HPLMN	Home Public Land Mobile Network
HRPD	CDMA2000 High Rate Packet Data
HSDN	High Speed Dedicated Network
H-SFN	Hyper SFN
IAB	Integrated Access and Backhaul
IAB-DU	IAB-node DU
IAB-MT	IAB Mobile Termination
IDC	In-Device Coexistence
IE	Information element
IMEI	International Mobile Equipment Identity
IMSI	International Mobile Subscriber Identity
IoT	Internet of Things
ISM	Industrial, Scientific and Medical
kB	Kilobyte (1000 bytes)
L1	Layer 1
L2	Layer 2
L3	Layer 3
LAA	Licensed-Assisted Access
LWA	LTE-WLAN Aggregation
LWAAP	LTE-WLAN Aggregation Adaptation Protocol
LWIP	LTE-WLAN Radio Level Integration with IPsec Tunnel
MAC	Medium Access Control
MBMS	Multimedia Broadcast Multicast Service
MBSFN	Multimedia Broadcast multicast service Single Frequency Network
MCG	Master Cell Group
MCOT	Maximum Channel Occupancy Time
MCPTT	Mission Critical Push To Talk
MDT	Minimization of Drive Tests
MIB	Master Information Block
MO	Mobile Originating
MPDCCH	MTC Physical Downlink Control Channel
MRB	MBMS Point to Multipoint Radio Bearer
MR-DC	Multi-Radio Dual Connectivity
MRO	Mobility Robustness Optimisation
MSI	MCH Scheduling Information
MT	Mobile Terminating
MTSI	Multimedia Telephony Service for IMS

MUSIM	Multi-Universal Subscriber Identity Module
MUST	MultiUser Superposition Transmission
N/A	Not Applicable
NACC	Network Assisted Cell Change
NAICS	Network Assisted Interference Cancellation/Suppression
NAS	Non Access Stratum
NB-IoT	NarrowBand Internet of Things
NE-DC	NR E-UTRA Dual Connectivity
(NG)EN-DC	E-UTRA NR Dual Connectivity (i.e. covering both EN-DC and NGEN-DC)
NGEN-DC	E-UTRA NR Dual Connectivity with E-UTRAN connected to 5GC
NGSO	Non-Geosynchronous Orbit
NPBCH	Narrowband Physical Broadcast channel
NPDCCH	Narrowband Physical Downlink Control channel
NPDSCH	Narrowband Physical Downlink Shared channel
NPRACH	Narrowband Physical Random Access channel
NPSS	Narrowband Primary Synchronization Signal
NPUSCH	Narrowband Physical Uplink Shared channel
NR	NR Radio Access
NRS	Narrowband Reference Signal
NSSAI	Network Slice Selection Assistance Information
NSSS	Narrowband Secondary Synchronization Signal
NTN	Non-Terrestrial Network
OS	OFDM Symbol
P2X	Pedestrian-to-Everything
PCCH	Paging Control Channel
PCell	Primary Cell
PDCCH	Physical Downlink Control Channel
PDCP	Packet Data Convergence Protocol
PDU	Protocol Data Unit
PLMN	Public Land Mobile Network
PMK	Pairwise Master Key
PO	Paging Occasion
posSIB	Positioning SIB
ProSe	Proximity based Services
PS	Public Safety (in context of sidelink), Packet Switched (otherwise)
PSCell	Primary Secondary Cell
PSK	Pre-Shared Key
PTAG	Primary Timing Advance Group
PUCCH	Physical Uplink Control Channel
PUR	Preconfigured Uplink Resource
QCI	QoS Class Identifier
QoE	Quality of Experience
QoS	Quality of Service
RACH	Random Access CHannel
RAI	Release Assistance Indication
RAT	Radio Access Technology
RB	Radio Bearer
RCLWI	RAN Controlled LTE-WLAN Integration
RLC	Radio Link Control
RLOS	Restricted Local Operator Services
RMTC	RSSI Measurement Timing Configuration
RN	Relay Node
RNA	RAN-based Notification Area
RNAU	RAN-based Notification Area Update
RNTI	Radio Network Temporary Identifier
ROHC	RObust Header Compression
RPLMN	Registered Public Land Mobile Network
RRC	Radio Resource Control
RSCP	Received Signal Code Power
RSRP	Reference Signal Received Power
RSRQ	Reference Signal Received Quality
RSS	Resynchronisation signal

RSSI	Received Signal Strength Indicator
SAE	System Architecture Evolution
SAP	Service Access Point
SBAS	Satellite Based Augmentation System
SC	Sidelink Control
SCell	Secondary Cell
SCG	Secondary Cell Group
SC-MRB	Single Cell MRB
SC-RNTI	Single Cell RNTI
SD-RSRP	Sidelink Discovery Reference Signal Received Power
SFN	System Frame Number
SHR	Successfull Handover Report
SI	System Information
SIB	System Information Block
SI-RNTI	System Information RNTI
SL	Sidelink
SLSS	Sidelink Synchronisation Signal
SMC	Security Mode Control
SMTC	SS/PBCH Block Measurement Timing Configuration
SPDCCH	Short PDCCH
SPS	Semi-Persistent Scheduling
SPT	Short Processing Time
SPUCCH	Short PUCCH
SR	Scheduling Request
SRB	Signalling Radio Bearer
S-RSRP	Sidelink Reference Signal Received Power
SSAC	Service Specific Access Control
SSTD	SFN and Subframe Timing Difference
STAG	Secondary Timing Advance Group
S-TMSI	SAE Temporary Mobile Station Identifier
STTI	Short TTI
TA	Tracking Area
TAG	Timing Advance Group
TDD	Time Division Duplex
TDM	Time Division Multiplexing
TLE	Two-Line Element
TM	Transparent Mode
TN	Terrestrial Network
TPC-RNTI	Transmit Power Control RNTI
T-RPT	Time Resource Pattern of Transmission
TTI	Transmission Time Interval
TTT	Time To Trigger
UDC	Uplink Data Compression
UE	User Equipment
UICC	Universal Integrated Circuit Card
UL	Uplink
UL-SCH	Uplink Shared Channel
UM	Unacknowledged Mode
UP	User Plane
UP-EDT	User Plane EDT
UTC	Coordinated Universal Time
UTRAN	Universal Terrestrial Radio Access Network
V2X	Vehicle-to-Everything
VoLTE	Voice over Long Term Evolution
WLAN	Wireless Local Area Network
WT	WLAN Termination
WUS	Wake-up Signal

In the ASN.1, lower case may be used for some (parts) of the above abbreviations e.g. c-RNTI.

4 General

4.1 Introduction

In this specification, (parts of) procedures and messages specified for the UE equally apply to the RN for functionality necessary for the RN. There are also (parts of) procedures and messages which are only applicable to the RN in its communication with the E-UTRAN, in which case the specification denotes the RN instead of the UE. Such RN-specific aspects are not applicable to the UE.

This specification covers MR-DC i.e. the case in which the UE is configured with resources belonging to another node using NR RAT. The NR related configuration is performed using NR RRC as specified in TS 38.331 [82].

NB-IoT is a non backward compatible variant of E-UTRAN supporting a reduced set of functionality. In this specification, (parts of) procedures and messages specified for the UE equally apply to the UE in NB-IoT. There are also some features and related procedures and messages that are not supported by UEs in NB-IoT.

In particular, the following features are not supported in NB-IoT and corresponding procedures and messages do not apply to the UE in NB-IoT:

- Connected mode mobility (Handover and measurement reporting);
- Inter-RAT cell reselection or inter-RAT mobility in connected mode;
- RRC_INACTIVE;
- CSG;
- Relay Node (RN);
- Carrier Aggregation (CA);
- Dual connectivity (DC);
- Multi-Radio Dual Connectivity (MR-DC);
- PDCP duplication;
- GBR (QoS);
- ACB, EAB, SSAC and ACDC;
- MBMS, except for MBMS via SC-PTM in Idle mode;
- Measurement logging and reporting for network performance optimisation;
- Public warning systems e.g. CMAS, ETWS and PWS;
- Broadcast of positioning assistance data;
- Real time services (including emergency call);
- CS services and CS fallback;
- In-device coexistence;
- RAN assisted WLAN interworking;
- Network-assisted interference cancellation/suppression;
- Sidelink (including direct communication and direct discovery).

NOTE: In regard to mobility, NB-IoT is a separate RAT from E-UTRAN.

In this specification, there are also (parts of) procedures and messages which are only applicable to UEs in NB-IoT, in which case this is stated explicitly.

This specification is organised as follows:

- clause 4.2 describes the RRC protocol model;
- clause 4.3 specifies the services provided to upper layers as well as the services expected from lower layers;
- clause 4.4 lists the RRC functions;
- clause 5 specifies RRC procedures, including UE state transitions;
- clause 6 specifies the RRC message in a mixed format (i.e. tabular & ASN.1 together);
- clause 7 specifies the variables (including protocol timers and constants) and counters to be used by the UE;
- clause 8 specifies the encoding of the RRC messages;
- clause 9 specifies the specified and default radio configurations;
- clause 10 specifies the RRC messages transferred across network nodes;
- clause 11 specifies the UE capability related constraints and performance requirements.

4.2 Architecture

4.2.1 UE states and state transitions including inter RAT

A UE is in RRC_CONNECTED when an RRC connection has been established or in RRC_INACTIVE (if the UE is connected to 5GC) when RRC connection is suspended. If this is not the case, i.e. no RRC connection is established, the UE is in RRC_IDLE state. The RRC states can further be characterised as follows:

- **RRC_IDLE:**
 - A UE specific DRX may be configured by upper layers;
 - UE controlled mobility;
 - The UE:
 - Monitors a Paging channel to detect incoming calls (by CN paging), system information change, for ETWS capable UEs, ETWS notification, and for CMAS capable UEs, CMAS notification;
 - Performs neighbouring cell measurements and cell (re-)selection;
 - Acquires system information;
 - Performs logging of available measurements together with location and time for logged measurement configured UEs;
 - May perform EDT;
 - May perform transmission using PUR;
 - Performs idle/inactive measurements for idle/inactive measurement configured UEs.
- **RRC_INACTIVE:**
 - A UE specific DRX may be configured by upper layers or by RRC layer;
 - A RAN-based notification area is configured by RRC layer;
 - The UE stores the UE Inactive AS context;
 - The UE:
 - Applies RRC_IDLE procedures unless specified otherwise;

- Monitors a Paging channel for CN paging using 5G-S-TMSI and RAN paging using fullII-RNTI;
 - Performs periodic RAN-based notification area update;
 - Performs RAN-based notification area update when moving out of the configured RAN-based notification area.
- **RRC_CONNECTED:**
- Transfer of unicast data to/from UE;
 - At lower layers, the UE may be configured with a UE specific DRX;
 - For UEs supporting CA, use of one or more SCells, aggregated with the PCell, for increased bandwidth;
 - For UEs supporting DC, use of one SCG, aggregated with the MCG, for increased bandwidth;
 - For UEs supporting (NG)EN-DC, option to configure one NR SCG in conjunction with the MCG for DRBs and SRBs, for improved performance (SRBs) and increased bandwidth (DRBs);
 - For UEs supporting NE-DC, option to configure one SCG in conjunction with the NR MCG for DRBs and SRBs, for improved performance (SRBs) and increased bandwidth (DRBs);
 - Network controlled mobility, i.e. handover and cell change order with optional network assistance (NACC) to GERAN (not applicable for NB-IoT);
 - The UE:
 - Monitors a Paging channel and/ or System Information Block Type 1 contents to detect system information change, for ETWS capable UEs, ETWS notification, and for CMAS capable UEs, CMAS notification (not applicable for BL UEs, UEs in CE and NB-IoT UEs);
 - Monitors control channels associated with the shared data channel to determine if data is scheduled for it;
 - For UEs in CE supporting reception of ETWS/CMAS indication in RRC_CONNECTED mode, monitors control channels associated with the shared data channel to acquire ETWS notification and/or CMAS notification;
 - Provides channel quality and feedback information (not applicable for NB-IoT);
 - Performs neighbouring cell measurements and measurement reporting (not applicable for NB-IoT);
 - Acquires system information (not applicable for BL UEs, UEs in CE and NB-IoT UEs), except for ETWS/CMAS reception where applicable.

NOTE: The term "UE is connected to 5GC" covers the scenarios that the UE is connected to 5GC and the UE is requesting to connect with 5GC.

Figure 4.2.1-1 not only provides an overview of the RRC states in E-UTRA/EPC, but also illustrates the mobility support between E-UTRA/EPC, UTRAN and GERAN.

Figure 4.2.1-1: E-UTRA/EPC states and inter RAT mobility procedures, 3GPP

Figure 4.2.1-2 illustrates the mobility support between E-UTRA/EPC, CDMA2000 1xRTT and CDMA2000 HRPD. The details of the CDMA2000 state models are out of the scope of this specification.

Figure 4.2.1-2: Mobility procedures between E-UTRA/EPC and CDMA2000

Figure 4.2.1-3 not only provides an overview of the RRC states in E-UTRA/5GC, but also illustrates the mobility support between E-UTRA/5GC, UTRAN and GERAN.

Figure 4.2.1-3: E-UTRA/5GC states and inter RAT mobility procedures, 3GPP

Figure 4.2.1-4 illustrates the mobility procedures supported between E-UTRA/5GC, CDMA2000 1xRTT and CDMA2000 HRPD. The details of the CDMA2000 state models are out of the scope of this specification.

Figure 4.2.1-4: Mobility procedures between E-UTRA/5GC and CDMA2000

Figure 4.2.1-5 illustrates the mobility procedures supported between E-UTRA/5GC and E-UTRA/EPC.

**Figure 4.2.1-5: Mobility procedures between E-UTRA/5GC and E-UTRA/EPC**

Figure 4.2.1-6 illustrates the mobility procedures supported between E-UTRA/EPC, E-UTRA/5GC and NR.

**Figure 4.2.1-6: Mobility procedures between E-UTRA/EPC, E-UTRA/5GC and NR**

The inter-RAT handover procedure(s) supports the case of signalling, conversational services, non-conversational services and combinations of these.

In addition to the state transitions shown in figures above, there is support for connection release with redirection information from E-UTRA RRC_CONNECTED to GERAN, UTRAN, CDMA2000 (HRPD Idle/ 1xRTT Dormant mode) and NR. A UE in RRC_INACTIVE enters RRC_IDLE when it enters another RAT or switches to another CN type.

For NB-IoT, mobility between E-UTRA and UTRAN, GERAN and between E-UTRA and CDMA2000 1xRTT and CDMA2000 HRPD is not supported at AS level and hence only the E-UTRA states depicted in Figure 4.2.1-1 are applicable.

4.2.2 Signalling radio bearers

"Signalling Radio Bearers" (SRBs) are defined as Radio Bearers (RB) that are used only for the transmission of RRC and NAS messages. More specifically, the following SRBs are defined:

- SRB0 is for RRC messages using the CCCH logical channel;
- SRB1 is for RRC messages (which may include a piggybacked NAS message) as well as for NAS messages prior to the establishment of SRB2, all using DCCH logical channel;
- For NB-IoT, SRB1bis is for RRC messages (which may include a piggybacked NAS message) as well as for NAS messages prior to the activation of security, all using DCCH logical channel;
- SRB2 is for RRC messages which include logged measurement information as well as for NAS messages and messages which include IAB-DU specific F1-C related information, all using DCCH logical channel. SRB2 has a lower-priority than SRB1 and is always configured by E-UTRAN after security activation. SRB2 is not applicable for NB-IoT;
- SRB4 is for RRC messages which include application layer measurement reporting information, all using DCCH logical channel. SRB4 can only be configured by E-UTRAN after security activation. SRB4 is not applicable for NB-IoT.

In downlink piggybacking of NAS messages is used only for one dependant (i.e. with joint success/ failure) procedure: bearer establishment/ modification/ release. In uplink NAS message piggybacking is used only for transferring the initial NAS message during connection setup.

NOTE 1: The NAS messages transferred via SRB2 are also contained in RRC messages, which however do not include any RRC protocol control information.

Once security is activated, all RRC messages on SRB1, SRB2 and SRB4, including those containing NAS or non-3GPP messages, are integrity protected and ciphered by PDCP. NAS independently applies integrity protection and ciphering to the NAS messages.

For a UE configured with DC, all RRC messages, regardless of the SRB used and both in downlink and uplink, are transferred via the MCG. In case of EN-DC, after connection establishment NR PDCP may be configured for both SRB1 and SRB2 and if so, these SRBs may be configured as split SRB. In case of NGEN-DC and NE-DC, NR PDCP is always configured. For a split SRB, the UE receives RRC messages via both MCG and NR SCG i.e. handles out of order and duplicate PDUs as specified in TS 38.323 [83]. For a split SRB, the network configures via which cell group(s) the UE sends uplink RRC messages.

NOTE 2: In case of (NG)EN-DC, SRB3 may be configured for the transfer of some NR RRC messages between UE and SgNB via the NR radio interface, see TS 38.331 [82].

An SRB can be configured with PDCP duplication, either by two logical channels within the same CG (CA duplication) or by two logical channels each within a different CG (DC duplication).

4.3 Services

4.3.1 Services provided to upper layers

The RRC protocol offers the following services to upper layers:

- Broadcast of common control information;
- Broadcast of positioning assistance data;
- Notification of UEs in RRC_IDLE and RRC_INACTIVE, e.g. about a terminating call, for ETWS, for CMAS;
- Transfer of dedicated control information, i.e. information for one specific UE.

4.3.2 Services expected from lower layers

In brief, the following are the main services that RRC expects from lower layers:

- PDCP: integrity protection and ciphering;
- RLC: reliable and in-sequence transfer of information, without introducing duplicates and with support for segmentation and concatenation.

Further details about the services provided by Packet Data Convergence Protocol layer (e.g. integrity and ciphering) are provided in TS 36.323 [8]. The services provided by Radio Link Control layer (e.g. the RLC modes) are specified in TS 36.322 [7]. Further details about the services provided by Medium Access Control layer (e.g. the logical channels) are provided in TS 36.321 [6]. The services provided by physical layer (e.g. the transport channels) are specified in TS 36.302 [3].

4.4 Functions

The RRC protocol includes the following main functions:

- Broadcast of system information:
 - Including NAS common information;
 - Information applicable for UEs in RRC_IDLE, e.g. cell (re-)selection parameters, neighbouring cell information and information (also) applicable for UEs in RRC_CONNECTED, e.g. common channel configuration information;
 - Including ETWS notification, CMAS notification (not applicable for NB-IoT);
 - Including positioning assistance data.
- RRC connection control:
 - Paging;
 - Establishment/ modification/ suspension / resumption / release of RRC connection, including e.g. assignment/ modification of UE identity (C-RNTI), establishment/ modification/ suspension/ resumption/ release of SRB1, SRB1bis, SRB2 and SRB4, access class barring;
 - Initial security activation, i.e. initial configuration of AS integrity protection (SRBs) and AS ciphering (SRBs, DRBs);
 - For RNs, configuration of AS integrity protection for DRBs;
 - RRC connection mobility including e.g. intra-frequency and inter-frequency handover, associated security handling, i.e. key/ algorithm change, specification of RRC context information transferred between network nodes;

NOTE 1: In NB-IoT, only key change (but no re-keying) at RRC Connection Resumption and RRC context information transfer are applicable.

- Establishment/ modification/ release of RBs carrying user data (DRBs);
- Radio configuration control including e.g. assignment/ modification of ARQ configuration, HARQ configuration, DRX configuration;
- For RNs, RN-specific radio configuration control for the radio interface between RN and E-UTRAN;
- In case of CA, cell management including e.g. change of PCell, addition/ modification/ release of SCell(s) and addition/modification/release of STAG(s);
- In case of DC, cell management including e.g. change of PSCell, addition/ modification/ release of SCG cell(s) and addition/modification/release of SCG TAG(s);

- In case of (NG)EN-DC, transparent transfer of NR RRC messages (e.g. DL: reconfiguration messages used to add or modify the NR SCG configuration or to (re-)configure measurements; configure conditional PSCell change; UL: measurement reports and reconfiguration complete messages) and of configurations of radio bearers using NR PDCP;
- QoS control including assignment/ modification of semi-persistent scheduling (SPS) configuration information for DL and UL, assignment/ modification of parameters for UL rate control in the UE, i.e. allocation of a priority and a prioritised bit rate (PBR) for each RB (not applicable for NB-IoT);
- Recovery from radio link failure;
- In case of LWA, RCLWI and LWIP, WLAN mobility set management including e.g. addition/ modification/ release of WLAN(s) from the WLAN mobility set;
- Inter-RAT mobility including e.g. security activation, transfer of RRC context information (not applicable for NB-IoT);
- Measurement configuration and reporting (not applicable for NB-IoT):
 - Establishment/ modification/ release of measurements (e.g. intra-frequency, inter-frequency and inter- RAT measurements);
 - Setup and release of measurement gaps;
 - Measurement reporting;
- Other functions including e.g. transfer of dedicated NAS information and non-3GPP dedicated information, transfer of UE radio access capability information, support for E-UTRAN sharing (multiple PLMN identities);
- Generic protocol error handling;
- Support of self-configuration and self-optimisation (not applicable for NB-IoT);
- Support of measurement logging and reporting for network performance optimisation, as specified in TS 37.320 [60] (not applicable for NB-IoT).

NOTE 2: Random access is specified entirely in the MAC including initial transmission power estimation.

4.5 Data available for transmission for NB-IoT

For the purpose of MAC Data Volume and Power Headroom reporting, the NB-IoT UE shall consider the following as data available for transmission in the RRC layer:

- For SDUs to be submitted to lower layers:
 - the SDU itself, if the SDU has not yet been processed by RRC; or
 - the PDU if the SDU has been processed by RRC;
- The data available for transmission in upper layers not submitted to the RRC layer.

5 Procedures

5.1 General

5.1.1 Introduction

The procedural requirements are structured according to the main functional areas: system information (5.2), connection control (5.3), inter-RAT mobility (5.4) and measurements (5.5). In addition, clause 5.6 covers other aspects e.g. NAS dedicated information transfer, UE capability transfer, clause 5.7 specifies the generic error handling, clause 5.8 covers

MBMS (i.e. MBMS service reception via MRB), clause 5.8a covers SC-PTM (i.e. MBMS service reception via SC-MRB), clause 5.9 covers RN-specific procedures and clause 5.10 covers sidelink.

For NB-IoT, only a subset of the above procedural requirements applies: system information (5.2), connection control (5.3), measurements (5.5), other (5.6), general error handling (5.7), and SC-PTM (5.8a). Clauses inter-RAT mobility (5.4), MBMS (5.8), RN procedures (5.9) and Sidelink (5.10) are not applicable in NB-IoT.

5.1.2 General requirements

The UE shall:

- 1> process the received messages in order of reception by RRC, i.e. the processing of a message shall be completed before starting the processing of a subsequent message;

NOTE 1: E-UTRAN may initiate a subsequent procedure prior to receiving the UE's response of a previously initiated procedure.

- 1> within a clause execute the steps according to the order specified in the procedural description;

- 1> consider the term 'radio bearer' (RB) to cover SRBs and DRBs but not MRBs or SC-MRBs unless explicitly stated otherwise;

- 1> set the *rrc-TransactionIdentifier* in the response message, if included, to the same value as included in the received RRC message that triggered the response message;

- 1> upon receiving a choice value set to *setup*:

- 2> apply the corresponding received configuration and start using the associated resources, unless explicitly specified otherwise;

- 1> upon receiving a choice value set to *release*:

- 2> clear the corresponding configuration and stop using the associated resources;

NOTE 1a: Following receipt of choice value set to release, the UE considers the field as if it was never configured.

- 1> upon handover to E-UTRA; or

- 1> upon receiving an *RRCConnectionReconfiguration* message including the *fullConfig*:

- 2> apply the Conditions in the ASN.1 for inclusion of the fields for the DRB/PDCP/RLC setup during the reconfiguration of the DRBs included in the *drb-ToAddModList*;

NOTE 2: At each point in time, the UE keeps a single value for each field except for during handover when the UE temporarily stores the previous configuration so it can revert back upon handover failure. In other words: when the UE reconfigures a field, the existing value is released except for during handover.

NOTE 3: Although not explicitly stated, the UE initially considers all functionality to be deactivated/ released until it is explicitly stated that the functionality is setup/ activated. Correspondingly, the UE initially considers lists to be empty e.g. the list of radio bearers, the list of measurements.

- 1> upon receiving an extension field comprising the entries in addition to the ones carried by the original field (regardless of whether E-UTRAN may signal more entries in total); apply the following generic behaviour if explicitly stated to be applicable:

- 2> create a combined list by concatenating the additional entries included in the extension field to the original field while maintaining the order among both the original and the additional entries;

- 2> for the combined list, created according to the previous, apply the same behaviour as defined for the original field;

NOTE 4: A field comprising a list of entries normally includes 'list' in the field name. The typical way to extend (the size of) such a list is to introduce a field comprising the additional entries, which should include 'listExt' in the name of the field/ IE. E.g. *field1List-RAT*, *field1ListExt-RAT*.

1> consider the term DC to cover the case of an E-UTRA MCG and SCG; Likewise, MCG covers the case of an E-UTRA MCG, SCG covers the case of an E-UTRA SCG, serving cell covers the case of an E-UTRA serving cell, PDCP covers the case of PDCP defined by E-UTRA specifications;

NOTE 5: In this specification, UE configuration refers to the parameters configured by E-UTRA RRC unless stated otherwise. Likewise, when a procedure is mentioned, this concerns the procedure defined by E-UTRA RRC unless stated otherwise.

5.1.3 Requirements for UE in MR-DC

In this specification, the UE considers itself to be configured with;

- EN-DC if and only if it is configured with *nr-SecondaryCellGroupConfig* and it is connected to EPC,
- NGEN-DC if and only if it is configured with *nr-SecondaryCellGroupConfig* and it is connected to 5GC,
- NE-DC if and only if it is configured with *mrdc-SecondaryCellGroup* set to *eutra-SCG* according to TS 38.331[82],
- MR-DC if and only if it is configured with (NG)EN-DC or NE-DC.

NOTE 1: The above deviates from the definition in TS 37.340 [81] (and some other specifications) i.e. according to TS 37.340 [81] a UE that is not configured with an SCG is in MR-DC when one or more bearers are terminated in the secondary node (i.e. using NR PDCP).

NOTE 2: MR-DC includes NR-DC, but that option is not relevant for this specification.

The UE configured with NE-DC only executes a subclause of clause 5 from this specification when the concerned subclause:

- is referenced from a subclause, either in this specification or in TS 38.331 [82], that is executed by the UE; or
- covers actions upon (re-)configuration of field(s), IE(s), UE variable(s) or timer(s) applicable for NE-DC;

When executing a subclause of clause 5 in this specification, the UE also follows the related general requirements as defined in clause 5.1.2 and other subclauses of this specification e.g. message processing delay requirements.

5.2 System information

5.2.1 Introduction

5.2.1.1 General

System information is divided into the *MasterInformationBlock* (MIB) and a number of *SystemInformationBlocks* (SIBs) and *SystemInformationBlockPos* (posSIBs). The MIB includes a limited number of most essential and most frequently transmitted parameters that are needed to acquire other information from the cell, and is transmitted on BCH. SIBs other than *SystemInformationBlockType1* and posSIBs are carried in *SystemInformation* (SI) messages. The mapping of SIBs and posSIBs to SI messages is flexibly configurable by *schedulingInfoList* and *posSchedulingInfoList*, respectively, included in *SystemInformationBlockType1*, with restrictions that: each SIB is contained only in a single SI message and each SIB and posSIB is contained at most once in that SI message; only SIBs and posSIBs having the same scheduling requirement (periodicity) can be mapped to the same SI message; *SystemInformationBlockType2* is always mapped to the SI message that corresponds to the first entry in the list of SI messages in *schedulingInfoList*. There may be multiple SI messages transmitted with the same periodicity. *SystemInformationBlockType1* and all SI messages are transmitted on DL-SCH.

The Bandwidth reduced Low Complexity (BL) UEs and UEs in Coverage Enhancement (CE) apply Bandwidth Reduced (BR) version of the SIB, posSIB or SI messages. A UE considers itself in enhanced coverage as specified in TS 36.304 [4]. In this and subsequent clauses, anything applicable for a particular SIB, posSIB or SI message equally applies to the corresponding BR version unless explicitly stated otherwise.

For NB-IoT, a reduced set of system information block with similar functionality but different content is defined; the UE applies the NB-IoT (NB) version of the MIB and the SIBs. These are denoted *MasterInformationBlock-NB*,

MasterInformationBlock-TDD-NB and *SystemInformationBlockTypeX-NB* in this specification. All other system information blocks (without NB suffix) are not applicable to NB-IoT; this is not further stated in the corresponding text.

NOTE 1: The physical layer imposes a limit to the maximum size a SIB can take. When DCI format 1C is used the maximum allowed by the physical layer is 1736 bits (217 bytes) while for format 1A the limit is 2216 bits (277 bytes), see TS 36.212 [22] and TS 36.213 [23]. For BL UEs and UEs in CE, the maximum SIB and SI message size is 936 bits, see TS 36.213 [23]. For NB-IoT, the maximum SIB and SI message size is 680 bits, see TS 36.213 [23].

In addition to broadcasting, E-UTRAN may provide *SystemInformationBlockType1*, *SystemInformationBlockType2* and/or *SystemInformationBlockType31*, including the same parameter values, via dedicated signalling i.e., within an *RRCConnectionReconfiguration* message.

The UE applies the system information acquisition and change monitoring procedures for the PCell, except when being a BL UE or a UE in CE or a NB-IoT UE in RRC_CONNECTED mode while T311 is not running. For an SCell, E-UTRAN provides, via dedicated signalling, all system information relevant for operation in RRC_CONNECTED when adding the SCell. However, a UE that is configured with DC shall acquire the *MasterInformationBlock* of the PSCell but use it only to determine the SFN timing of the SCG, which may be different from the MCG. Upon change of the relevant system information of a configured SCell, E-UTRAN releases and subsequently adds the concerned SCell, which may be done with a single *RRCConnectionReconfiguration* message. If the UE is receiving or interested to receive an MBMS service in a cell, the UE shall apply the system information acquisition and change monitoring procedure to acquire parameters relevant for MBMS operation and apply the parameters acquired from system information only for MBMS operation for this cell.

NOTE 2: E-UTRAN may configure via dedicated signalling different parameter values than the ones broadcast in the concerned SCell.

In MBMS-dedicated cell, non-MBSFN subframes are used for providing *MasterInformationBlock-MBMS* (MIB-MBMS) and *SystemInformationBlockType1-MBMS*. SIBs other than *SystemInformationBlockType1-MBMS* are carried in *SystemInformation-MBMS* message which is also provided on non-MBSFN subframes.

An RN configured with an RN subframe configuration does not need to apply the system information acquisition and change monitoring procedures. Upon change of any system information relevant to an RN, E-UTRAN provides the system information blocks containing the relevant system information to an RN configured with an RN subframe configuration via dedicated signalling using the *RNReconfiguration* message. For RNs configured with an RN subframe configuration, the system information contained in this dedicated signalling replaces any corresponding stored system information and takes precedence over any corresponding system information acquired through the system information acquisition procedure. The dedicated system information remains valid until overridden.

NOTE 3: E-UTRAN may configure an RN, via dedicated signalling, with different parameter values than the ones broadcast in the concerned cell.

5.2.1.2 Scheduling

The MIB uses a fixed schedule with a periodicity of 40 ms and repetitions made within 40 ms. The first transmission of the MIB is scheduled in subframe #0 of radio frames for which the SFN mod 4 = 0, and repetitions are scheduled in subframe #0 of all other radio frames. For TDD/FDD system with a bandwidth larger than 1.4 MHz that supports BL UEs or UEs in CE, MIB transmission may additionally be repeated in subframe#0 of the same radio frame, and in subframe#9 of the previous radio frame for FDD and subframe #5 of the same radio frame for TDD.

NOTE: The UE may assume the scheduling of MIB repetitions does not change. E-UTRAN may indicate in *MobilityControlInfo* whether optional MIB repetitions are enabled or not.

The MIB-MBMS uses a fixed schedule with a periodicity of 160 ms and repetitions made within 160 ms. The first transmission of the MIB-MBMS is scheduled in subframe #0 of radio frames for which the SFN mod 16 = 0, and repetitions are scheduled in subframe #0 of all other radio frames for which the SFN mod 4 = 0.

The *SystemInformationBlockType1* uses a fixed schedule with a periodicity of 80 ms and repetitions made within 80 ms. The first transmission of *SystemInformationBlockType1* is scheduled in subframe #5 of radio frames for which the SFN mod 8 = 0, and repetitions are scheduled in subframe #5 of all other radio frames for which SFN mod 2 = 0.

For BL UEs or UEs in CE, MIB is applied which may be provided with additional repetitions, while for SIB1 and further SI messages, separate messages are used which are scheduled independently and with content that may differ. The separate instance of SIB1 is named as *SystemInformationBlockType1-BR*. The *SystemInformationBlockType1-BR*

uses a schedule with a periodicity of 80ms. TBS for *SystemInformationBlockType1-BR* and the repetitions made within 80ms are indicated via *schedulingInfoSIB1-BR* in MIB or optionally in the *RRCCConnectionReconfiguration* message including the *MobilityControlInfo*.

The *SystemInformationBlockType1-MBMS* uses fixed schedule with a periodicity of 160 ms. The first transmission of *SystemInformationBlockType1-MBMS* is scheduled in subframe #0 of radio frames for which the SFN mod 16 = 0, and repetitions are scheduled in subframe #0 of all other radio frames for which SFN mod 8 = 0. Additionally, the *SystemInformationBlockType1-MBMS* and other system informations blocks may be scheduled in additional non-MBSFN subframes indicated in *MasterInformationBlock-MBMS*.

The SI messages are transmitted within periodically occurring time domain windows (referred to as SI-windows) using dynamic scheduling. Each SI message is associated with a SI-window and the SI-windows of different SI messages do not overlap. That is, within one SI-window only the corresponding SI is transmitted. The length of the SI-window is common for all SI messages, and is configurable. Within the SI-window, the corresponding SI message can be transmitted a number of times in any subframe other than MBSFN subframes, uplink subframes in TDD, and subframe #5 of radio frames for which SFN mod 2 = 0. The UE acquires the detailed time-domain scheduling (and other information, e.g. frequency-domain scheduling, used transport format) from decoding SI-RNTI on PDCCH (see TS 36.321 [6]). For a BL UE or a UE in CE, the detailed time/frequency domain scheduling information for the SI messages is provided in *SystemInformationBlockType1-BR*.

For UEs other than BL UE or UEs in CE SI-RNTI is used to address *SystemInformationBlockType1* as well as all SI messages. On MBMS-dedicated cell and on FeMBMS/Unicast-mixed cell, SI-RNTI with value in accordance with TS 36.321 [6] is used to address all SI messages whereas SI-RNTI with value in accordance with TS 36.321 [6] is used to address *SystemInformationBlockType1-MBMS*.

SystemInformationBlockType1 configures the SI-window length and the transmission periodicity for the SI messages.

5.2.1.2a Scheduling for NB-IoT

The *MasterInformationBlock-NB* (MIB-NB) uses a fixed schedule with a periodicity of 640 ms and repetitions made within 640 ms. The first transmission of the MIB-NB is scheduled in subframe #0 of radio frames for which the SFN mod 64 = 0 and repetitions are scheduled in subframe #0 of all other radio frames. The transmissions are arranged in 8 independently decodable blocks of 80 ms duration.

The *MasterInformationBlock-TDD-NB* (MIB-TDD-NB) uses a fixed schedule with a periodicity of 640 ms and repetitions made within 640 ms. The first transmission of the MIB-TDD-NB is scheduled in subframe #9 of radio frames for which the SFN mod 64 = 0 and repetitions are scheduled in subframe #9 of all other radio frames. The transmissions are arranged in 8 independently decodable blocks of 80 ms duration.

The *SystemInformationBlockType1-NB* (SIB1-NB) uses a fixed schedule with a periodicity of 2560 ms.

For FDD, SIB1-NB transmission occurs in subframe #4 of every other frame in 16 continuous frames. The starting frame for the first transmission of the SIB1-NB is derived from the cell PCID and the number of repetitions within the 2560 ms period and repetitions are made, equally spaced, within the 2560 ms period (see TS 36.213 [23]). TBS for *SystemInformationBlockType1-NB* and the repetitions made within the 2560 ms are indicated by *schedulingInfoSIB1* field in the MIB-NB. If *additionalTransmissionSIB1* is set to TRUE in the MIB-NB, additional SIB1-NB transmission occurs in subframe #3 of the same radio frames where SIB1-NB transmission occurs with the same number of repetitions.

For TDD, SIB1-NB transmission on the anchor carrier occurs in either subframe #0 or subframe #4 of every other frame in 16 continuous frames and SIB1-NB transmission on a non-anchor carrier occurs in subframe #0 and next in subframe #5 of every other frame in 16 continuous frames. The starting frame for the first transmission of the SIB1-NB is derived from the cell PCID and the number of repetitions within the 2560 ms period and repetitions are made, equally spaced, within the 2560 ms period (see TS 36.213 [23]). TBS for *SystemInformationBlockType1-NB*, the repetitions made within the 2560 ms, and the subframe index (#0 or #4) are indicated by *schedulingInfoSIB1* field in the MIB-TDD-NB.

The SI messages are transmitted within periodically occurring time domain windows (referred to as SI-windows) using scheduling information provided in *SystemInformationBlockType1-NB*. Each SI message is associated with a SI-window and the SI-windows of different SI messages do not overlap. That is, within one SI-window only the corresponding SI is transmitted. The length of the SI-window is common for all SI messages, and is configurable.

Within the SI-window, the corresponding SI message can be transmitted a number of times over 2 or 8 consecutive NB-IoT downlink subframes depending on TBS. The UE acquires the detailed time/frequency domain scheduling

information and other information, e.g. used transport format for the SI messages from *schedulingInfoList* field in *SystemInformationBlockType1-NB*. The UE is not required to accumulate several SI messages in parallel but may need to accumulate a SI message across multiple SI windows, depending on coverage condition.

SystemInformationBlockType1-NB configures the SI-window length and the transmission periodicity for all SI messages.

5.2.1.3 System information validity and notification of changes

Change of system information (other than for ETWS, CMAS, EAB, UAC, and satellite assistance information parameters except for discontinuous coverage scenarios and for NB-IoT, other than for AB parameters and satellite assistance information parameters except for discontinuous coverage scenarios) only occurs at specific radio frames, i.e. the concept of a modification period is used. System information may be transmitted a number of times with the same content within a modification period, as defined by its scheduling. The modification period boundaries are defined by SFN values for which SFN mod $m=0$, where m is the number of radio frames comprising the modification period. The modification period is configured by system information. If H-SFN is provided in *SystemInformationBlockType1-BR*, modification period boundaries for BL UEs and UEs in CE are defined by SFN values for which $(H\text{-SFN} * 1024 + SFN) \text{ mod } m=0$. For NB-IoT, H-SFN is always provided and the modification period boundaries are defined by SFN values for which $(H\text{-SFN} * 1024 + SFN) \text{ mod } m=0$.

To enable system information update notification for RRC_IDLE UEs configured to use a DRX cycle longer than the modification period, an eDRX acquisition period is defined. The boundaries of the eDRX acquisition period are determined by H-SFN values for which H-SFN mod 256 =0. For NB-IoT, the boundaries of the eDRX acquisition period are determined by H-SFN values for which H-SFN mod 1024 =0.

NOTE 1: If the UE in RRC_IDLE is configured to use extended DRX cycle, e.g., in the order of several minutes or longer, in case the eNB is reset the UE SFN may not be synchronized to the new eNB SFN. The UE is expected to recover, e.g., acquire MIB within a reasonable time, to avoid repeated paging failures.

NOTE 1a: For the UE in RRC_INACTIVE, the idle mode extended DRX cycle, if configured, is used to compare with the modification period.

When the network changes (some of the) system information, it first notifies the UEs about this change, i.e. this may be done throughout a modification period. In the next modification period, the network transmits the updated system information. During a modification period where ETWS or CMAS transmission is started or stopped, the SI messages carrying the SIBs scheduled in *schedulingInfoListExt* and/or SI messages carrying the posSIBs scheduled in *posSchedulingInfoList* may change, so the UE might not be able to successfully receive those SIBs and/or posSIBs in the remainder of the current modification period and next modification period according to the scheduling information received prior to the change. These general principles are illustrated in figure 5.2.1.3-1, in which different colours indicate different system information. Upon receiving a change notification, the UE not configured to use a DRX cycle that is longer than the modification period acquires the new system information immediately from the start of the next modification period. Upon receiving a change notification applicable to eDRX, a UE in RRC_IDLE configured to use a DRX cycle that is longer than the modification period acquires the updated system information immediately from the start of the next eDRX acquisition period. The UE applies the previously acquired system information until the UE acquires the new system information. The possible boundaries of modification for *SystemInformationBlockType1-BR* are defined by SFN values for which SFN mod 512 = 0 except for notification of ETWS/CMAS for which the eNB may change *SystemInformationBlockType1-BR* content at any time. For NB-IoT, the possible boundaries of modification for *SystemInformationBlockType1-NB* are defined by SFN values for which $(H\text{-SFN} * 1024 + SFN) \text{ mod } 4096 = 0$.

Figure 5.2.1.3-1: Change of system Information

The *Paging* message is used to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about a system information change. If the UE is in RRC_CONNECTED or is not configured to use a DRX cycle longer than the modification

period in RRC_IDLE, and receives a *Paging* message including the *systemInfoModification*, it knows that the system information will change at the next modification period boundary. A UE in RRC_IDLE that is configured to use a DRX cycle longer than the modification period, and receives in an eDRX acquisition period at least one *Paging* message including the *systemInfoModification-eDRX*, shall acquire the updated system information at the next eDRX acquisition period boundary. Although the UE may be informed about changes in system information, no further details are provided e.g. regarding which system information will change, except if *systemInfoValueTagSI* is received by BL UEs or UEs in CE.

In RRC_CONNECTED, BL UEs or UEs in CE or NB-IoT UEs are not required to acquire system information except when T311 is running, or upon handover where the UE is only required to acquire the *MasterInformationBlock* in the target PCell, or for UEs in CE to receive ETWS/CMAS information, or upon expiry of T317 where the UE is only required to acquire the *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT). In RRC_IDLE, E-UTRAN may notify BL UEs or UEs in CE or NB-IoT UEs about SI update, and except for NB-IoT, ETWS and CMAS notification, EAB modification and UAC modification, using Direct Indication information, as specified in 6.6 (or 6.7.5 in NB-IoT) and TS 36.212 [22].

NOTE 2: Upon system information change essential for BL UEs, UEs in CE, or NB-IoT UEs in RRC_CONNECTED, E-UTRAN may initiate connection release.

NOTE 3: When acquiring SIB31(-NB) in RRC_CONNECTED, UE may assume that the scheduling is unchanged.

SystemInformationBlockType1 (or *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* in NB-IoT) includes a value tag *systemInfoValueTag*, that indicates if a change has occurred in the SI messages. UEs may use *systemInfoValueTag*, e.g. upon return from out of coverage, to verify if the previously stored SI messages are still valid. *MasterInformationBlock* and RSS (if transmitted, see TS 36.211 [21]) may indicate using *systemInfoUnchanged-BR* that a change has not occurred in the SIB1-BR and SI messages of the current cell at least over the SI validity time, and the BL UEs or UEs in CE may use the *systemInfoUnchanged-BR*, e.g. upon return from out of coverage, to verify if the previously stored SIB1-BR and SI messages are still valid. Additionally, for other than BL UEs or UEs in CE or NB-IoT UEs, the UE considers stored system information to be invalid after 3 hours from the moment it was successfully confirmed as valid, unless specified otherwise. BL UE or UE in CE considers stored system information to be invalid after 24 hours from the moment it was successfully confirmed as valid, unless the UE is configured by parameter *si-ValidityTime* to consider stored system information to be invalid 3 hours after validity confirmation. NB-IoT UE considers stored system information to be invalid after 24 hours from the moment it was successfully confirmed as valid. If a BL UE, UE in CE or NB-IoT UE in RRC_CONNECTED state considers the stored system information invalid, the UE shall continue using the stored system information while in RRC_CONNECTED state in the serving cell.

For BL UEs or UEs in CE or NB-IoT UEs, the change of specific SI message can additionally be indicated by a SI message specific value tag *systemInfoValueTagSI*. If *systemInfoValueTag* included in the *SystemInformationBlockType1-BR* (or *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* in NB-IoT) is different from the one of the stored system information and if *systemInfoValueTagSI* is included in the *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) for a specific SI message and is different from the stored one, the UE shall consider this specific SI message to be invalid. If only *systemInfoValueTag* is included and is different from the stored one, the BL UE or UE in CE should consider any stored system information except *SystemInformationBlockType10*, *SystemInformationBlockType11*, *SystemInformationBlockType12*, *SystemInformationBlockType14*, *SystemInformationBlockType25*, *SystemInformationBlockType31* and *SystemInformationBlockType33* to be invalid; the NB-IoT UE should consider any stored system information except *SystemInformationBlockType14-NB*, *SystemInformationBlockType31-NB* and *SystemInformationBlockType33-NB* to be invalid.

On MBMS-dedicated cell and on FeMBMS/Unicast-mixed cell, the change of system information and ETWS/CMAS notification is indicated by using Direct Indication FeMBMS defined in 6.6a. The modification periodicity follows MCCH modification periodicity as defined in 5.8.1.3.

E-UTRAN may not update *systemInfoValueTag* upon change of some system information e.g. ETWS information, CMAS information, RLOS indication (i.e., *rlos-Enabled*), regularly changing parameters like time information (*SystemInformationBlockType8*, *SystemInformationBlockType16*, *hyperSFN-MSB* in *SystemInformationBlockType1-NB*), EAB and AB parameters, UAC parameters, positioning system information blocks, or satellite assistance information. Similarly, E-UTRAN may not include the *systemInfoModification* within the *Paging* message upon change of some system information.

NOTE 4: UE connected to NTN is expected to re-acquire SIB32(-NB) based on its own decision regardless of *systemInfoValueTag* change.

The UE that is not configured to use a DRX cycle longer than the modification period verifies that stored system information remains valid by either checking *systemInfoValueTag* in *SystemInformationBlockType1* (or *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* in NB-IoT) after the modification period boundary, or attempting to find the *systemInfoModification* indication at least *modificationPeriodCoeff* times during the modification period in case no paging is received, in every modification period. If no paging message is received by the UE during a modification period, the UE may assume that no change of system information will occur at the next modification period boundary. If UE in RRC_CONNECTED, during a modification period, receives one paging message, it may deduce from the presence/ absence of *systemInfoModification* whether a change of system information other than ETWS information, CMAS information, EAB and UAC parameters will occur in the next modification period or not.

When the RRC_IDLE UE is configured with a DRX cycle that is longer than the modification period, and at least one modification period boundary has passed since the UE last verified validity of stored system information, the UE verifies that stored system information remains valid by checking the *systemInfoValueTag* before establishing or resuming an RRC connection.

ETWS and/or CMAS capable UEs in RRC_CONNECTED, other than BL UEs and UEs in CE, shall attempt to read paging at least once every *defaultPagingCycle* to check whether ETWS and/or CMAS notification is present or not.

5.2.1.4 Indication of ETWS notification

ETWS primary notification and/ or ETWS secondary notification can occur at any point in time. The *Paging* message is used to inform ETWS capable UEs in RRC_IDLE and UEs not in CE in RRC_CONNECTED about presence of an ETWS primary notification and/ or ETWS secondary notification. For UEs in CE supporting reception of ETWS indication in RRC_CONNECTED mode, control channels associated with the shared data channel are used to inform the UE about the presence of an ETWS primary notification and/or ETWS secondary notification. If the UE receives a *Paging* message or control channels associated with the shared data channel including the *etws-Indication*, it shall start receiving the ETWS primary notification and/ or ETWS secondary notification according to *schedulingInfoList* contained in *SystemInformationBlockType1*. If the UE receives *Paging* message or control channels associated with the shared data channel including the *etws-Indication* while it is acquiring ETWS notification(s), the UE shall continue acquiring ETWS notification(s) based on the previously acquired *schedulingInfoList* until it re-acquires *schedulingInfoList* in *SystemInformationBlockType1*.

NOTE: The UE is not required to periodically check *schedulingInfoList* contained in *SystemInformationBlockType1*, but *Paging* message including the *etws-Indication* triggers the UE to re-acquire *schedulingInfoList* contained in *SystemInformationBlockType1* for scheduling changes for *SystemInformationBlockType10* and *SystemInformationBlockType11*. The UE may or may not receive a *Paging* message including the *etws-Indication* and/or *systemInfoModification* when ETWS is no longer scheduled.

ETWS primary notification is contained in *SystemInformationBlockType10* and ETWS secondary notification is contained in *SystemInformationBlockType11*. Segmentation can be applied for the delivery of a secondary notification. The segmentation is fixed for transmission of a given secondary notification within a cell (i.e. the same segment size for a given segment with the same *messageIdentifier*, *serialNumber* and *warningMessageSegmentNumber*). An ETWS secondary notification corresponds to a single *CB data* IE as defined according to TS 23.041 [37].

5.2.1.5 Indication of CMAS notification

CMAS notification can occur at any point in time. The *Paging* message is used to inform CMAS capable UEs in RRC_IDLE and UEs not in CE in RRC_CONNECTED about presence of one or more CMAS notifications. For UEs in CE supporting reception of CMAS indication in RRC_CONNECTED mode, control channels associated with the shared data channel are used to inform the UE about the presence of one or more CMAS notifications. If the UE receives a *Paging* message including the *cmas-Indication*, it shall start receiving the CMAS notifications according to *schedulingInfoList* contained in *SystemInformationBlockType1*. If the UE receives *Paging* message or control channels associated with the shared data channel including the *cmas-Indication* while it is acquiring CMAS notification(s), the UE shall continue acquiring CMAS notification(s) based on the previously acquired *schedulingInfoList* until it re-acquires *schedulingInfoList* in *SystemInformationBlockType1*.

NOTE: The UE is not required to periodically check *schedulingInfoList* contained in *SystemInformationBlockType1*, but *Paging* message including the *cmas-Indication* triggers the UE to re-acquire *schedulingInfoList* contained in *SystemInformationBlockType1* for scheduling changes for *SystemInformationBlockType12*. The UE may or may not receive a *Paging* message including the *cmas-Indication* and/or *systemInfoModification* when *SystemInformationBlockType12* is no longer scheduled.

CMAS notification is contained in *SystemInformationBlockType12*. A CMAS notification corresponds to a single *CB data* IE as defined according to TS 23.041 [37]. A CMAS notification may optionally have associated warning area coordinates. Segmentation can be applied for the delivery of a CMAS notification and, if present, the associated warning area coordinates. The segmentation is fixed for transmission of a given CMAS notification and, if present, any associated warning area coordinates within a cell (i.e. the same segment size for a given segment with the same *messageIdentifier*, *serialNumber* and *warningMessageSegmentNumber*). E-UTRAN does not interleave transmissions of CMAS notifications, i.e. all segments of a given CMAS notification transmission are transmitted prior to those of another CMAS notification.

5.2.1.6 Notification of EAB parameters change

Change of EAB parameters can occur at any point in time. The EAB parameters are contained in *SystemInformationBlockType14*. The *Paging* message is used to inform EAB capable UEs in RRC_IDLE about a change of EAB parameters or that *SystemInformationBlockType14* is no longer scheduled. If the UE receives a *Paging* message including the *eab-ParamModification*, it shall acquire *SystemInformationBlockType14* according to *schedulingInfoList* contained in *SystemInformationBlockType1*. If the UE receives a *Paging* message including the *eab-ParamModification* while it is acquiring *SystemInformationBlockType14*, the UE shall continue acquiring *SystemInformationBlockType14* based on the previously acquired *schedulingInfoList* until it re-acquires *schedulingInfoList* in *SystemInformationBlockType1*.

NOTE: The EAB capable UE is not expected to periodically check *schedulingInfoList* contained in *SystemInformationBlockType1*.

5.2.1.7 Access Barring parameters change in NB-IoT

Change of Access Barring (AB) parameters can occur at any point in time. The AB parameters are contained in *SystemInformationBlockType14-NB*. Update of the AB parameters does not impact the *systemInfoValueTag* in the *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* or the *systemInfoValueTagSI* in *SystemInformationBlockType1-NB*.

If *SystemInformationBlockType14-NB* is scheduled, a NB-IoT UE connected to EPC is required to acquire *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* before initiating RRC connection establishment / resume for all access causes except mobile terminating calls to check *ab-Enabled* indication. If access barring is enabled the UE shall not initiate the RRC connection establishment / resume for all access causes except mobile terminating calls until the UE has acquired the *SystemInformationBlockType14-NB*.

If *SystemInformationBlockType14-NB* is scheduled, a NB-IoT UE connected to 5GC is required to acquire *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* before initiating RRC connection establishment / resume / re-establishment to check *ab-Enabled-5GC* indication. If access barring is enabled the UE shall not initiate the RRC connection establishment / resume / re-establishment until the UE has acquired the *SystemInformationBlockType14-NB*.

5.2.1.8 Notification of UAC parameters change

Change of UAC parameters can occur at any point in time. The UAC parameters are contained in *SystemInformationBlockType25*. The *Paging* message is used to inform BL UEs or UEs in CE in RRC_INACTIVE or RRC_IDLE connected to 5GC about a change of UAC parameters or that *SystemInformationBlockType25* is no longer scheduled. If the UE receives a *Paging* message including the *uac-ParamModification*, it shall acquire *SystemInformationBlockType25* according to *schedulingInfoList* contained in *SystemInformationBlockType1*. If the UE receives a *Paging* message including the *uac-ParamModification* while it is acquiring *SystemInformationBlockType25*, the UE shall continue acquiring *SystemInformationBlockType25* based on the previously acquired *schedulingInfoList* until it re-acquires *schedulingInfoList* in *SystemInformationBlockType1*.

NOTE: The BL UE or UE in CE is not expected to periodically check *schedulingInfoList* contained in *SystemInformationBlockType1*.

5.2.2 System information acquisition

5.2.2.1 General

Figure 5.2.2.1-1: System information acquisition, normal

The UE applies the system information acquisition procedure to acquire the AS- and NAS- and positioning-system information that is broadcasted by the E-UTRAN. The procedure applies to UEs in RRC_IDLE and UEs in RRC_CONNECTED.

For BL UE, UE in CE and NB-IoT UE, specific conditions apply, as specified below.

5.2.2.2 Initiation

The UE shall apply the system information acquisition procedure upon selecting (e.g. upon power on) and upon re-selecting a cell, after handover completion, after entering E-UTRA from another RAT, upon return from out of coverage, upon receiving a notification that the system information has changed, upon receiving an indication about the presence of an ETWS notification, upon receiving an indication about the presence of a CMAS notification, upon receiving a notification that the EAB parameters have changed, upon receiving a request from CDMA2000 upper layers, upon receiving a request from positioning upper layers, upon receiving a notification that the UAC parameters have changed and upon exceeding the maximum validity duration. Unless explicitly stated otherwise in the procedural specification, the system information acquisition procedure overwrites any stored system information, i.e. delta configuration is not applicable for system information and the UE discontinues using a field if it is absent in system information unless explicitly specified otherwise.

In RRC_CONNECTED, BL UEs and UEs in CE are required to acquire system information when T311 is running or upon handover where the UE is only required to acquire the *MasterInformationBlock* in the target PCell.

NOTE: Upon handover, E-UTRAN provides system information required by the UE in RRC_CONNECTED except MIB with RRC signalling, i.e. *systemInformationBlockType1Dedicated* and *mobilityControlInfo*.

5.2.2.3 System information required by the UE

The UE shall:

- 1> ensure having a valid version, as defined below, of (at least) the following system information, also referred to as the 'required' system information:
- 2> if in RRC_IDLE:
- 3> if the UE is a NB-IoT UE:
- 4> the *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* and *SystemInformationBlockType1-NB* as well as *SystemInformationBlockType2-NB* through *SystemInformationBlockType5-NB*, *SystemInformationBlockType22-NB*;
- 3> else:
- 4> the *MasterInformationBlock* and *SystemInformationBlockType1* (or *SystemInformationBlockType1-BR* depending on whether the UE is a BL UE or the UE in CE) as well as *SystemInformationBlockType2*

through *SystemInformationBlockType8* and *SystemInformationBlockType24* (depending on support of the concerned RATs), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking when the UE is connected to EPC), *SystemInformationBlockType25* (depending on support of E-UTRA/5GC), *SystemInformationBlockType29* (only for BL UE or the UE in CE depending on support of resource reservation), *SystemInformationBlockType21*, *SystemInformationBlockType26* (if UE is capable of V2X sidelink communication and is configured by upper layers to receive or transmit V2X sidelink communication), and *SystemInformationBlockType28* (if UE is capable of NR sidelink communication and is configured by upper layers to receive or transmit NR sidelink communication), *SystemInformationBlockType30* (if UE is configured by upper layers to report disaster roaming related information);

3> if initiating a RRC connection establishment/resume procedure; and

3> the UE is NTN capable:

4> *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT), if scheduled;

2> if in RRC_INACTIVE:

3> the *MasterInformationBlock* and *SystemInformationBlockType1* as well as *SystemInformationBlockType2* through *SystemInformationBlockType8* (depending on support of the concerned RATs), *SystemInformationBlockType24* (depending on support of the concerned RATs), *SystemInformationBlockType25*, *SystemInformationBlockType29* (only for BL UE or the UE in CE depending on support of resource reservation), *SystemInformationBlockType21*, *SystemInformationBlockType26* (if UE is capable of V2X sidelink communication and is configured by upper layers to receive or transmit V2X sidelink communication), and *SystemInformationBlockType28* (if UE is capable of NR sidelink communication and is configured by upper layers to receive or transmit NR sidelink communication), *SystemInformationBlockType30* (if UE is configured by upper layers to report disaster roaming related information);

2> if in RRC_CONNECTED; and

2> the UE is not a BL UE; and

2> the UE is not in CE; and

2> the UE is not a NB-IoT UE:

3> the *MasterInformationBlock*, *SystemInformationBlockType1* and *SystemInformationBlockType2* as well as *SystemInformationBlockType8* (depending on support of CDMA2000), *SystemInformationBlockType17* (depending on support of RAN-assisted WLAN interworking when the UE is connected to EPC), *SystemInformationBlockType25* (depending on support of E-UTRA/5GC);

2> if in RRC_CONNECTED and T311 is running; and

2> the UE is a BL UE or the UE is in CE or the UE is a NB-IoT UE:

3> the *MasterInformationBlock* (or *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* in NB-IoT), *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) and *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT), *SystemInformationBlockType25* (only for BL UE or the UE in CE depending on support of E-UTRA/5GC), *SystemInformationBlockType29* (only for BL UE or the UE in CE depending on support of resource reservation), *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) (only for NTN capable UE) if scheduled, and for NB-IoT *SystemInformationBlockType22-NB*;

2> if in RRC_CONNECTED and T317 is not running; and

2> the UE is NTN capable:

3> *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT), if scheduled;

1> delete any stored system information after 3 hours or 24 hours from the moment it was confirmed to be valid as defined in 5.2.1.3, unless specified otherwise;

1> consider any stored system information except *SystemInformationBlockType10*, *SystemInformationBlockType11*, *SystemInformationBlockType12*, *SystemInformationBlockType14* (*SystemInformationBlockType14-NB* in NB-

IoT), systemInformationBlockType25 and systemInformationBlockType31 (systemInformationBlockType31-NB in NB-IoT), to be invalid if systemInfoValueTag included in the SystemInformationBlockType1 (MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB in NB-IoT) is different from the one of the stored system information and in case of NB-IoT UEs, BL UEs and UEs in CE, systemInfoValueTagSI is not broadcasted. Otherwise consider system information validity as defined in 5.2.1.3;

5.2.2.4 System information acquisition by the UE

The UE shall:

- 1> apply the specified BCCH configuration defined in 9.1.1.1 or BR-BCCH configuration defined in 9.1.1.8;
- 1> if the procedure is triggered by a system information change notification:
 - 2> if the UE uses an idle DRX cycle longer than the modification period:
 - 3> start acquiring the required system information, as defined in 5.2.2.3, from the next eDRX acquisition period boundary;
 - 2> else
 - 3> start acquiring the required system information, as defined in 5.2.2.3, from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received system information until the new system information has been acquired.

- 1> if the UE is in RRC_IDLE and enters a cell for which the UE does not have stored a valid version of the system information required in RRC_IDLE, as defined in 5.2.2.3:
 - 2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_IDLE, as defined in 5.2.2.3;
- 1> following successful handover completion to a PCell for which the UE does not have stored a valid version of the system information required in RRC_CONNECTED, as defined in 5.2.2.3:
 - 2> acquire, using the system information acquisition procedure as defined in 5.2.3, the system information required in RRC_CONNECTED, as defined in 5.2.2.3;
 - 2> upon acquiring the concerned system information:
 - 3> discard the corresponding radio resource configuration information included in the *radioResourceConfigCommon* previously received in a dedicated message, if any;
- 1> following a request from CDMA2000 upper layers:
 - 2> acquire *SystemInformationBlockType8*, as defined in 5.2.3;
- 1> neither initiate the RRC connection establishment/resume procedure nor initiate transmission of the *RRCConnectionReestablishmentRequest* message until the UE has a valid version of the *MasterInformationBlock* (*MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* in NB-IoT) and *SystemInformationBlockType1* (*SystemInformationBlockType1-NB* in NB-IoT) messages as well as *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT), and for NB-IoT, *SystemInformationBlockType22-NB*;
- 1> not initiate the RRC connection establishment/resume procedure subject to EAB until the UE has a valid version of *SystemInformationBlockType14*, if broadcast;
- 1> if the UE is ETWS capable:
 - 2> upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:
 - 3> discard any previously buffered *warningMessageSegment*;
 - 3> clear, if any, the current values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*;

2> when the UE acquires *SystemInformationBlockType1* following ETWS indication, upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType10* is present:

4> if the UE is in CE:

5> start acquiring *SystemInformationBlockType10*;

4> else

5> start acquiring *SystemInformationBlockType10* immediately;

3> if *schedulingInfoList* indicates that *SystemInformationBlockType11* is present:

4> start acquiring *SystemInformationBlockType11* immediately;

NOTE 2: UEs shall start acquiring *SystemInformationBlockType10* and *SystemInformationBlockType11* as described above even when *systemInfoValueTag* in *SystemInformationBlockType1* has not changed.

1> if the UE is CMAS capable:

2> upon entering a cell during RRC_IDLE, following successful handover or upon connection re-establishment:

3> discard any previously buffered *warningMessageSegment*;

3> clear, if any, stored values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType12* associated with the discarded *warningMessageSegment*;

2> when the UE acquires *SystemInformationBlockType1* following CMAS indication, upon entering a cell during RRC_IDLE, following successful handover and upon connection re-establishment:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType12* is present:

4> acquire *SystemInformationBlockType12*;

NOTE 3: UEs shall start acquiring *SystemInformationBlockType12* as described above even when *systemInfoValueTag* in *SystemInformationBlockType1* has not changed.

1> if the UE is interested to receive MBMS services:

2> if the UE is capable of MBMS reception as specified in 5.8:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType13* is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType13*;

3> else if *SystemInformationBlockType13* is present in *SystemInformationBlockType1-MBMS* and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType13* from *SystemInformationBlockType1-MBMS*;

2> if the UE is capable of SC-PTM reception as specified in 5.8a:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT) is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT);

2> if the UE is capable of MBMS Service Continuity:

3> if *schedulingInfoList* indicates that *SystemInformationBlockType15* (*SystemInformationBlockType15-NB* in NB-IoT) is present and the UE does not have stored a valid version of this system information block:

4> acquire *SystemInformationBlockType15* (*SystemInformationBlockType15-NB* in NB-IoT);

1> if the UE is EAB capable:

2> when the UE does not have stored a valid version of *SystemInformationBlockType14* upon entering RRC_IDLE, or when the UE acquires *SystemInformationBlockType1* following EAB parameters change notification, or upon entering a cell during RRC_IDLE, or before establishing an RRC connection if using eDRX with DRX cycle longer than the modification period;

3> if *schedulingInfoList* indicates that *SystemInformationBlockType14* is present:

4> start acquiring *SystemInformationBlockType14* immediately;

3> else:

4> discard *SystemInformationBlockType14*, if previously received;

NOTE 4: EAB capable UEs start acquiring *SystemInformationBlockType14* as described above even when *systemInfoValueTag* in *SystemInformationBlockType1* has not changed.

NOTE 5: EAB capable UEs maintain an up to date *SystemInformationBlockType14* in RRC_IDLE.

1> if the UE is capable of sidelink communication and is configured by upper layers to receive or transmit sidelink communication:

2> if the cell used for sidelink communication meets the S-criteria as defined in TS 36.304 [4]; and

2> if *schedulingInfoList* indicates that *SystemInformationBlockType18* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType18*;

1> if the UE is capable of sidelink discovery and is configured by upper layers to receive or transmit sidelink discovery announcements on the primary frequency:

2> if *schedulingInfoList* of the serving cell/ PCell indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

1> if the UE is capable of sidelink discovery and, for each of the one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19* and for which the UE is configured by upper layers to receive sidelink discovery announcements on:

2> if *SystemInformationBlockType19* of the serving cell/ PCell does not provide the corresponding reception resources; and

2> if *schedulingInfoList* of the cell on the concerned frequency indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

1> if the UE is capable of sidelink discovery and, for each of the one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19* and for which the UE is configured by upper layers to transmit sidelink discovery announcements on:

2> if *SystemInformationBlockType19* of the serving cell/ PCell includes *discTxResourcesInterFreq* which is set to *acquireSI-FromCarrier*; and

2> if *schedulingInfoList* of the cell on the concerned frequency indicates that *SystemInformationBlockType19* is present and the UE does not have stored a valid version of this system information block:

3> acquire *SystemInformationBlockType19*;

1> if the UE is a NB-IoT UE connected to EPC and if *ab-Enabled* included in *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* is set to *TRUE*:

2> not initiate the RRC connection establishment/resume procedure for all access causes except mobile terminating calls until the UE has acquired the *SystemInformationBlockType14-NB*;

- 1> if the UE is capable of V2X sidelink communication and is configured by upper layers to receive or transmit V2X sidelink communication on a frequency:
- 2> if *schedulingInfoList* on the serving cell/PCell indicates that *SystemInformationBlockType21* is present and the UE does not have stored valid version of this system information block:
 - 3> acquire *SystemInformationBlockType21* from serving cell/PCell;
- 2> if *schedulingInfoList* on the serving cell/PCell indicates that *SystemInformationBlockType26* is present and the UE does not have stored valid version of this system information block:
 - 3> acquire *SystemInformationBlockType26* from serving cell/PCell;
- 1> if the UE is capable of V2X sidelink communication and is configured by upper layers to receive V2X sidelink communication on a frequency, which is not primary frequency:
 - 2> if neither *SystemInformationBlockType21* nor *SystemInformationBlockType26* of the serving cell/ PCCell provide reception resource pool for V2X sidelink communication for the concerned frequency; and
 - 2> if the cell used for V2X sidelink communication on the concerned frequency meets the S-criteria as defined in TS 36.304 [4]:
 - 3> if *schedulingInfoList* on the concerned frequency indicates that *SystemInformationBlockType21* is present and the UE does not have stored a valid version of this system information block:
 - 4> acquire *SystemInformationBlockType21* from the concerned frequency;
 - 3> if *schedulingInfoList* on the concerned frequency indicates that *SystemInformationBlockType26* is present and the UE does not have stored a valid version of this system information block:
 - 4> acquire *SystemInformationBlockType26* from the concerned frequency;
 - 1> if the UE is capable of V2X sidelink communication and is configured by upper layers to transmit V2X sidelink communication on a frequency, which is not primary frequency and is not included in *v2x-InterFreqInfoList* in *SystemInformationBlockType21* nor *SystemInformationBlockType26* of the serving cell/PCell:
 - 2> if the cell used for V2X sidelink communication on the concerned frequency meets the S-criteria as defined in TS 36.304 [4]:
 - 3> if *schedulingInfoList* on the concerned frequency indicates that *SystemInformationBlockType21* is present and the UE does not have stored a valid version of this system information block:
 - 4> acquire *SystemInformationBlockType21* from the concerned frequency;
 - 3> if *schedulingInfoList* on the concerned frequency indicates that *SystemInformationBlockType26* is present and the UE does not have stored a valid version of this system information block:
 - 4> acquire *SystemInformationBlockType26* from the concerned frequency;
 - 1> if the NB-IoT UE supports NPRACH resources using preamble format 2:
 - 2> if *schedulingInfoList* indicates that *SystemInformationBlockType23-NB* is present and the UE does not have stored a valid version of this system information block:
 - 3> acquire *SystemInformationBlockType23-NB*;
 - 1> following a request from positioning upper layers:
 - 2> acquire *SystemInformationBlockPos*, as defined in 5.2.3;
 - 1> if the UE is capable of NR sidelink communication and is configured by upper layers to receive or transmit NR sidelink communication on a frequency:
 - 2> if *schedulingInfoList* on the serving cell/PCell indicates that *SystemInformationBlockType28* is present and the UE does not have stored valid version of this system information block:
 - 3> acquire *SystemInformationBlockType28* from serving cell/PCell;

- 1> if the UE connected to 5GC is a BL UE or a UE in CE;
- 2> when the UE does not have stored a valid version of *SystemInformationBlockType25* upon entering RRC_IDLE, or when the UE acquires *SystemInformationBlockType1-BR* following UAC parameters change notification, or upon entering a cell during RRC_IDLE, or before establishing, resuming or re-establishing an RRC connection if using an eDRX cycle longer than the modification period;
- 3> if *schedulingInfoList* indicates that *SystemInformationBlockType25* is present:
 - 4> start acquiring *SystemInformationBlockType25* immediately before establishing, resuming or re-establishing an RRC connection;
- 3> else:
 - 4> discard *SystemInformationBlockType25*, if previously received;

NOTE 5a: When connected to 5GC, BL UEs or a UEs in CE start acquiring *SystemInformationBlockType25* as described above even when *systemInfoValueTag* in *SystemInformationBlockType1-BR* has not changed.

NOTE 5b: When connected to 5GC, BL UEs or a UEs in CE maintain an up to date *SystemInformationBlockType25* in RRC_IDLE.

- 1> if the UE is a NB-IoT UE connected to 5GC and if *ab-Enabled5GC* included in *MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* is set to TRUE:
 - 2> not initiate the RRC connection establishment/ resume/ re-establishment procedure for all access causes until the UE has acquired the *SystemInformationBlockType14-NB*;
- 1> if the UE is NTN capable:
 - 2> if *schedulingInfoList* indicates that *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) is present:
 - 3> immediately before establishing, resuming or re-establishing an RRC connection; or
 - 3> immediately before EDT or transmission using PUR; or
 - 3> if in RRC_CONNECTED and T317 is not running:
 - 4> acquire *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT);
 - 2> if the UE supports discontinuous coverage; and
 - 2> if *schedulingInfoList* indicates that *SystemInformationBlockType32* (*SystemInformationBlockType32-NB* in NB-IoT) is present and the UE does not have a valid version of this system information block:
 - 3> acquire *SystemInformationBlockType32* (*SystemInformationBlockType32-NB* in NB-IoT);

The UE may apply the received SIBs or posSIBs immediately, i.e. the UE does not need to delay using a SIB or posSIB until all SI messages have been received. The UE may delay applying the received SIBs until completing lower layer procedures associated with a received or a UE originated RRC message, e.g. an ongoing random access procedure.

NOTE 6: While attempting to acquire a particular SIB/posSIB, if the UE detects from *schedulingInfoList/ posSchedulingInfoList* that it is no longer present, the UE should stop trying to acquire the particular SIB/ posSIB.

5.2.2.5 Essential system information missing

The UE shall:

- 1> if in RRC_IDLE, RRC_INACTIVE or in RRC_CONNECTED while T311 is running;
- 2> if the UE is unable to acquire the *MasterInformationBlock* (*MasterInformationBlock-NB/ MasterInformationBlock-TDD-NB* in NB-IoT); or
- 2> if the UE is neither a BL UE nor in CE nor in NB-IoT and the UE is unable to acquire the *SystemInformationBlockType1*; or

- 2> if the BL UE or UE in CE is unable to acquire *SystemInformationBlockType1-BR* or *SystemInformationBlockType1-BR* is not scheduled; or
- 2> if the NB-IoT UE is unable to acquire the *SystemInformationBlockType1-NB*:
 - 3> consider the cell as barred in accordance with TS 36.304 [4]; and
 - 3> perform barring as if *intraFreqReselection* is set to *allowed*, and as if the *csg-Indication* is set to *FALSE*;
- 2> else:
 - 3> if the UE is unable to acquire the *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT) and for NB-IoT, *SystemInformationBlockType22-NB* if scheduled; or
 - 3> if *SystemInformationBlockType25* is broadcast and if the UE is connected to 5GC and is unable to acquire the *SystemInformationBlockType25*; or
 - 3> if the UE is NTN capable, *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) is broadcast and if the UE is unable to acquire the *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT):
 - 4> treat the cell as barred in accordance with TS 36.304 [4];

5.2.2.6 Actions upon reception of the *MasterInformationBlock* message

Upon receiving the *MasterInformationBlock* message the UE shall:

- 1> apply the radio resource configuration included in the *phich-Config*;
- 1> if the UE is in RRC_IDLE or if the UE is in RRC_CONNECTED while T311 is running:
 - 2> if the UE has no valid system information stored according to 5.2.2.3 for the concerned cell:
 - 3> apply the received value of *dl-Bandwidth* to the *ul-Bandwidth* until *SystemInformationBlockType2* is received;

Upon receiving the *MasterInformationBlock-NB* or *MasterInformationBlock-TDD-NB* message the UE shall:

- 1> apply the radio resource configuration included in accordance with the *operationModeInfo*.

No UE requirements related to the contents of *MasterInformationBlock-MBMS* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.7 Actions upon reception of the *SystemInformationBlockType1* message

Upon receiving the *SystemInformationBlockType1* or *SystemInformationBlockType1-BR* either via broadcast or via dedicated signalling, the UE shall:

- 1> if the upper layers indicate the selected core network type as 5GC:
 - 2> if the *cellAccessRelatedInfoList-5GC* contains an entry with the *plmn-Identity* or *plmn-Index* of the selected PLMN:
 - 3> in the remainder of the procedures use *plmn-IdentityList*, *trackingAreaCode*, and *cellIdentity* for the cell as received in the corresponding *cellAccessRelatedInfoList-5GC* containing the selected PLMN;
- 1> else if the *cellAccessRelatedInfoList* contains an entry with the *PLMN-Identity* of the selected PLMN:
 - 2> in the remainder of the procedures use *plmn-IdentityList*, *trackingAreaCode*, *trackingAreaList* and *cellIdentity* for the cell as received in the corresponding *cellAccessRelatedInfoList* containing the selected PLMN;
- 1> if in RRC_IDLE or in RRC_CONNECTED while T311 is running; and
- 1> if the UE is a category 0 UE according to TS 36.306 [5]; and

- 1> if *category0Allowed* is not included in *SystemInformationBlockType1*:
- 2> consider the cell as barred in accordance with TS 36.304 [4];
- 1> if in RRC_CONNECTED while T311 is not running, and the UE supports multi-band cells as defined by bit 31 in *featureGroupIndicators*:
- 2> disregard the *freqBandIndicator* and *multiBandInfoList*, if received, while in RRC_CONNECTED;
- 2> forward the *cellIdentity* to upper layers;
- 2> forward the *trackingAreaCode* to upper layers;
- 2> forward the *trackingAreaList* to upper layers, if present;
- 1> else:
 - 2> if UE is IAB-MT and if *iab-Support* is not provided for the selected PLMN nor the registered PLMN nor PLMN of the equivalent PLMN list:
 - 3> consider the cell as barred for IAB-MT in accordance with TS 36.304 [4];
 - 3> perform barring as if *intraFreqReselection* is set to allowed, and as if the *csg-Indication* is set to FALSE;
 - 2> else:
 - 3> if the frequency band indicated in the *freqBandIndicator* or *freqBandIndicatorAerial* is part of the frequency bands supported by the UE and it is not a downlink only band; or
 - 3> if the UE supports *multiBandInfoList*, and if one or more of the frequency bands indicated in the *multiBandInfoList* or *multiBandInfoListAerial* are part of the frequency bands supported by the UE and they are not downlink only bands:
 - 4> forward the *cellIdentity* to upper layers;
 - 4> forward the *trackingAreaCode* to upper layers;
 - 4> forward the *trackingAreaList* to upper layers, if present;
 - 4> forward the PLMN identity to upper layers;
 - 4> if in RRC_INACTIVE and the forwarded information does not trigger message transmission by upper layers:
 - 5> if the serving cell does not belong to the configured *ran-NotificationAreaInfo*:
 - 6> initiate an RNA update as specified in 5.3.17.2;
 - 4> forward the *ims-EmergencySupport* to upper layers, if present;
 - 4> forward the *eCallOverIMS-Support* to upper layers, if present;
 - 4> if the UE is capable of 5G NAS:
 - 5> forward the *ims-EmergencySupport5GC* to upper layers, if present;
 - 5> forward the *eCallOverIMS-Support5GC* to upper layers, if present;
 - 5> forward *cp-CIoT-5GS-Optimisation* to upper layers, if present for the selected PLMN;
 - 5> forward *up-CIoT-5GS-Optimisation* to upper layers, if present for the selected PLMN;
 - 4> if the UE is aerial UE and for the frequency band selected by the UE (from *freqBandIndicatorAerial* or *multiBandInfoListAerial*), the *freqBandInfoAerial* or the *multiBandInfoListAerial* is present and the UE capable of *multINS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxListAerial* within the *freqBandInfoAerial* or *multiBandInfoListAerial*:

- 5> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxListAerial* within *freqBandInfoAerial* or *multiBandInfoListAerial*;
- 5> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxListAerial*:
 - 6> apply the *additionalPmax*;
- 5> else:
 - 6> apply the *p-Max*;
- 4> else if, for the frequency band selected by the UE (from *freqBandIndicator* or *multiBandInfoList*), the *freqBandInfo* or the *multiBandInfoList-v10j0* is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo* or *multiBandInfoList-v10j0*:
 - 5> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo* or *multiBandInfoList-v10j0*;
 - 5> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:
 - 6> apply the *additionalPmax*;
 - 5> else:
 - 6> apply the *p-Max*;
 - 4> else:
 - 5> apply the *additionalSpectrumEmission* in *SystemInformationBlockType2* and the *p-Max*;
 - 3> else:
 - 4> consider the cell as barred in accordance with TS 36.304 [4]; and
 - 4> perform barring as if *intraFreqReselection* is set to *notAllowed*, and as if the *csg-Indication* is set to *FALSE*;

Upon receiving the *SystemInformationBlockType1-NB*, the UE shall:

- 1> if the upper layers indicate the selected core network type as 5GC:
 - 2> in the remainder of the procedures use *plmn-IdentityList*, *trackingAreaCode*, and *cellIdentity* for the cell as received in the *cellAccessRelatedInfo-5GC*;
- 1> else:
 - 2> in the remainder of the procedures use *plmn-IdentityList*, *trackingAreaCode*, *trackingAreaList* and *cellIdentity* for the cell as received in the *cellAccessRelatedInfo*;
- 1> if the frequency band indicated in the *freqBandIndicator* is part of the frequency bands supported by the UE; or
- 1> if one or more of the frequency bands indicated in the *multiBandInfoList* are part of the frequency bands supported by the UE:
 - 2> forward the *cellIdentity* to upper layers;
 - 2> forward the *trackingAreaCode* to upper layers;
 - 2> forward the *trackingAreaList* to upper layers, if present;
 - 2> if *attachWithoutPDN-Connectivity* is received for the selected PLMN:
 - 3> forward the *attachWithoutPDN-Connectivity* to upper layers;
 - 2> else:

- 3> indicate to upper layers that *attachWithoutPDN-Connectivity* is not present;
- 2> if the UE is capable of 5G NAS:
 - 3> forward *ng-U-DataTransfer* to upper layers, if present for the selected PLMN;
 - 3> forward *up-CIoT-5GS-Optimisation* to upper layers, if present for the selected PLMN;
 - 2> if, for the frequency band selected by the UE (from *freqBandIndicator* or *multiBandInfoList*), the *freqBandInfo* is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo*:
 - 3> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo*;
 - 3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:
 - 4> apply the *additionalPmax*;
 - 3> else:
 - 4> apply the *p-Max*;
 - 2> else:
 - 3> apply the *additionalSpectrumEmission* in *SystemInformationBlockType2-NB* and the *p-Max*;

No UE requirements related to the contents of *SystemInformationBlockType1-MBMS* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.8 Actions upon reception of *SystemInformation* messages

No UE requirements related to the contents of the *SystemInformation* messages apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.9 Actions upon reception of *SystemInformationBlockType2*

Upon receiving *SystemInformationBlockType2*, the UE shall:

- 1> apply the configuration included in the *radioResourceConfigCommon*;
- 1> derive the DRX cycle as specified in TS 36.304 [4], clause 7.1;
- 1> if the *mbsfn-SubframeConfigList* is included:
 - 2> consider that DL assignments may occur in the MBSFN subframes indicated in the *mbsfn-SubframeConfigList* under the conditions specified in TS 36.213 [23], clause 7.1;
- 1> apply the specified PCCH configuration defined in 9.1.1.3;
- 1> not apply the *timeAlignmentTimerCommon*;
- 1> if in RRC_CONNECTED and UE is configured with RLF timers and constants values received within *rlf-TimersAndConstants*:
 - 2> not update its values of the timers and constants in *ue-TimersAndConstants* except for the value of timer T300;

- 1> if in RRC_CONNECTED while T311 is not running; and the UE supports multi-band cells as defined by bit 31 in *featureGroupIndicators* or *multipleNS-Pmax*;
- 2> disregard the *additionalSpectrumEmission* and *ul-CarrierFreq*, if received, while in RRC_CONNECTED;
- 1> if *attachWithoutPDN-Connectivity* is received for the selected PLMN:
 - 2> forward *attachWithoutPDN-Connectivity* to upper layers;
- 1> else:
 - 2> indicate to upper layers that *attachWithoutPDN-Connectivity* is not present;
- 1> if *cp-CIoT-EPS-Optimisation* is received for the selected PLMN:
 - 2> forward *cp-CIoT-EPS-Optimisation* to upper layers;
- 1> else:
 - 2> indicate to upper layers that *cp-CIoT-EPS-Optimisation* is not present;
- 1> if *up-CIoT-EPS-Optimisation* is received for the selected PLMN:
 - 2> forward *up-CIoT-EPS-Optimisation* to upper layers;
- 1> else:
 - 2> indicate to upper layers that *up-CIoT-EPS-Optimisation* is not present;
- 1> if *SystemInformationBlockType26a* is not present:
 - 2> to upper layers either forward *upperLayerIndication*, if present for the selected PLMN, or otherwise indicate absence of this field;

NOTE: *upperLayerIndication* is an indication to upper layers that the UE has entered a coverage area that offers 5G capabilities.

- 1> to upper layers either forward *rlos-Enabled*, if present, or otherwise indicate absence of this field;

Upon receiving *SystemInformationBlockType2-NB*, the UE shall:

- 1> apply the configuration included in the *radioResourceConfigCommon*;
- 1> derive the DRX cycle as specified in TS 36.304 [4], clause 7.1;
- 1> if *SystemInformationBlockType22-NB* is scheduled:
 - 2> read and act on information sent in *SystemInformationBlockType22-NB*;
- 1> apply the specified PCCH configuration defined in 9.1.1.3.
- 1> if in RRC_CONNECTED and UE is configured with RLF timers and constants values received within *rlf-TimersAndConstants*:
 - 2> not update its values of the timers and constants in *ue-TimersAndConstants* except for the value of timer T300;

Upon receiving *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT), the UE shall:

- 1> if *up-PUR-5GC* is not included and the UE connected to 5GC in RRC_IDLE with a suspended RRC connection is configured with *pur-Config*; or
- 1> if *up-PUR-EPC* is not included and the UE connected to EPC in RRC_IDLE with a suspended RRC connection is configured with *pur-Config*; or
- 1> if *cp-PUR-5GC* is not included and the UE connected to 5GC in RRC_IDLE without a suspended RRC connection is configured with *pur-Config*; or

- 1> if *cp-PUR-EPC* is not included and the UE connected to EPC in RRC_IDLE without a suspended RRC connection is configured with *pur-Config*:
- 2> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
- 2> release *pur-Config*;
- 2> discard previously stored *pur-Config*.

5.2.2.10 Actions upon reception of *SystemInformationBlockType3*

Upon receiving *SystemInformationBlockType3*, the UE shall:

- 1> if in RRC_IDLE, the *redistributionServingInfo* is included and the UE is redistribution capable:
 - 2> perform E-UTRAN inter-frequency redistribution procedure as specified in TS 36.304 [4], clause 5.2.4.10;
- 1> if in RRC_IDLE, or in RRC_CONNECTED while T311 is running:
 - 2> if, for the frequency band selected by the UE (from the procedure in clause 5.2.2.7) to represent the serving cell's carrier frequency, the *freqBandInfo* or the *multiBandInfoList-v10j0* (for aerial UE the *freqBandInfoAerial* or the *multiBandInfoListAerial*) is present in *SystemInformationBlockType3* and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo* or *multiBandInfoList-v10j0* (for aerial UE the *NS-PmaxListAerial* within the *freqBandInfoAerial* or the *multiBandInfoListAerial*):
 - 3> if the UE is aerial UE:
 - 4> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxListAerial* within *freqBandInfoAerial* or *multiBandInfoListAerial*;
 - 3> else:
 - 4> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo* or *multiBandInfoList-v10j0*;
 - 3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList* (for aerial UE the *NS-PmaxListAerial*):
 - 4> apply the *additionalPmax*;
 - 3> else:
 - 4> apply the *p-Max*;
- 2> else:
 - 3> apply the *p-Max*;

Upon receiving *SystemInformationBlockType3-NB*, the UE shall:

- 1> if in RRC_IDLE, or in RRC_CONNECTED while T311 is running:
- 2> if, for the frequency band selected by the UE (from the procedure in clause 5.2.2.7) to represent the serving cell's carrier frequency, the *freqBandInfo* or the *multiBandInfoList* is present in *SystemInformationBlockType3-NB* and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo* or the *multiBandInfoList*:
- 3> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo* or *multiBandInfoList*;
- 3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:
 - 4> apply the *additionalPmax*;
- 3> else:

- 4> apply the *p-Max*;
- 2> else:
 - 3> apply the *p-Max*;

5.2.2.11 Actions upon reception of *SystemInformationBlockType4*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType4* or *SystemInformationBlockType4-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.12 Actions upon reception of *SystemInformationBlockType5*

Upon receiving *SystemInformationBlockType5*, the UE shall:

- 1> if in RRC_IDLE, the *redistributionInterFreqInfo* is included and the UE is redistribution capable:
 - 2> perform E-UTRAN inter-frequency redistribution procedure as specified in TS 36.304 [4], clause 5.2.4.10;
- 1> if in RRC_IDLE, or in RRC_CONNECTED while T311 is running:
 - 2> if the frequency band selected by the UE to represent a non-serving E UTRA carrier frequency is not a downlink only band:
 - 3> if, for the selected frequency band, the *freqBandInfo* or the *multiBandInfoList-v10j0* (for aerial UE the *freqBandInfoAerial* or the *multiBandInfoListAerial*) is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within *freqBandInfo* or *multiBandInfoList-v10j0* (for aerial UE the *NS-PmaxListAerial* within the *freqBandInfoAerial* or the *multiBandInfoListAerial*):
 - 4> if the UE is aerial UE:
 - 5> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxListAerial* within *freqBandInfoAerial* or *multiBandInfoListAerial*;
 - 4> else:
 - 5> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo* or *multiBandInfoList-v10j0*;
 - 4> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList* (for aerial UE the *NS-PmaxListAerial*):
 - 5> apply the *additionalPmax*;
 - 4> else:
 - 5> apply the *p-Max*;
 - 3> else:
 - 4> apply the *p-Max*;

- 1> if in RRC_IDLE or RRC_INACTIVE, and T331 is running:
 - 2> perform the actions as specified in 5.6.20.1a;

Upon receiving *SystemInformationBlockType5-NB*, the UE shall:

- 1> if in RRC_IDLE, or in RRC_CONNECTED while T311 is running:
 - 2> if, for the frequency band selected by the UE (from *multiBandInfoList*) to represent a non-serving NB-IoT carrier frequency, the *freqBandInfo* is present and the UE capable of *multiNS-Pmax* supports at least one *additionalSpectrumEmission* in the *NS-PmaxList* within the *freqBandInfo*:

- 3> apply the first listed *additionalSpectrumEmission* which it supports among the values included in *NS-PmaxList* within *freqBandInfo*;
- 3> if the *additionalPmax* is present in the same entry of the selected *additionalSpectrumEmission* within *NS-PmaxList*:
 - 4> apply the *additionalPmax*;
- 3> else:
 - 4> apply the *p-Max*;
- 2> else:
 - 3> apply the *p-Max*;

5.2.2.13 Actions upon reception of *SystemInformationBlockType6*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.14 Actions upon reception of *SystemInformationBlockType7*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.15 Actions upon reception of *SystemInformationBlockType8*

Upon receiving *SystemInformationBlockType8*, the UE shall:

- 1> if *sib8-PerPLMN-List* is included and the UE is capable of network sharing for CDMA2000:
 - 2> apply the CDMA2000 parameters below corresponding to the RPLMN;
- 1> if the *systemTimeInfo* is included:
 - 2> forward the *systemTimeInfo* to CDMA2000 upper layers;
- 1> if the UE is in RRC_IDLE and if *searchWindowSize* is included:
 - 2> forward the *searchWindowSize* to CDMA2000 upper layers;
- 1> if *parametersHRPD* is included:
 - 2> forward the *preRegistrationInfoHRPD* to CDMA2000 upper layers only if the UE has not received the *preRegistrationInfoHRPD* within an *RRCConnectionReconfiguration* message after entering this cell;
 - 2> if the *cellReselectionParametersHRPD* is included:
 - 3> forward the *neighCellList* to the CDMA2000 upper layers;
- 1> if the *parameters1XRTT* is included:
 - 2> if the *csfb-RegistrationParam1XRTT* is included:
 - 3> forward the *csfb-RegistrationParam1XRTT* to the CDMA2000 upper layers which will use this information to determine if a CS registration/re-registration towards CDMA2000 1xRTT in the EUTRA cell is required;
 - 2> else:
 - 3> indicate to CDMA2000 upper layers that CSFB Registration to CDMA2000 1xRTT is not allowed;
 - 2> if the *longCodeState1XRTT* is included:
 - 3> forward the *longCodeState1XRTT* to CDMA2000 upper layers;

- 2> if the *cellReselectionParameters1XRTT* is included:
 - 3> forward the *neighCellList* to the CDMA2000 upper layers;
- 2> if the *csfb-SupportForDualRxUEs* is included:
 - 3> forward *csfb-SupportForDualRxUEs* to the CDMA2000 upper layers;
- 2> else:
 - 3> forward *csfb-SupportForDualRxUEs*, with its value set to *FALSE*, to the CDMA2000 upper layers;
- 2> if *ac-BarringConfig1XRTT* is included:
 - 3> forward *ac-BarringConfig1XRTT* to the CDMA2000 upper layers;
- 2> if the *csfb-DualRxTxSupport* is included:
 - 3> forward *csfb-DualRxTxSupport* to the CDMA2000 upper layers;
- 2> else:
 - 3> forward *csfb-DualRxTxSupport*, with its value set to *FALSE*, to the CDMA2000 upper layers;

5.2.2.16 Actions upon reception of *SystemInformationBlockType9*

Upon receiving *SystemInformationBlockType9*, the UE shall:

- 1> if *hnb-Name* is included, forward the *hnb-Name* to upper layers;

5.2.2.17 Actions upon reception of *SystemInformationBlockType10*

Upon receiving *SystemInformationBlockType10*, the UE shall:

- 1> forward the received *warningType*, *messageIdentifier* and *serialNumber* to upper layers;

5.2.2.18 Actions upon reception of *SystemInformationBlockType11*

Upon receiving *SystemInformationBlockType11*, the UE shall:

- 1> if there is no current value for *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*; or
- 1> if either the received value of *messageIdentifier* or of *serialNumber* or of both are different from the current values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*:
 - 2> use the received values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11* as the current values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*;
 - 2> discard any previously buffered *warningMessageSegment*;
 - 2> if all segments of a warning message have been received:
 - 3> assemble the warning message from the received *warningMessageSegment*;
 - 3> forward the received warning message, *messageIdentifier*, *serialNumber* and *dataCodingScheme* to upper layers;
 - 3> stop reception of *SystemInformationBlockType11*;
 - 3> discard the current values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*;
 - 2> else:
 - 3> store the received *warningMessageSegment*;
 - 3> continue reception of *SystemInformationBlockType11*;

- 1> else if all segments of a warning message have been received:
 - 2> assemble the warning message from the received *warningMessageSegment*;
 - 2> forward the received complete warning message, *messageIdentifier*, *serialNumber* and *dataCodingScheme* to upper layers;
 - 2> stop reception of *SystemInformationBlockType11*;
 - 2> discard the current values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11*;
- 1> else:
 - 2> store the received *warningMessageSegment*;
 - 2> continue reception of *SystemInformationBlockType11*;

The UE should discard any stored *warningMessageSegment* and the current value of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType11* if the complete warning message has not been assembled within a period of 3 hours.

5.2.2.19 Actions upon reception of *SystemInformationBlockType12*

Upon receiving *SystemInformationBlockType12*, the UE shall:

- 1> if the *SystemInformationBlockType12* contains a complete warning message and the complete geographical area coordinates (if any):
 - 2> forward the received warning message, *messageIdentifier*, *serialNumber*, *dataCodingScheme* and the geographical area coordinates (if any) to upper layers;
 - 2> continue reception of *SystemInformationBlockType12*;
- 1> else:
 - 2> if the received values of *messageIdentifier* and *serialNumber* are the same (each value is the same) as a pair for which a warning message and the geographical area coordinates (if any) are currently being assembled:
 - 3> store the received *warningMessageSegment*;
 - 3> store the received *warningAreaCoordinatesSegment* (if any);
 - 3> if all segments of a warning message and geographical area coordinates (if any) have been received:
 - 4> assemble the warning message from the received *warningMessageSegment*;
 - 4> assemble the geographical area coordinates from the received *warningAreaCoordinatesSegment* (if any);
 - 4> forward the received warning message, *messageIdentifier*, *serialNumber*, *dataCodingScheme* and geographical area coordinates (if any) to upper layers;
 - 4> stop assembling a warning message and warning area coordinates (if any) for this *messageIdentifier* and *serialNumber* and delete all stored information held for it;
 - 3> continue reception of *SystemInformationBlockType12*;
 - 2> else if the received values of *messageIdentifier* and/or *serialNumber* are not the same as any of the pairs for which a warning message is currently being assembled:
 - 3> start assembling a warning message for this *messageIdentifier* and *serialNumber* pair;
 - 3> start assembling the geographical area coordinates (if any) for this *messageIdentifier* and *serialNumber* pair;
 - 3> store the received *warningMessageSegment*;

- 3> store the received *warningAreaCoordinatesSegment* (if any);
- 3> continue reception of *SystemInformationBlockType12*;

The UE should discard *warningMessageSegment* and *warningAreaCoordinatesSegment* (if any) and the associated values of *messageIdentifier* and *serialNumber* for *SystemInformationBlockType12* if the complete warning message and the warning area coordinates (if any) have not been assembled within a period of 3 hours.

NOTE: The number of warning messages that a UE can re-assemble simultaneously is a function of UE implementation.

5.2.2.20 Actions upon reception of *SystemInformationBlockType13*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.21 Actions upon reception of *SystemInformationBlockType14*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType14* or *SystemInformationBlockType14-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.22 Actions upon reception of *SystemInformationBlockType15*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType15* or *SystemInformationBlockType15-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.23 Actions upon reception of *SystemInformationBlockType16*

Upon receiving *SystemInformationBlockType16* with *timeReferenceInfo*, the UE may perform the related actions as specified in clause 5.6.1.3.

5.2.2.24 Actions upon reception of *SystemInformationBlockType17*

Upon receiving *SystemInformationBlockType17*, the UE shall:

- 1> if *wlan-OffloadConfigCommon* corresponding to the RPLMN is included:
- 2> if the UE is not configured with *rclwi-Configuration* with *command* set to *steerToWLAN*:

 - 3> apply the *wlan-Id-List* corresponding to the RPLMN;

- 2> if not configured with the *wlan-OffloadConfigDedicated*:

 - 3> apply the *wlan-OffloadConfigCommon* corresponding to the RPLMN;

5.2.2.25 Actions upon reception of *SystemInformationBlockType18*

Upon receiving *SystemInformationBlockType18*, the UE shall:

- 1> if *SystemInformationBlockType18* message includes the *commConfig*:
- 2> if configured to receive sidelink communication:

 - 3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commRxPool* for sidelink communication monitoring, as specified in 5.10.3;

- 2> if configured to transmit sidelink communication:

- 3> from the next SC period, as defined by *sc-Period*, use the resource pool indicated by *commTxPoolNormalCommon*, *commTxPoolNormalCommonExt* or by *commTxPoolExceptional* for sidelink communication transmission, as specified in 5.10.4;

5.2.2.26 Actions upon reception of *SystemInformationBlockType19*

Upon receiving *SystemInformationBlockType19*, the UE shall:

- 1> if *SystemInformationBlockType19* message includes the *discConfig* or *discConfigPS*:
- 2> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discRxPool*, *discRxResourcesInterFreq* or *discRxPoolPS* for sidelink discovery monitoring, as specified in 5.10.5;
- 2> if *SystemInformationBlockType19* message includes the *discTxPoolCommon* or *discTxPoolPS-Common*; and the UE is in RRC_IDLE:
 - 3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxPoolCommon* or *discTxPoolPS-Common* for sidelink discovery announcement, as specified in 5.10.6;
- 2> if the *SystemInformationBlockType19* message includes the *discTxPowerInfo*:
 - 3> use the power information included in *discTxPowerInfo* for sidelink discovery transmission on the serving frequency, as specified in TS 36.213 [23];
- 1> if *SystemInformationBlockType19* message includes the *discConfigRelay*:
- 2> if the *SystemInformationBlockType19* message includes the *txPowerInfo*:
 - 3> use the power information included in *txPowerInfo* for sidelink discovery transmission on the corresponding non-serving frequency, as specified in TS 36.213 [23];

5.2.2.27 Actions upon reception of *SystemInformationBlockType20*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType20* or *SystemInformationBlockType20-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.28 Actions upon reception of *SystemInformationBlockType21*

Upon receiving *SystemInformationBlockType21*, the UE shall:

- 1> if *SystemInformationBlockType21* message includes *sl-A2X-ConfigCommon*:
- 2> if configured to receive A2X sidelink communication:
 - 3> in the remainder of the procedures, consider *sl-V2X-ConfigCommon* as included and use the resource pool indicated by *a2x-CommRxPool* and *a2x-CommTxPool* in *sl-A2X-ConfigCommon* for sidelink communication for A2X instead of *v2x-CommRxPool* and *v2x-CommTxPoolNormalCommon* in *sl-V2XConfigCommon*;
- 1> if *SystemInformationBlockType21* message includes *sl-V2X-ConfigCommon*:
- 2> if configured to receive V2X sidelink communication:
 - 3> use the resource pool indicated by *v2x-CommRxPool* in *sl-V2X-ConfigCommon* for V2X sidelink communication monitoring, as specified in 5.10.12;
- 2> if configured to transmit V2X sidelink communication:
 - 3> use the resource pool indicated by *v2x-CommTxPoolNormalCommon*, *p2x-CommTxPoolNormalCommon*, *v2x-CommTxPoolNormal*, *p2x-CommTxPoolNormal* or by *v2x-CommTxPoolExceptional* for V2X sidelink communication transmission, as specified in 5.10.13;

3> perform CBR measurement on the transmission resource pool(s) indicated by $v2x\text{-}CommTxPoolNormalCommon$, $v2x\text{-}CommTxPoolNormal$ and $v2x\text{-}CommTxPoolExceptional$ for V2X sidelink communication transmission, as specified in 5.5.3;

5.2.2.29 Actions upon reception of *SystemInformationBlockType22-NB*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.30 Actions upon reception of *SystemInformationBlockType23-NB*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.31 Actions upon reception of *SystemInformationBlockType24*

Upon receiving *SystemInformationBlockType24*, the UE shall:

- 1> if in RRC_IDLE or RRC_INACTIVE, and T331 is running:
- 2> perform the actions as specified in 5.6.20.1a;

5.2.2.32 Actions upon reception of *SystemInformationBlockType25*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.33 Actions upon reception of *SystemInformationBlockType26*

Upon receiving *SystemInformationBlockType26*, the UE shall:

- 1> if configured to receive V2X sidelink communication:
 - 2> use the resource pool indicated by $v2x\text{-}CommRxPool$ for V2X sidelink communication monitoring, as specified in 5.10.12;
- 1> if configured to transmit V2X sidelink communication:
 - 2> use the resource pool indicated by $v2x\text{-}CommTxPoolNormal$, $p2x\text{-}CommTxPoolNormal$ or by $v2x\text{-}CommTxPoolExceptional$ for V2X sidelink communication transmission, as specified in 5.10.13;
 - 2> perform CBR measurement on the transmission resource pool(s) indicated by $v2x\text{-}CommTxPoolNormal$ and $v2x\text{-}CommTxPoolExceptional$ for V2X sidelink communication transmission, as specified in 5.5.3;

5.2.2.33a Actions upon reception of *SystemInformationBlockType26a*

Upon receiving *SystemInformationBlockType26a* the UE shall:

- 1> if $nrBandList$ is included for the selected PLMN and the UE supports to operate in EN-DC using the serving cell and at least one of NR bands in $nrBandList$:
 - 2> forward *upperLayerIndication*, as if the UE receives this field from SIB2, to upper layers;
- 1> else:
 - 2> indicate upper layers absence of *upperLayerIndication*;

5.2.2.34 Actions upon reception of *SystemInformationBlockPos*

No UE requirements related to the contents of the *SystemInformationBlockPos* apply other than those specified elsewhere e.g. within TS 36.355 [54], and/or within the corresponding field descriptions.

5.2.2.35 Actions upon reception of *SystemInformationBlockType27*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType27* or *SystemInformationBlockType27-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.36 Actions upon reception of *SystemInformationBlockType28*

- 1> if the UE has stored at least one segment of *SIB28* and the value tag of *SIB28* has changed since a previous segment was stored:
 - 2> discard all stored segments;
- 1> store the segment;
- 1> if all segments have been received:
 - 2> assemble *SIB12-IEs* from the received segments;
 - 2> perform actions as specified in 5.2.2.4.13 in TS 38.331 [82].

The UE should discard any stored segments for *SIB28* if the complete *SIB28* has not been assembled within a period of 3 hours. The UE shall discard any stored segments for *SIB 28* upon cell (re-)selection.

5.2.2.37 Actions upon reception of *SystemInformationBlockType29*

No UE requirements related to the contents of this *SystemInformationBlock* apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.38 Actions upon reception of *SystemInformationBlockType30*

Upon receiving *SystemInformationBlockType30*, the UE shall:

- 1> forward the applicable disaster roaming information for each PLMN sharing the cell to upper layers.

5.2.2.39 Actions upon reception of *SystemInformationBlockType31*

Upon receiving *SystemInformationBlockType31* (*SystemInformationBlockType31-NB*), the UE shall:

- 1> start or restart timer T317 with the duration *ul-SyncValidityDuration* from the subframe indicated by *epochTime*.

5.2.2.40 Actions upon reception of *SystemInformationBlockType32*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType32* or *SystemInformationBlockType32-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, and/ or within the corresponding field descriptions.

5.2.2.41 Actions upon reception of *SystemInformationBlockType33*

No UE requirements related to the contents of this *SystemInformationBlock* (*SystemInformationBlockType33* or *SystemInformationBlockType33-NB*) apply other than those specified elsewhere e.g. within procedures using the concerned system information, or within the corresponding field descriptions.

5.2.3 Acquisition of an SI message

When acquiring an SI message, the UE shall:

- 1> determine the start of the SI-window for the concerned SI message as follows:
 - 2> if the concerned SI message is configured in the *schedulingInfoList*, *schedulingInfoListExt* (if present) or if the concerned SI message is configured in the *posSchedulingInfoList* and *si-posOffset* is not configured;

- 3> for the concerned SI message, determine the number n which corresponds to the order of entry in the concatenated list of SI messages configured by *schedulingInfoList*, *schedulingInfoListExt* (if present) and *posSchedulingInfoList* in *SystemInformationBlockType1*;
- 3> determine the integer value $x = (n - 1)*w$, where w is the *si-WindowLength*;
- 3> the SI-window starts at the subframe $\#a$, where $a = x \bmod 10$, in the radio frame for which SFN mod $T = \text{FLOOR}(x/10)$, where T is the *si-Periodicity* or the *posSI-Periodicity* of the concerned SI message;
- 2> else if the concerned SI message is configured by the *posSchedulingInfoList* and *si-posOffset* is configured determine the start of the SI-window for the concerned SI message as follows:
 - 3> determine the number m which corresponds to the number of SI messages with an associated *si-Periodicity* of 8 radio frames (80 ms), configured by *schedulingInfoList* and *schedulingInfoListExt* (if present) in *SystemInformationBlockType1*;
 - 3> for the concerned SI message, determine the number n which corresponds to the order of entry in the list of SI messages configured by *posSchedulingInfoList* in *SystemInformationBlockType1*;
 - 3> determine the integer value $x = m*w + (n - 1)*w$, where w is the *si-WindowLength*
 - 3> the SI-window starts at the subframe $\#a$, where $a = x \bmod 10$, in the radio frame for which SFN mod $T = \text{FLOOR}(x/10) + 8$, where T is the *posSI-Periodicity* of the concerned SI message;

NOTE: E-UTRAN should configure an SI-window of 1 ms only if all SIs are scheduled before subframe #5 in radio frames for which SFN mod 2 = 0.

- 1> receive DL-SCH using the SI-RNTI from the start of the SI-window and continue until the end of the SI-window whose absolute length in time is given by *si-WindowLength*, or until the SI message was received, excluding the following subframes:
 - 2> subframe #5 in radio frames for which SFN mod 2 = 0;
 - 2> any MBSFN subframes;
 - 2> any uplink subframes in TDD;
- 1> if the SI message was not received by the end of the SI-window, repeat reception at the next SI-window occasion for the concerned SI message;

5.2.3a Acquisition of an SI message by BL UE or UE in CE or a NB-IoT UE

When acquiring an SI message, the BL UE or UE in CE or NB-IoT UE shall:

- 1> determine the start of the SI-window for the concerned SI message as follows:
 - 2> if the concerned SI message is configured in the *schedulingInfoList*, *schedulingInfoListExt* (if present) or if the concerned SI message is configured in the *posSchedulingInfoList* and *si-posOffset* is not configured;
 - 3> for the concerned SI message, determine the number n which corresponds to the order of entry in the concatenated list of SI messages configured by *schedulingInfoList*, *schedulingInfoListExt* (if present) in *SystemInformationBlockType1-BR* (or *SystemInformationBlockType1-NB* in NB-IoT) and *posSchedulingInfoList* in *SystemInformationBlockType1-BR*;
 - 3> determine the integer value $x = (n - 1)*w$, where w is the *si-WindowLength-BR* (or *si-WindowLength* in NB-IoT);
 - 3> if the UE is a NB-IoT UE:
 - 4> the SI-window starts at the subframe #0 in the radio frame for which $(\text{H-SFN} * 1024 + \text{SFN}) \bmod T = \text{FLOOR}(x/10) + \text{Offset}$, where T is the *si-Periodicity* of the concerned SI message and, Offset is the offset of the start of the SI-Window (*si-RadioFrameOffset*);
 - 3> else:

- 4> the SI-window starts at the subframe #0 in the radio frame for which SFN mod $T = \text{FLOOR}(x/10)$, where T is the *si-Periodicity* or the *posSI-Periodicity* of the concerned SI message;
- 2> else if the concerned SI message is configured by the *posSchedulingInfoList* and *si-posOffset* is configured determine the start of the SI-window for the concerned SI message as follows:
 - 3> determine the number m which corresponds to the number of SI messages with an associated *si-Periodicity* of 8 radio frames (80 ms), configured by *schedulingInfoList* and *schedulingInfoListExt* (if present) in *SystemInformationBlockType1-BR*;
 - 3> for the concerned SI message, determine the number n which corresponds to the order of entry in the list of SI messages configured by *posSchedulingInfoList* in *SystemInformationBlockType1-BR*;
 - 3> determine the integer value $x = m*w + (n - 1)*w$, where w is the *si-WindowLength-BR*;
 - 3> the SI-window starts at the subframe #0 in the radio frame for which SFN mod $T = \text{FLOOR}(x/10) + 8$, where T is the *posSI-Periodicity* of the concerned SI message;
- 1> if the UE is a NB-IoT UE:
 - 2> receive and accumulate SI message transmissions on DL-SCH from the start of the SI-window and continue until the end of the SI-window whose absolute length in time is given by *si-WindowLength*, starting from the radio frames as provided in *si-RepetitionPattern* and in subframes as provided in *downlinkBitmap*, or until successful decoding of the accumulated SI message transmissions excluding the subframes used for transmission of NPSS, NSSS, *MasterInformationBlock-NB*/ *MasterInformationBlock-TDD-NB* and *SystemInformationBlockType1-NB*. If there are not enough subframes for one SI message transmission in the radio frames as provided in *si-RepetitionPattern*, the UE shall continue to receive the SI message transmission in the radio frames following the radio frame indicated in *si-RepetitionPattern*;
- 1> else:
 - 2> receive and accumulate SI message transmissions on DL-SCH on narrowband provided by *si-Narrowband*, from the start of the SI-window and continue until the end of the SI-window whose absolute length in time is given by *si-WindowLength-BR*, only in radio frames as provided in *si-RepetitionPattern* and subframes as provided in *fdd-DownlinkOrTddSubframeBitmapBR* in *bandwidthReducedAccessRelatedInfo*, or until successful decoding of the accumulated SI message transmissions;
- 1> if the SI message was not possible to decode from the accumulated SI message transmissions by the end of the SI-window, continue reception and accumulation of SI message transmissions on DL-SCH in the next SI-window occasion for the concerned SI message;

5.2.3b Acquisition of an SI message from MBMS-dedicated cell

When acquiring an SI message, the UE shall:

- 1> determine the start of the SI-window for the concerned SI message as follows:
 - 2> for the concerned SI message, determine the number n which corresponds to the order of entry in the list of SI messages configured by *schedulingInfoList* in *SystemInformationBlockType1-MBMS*;
 - 2> determine the integer value $x = (n - 1)*w$, where w is the *si-WindowLength*;
 - 2> the SI-window starts always at the subframe $\#a$, where $a = x \bmod 10$, in the radio frame for which SFN mod $T = \text{FLOOR}(x/10)$, where T is the *si-Periodicity* of the concerned SI message;
- 1> receive DL-SCH using SI-RNTI with value in accordance with 36.321 [6] from the start of the SI-window and continue until the end of the SI-window whose absolute length in time is given by *si-WindowLength*, or until the SI message was received, excluding the following subframes:
 - 2> any MBSFN subframes;
- 1> if the SI message was not received by the end of the SI-window, repeat reception at the next SI-window occasion for the concerned SI message;

5.3 Connection control

5.3.1 Introduction

5.3.1.1 RRC connection control

RRC connection establishment involves the establishment of SRB1. Except for EDT and transmission using PUR, E-UTRAN completes RRC connection establishment prior to completing the establishment of the S1 connection, i.e. prior to receiving the UE context information from the EPC. Consequently, AS security is not activated during the initial phase of the RRC connection. During this initial phase of the RRC connection, the E-UTRAN may configure the UE to perform measurement reporting, but the UE only sends the corresponding measurement reports after successful security activation. However, the UE only accepts a handover message when security has been activated.

NOTE 1: In case the serving frequency broadcasts multiple overlapping bands, E-UTRAN can only configure measurements after having obtained the UE capabilities, as the measurement configuration needs to be set according to the band selected by the UE.

Upon receiving the UE context from the EPC, E-UTRAN activates security (both ciphering and integrity protection) using the initial security activation procedure. The RRC messages to activate security (command and successful response) are integrity protected, while ciphering is started only after completion of the procedure. That is, the response to the message used to activate security is not ciphered, while the subsequent messages (e.g. used to establish SRB2 and DRBs) are both integrity protected and ciphered.

After having initiated the initial security activation procedure, E-UTRAN initiates the establishment of SRB2 and DRBs, i.e. E-UTRAN may do this prior to receiving the confirmation of the initial security activation from the UE. In any case, E-UTRAN will apply both ciphering and integrity protection for the RRC connection reconfiguration messages used to establish SRB2 and DRBs. E-UTRAN should release the RRC connection if the initial security activation and/ or the radio bearer establishment fails (i.e. security activation and DRB establishment are triggered by a joint S1-procedure, which does not support partial success).

For SRB2 and DRBs, security is always activated from the start, i.e. the E-UTRAN does not establish these bearers prior to activating security.

For some radio configuration fields, a critical extension has been defined. A switch from the original version of the field to the critically extended version is allowed using any connection reconfiguration. The UE reverts to the original version of some critically extended fields upon handover and re-establishment as specified elsewhere in this specification. Otherwise, switching a field from the critically extended version to the original version is only possible using the handover or re-establishment procedure with the full configuration option. This also applies for fields that are critically extended within a release (i.e. original and extended version defined in same release).

After having initiated the initial security activation procedure, E-UTRAN may configure a UE that supports CA, with one or more SCells in addition to the PCell that was initially configured during connection establishment. The PCell is used to provide the security inputs and upper layer system information (i.e. the NAS mobility information e.g. TAI). SCells are used to provide additional downlink and optionally uplink radio resources. When not configured with any kind of DC, all SCells the UE is configured with, if any, are part of the MCG.

When configured with DC, some of the SCells are part of a SCG. In this case, user data carried by a DRB may either be transferred via MCG (i.e. MCG-DRB), via SCG (SCG-DRB) or via both MCG and SCG in DL while E-UTRAN configures the CG used in UL (split DRB). An RRC connection reconfiguration message may be used to change the DRB type from MCG-DRB to SCG-DRB or to split DRB, as well as from SCG-DRB or split DRB to MCG-DRB.

DC employs SCG change, which is a synchronous SCG reconfiguration procedure (i.e. involving RA to the PSCell) including reset/ re-establishment of layer 2 and, if SCG DRBs are configured, refresh of security. The procedure is used in a number of different scenarios e.g. SCG establishment, PSCell change, Key refresh, change of DRB type. The UE performs the SCG change related actions upon receiving an *RRConnectionReconfiguration* message including *mobilityControlInfoSCG*, see 5.3.10.10.

In case of MR-DC, the cells of one CG use another RAT, namely NR. The configuration of an NR CG is specified in TS 38.331 [82]. When configured with MR-DC, user data carried by a DRB may either be transferred via MCG, via NR SCG or via both MCG and NR SCG. Also RRC signalling carried by a SRB may either be transferred via MCG or via both MCG and NR SCG. When DRBs and SRBs are configured with transmission via both MCG and SCG, duplication may be used in both DL and UL.

When connected to EPC, change to NR PDCP or vice versa can be done for both SRBs and DRBs as follows. For DRBs, it can be performed using an *RRConnectionReconfiguration* message either with or without the *mobilityControlInfo* (handover) by release and addition of the concerned RB. For SRBs, it can be performed using an *RRConnectionReconfiguration* message with the *mobilityControlInfo* (handover) by release and addition of the concerned PDCP entity. For SRBs and DRBs, it can also be performed using the full configuration option. The same *RRConnectionReconfiguration* message may be used to make changes regarding the CG(s) used for transmission. For SRB1, change from E-UTRA PDCP to NR PDCP type may, before initial security activation, also be performed using an *RRConnectionReconfiguration* message not including the *mobilityControlInfo*.

In case of (NG)EN-DC, there are three types of NR SCG reconfigurations:

- Reconfiguration with sync and key change i.e. a procedure involving RA to the PSCell, including NR MAC reset, re-establishment of NR RLC and NR PDCP and refresh of NR SCG security; and
- Reconfiguration with sync but without key change i.e. a procedure involving RA to the PSCell, including NR MAC reset and NR RLC re-establishment and PDCP data recovery (for AM DRB); and
- Regular NR SCG reconfiguration neither involving refresh of NR SCG security, nor RA to the PSCell, NR MAC reset or NR RLC re-establishment;

The network is only required to use the NR SCG reconfiguration with sync and key change in case the NR SCG security key changes (i.e. handover, change of SNs, S-KgNB refresh). Further details are specified in NR RRC TS 38.331 [82].

NOTE 2: In case of MR-DC, E-UTRA RRC configuration parameters should only affect E-UTRA operation. E.g., *s-Measure* only affects measurements configured by parameters defined in this specification. Should an E-UTRA RRC configuration change require a change of NR RRC configuration, the network should indicate such NR change by NR RRC signalling. E.g. a specific indication is used to trigger RLC re-establishment upon reconfigurations changing the CG(s) used for transmission (in DL or UL) that otherwise would only involve NR RRC signalling.

In this release of the specification, change between DC and MR-DC as well as change between DC and E-UTRA configured with SN terminated DRB without SCG are not supported (i.e. neither the direct reconfiguration nor specific measurement events). Likewise, the direct transition between (NG)EN-DC and NR DC or NE-DC is not supported in this release of the specification.

The release of the RRC connection normally is initiated by E-UTRAN. The procedure may be used to re-direct the UE to an E-UTRA frequency or an inter-RAT carrier frequency. Only in exceptional cases, as specified within this specification, TS 36.300 [9], TS 36.304 [4] or TS 24.301 [35], may the UE abort the RRC connection, i.e. move to RRC_IDLE without notifying E-UTRAN.

The suspension of the RRC connection is initiated by E-UTRA/EPC or E-UTRA/5GC. When the RRC connection is suspended, the UE stores the UE AS context and the *resumeIdentity* (EPC) or I-RNTI (5GC), and transitions to RRC_IDLE state. The RRC message to suspend the RRC connection is integrity protected and ciphered. Suspension can only be performed when at least 1 DRB is successfully established.

The resumption of a suspended RRC connection is initiated by upper layers when the UE has a stored UE AS context, RRC connection resume is permitted by E-UTRA/EPC or E-UTRA/5GC and the UE needs to transit from RRC_IDLE state to RRC_CONNECTED state. When the RRC connection is resumed, RRC configures the UE according to the RRC connection resume procedure based on the stored UE AS context and any RRC configuration received from E-UTRA/EPC or E-UTRA/5GC. The RRC connection resume procedure re-activates security and re-establishes SRB(s) and DRB(s). The request to resume the RRC connection includes the *resumeIdentity* (EPC) or I-RNTI (5GC). The request is not ciphered, but protected with a message authentication code.

In response to a request to resume the RRC connection, E-UTRA/EPC or E-UTRA/5GC may resume the suspended RRC connection, reject the request to resume and instruct the UE to either keep or discard the stored context, or setup a new RRC connection.

In case of CP-EDT or CP transmission using PUR, the data are appended in the *RRCEarlyDataRequest* and *RRCEarlyDataComplete* messages, if available, and sent over SRB0. In case of UP-EDT or UP transmission using PUR, security is re-activated prior to transmission of RRC message using the *nextHopChainingCount* provided in the *RRConnectionRelease* message with suspend indication during the preceding suspend procedure and the radio bearers are re-established. The uplink data are transmitted ciphered on DTCH multiplexed with the *RRConnectionResumeRequest* message on CCCH. In the downlink, the data, if available, are transmitted on DTCH

multiplexed with the *RRConnectionRelease* message on DCCH. In response to a request for EDT or transmission using PUR, E-UTRA/EPC or E-UTRA/5GC may also choose to establish or resume the RRC connection.

A UE in RRC_CONNECTED enters RRC_INACTIVE when the network indicates RRC connection suspension in *RRConnectionRelease* message. When entering RRC_INACTIVE, the UE stores the UE Inactive AS context and any RRC configuration received from the network.

The resumption of an RRC connection from RRC_INACTIVE is initiated by upper layers when the UE needs to transit from RRC_INACTIVE state to RRC_CONNECTED state or by RRC layer for, e.g. RNAU or reception of RAN paging. When the RRC connection is resumed, network configures the UE according to the RRC connection resume procedure based on the stored UE Inactive AS context and any RRC configuration received from the network. The RRC connection resume procedure re-activates security and re-establishes SRB(s) and DRB(s).

In response to a request to resume the RRC connection from RRC_INACTIVE, the network may resume the suspended RRC connection and UE enters to RRC_CONNECTED, or reject the request to resume using RRC message without security protection and send UE to RRC_INACTIVE with wait time, or directly re-suspend the RRC connection and send UE to RRC_INACTIVE, or directly release the RRC connection and send UE to RRC_IDLE, or instruct the UE to initiate NAS level recovery.

NOTE 3: In case the configurations for V2X sidelink communication are acquired from NR, the configurations for V2X sidelink communication in *SystemInformationBlockType21*, *SystemInformationBlockType26*, *SL-V2X-ConfigDedicated* within *RRConnectionReconfiguration* used in this clause can be provided by *SIB13*, *SIB14*, *sl-ConfigDedicatedEUTRA* within *RRCReconfiguration* as specified in TS 38.331 [82], respectively.

5.3.1.2 Security

AS security comprises of the integrity protection of RRC signalling (SRBs) as well as the ciphering of RRC signalling (SRBs) and user data (DRBs). Integrity protection is optionally supported for DRBs when using NR PDCP configured with *nr-RadioBearerConfig1* or *nr-RadioBearerConfig2*.

RRC handles the configuration of the security parameters which are part of the AS configuration: the integrity protection algorithm, the ciphering algorithm and two parameters, namely the *keyChangeIndicator* and the *nextHopChainingCount*, which are used by the UE to determine the AS security keys upon handover, connection re-establishment, connection resume, UP-EDT and/or UP transmission using PUR.

The integrity protection algorithm is common for signalling radio bearers SRB1, SRB2 and SRB4. The integrity protection algorithm signalled in *nr-RadioBearerConfig1*/ *nr-RadioBearerConfig2* for the DRBs configured to apply integrity protection of user data and *keyToUse* set to *master* as defined in TS 38.331 [82] is the same as the one signalled in *securityAlgorithmConfig*. When configured with MCG only, the ciphering algorithm is common for all radio bearers (i.e. SRB1, SRB2, SRB4 and DRBs). Neither integrity protection nor ciphering applies for SRB0.

RRC integrity and ciphering are always activated together, i.e. in one message/ procedure. RRC integrity and ciphering are never de-activated. However, it is possible to switch to a 'NULL' ciphering algorithm (eea0).

The 'NULL' integrity protection algorithm (eia0) is used only for the UE in limited service mode, as specified in TS 33.401 [32]. In case the 'NULL' integrity protection algorithm is used, 'NULL' ciphering algorithm is also used.

NOTE 1: Lower layers discard RRC messages for which the integrity check has failed and indicate the integrity verification check failure to RRC.

The AS applies different security keys: one for the integrity protection of RRC signalling (K_{RRCint}), one for the ciphering of RRC signalling (K_{RRCenc}) and one for the ciphering of user data (K_{UPenc}). For the UE capable of user plane integrity protection when it is connected to E-UTRA/EPC (TS 33.401 [32]), the AS applies a security key for integrity protection of user data (K_{UPint}) for the DRBs that are configured to apply integrity protection of user data. All AS keys are derived from the K_{eNB} key. The K_{eNB} is based on the K_{ASME} key for E-UTRA/EPC, or K_{AMF} for E-UTRA/5GC, which is handled by upper layers.

Upon connection establishment new AS keys are derived. No AS-parameters are exchanged to serve as inputs for the derivation of the new AS keys at connection establishment.

The integrity and ciphering of the RRC message used to perform handover is based on the security configuration used prior to the handover and is performed by the source eNB.

The integrity and ciphering algorithms can only be changed upon handover. The AS keys (K_{eNB} , K_{RRCint} , K_{RRCenc} , K_{UPenc} and K_{UPint}) change upon every handover, connection re-establishment, connection resume, UP-EDT and UP transmission using PUR. The *keyChangeIndicator* is used upon handover and indicates whether the UE should use the keys associated with the K_{ASME} key for E-UTRA/EPC, or K_{AMF} for E-UTRA/5GC, taken into use with the latest successful NAS SMC procedure. The *nextHopChainingCount* parameter is used upon handover, connection re-establishment, connection resume, UP-EDT and UP transmission using PUR by the UE when deriving the new K_{eNB} that is used to generate K_{RRCint} , K_{RRCenc} and K_{UPenc} (see TS 33.401 [32]). An intra cell handover procedure may be used to change the keys in RRC_CONNECTED.

For each radio bearer an independent counter (COUNT, as specified in TS 36.323 [8] for E-UTRA/EPC, and TS 38.323 [83] for E-UTRA/5GC) is maintained for each direction. For each DRB, the COUNT is used as input for ciphering. For each SRB, the COUNT is used as input for both ciphering and integrity protection. It is not allowed to use the same COUNT value more than once for a given security key. At connection resume the COUNT is reset. As specified in TS 33.401 clause 7.2.9.1 [32], the eNB is responsible for avoiding reuse of the COUNT with the same RB identity and with the same K_{eNB} , e.g. due to the transfer of large volumes of data, release and establishment of new RBs, and multiple termination point changes for RLC-UM bearers, multiple termination point changes for RLC-AM bearer with SN terminated PDCP re-establishment (COUNT reset) due to SN only full configuration whilst the key stream inputs (i.e. bearer ID, security key) at MN have not been updated. In order to avoid such re-use, the eNB may e.g. use different RB identities for successive RB establishments, trigger an intra cell handover or by triggering a transition from RRC_CONNECTED to RRC_IDLE or RRC_INACTIVE and then back to RRC_CONNECTED.

In order to limit the signalling overhead, individual messages/ packets include a short sequence number (PDCP SN, as specified in TS 36.323 [8] for E-UTRA/EPC, and TS 38.323 [83] for E-UTRA/5GC). In addition, an overflow counter mechanism is used: the hyper frame number (TX_HFN and RX_HFN, as specified in TS 36.323 [8] for E-UTRA/EPC, and HFN as specified in TS 38.323 [83] for E-UTRA/5GC). The HFN needs to be synchronized between the UE and the eNB.

For each SRB, the value provided by RRC to lower layers to derive the 5-bit BEARER parameter used as input for ciphering and for integrity protection is the value of the corresponding *srb-Identity* with the MSBs padded with zeroes.

With E-UTRA/5GC for a UE not capable of NGEN-DC, the same ciphering algorithm signalled at SMC or handover is used for all radio bearers. Likewise, the same integrity algorithm signalled at SMC or handover is used for all SRBs.

In case of DC, a separate K_{eNB} is used for SCG-DRBs (S- K_{eNB}). This key is derived from the key used for the MCG (K_{eNB}) and an SCG counter that is used to ensure freshness. To refresh the S- K_{eNB} e.g. when the COUNT will wrap around, E-UTRAN employs an SCG change, i.e. an *RRConnectionReconfiguration* message including *mobilityControlInfoSCG*. When performing handover, while at least one SCG-DRB remains configured, both K_{eNB} and S- K_{eNB} are refreshed. In such case E-UTRAN performs handover with SCG change i.e. an *RRConnectionReconfiguration* message including both *mobilityControlInfo* and *mobilityControlInfoSCG*. The ciphering algorithm is common for all radio bearers within a CG but may be different between MCG and SCG. The ciphering algorithm for SCG DRBs can only be changed upon SCG change.

In case of (NG)EN-DC or of SN terminated RB without SCG, the network indicates whether the UE shall use either K_{eNB} or S- K_{gNB} for a particular DRB. In case of NE-DC, the network indicates whether the UE shall use either K_{gNB} or S- K_{eNB} for a particular DRB. S- K_{gNB} /S- K_{eNB} is derived from K_{eNB}/K_{gNB} as defined in TS 33.501 [86], uses a different counter (*sk-Counter*) and is used only for DRBs using NR PDCP. Whenever there is a need to refresh S- K_{gNB} /S- K_{eNB} , e.g. upon change of MN or SN, the NR SCG reconfiguration with sync and key change is used for S- K_{gNB} refresh (see 5.3.1.1) and the *RRConnectionReconfiguration* message including *mobilityControlInfoSCG* is used for S- K_{eNB} refresh (see 5.3.10.10). E-UTRAN provides a UE configured with (NG)EN-DC with an *sk-Counter* even when no DRB is setup using S- K_{gNB} i.e. to facilitate configuration of SRB3. The same ciphering algorithm as signalled by *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2* as defined in TS 38.331 [82] is used for all radio bearers using the same key (i.e. K_{eNB} or S- K_{gNB}). Likewise, the same integrity algorithm as signalled by *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2* as defined in TS 38.331 [82] is used for all SRBs, and DRBs configured to apply integrity protection of user data, using the same key. Although NR RRC uses different values for the security algorithms than E-UTRA, the actual algorithms are the same in case of (NG)EN-DC and NE-DC in this version of the specification. Hence, for such algorithms, the security capabilities supported by a UE are consistent across these RATs. For MR-DC with 5GC, integrity protection is not enabled for DRBs terminated on ng-eNB or when the master node is an ng-eNB.

NOTE 2: The network ensures that different values are used for the SCG counter and for the *sk-Counter* when deriving S- K_{gNB} and/or S- K_{eNB} from the same master key.

5.3.1.2a RN security

For RNs, AS security follows the procedures in 5.3.1.2. Furthermore, E-UTRAN may configure per DRB whether or not integrity protection is used. The use of integrity protection may be configured only upon DRB establishment and reconfigured only upon handover or upon the first reconfiguration following RRC connection re-establishment.

To provide integrity protection on DRBs between the RN and the E-UTRAN, the K_{UPint} key is derived from the K_{eNB} key as described in TS 33.401 [32]. The same integrity protection algorithm used for SRBs also applies to the DRBs. The K_{UPint} changes at every handover and RRC connection re-establishment and is based on an updated K_{eNB} which is derived by taking into account the *nextHopChainingCount*. The COUNT value maintained for DRB ciphering is also used for integrity protection, if the integrity protection is configured for the DRB.

5.3.1.3 Connected mode mobility

In RRC_CONNECTED, the network controls UE mobility, i.e. the network decides when the UE shall connect to which E-UTRA cell(s), or inter-RAT cell. For network controlled mobility in RRC_CONNECTED, the PCell can be changed using an *RRCConnectionReconfiguration* message including the *mobilityControlInfo* (handover), whereas the SCell(s) can be changed using the *RRCConnectionReconfiguration* message either with or without the *mobilityControlInfo*.

In DC, an SCG can be established, reconfigured or released by using an *RRCConnectionReconfiguration* message with or without the *mobilityControlInfo*. In case Random Access to the PSCell or initial PUSCH transmission to the PSCell if *rach-SkipSCG* is configured is required upon SCG reconfiguration, E-UTRAN employs the SCG change procedure (i.e. an *RRCConnectionReconfiguration* message including the *mobilityControlInfoSCG*). The PSCell can only be changed using the SCG change procedure and by release and addition of the PSCell.

In (NG)EN-DC, an NR SCG can be established or reconfigured by using an *RRCConnectionReconfiguration* message containing *nr-secondaryCellGroupConfig* and *nr-RadioBearerConfig*. The contents of *nr-secondaryCellGroupConfig* and *nr-RadioBearerConfig*, of other (NG)EN-DC fields as well as the associated procedures are specified in TS 38.331 [82]. In (NG)EN-DC, the PSCell can only be changed using the Reconfiguration with sync procedure, with or without MR-DC release and addition.

The network triggers the handover procedure e.g. based on radio conditions, load. To facilitate this, the network may configure the UE to perform measurement reporting (possibly including the configuration of measurement gaps). The network may also initiate handover blindly, i.e. without having received measurement reports from the UE.

Before sending the handover message to the UE, the source eNB prepares one or more target cells. The source eNB selects the target PCell. The source eNB may also provide the target eNB with a list of best cells on each frequency for which measurement information is available, in order of decreasing RSRP. The source eNB may also include available measurement information for the cells provided in the list. The target eNB decides which SCells are configured for use after handover, which may include cells other than the ones indicated by the source eNB. If an SCG is configured, handover involves either SCG release or either SCG change (in case of DC) or an NR SCG reconfiguration with sync and key change (in case of EN-DC and NGEN-DC). In case the UE was configured with (EN-) DC or NGEN-DC, the target eNB indicates in the handover message whether the UE shall release the entire (NR) SCG configuration. Upon connection re-establishment, the UE releases the entire SCG configuration except for the DRB configuration, while E-UTRAN in the first reconfiguration message following the re-establishment either releases the DRB(s) or reconfigures the DRB(s) to MCG DRB(s).

The target eNB generates the message used to perform the handover, i.e. the message including the AS-configuration to be used in the target cell(s). The source eNB transparently (i.e. does not alter values/ content) forwards the handover message/ information received from the target to the UE. When appropriate, the source eNB may initiate data forwarding for (a subset of) the DRBs.

After receiving the handover message, the UE attempts to access the target PCell at the first available RACH occasion according to Random Access resource selection defined in TS 36.321 [6], i.e. the handover is asynchronous, or at the first available PUSCH occasion if *rach-Skip* is configured. Consequently, when allocating a dedicated preamble for the random access in the target PCell, E-UTRA shall ensure it is available from the first RACH occasion the UE may use. The first available PUSCH occasion is provided by *ul-ConfigInfo*, if configured, otherwise UE shall monitor the PDCCCH of target eNB. Upon successful completion of the handover, the UE sends a message used to confirm the handover.

If the target eNB does not support the release of RRC protocol which the source eNB used to configure the UE, the target eNB may be unable to comprehend the UE configuration provided by the source eNB. In this case, the target eNB

should use the full configuration option to reconfigure the UE for Handover and Re-establishment. Full configuration option includes an initialization of the radio configuration, which makes the procedure independent of the configuration used in the source cell(s) with the exception that the security algorithms are continued for the RRC re-establishment.

The same behavior applies in (NG)EN-DC, if upon handover the target eNB is unable to comprehend the MCG part of the UE configuration i.e. the target eNB uses the full configuration option which involves release and configuration of (most of the) MCG and NR SCG configuration. In case of (NG)EN-DC, the target SgNB may be unable to comprehend the NR SCG configuration provided by the source SgNB. In such a case, release and addition may be applied for the NR SCG part of the configuration.

NOTE 1: When using release and addition for the NR SCG configuration during handover or SN change, E-UTRAN includes *drb-ToReleaseList* for the SN terminated RBs. For SN modification case, see TS 37.340 [81].

After the successful completion of handover, PDCP SDUs may be re-transmitted in the target cell(s). This only applies for DRBs using RLC-AM mode and for handovers not involving full configuration option. The further details are specified in TS 36.323 [8]. After the successful completion of handover not involving full configuration option, the SN and the HFN are reset except for the DRBs using RLC-AM mode (for which both SN and HFN continue). For reconfigurations involving the full configuration option, the PDCP entities are newly established (SN and HFN do not continue) for all DRBs irrespective of the RLC mode. The further details are specified in TS 36.323 [8].

One UE behaviour to be performed upon handover is specified, i.e. this is regardless of the handover procedures used within the network (e.g. whether the handover includes X2 or S1 signalling procedures).

The source eNB should, for some time, maintain a context to enable the UE to return in case of handover failure. After having detected handover failure, the UE attempts to resume the RRC connection either in the source PCell or in another cell using the RRC re-establishment procedure. This connection resumption succeeds only if the accessed cell is prepared, i.e. concerns a cell of the source eNB or of another eNB towards which handover preparation has been performed. The cell in which the re-establishment procedure succeeds becomes the PCell while SCells and STAGs, if configured, are released.

Normal measurement and mobility procedures are used to support handover to cells broadcasting a CSG identity. In addition, E-UTRAN may configure the UE to report that it is entering or leaving the proximity of cell(s) included in its Permitted CSG list. Furthermore, E-UTRAN may request the UE to provide additional information broadcast by the handover candidate cell e.g. global cell identity, CSG identity, CSG membership status.

NOTE 2: E-UTRAN may use the 'proximity report' to configure measurements as well as to decide whether or not to request additional information broadcast by the handover candidate cell. The additional information is used to verify whether or not the UE is authorised to access the target PCell and may also be needed to identify handover candidate cell (*PCI confusion* i.e. when the physical layer identity that is included in the measurement report does not uniquely identify the cell).

5.3.1.4 Connection control in NB-IoT

In NB-IoT, during the RRC connection establishment procedure, SRB1bis is established implicitly with SRB1. SRB1bis uses the logical channel identity defined in 9.1.2a, with the same configuration as SRB1 but no PDCP entity. SRB1bis is used until security is activated. The RRC messages to activate security (command and successful response) are sent over SRB1 being integrity protected and ciphering is started after completion of the procedure. In case of unsuccessful security activation, the failure message is sent over SRB1 and subsequent messages are sent over SRB1bis. Once security is activated, new RRC messages shall be transmitted using SRB1. A NB-IoT UE that only supports the Control Plane CIoT EPS optimisation (see TS 24.301 [35]) or the Control Plane CIoT 5GS optimisation (see TS 24.501 [95]) only establishes SRB1bis.

A NB-IoT UE only supports 0, 1 or 2 DRBs, depending on its capability. A NB-IoT UE that only supports the Control Plane CIoT EPS optimisation (see TS 24.301 [35]) or the Control Plane CIoT 5GS optimisation (see TS 24.501 [95]) does not need to support any DRBs and associated procedures.

Table 5.3.1.4-1 lists the procedures that are applicable for NB-IoT. All other procedures are not applicable; this is not further stated in the corresponding procedures.

Table 5.3.1.4-1: Connection control procedures applicable to a NB-IoT UE

Clause	Procedures
5.3.2	Paging
5.3.3	RRC connection establishment RRC connection resume (see NOTE) CP-EDT UP-EDT (see NOTE) CP transmission using PUR UP transmission using PUR (see NOTE)
5.3.4	Initial security activation (see NOTE)
5.3.5	RRC connection reconfiguration (see NOTE)
5.3.7	RRC connection re-establishment
5.3.8	RRC connection release
5.3.9	RRC connection release requested by upper layers
5.3.10	Radio resource configuration
5.3.11	Radio link failure related actions
5.3.12	UE actions upon leaving RRC_CONNECTED
5.3.13b	Action upon receiving PUR release request
5.3.16	Unified Access Control

NOTE: Not applicable for a UE that only supports the Control Plane CIoT EPS optimisation (see TS 24.301 [35]) or the Control Plane CIoT 5GS optimisation (see TS 24.501 [95]).

5.3.2 Paging

5.3.2.1 General

**Figure 5.3.2.1-1: Paging**

The purpose of this procedure is:

- to transmit CN initiated paging information to a UE in RRC_IDLE or RRC_INACTIVE and/or;
- to transmit RAN initiated paging information to a UE in RRC_INACTIVE and/or;
- to inform UEs in RRC_IDLE, UEs in RRC_INACTIVE and UEs in RRC_CONNECTED other than NB-IoT UEs, BL UEs and UEs in CE, about a system information change and/or;
- to inform UEs in RRC_IDLE other than NB-IoT UEs, UEs in RRC_INACTIVE and UEs in RRC_CONNECTED other than NB-IoT UEs, BL UEs and UEs in CE, about an ETWS primary notification and/or ETWS secondary notification and/or;
- to inform UEs in RRC_IDLE other than NB-IoT UEs, UEs in RRC_INACTIVE and UEs in RRC_CONNECTED other than NB-IoT UEs, BL UEs and UEs in CE, about a CMAS notification and/or;
- to inform UEs other than NB-IoT UEs in RRC_IDLE, and other than UEs connected to 5GC about an EAB parameters modification and/or;
- to inform UEs other than NB-IoT UEs in RRC_IDLE, and UEs in RRC_INACTIVE to perform E-UTRAN inter-frequency redistribution procedure.

The paging information of CN initiated paging is provided to upper layers, which in response may initiate RRC connection establishment, e.g. to receive an incoming call.

5.3.2.2 Initiation

E-UTRAN initiates the paging procedure by transmitting the *Paging* message at the UE's paging occasion as specified in TS 36.304 [4]. E-UTRAN may address multiple UEs within a *Paging* message by including one *PagingRecord* for each UE. E-UTRAN may also indicate a change of system information, and/ or provide an ETWS notification or a CMAS notification in the *Paging* message.

5.3.2.3 Reception of the *Paging* message by the UE

Upon receiving the *Paging* message, the UE shall:

- 1> if in RRC_IDLE, for each of the *PagingRecord*, if any, included in the *Paging* message:
 - 2> if the *ue-Identity* included in the *PagingRecord* matches one of the UE identities allocated by upper layers:
 - 3> except for NB-IoT, if upper layers indicate the support of paging cause:
 - 4> forward the *ue-Identity*, *accessType* (if present), paging cause (if determined) and the *cn-Domain* to the upper layers;
 - 3> else:
 - 4> forward the *ue-Identity*, *accessType* (if present) and, except for NB-IoT, the *cn-Domain* to the upper layers;
 - 3> store *mt-EDT*, if present;
 - 1> if in RRC_INACTIVE, for each of the *PagingRecord*, if any, included in the *Paging* message:
 - 2> if the *ue-Identity* included in the *PagingRecord* matches the stored *fullI-RNTI*:
 - 3> if UE is configured with one or more access identities equal to 1, 2 or 11-15 applicable in the selected PLMN:
 - 4> initiate RRC connection resume procedure in 5.3.3.2 with cause value set to 'highPriorityAccess';
 - 3> else:
 - 4> initiate the RRC connection resumption procedure according to 5.3.3.2 with cause value set to 'mt-access';
 - 1> if the UE is not configured with a DRX cycle longer than the modification period and the *systemInfoModification* is included; or
 - 1> if the UE is configured with a DRX cycle longer than the modification period and the *systemInfoModification-eDRX* is included:
 - 2> re-acquire the required system information using the system information acquisition procedure as specified in 5.2.2;

- 1> if the *etws-Indication* is included and the UE is ETWS capable:
 - 2> re-acquire *SystemInformationBlockType1* immediately, i.e., without waiting until the next system information modification period boundary;
 - 2> if the *schedulingInfoList* indicates that *SystemInformationBlockType10* is present:
 - 3> acquire *SystemInformationBlockType10*;

NOTE 2: If the UE is in CE, it is up to UE implementation when to start acquiring *SystemInformationBlockType10*.

- 2> if the *schedulingInfoList* indicates that *SystemInformationBlockType11* is present:
 - 3> acquire *SystemInformationBlockType11*;
- 1> if the *cmas-Indication* is included and the UE is CMAS capable:
 - 2> re-acquire *SystemInformationBlockType1* immediately, i.e., without waiting until the next system information modification period boundary as specified in 5.2.1.5;
 - 2> if the *schedulingInfoList* indicates that *SystemInformationBlockType12* is present:
 - 3> acquire *SystemInformationBlockType12*;
- 1> if in RRC_IDLE, the *eab-ParamModification* is included and the UE is EAB capable:
 - 2> consider previously stored *SystemInformationBlockType14* as invalid;
 - 2> re-acquire *SystemInformationBlockType1* immediately, i.e., without waiting until the next system information modification period boundary as specified in 5.2.1.6;
 - 2> re-acquire *SystemInformationBlockType14* using the system information acquisition procedure as specified in 5.2.2.4;
- 1> if in RRC_IDLE, the *uac-ParamModification* is included and the UE connected to 5GC is a BL UE or UE in CE:
 - 2> consider previously stored *SystemInformationBlockType25* as invalid;
 - 2> re-acquire *SystemInformationBlockType1* immediately, i.e., without waiting until the next system information modification period boundary as specified in 5.2.1.6;
 - 2> re-acquire *SystemInformationBlockType25* using the system information acquisition procedure as specified in 5.2.2.4;
- 1> if in RRC_IDLE, the *redistributionIndication* is included and the UE is redistribution capable:
 - 2> perform E-UTRAN inter-frequency redistribution procedure as specified in TS 36.304 [4], clause 5.2.4.10;

5.3.3 RRC connection establishment

5.3.3.1 General

Figure 5.3.3.1-6: RRC connection resume (RRC_INACTIVE), network release or suspend or UP-EDT or UP transmission using PUR, successful

Figure 5.3.3.1-7: CP-EDT or CP transmission using PUR, successful

**Figure 5.3.3.1-7a: CP transmission using PUR, successful****Figure 5.3.3.1-8: CP-EDT fallback or fallback from CP transmission using PUR to RRC connection establishment, successful****Figure 5.3.3.1-9: CP-EDT or CP transmission using PUR, network reject**

The purpose of this procedure is to establish an RRC connection, to resume a suspended RRC connection, to move the UE from RRC_INACTIVE to RRC_CONNECTED, to perform EDT or to perform transmission using PUR. RRC connection establishment involves SRB1 (and SRB1bis for NB-IoT) establishment. The procedure is also used to transfer the initial NAS dedicated information/ message from the UE to E-UTRAN.

E-UTRAN applies the procedure as follows:

- When establishing an RRC connection:
 - to establish SRB1 and, for NB-IoT, SRB1bis;
- When resuming an RRC connection from a suspended RRC connection or from RRC_INACTIVE:
 - to restore the AS configuration from a stored context including resuming SRB(s) and DRB(s);
- When performing EDT;

- When performing transmission using PUR.

5.3.3.1a Conditions for establishing RRC Connection for sidelink communication/discovery/ V2X sidelink communication/ NR sidelink communication

For sidelink communication an RRC connection is initiated only in the following case:

- 1> if configured by upper layers to transmit non-relay related sidelink communication and related data is available for transmission;
- 2> if *SystemInformationBlockType18* is broadcast by the cell on which the UE camps; and if the valid version of *SystemInformationBlockType18* does not include *commTxPoolNormalCommon*;
- 1> if configured by upper layers to transmit relay related sidelink communication:
 - 2> if the UE is acting as sidelink relay UE; and if *SystemInformationBlockType18* is broadcast by the cell on which the UE camps; or
 - 2> if the UE has a selected sidelink relay UE; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met and if *SystemInformationBlockType18* is broadcast by the cell on which the UE camps; and if the valid version of *SystemInformationBlockType18* does not include *commTxPoolNormalCommon* or *commTxAllowRelayCommon*;

For V2X sidelink communication an RRC connection is initiated only in the following case:

- 1> if configured by upper layers to transmit non-P2X related V2X sidelink communication and related data is available for transmission:
 - 2> if the frequency on which the UE is configured to transmit non-P2X related V2X sidelink communication concerns the camped frequency; and if *SystemInformationBlockType21* is broadcast by the cell on which the UE camps; and if the valid version of *SystemInformationBlockType21* includes *sl-V2X-ConfigCommon*; and *sl-V2X-ConfigCommon* does not include *v2x-CommTxPoolNormalCommon*; or
 - 2> if the frequency on which the UE is configured to transmit non-P2X related V2X sidelink communication is included in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* broadcast by the cell on which the UE camps; and if neither the valid version of *SystemInformationBlockType21* nor that of *SystemInformationBlockType26* includes *v2x-CommTxPoolNormal* for the concerned frequency;
- 1> if configured by upper layers to transmit P2X related V2X sidelink communication and related data is available for transmission:
 - 2> if the frequency on which the UE is configured to transmit P2X related V2X sidelink communication concerns the camped frequency; and if *SystemInformationBlockType21* is broadcast by the cell on which the UE camps; and if the valid version of *SystemInformationBlockType21* includes *sl-V2X-ConfigCommon*; and *sl-V2X-ConfigCommon* does not include *p2x-CommTxPoolNormalCommon*; or
 - 2> if the frequency on which the UE is configured to transmit P2X related V2X sidelink communication is included in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* broadcast by the cell on which the UE camps; and if neither the valid version of *SystemInformationBlockType21* nor that of *SystemInformationBlockType26* includes *p2x-CommTxPoolNormal* for the concerned frequency;

For NR sidelink communication an RRC connection is initiated only when the conditions for NR sidelink communication specified in clause 5.3.3.1a of TS 38.331 [82] are met;

NOTE 1: *SIB12* specified in clause 5.3.3.1a of TS 38.331 is provided in *SystemInformationBlockType28*.

For sidelink discovery an RRC connection is initiated only in the following case:

- 1> if configured by upper layers to transmit non-PS related sidelink discovery announcements:
- 2> if the frequency on which the UE is configured to transmit non-PS related sidelink discovery announcements concerns the camped frequency; and *SystemInformationBlockType19* of the cell on which the UE camps does not include *discTxPoolCommon-r12*; or

- 2> if the frequency on which the UE is configured to transmit non-PS related sidelink discovery announcements is included in *discInterFreqList* in *SystemInformationBlockType19* broadcast by the cell on which the UE camps, with *discTxResourcesInterFreq* included within *discResourcesNonPS* and set to *requestDedicated*;
- 1> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements:
 - 2> if the frequency on which the UE is configured to transmit non-relay PS related sidelink discovery announcements concerns the camped frequency; and *SystemInformationBlockType19* of the cell on which the UE camps includes *discConfigPS* but does not include *discTxPoolPS-Common*; or
 - 2> if the frequency on which the UE is configured to transmit non-relay PS related sidelink discovery announcements (e.g. group member discovery) is included in *discInterFreqList* in *SystemInformationBlockType19* broadcast by the cell on which the UE camps, with *discTxResourcesInterFreq* within *discResourcesPS* included and set to *requestDedicated*;
- 1> if configured by upper layers to transmit relay PS related sidelink discovery announcements:
 - 2> if the UE is acting as sidelink relay UE; and if the sidelink relay UE threshold conditions as specified in 5.10.10.4 are met; or
 - 2> if the UE is selecting a sidelink relay UE / has a selected sidelink relay UE; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met:
 - 3> if the frequency on which the UE is configured to transmit relay PS related sidelink discovery announcements concerns the camped frequency; and *SystemInformationBlockType19* of the cell on which the UE camps includes *discConfigRelay* and *discConfigPS* but does not include *discTxPoolPS-Common*;

NOTE: Upper layers initiate an RRC connection. The interaction with NAS is left to UE implementation.

5.3.3.1b Conditions for initiating EDT

A BL UE, UE in CE or NB-IoT UE can initiate EDT when all of the following conditions are fulfilled:

- 1> if the UE is connected to EPC:
 - 2> for CP-EDT, the upper layers request establishment of an RRC connection, the UE supports CP-EDT, and *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *cp-EDT*; or
 - 2> for UP-EDT, the upper layers request resumption of an RRC connection, the UE supports UP-EDT, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *up-EDT*, and the UE has a stored value of the *nextHopChainingCount* provided in the *RRCCConnectionRelease* message with suspend indication during the preceding suspend procedure;
- 1> else if the UE is connected to 5GC:
 - 2> for CP-EDT, the upper layers request establishment of an RRC connection, the UE connected to 5GC supports CP-EDT, and *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *cp-EDT-5GC*; or
 - 2> for UP-EDT, the upper layers request resumption of an RRC connection, the UE connected to 5GC supports UP-EDT, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *up-EDT-5GC*, and the UE has a stored value of the *nextHopChainingCount* provided in the *RRCCConnectionRelease* message with suspend indication during the preceding suspend procedure;
- 1> the establishment or resumption request is for mobile originating calls and the establishment cause is *mo-Data* or *mo-ExceptionData* or *delayTolerantAccess*; or
- 1> the establishment or resumption request is for mobile terminating calls, the UE has a stored *mt-EDT* indication and the establishment cause is *mt-Access*;
- 1> the establishment or resumption request is suitable for EDT as specified in TS 36.300 [9], clause 7.3b.1;
- 1> *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *edt-Parameters*;

1> for mobile originating calls, the size of the resulting MAC PDU including the total UL data is expected to be smaller than or equal to the TBS signalled in *edt-TBS* as specified in TS 36.321 [6], clause 5.1.1;

1> EDT fallback indication has not been received from lower layers for this establishment or resumption procedure;

NOTE 1: Upper layers request or resume an RRC connection. The interaction with NAS is up to UE implementation.

NOTE 2: It is up to UE implementation how the UE determines whether the size of UL data is suitable for EDT.

5.3.3.1c Conditions for initiating transmission using PUR

A BL UE, UE in CE or NB-IoT UE can initiate transmission using PUR when all of the following conditions are fulfilled:

1> the UE has a valid PUR configuration for the serving cell as specified in 5.3.3.20;

1> the UE has a valid timing alignment value as specified in 5.3.3.19;

1> the upper layers request establishment of an RRC connection; or the upper layers request resumption of an RRC connection and the UE has a stored value of the *nextHopChainingCount* provided in the *RRCConnectionRelease* message with suspend indication during the preceding suspend procedure;

1> the establishment or resumption request is for mobile originating calls and the establishment cause is *mo-Data* or *mo-ExceptionData* or *delayTolerantAccess*;

1> for CP transmission using PUR, the size of the resulting MAC PDU including the total UL data is expected to be smaller than or equal to the TBS configured for PUR.

NOTE 1: Upper layers request or resume an RRC connection. The interaction with NAS is up to UE implementation.

NOTE 2: It is up to UE implementation how the UE determines whether the establishment or resumption request is suitable for transmission using PUR.

5.3.3.1d Condition for establishing RRC Connection in NTN

If *systemInformationBlockType31* (*systemInformationBlockType31-NB* in NB-IoT) is broadcast, a RRC connection is initiated only if the UE has a valid GNSS position.

NOTE: The UE may need to re-acquire the GNSS position before establishing the connection to avoid interruption during the connection.

5.3.3.2 Initiation

The UE initiates the procedure when upper layers request establishment or resume of an RRC connection while the UE is in RRC_IDLE or when upper layers request resume of an RRC connection or RRC layer requests resume of an RRC connection for, e.g. RNAU or reception of RAN paging while the UE is in RRC_INACTIVE.

Except for NB-IoT, upon initiation of the procedure, if the UE is connected to EPC, the UE shall:

1> if *SystemInformationBlockType2* includes *ac-BarringPerPLMN-List* and the *ac-BarringPerPLMN-List* contains an *AC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]):

2> select the *AC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers;

2> in the remainder of this procedure, use the selected *AC-BarringPerPLMN* entry (i.e. presence or absence of access barring parameters in this entry) irrespective of the common access barring parameters included in *SystemInformationBlockType2*;

1> else

- 2> in the remainder of this procedure use the common access barring parameters (i.e. presence or absence of these parameters) included in *SystemInformationBlockType2*;
- 1> if *SystemInformationBlockType2* contains *acdc-BarringPerPLMN-List* and the *acdc-BarringPerPLMN-List* contains an *ACDC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]):
 - 2> select the *ACDC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers;
 - 2> in the remainder of this procedure, use the selected *ACDC-BarringPerPLMN* entry for ACDC barring check (i.e. presence or absence of access barring parameters in this entry) irrespective of the *acdc-BarringForCommon* parameters included in *SystemInformationBlockType2*;
- 1> else:
 - 2> in the remainder of this procedure use the *acdc-BarringForCommon* (i.e. presence or absence of these parameters) included in *SystemInformationBlockType2* for ACDC barring check;
- 1> if upper layers indicate that the RRC connection is subject to EAB (see TS 24.301 [35]):
 - 2> if the result of the EAB check, as specified in 5.3.3.12, is that access to the cell is barred:
 - 3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that EAB is applicable, upon which the procedure ends;
 - 1> if upper layers indicate that the RRC connection is subject to ACDC (see TS 24.301 [35]), *SystemInformationBlockType2* contains *BarringPerACDC-CategoryList*, and *acdc-HPLMNonly* indicates that ACDC is applicable for the UE:
 - 2> if the *BarringPerACDC-CategoryList* contains a *BarringPerACDC-Category* entry corresponding to the ACDC category selected by upper layers:
 - 3> select the *BarringPerACDC-Category* entry corresponding to the ACDC category selected by upper layers;
 - 2> else:
 - 3> select the last *BarringPerACDC-Category* entry in the *BarringPerACDC-CategoryList*;
 - 2> stop timer T308, if running;
 - 2> perform access barring check as specified in 5.3.3.13, using T308 as "Tbarring" and *acdc-BarringConfig* in the *BarringPerACDC-Category* as "ACDC barring parameter";
 - 2> if access to the cell is barred:
 - 3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring is applicable due to ACDC, upon which the procedure ends;
 - 1> else if the UE is establishing the RRC connection for mobile terminating calls:
 - 2> if timer T302 is running:
 - 3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile terminating calls is applicable, upon which the procedure ends;
 - 1> else if the UE is establishing the RRC connection for emergency calls:
 - 2> if *SystemInformationBlockType2* includes the *ac-BarringInfo*:
 - 3> if the *ac-BarringForEmergency* is set to *TRUE*:
 - 4> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11]:

NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

5> if the *ac-BarringInfo* includes *ac-BarringForMO-Data*, and for all of these valid Access Classes for the UE, the corresponding bit in the *ac-BarringForSpecialAC* contained in *ac-BarringForMO-Data* is set to *one*:

6> consider access to the cell as barred;

4> else:

5> consider access to the cell as barred;

2> if access to the cell is barred:

3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication, upon which the procedure ends;

1> else if the UE is establishing the RRC connection for mobile originating calls:

2> perform access barring check as specified in 5.3.3.11, using T303 as "Tbarring" and *ac-BarringForMO-Data* as "AC barring parameter";

2> if access to the cell is barred:

3> if *SystemInformationBlockType2* includes *ac-BarringForCSFB* or the UE does not support CS fallback:

4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls is applicable, upon which the procedure ends;

3> else (*SystemInformationBlockType2* does not include *ac-BarringForCSFB* and the UE supports CS fallback):

4> if timer T306 is not running, start T306 with the timer value of T303;

4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls and mobile originating CS fallback is applicable, upon which the procedure ends;

1> else if the UE is establishing the RRC connection for mobile originating signalling:

2> perform access barring check as specified in 5.3.3.11, using T305 as "Tbarring" and *ac-BarringForMO-Signalling* as "AC barring parameter";

2> if access to the cell is barred:

3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating signalling is applicable, upon which the procedure ends;

1> else if the UE is establishing the RRC connection for mobile originating CS fallback:

2> if *SystemInformationBlockType2* includes *ac-BarringForCSFB*:

3> perform access barring check as specified in 5.3.3.11, using T306 as "Tbarring" and *ac-BarringForCSFB* as "AC barring parameter";

3> if access to the cell is barred:

4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating CS fallback is applicable, due to *ac-BarringForCSFB*, upon which the procedure ends;

2> else:

- 3> perform access barring check as specified in 5.3.3.11, using T306 as "Tbarring" and *ac-BarringForMO-Data* as "AC barring parameter";
- 3> if access to the cell is barred:
 - 4> if timer T303 is not running, start T303 with the timer value of T306;
 - 4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating CS fallback and mobile originating calls is applicable, due to *ac-BarringForMO-Data*, upon which the procedure ends;
- 1> else if the UE is establishing the RRC connection for mobile originating MMTEL voice, mobile originating MMTEL video, mobile originating SMSoIP or mobile originating SMS; or
- 1> if the UE is establishing the RRC connection after EPS fallback for IMS voice (see TS 23.502 [102]) was triggered in NR via *RRCRelease* with *voiceFallbackIndication* (see TS 38.331 [82]):
 - 2> if the UE is establishing the RRC connection for mobile originating MMTEL voice and *SystemInformationBlockType2* includes *ac-BarringSkipForMMTELVoice*; or
 - 2> if the UE is establishing the RRC connection for mobile originating MMTEL video and *SystemInformationBlockType2* includes *ac-BarringSkipForMMTELVideo*; or
 - 2> if the UE is establishing the RRC connection for mobile originating SMSoIP or SMS and *SystemInformationBlockType2* includes *ac-BarringSkipForSMS*:
 - 3> consider access to the cell as not barred;
- 2> else:
 - 3> if *establishmentCause* received from higher layers is set to *mo-Signalling* (including the case that *mo-Signalling* is replaced by *highPriorityAccess* according to TS 24.301 [35] or by *mo-VoiceCall* according to the clause 5.3.3.3):
 - 4> perform access barring check as specified in 5.3.3.11, using T305 as "Tbarring" and *ac-BarringForMO-Signalling* as "AC barring parameter";
 - 4> if access to the cell is barred:
 - 5> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating signalling is applicable, upon which the procedure ends;
 - 3> if *establishmentCause* received from higher layers is set to *mo-Data* (including the case that *mo-Data* is replaced by *highPriorityAccess* according to TS 24.301 [35] or by *mo-VoiceCall* according to the clause 5.3.3.3):
 - 4> perform access barring check as specified in 5.3.3.11, using T303 as "Tbarring" and *ac-BarringForMO-Data* as "AC barring parameter";
 - 4> if access to the cell is barred:
 - 5> if *SystemInformationBlockType2* includes *ac-BarringForCSFB* or the UE does not support CS fallback:
 - 6> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls is applicable, upon which the procedure ends;
 - 5> else (*SystemInformationBlockType2* does not include *ac-BarringForCSFB* and the UE supports CS fallback):
 - 6> if timer T306 is not running, start T306 with the timer value of T303;

- 6> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls and mobile originating CS fallback is applicable, upon which the procedure ends;

Upon initiation of the procedure, if the UE is connected to 5GC, the UE shall:

- 1> if the upper layers provide an Access Category and one or more Access Identities upon requesting establishment of an RRC connection:
 - 2> perform the unified access control procedure as specified in 5.3.16 using the Access Category and Access Identities provided by upper layers;
 - 3> if the access attempt is barred, the procedure ends;
- 1> if the resumption of the RRC connection is triggered by response to NG-RAN paging:
 - 2> select '0' as the Access Category;
 - 2> perform the unified access control procedure as specified in 5.3.16 using the selected Access Category and one or more Access Identities provided by upper layers;
 - 3> if the access attempt is barred, the procedure ends;
- 1> else if the resumption of the RRC connection is triggered by upper layers:
 - 2> if the upper layers provide an Access Category and one or more Access Identities:
 - 3> perform the unified access control procedure as specified in 5.3.16 using the Access Category and Access Identities provided by upper layers;
 - 4> if the access attempt is barred, the procedure ends;
 - 2> set the *resumeCause* in accordance with the information received from upper layers;
- 1> else if the resumption of the RRC connection is triggered due to an RNAU:
 - 2> if an emergency service is ongoing:
 - 3> select '2' as the Access Category;
 - 3> set the *resumeCause* to *emergency*;
 - 2> else:
 - 3> select '8' as the Access Category;
 - 2> perform the unified access control procedure as specified in 5.3.16 using the selected Access Category and one or more Access Identities to be applied as specified in TS 24.501 [95];
 - 3> if the access attempt is barred:
 - 4> set the variable *pendingRnaUpdate* to 'TRUE';
 - 4> the procedure ends;

Except for NB-IoT, upon initiating the procedure, if connected to EPC or 5GC, the UE shall:

- 1> if the UE is resuming an RRC connection from a suspended RRC connection or from RRC_INACTIVE:
 - 2> if the UE was configured with (NG)EN-DC:
 - 3> if the UE does not support maintaining SCG configuration upon connection resumption:
 - 4> perform MR-DC release, as specified in TS 38.331 [82], clause 5.3.5.10;
 - 4> release *p-MaxEUTRA*, if configured;
 - 4> release *p-MaxUE-FRI*, if configured;

- 4> release *tdm-PatternConfig* or *tdm-PatternConfig2*, if configured;
- 3> release *otherConfig* associated with the SCG, if configured;
- 3> stop timers T346a, T346b, T346c, T346d and T346e associated with the SCG (see TS 38.331 [82], clause 7.1.1), if running;
- 2> if the UE does not support maintaining the MCG SCell configurations upon connection resumption:
 - 3> release the MCG SCell(s), if configured, in accordance with 5.3.10.3a;
- 2> release *powerPrefIndicationConfig*, if configured and stop timer T340, if running;
- 2> release *reportProximityConfig* and clear any associated proximity status reporting timer;
- 2> release *obtainLocationConfig*, if configured;
- 2> release *bt-NameListConfig*, if configured;
- 2> release *wlan-NameListConfig*, if configured;
- 2> release *measUncomBarPre*, if configured;
- 2> release *idc-Config*, if configured;
- 2> release *sps-AssistanceInfoReport*, if configured;
- 2> release *scg-DeactivationPreferenceConfig*, if configured and stop timer T346, if running;
- 2> release *measSubframePatternPCell*, if configured;
- 2> if the UE was configured with DC:
 - 3> release the entire SCG configuration, if configured, except for the DRB configuration (as configured by *drb-ToAddModListSCG*);
- 2> release *naics-Info* for the PCell, if configured;
- 2> release the LWA configuration, if configured, as described in 5.6.14.3;
- 2> release the LWIP configuration, if configured, as described in 5.6.17.3;
- 2> release *bw-PreferenceIndicationTimer*, if configured and stop timer T341, if running;
- 2> release *delayBudgetReportingConfig*, if configured and stop timer T342, if running;
- 2> release *ailc-BitConfig*, if configured;
- 2> release *uplinkDataCompression*, if configured;
- 2> release *overheatingAssistanceConfig* and *overheatingAssistanceConfigForSCG*, if configured and stop timer T345, if running;

NOTE 1a: The parameters and configurations are released from the UE Inactive AS context if the UE is resuming an RRC connection from RRC_INACTIVE.

- 1> if the UE is establishing or resuming an RRC connection from a suspended RRC connection:
 - 2> if the UE has a stored *pur-Config* and the cell is different from the cell where *pur-Config* was provided:
 - 3> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
 - 3> release *pur-Config*;
 - 3> discard previously stored *pur-Config*;
- 1> apply the default physical channel configuration as specified in 9.2.4;

- 1> apply the default semi-persistent scheduling configuration as specified in 9.2.3;
- 1> apply the default MAC main configuration as specified in 9.2.2;
- 1> apply the CCCH configuration as specified in 9.1.1.2;
- 1> apply the *timeAlignmentTimerCommon* included in *SystemInformationBlockType2*;
- 1> if UE supports timing advance reporting and *ta-Report* is included in *SystemInformationBlockType2*:
 - 2> instruct the associated MAC entity to trigger Timing Advance reporting;
- 1> start timer T300;
- 1> if the UE is resuming an RRC connection from a suspended RRC connection:
 - 2> initiate transmission of the *RRCConnectionResumeRequest* message in accordance with 5.3.3.3a;
- 1> else if the UE is resuming an RRC connection from RRC_INACTIVE:
 - 2> set the variable *pendingRnaUpdate* to 'FALSE';
 - 2> initiate transmission of the *RRCConnectionResumeRequest* message in accordance with 5.3.3.3a;
- 1> else:
 - 2> if stored, discard the UE AS context, UE Inactive AS context and *resumeIdentity*;
 - 2> release *rrc-InactiveConfig*, if configured;
 - 2> if the UE is initiating CP-EDT in accordance with conditions in 5.3.3.1b; or
 - 2> if the UE is initiating CP transmission using PUR in accordance with conditions in 5.3.3.1c:
 - 3> initiate transmission of the *RRCEarlyDataRequest* message in accordance with 5.3.3.3b;
 - 2> else:
 - 3> initiate transmission of the *RRCConnectionRequest* message in accordance with 5.3.3.3;
- 1> if stored, discard *mt-EDT*;

NOTE 2: Upon initiating the connection establishment procedure, the UE is not required to ensure it maintains up to date system information applicable only for UEs in RRC_IDLE state or UEs in RRC_INACTIVE. However, the UE needs to perform system information acquisition upon cell re-selection.

For NB-IoT, upon initiation of the procedure, the UE shall:

- 1> if the UE is connected to EPC:
 - 2> if the UE is establishing or resuming the RRC connection for mobile originating exception data; or
 - 2> if the UE is establishing or resuming the RRC connection for mobile originating data; or
 - 2> if the UE is establishing or resuming the RRC connection for delay tolerant access; or
 - 2> if the UE is establishing or resuming the RRC connection for mobile originating signalling;
 - 3> perform access barring check as specified in 5.3.3.14;
 - 3> if access to the cell is barred:
 - 4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication and that access barring is applicable, upon which the procedure ends;
 - 1> if the UE is connected to 5GC:
 - 2> if the Access Category provided by the upper layers is different from '0':

- 3> perform access barring check for per-NRSRP barring as specified in 5.3.3.14;
- 3> if access to the cell is barred:
 - 4> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication, upon which the procedure ends;
- 3> else:
 - 4> perform the unified access control procedure as specified in 5.3.16 using the Access Category and Access Identities provided by upper layers;
 - 4> if the access attempt is barred, the procedure ends;
- 1> if the UE is establishing or resuming an RRC connection:
 - 2> if the UE has a stored *pur-Config* and the cell is different from the cell where *pur-Config* was provided:
 - 3> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
 - 3> release *pur-Config*;
 - 3> discard previously stored *pur-Config*;
 - 2> release *obtainLocationNB*, if configured;
 - 1> apply the default physical channel configuration as specified in 9.2.4;
 - 1> apply the default MAC main configuration as specified in 9.2.2;
 - 1> apply the CCCH configuration as specified in 9.1.1.2;
 - 1> if UE supports timing advance reporting and *ta-Report* is included in *SystemInformationBlockType2-NB*:
 - 2> instruct the associated MAC entity to trigger Timing Advance reporting;
 - 1> start timer T300;
 - 1> if the UE is establishing an RRC connection:
 - 2> if stored, discard the UE AS context and *resumeIdentity*;
 - 2> if the UE is initiating CP-EDT in accordance with conditions in 5.3.3.1b; or
 - 2> if the UE is initiating CP transmission using PUR in accordance with conditions in 5.3.3.1c:
 - 3> initiate transmission of the *RRCEarlyDataRequest* message in accordance with 5.3.3.3b;
 - 2> else:
 - 3> initiate transmission of the *RRCConnectionRequest* message in accordance with 5.3.3.3;
 - 1> else if the UE is resuming an RRC connection:
 - 2> release *schedulingRequestConfig*, if configured;
 - 2> initiate transmission of the *RRCConnectionResumeRequest* message in accordance with 5.3.3.3a;
 - 1> if stored, discard *mt-EDT*;

NOTE 3: Upon initiating the connection establishment or resumption procedure, the UE is not required to ensure it maintains up to date system information applicable only for UEs in RRC_IDLE state. However, the UE needs to perform system information acquisition upon cell re-selection.

NOTE 4: For EDT and transmission using PUR, upon initiating the connection establishment or resumption procedure, it is up to UE implementation whether to continue cell re-selection related measurements as well as cell re-selection evaluation and, if the conditions for cell re-selection are fulfilled, whether to perform cell re-selection as specified in 5.3.3.5.

5.3.3.3 Actions related to transmission of *RRConnectionRequest* message

The UE shall set the contents of *RRConnectionRequest* message as follows:

1> if the UE is connected to EPC:

2> set the *ue-Identity* as follows:

3> if upper layers provide an S-TMSI:

4> set the *ue-Identity* to the value received from upper layers;

3> else:

4> draw a random value in the range 0 .. $2^{40}-1$ and set the *ue-Identity* to this value;

NOTE 1: Upper layers provide the S-TMSI if the UE is registered in the TA of the current cell.

2> if the establishment of the RRC connection is the result of release with redirect with *mpsPriorityIndication* (either in NR or E-UTRAN):

3> set the *establishmentCause* to *highPriorityAccess*;

2> else:

3> if the UE supports *mo-VoiceCall* establishment cause and UE is establishing the RRC connection for mobile originating MMTEL voice and *SystemInformationBlockType2* includes *voiceServiceCauseIndication* and the establishment cause received from upper layers is not set to *highPriorityAccess*; or

3> if the UE supports *mo-VoiceCall* establishment cause and EPS fallback for IMS voice (see TS 23.502 [102]) was triggered in NR via *RRCRelease* with *voiceFallbackIndication* (see TS 38.331 [82]) and *SystemInformationBlockType2* includes *voiceServiceCauseIndication* and the establishment cause received from upper layers is not set to *highPriorityAccess* or *emergency*:

4> set the *establishmentCause* to *mo-VoiceCall*;

3> else if the UE supports *mo-VoiceCall* establishment cause for mobile originating MMTEL video and UE is establishing the RRC connection for mobile originating MMTEL video and *SystemInformationBlockType2* includes *videoServiceCauseIndication* and the establishment cause received from upper layers is not set to *highPriorityAccess*:

4> set the *establishmentCause* to *mo-VoiceCall*;

3> else:

4> set the *establishmentCause* in accordance with the information received from upper layers;

1> if the UE is connected to 5GC:

2> set the *ue-Identity* as follows:

3> if upper layers provide a 5G-S-TMSI:

4> except for NB-IoT, set the *ue-Identity* to ng-5G-S-TMSI-Part1;

4> for NB-IoT, set the *ue-Identity* to ng-5G-S-TMSI;

3> else:

4> draw a random value in the range 0 .. $2^{40}-1$ and set the *ue-Identity* to this value;

- 2> if the establishment of the RRC connection is the result of release with redirect with *mpsPriorityIndication* (either in NR or E-UTRAN);
- 3> set the establishmentCause to *highPriorityAccess*;
- 2> else:
 - 3> set the *establishmentCause* in accordance with the information received from upper layers;
- 2> except for NB-IoT, apply the default NR PDCP configuration as specified in TS 38.331 [82], clause 9.2.1.1 for SRB1;
- 2> except for NB-IoT, use NR PDCP for all subsequent messages received and sent by the UE via SRB1;
- 1> if the UE is a NB-IoT UE:
 - 2> if the UE is connected to EPC:
 - 3> if the UE supports multi-tone transmission, include *multiToneSupport*;
 - 3> if the UE supports multi-carrier operation, include *multiCarrierSupport*;
 - 3> set *earlyContentionResolution* to TRUE;
 - 2> if the UE supports DL channel quality reporting in MSG3 and *cqi-Reporting* is present in *SystemInformationBlockType2-NB*:
 - 3> set the *cqi-NPDCCCH* to include the latest results of the downlink channel quality measurements of the carrier where the random access response is received as specified in TS 36.133 [16];

NOTE 2: The downlink channel quality measurements use measurement period T1 or T2, as defined in TS 36.133 [16].

- 1> if the UE is initiating transmission using PUR in accordance with conditions in 5.3.3.1c:
- 2> configure, except *pur-TimeAlignmentTimer*, the lower layers to use transmission using PUR;
- 2> deliver the UL grant for transmission using PUR to the MAC entity;

The UE shall submit the *RRCConnectionRequest* message to lower layers for transmission.

The UE shall continue cell re-selection related measurements as well as cell re-selection evaluation. If the conditions for cell re-selection are fulfilled, the UE shall perform cell re-selection as specified in 5.3.3.5.

5.3.3.3a Actions related to transmission of *RRCConnectionResumeRequest* message

If the UE is resuming the RRC connection from a suspended RRC connection, the UE shall set the contents of *RRCConnectionResumeRequest* message as follows:

- 1> if the UE is a NB-IoT UE; or
- 1> if the UE is initiating UP-EDT for mobile originating calls in accordance with conditions in 5.3.3.1b; or
- 1> if the UE is initiating UP transmission using PUR in accordance with conditions in 5.3.3.1c; or
- 1> if field *useFullResumeID* is signalled in *SystemInformationBlockType2*:
 - 2> if the UE connected to 5GC is a BL UE or UE in CE:
 - 3> set the *fullI-RNTI* to the stored *fullI-RNTI*;
 - 2> else:
 - 3> set the *resumeID* to the stored *resumeIdentity*;
- 1> else:

2> if the UE connected to 5GC is a BL UE or UE in CE:

3> set the *shortI-RNTI* to the stored *shortI-RNTI*;

2> else:

3> set the *truncatedResumeID* to include bits in bit position 9 to 20 and 29 to 40 from the left in the stored *resumeIdentity*.

1> if the UE is resuming the RRC connection after release with redirect with *mpsPriorityIndication*:

2> set the *resumeCause* to *highPriorityAccess*;

1> else if the UE supports *mo-VoiceCall* establishment cause and UE is resuming the RRC connection for mobile originating MMTEL voice and *SystemInformationBlockType2* includes *voiceServiceCauseIndication* and the establishment cause received from upper layers is not set to *highPriorityAccess*:

2> set the *resumeCause* to *mo-VoiceCall*;

1> else if the UE supports *mo-VoiceCall* establishment cause for mobile originating MMTEL video and UE is resuming the RRC connection for mobile originating MMTEL video and *SystemInformationBlockType2* includes *videoServiceCauseIndication* and the establishment cause received from upper layers is not set to *highPriorityAccess*:

2> set the *resumeCause* to *mo-VoiceCall*;

1> else if the UE is initiating UP-EDT for mobile terminating calls in accordance with conditions in 5.3.3.1b:

2> set the *resumeCause* to *mt-EDT*;

1> else:

2> set the *resumeCause* in accordance with the information received from upper layers;

1> set the *shortResumeMAC-I* to the 16 least significant bits of the MAC-I calculated:

2> over the ASN.1 encoded as per clause 8 (i.e., a multiple of 8 bits) *VarShortResumeMAC-Input* (or *VarShortResumeMAC-Input-NB* in NB-IoT);

2> with the K_{RRCint} key and the previously configured integrity protection algorithm; and

2> with all input bits for COUNT, BEARER and DIRECTION set to binary ones;

1> if the UE is a NB-IoT UE:

2> if the UE supports DL channel quality reporting in MSG3 and *cqi-Reporting* is present in *SystemInformationBlockType2-NB*:

3> set the *cqi-NPDCCH* to include the latest results of the downlink channel quality measurements of the carrier where the random access response is received as specified in TS 36.133 [16];

NOTE 0: The downlink channel quality measurements use measurement period T1 or T2, as defined in TS 36.133 [16].

2> if the UE is connected to EPC, set *earlyContentionResolution* to TRUE;

1> restore the RRC configuration and security context from the stored UE AS context, except for the following:

- MCG SCell(s) configuration, if stored,
- *nr-SecondaryCellGroupConfig*, if stored;

1> if the UE is initiating UP-EDT for mobile originating calls in accordance with conditions in 5.3.3.1b:

2> if the UE is a NB-IoT UE connected to EPC:

3> if the UE has ANR measurements information available in *VarANR-MeasReport-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarANR-MeasReport-NB*:

- 4> set *anr-InfoAvailable* to TRUE;
- 1> if the UE is resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18:
 - 2> if the UE is initiating UP-EDT in accordance with conditions in 5.3.3.1b; or
 - 2> if the UE is initiating UP transmission using PUR in accordance with conditions in 5.3.3.1c:
 - 3> restore the PDCP state and re-establish PDCP entities for all SRBs and all DRBs;
 - 3> if *drb-ContinueROHC* has been provided in immediately preceding RRC connection release message, and the UE is requesting to resume RRC connection in the same cell:
 - 4> indicate to lower layers that stored UE AS context is used and that *drb-ContinueROHC* is configured;
 - 4> continue the header compression protocol context for the DRBs configured with the header compression protocol;
 - 3> else:
 - 4> indicate to lower layers that stored UE AS context is used;
 - 4> reset the header compression protocol context for the DRBs configured with the header compression protocol;
 - 3> resume all SRBs and all DRBs;
 - 2> else:
 - 3> if the UE is a NB-IoT UE or the UE is connected to EPC, restore the PDCP state and re-establish the PDCP entity for SRB1;
 - 3> if the UE is connected to 5GC:
 - 4> apply the default configuration for SRB1 as specified in 9.2.1.1;
 - 4> except for NB-IoT, apply the default NR PDCP configuration as specified in TS 38.331 [82], clause 9.2.1 for SRB1;
 - 3> resume SRB1;
 - 2> derive the K_{eNB} key based on the K_{ASME} key to which the current K_{eNB} is associated, using the stored value of *nextHopChainingCount* received in the *RRCConnectionRelease* message in the preceding connection, as specified in TS 33.401 [32] for EPC and TS 33.501 [86] for 5GC;
 - 2> derive the K_{RRCint} key associated with the previously configured integrity algorithm, as specified in TS 33.401 [32] for EPC and TS 33.501 [86] for 5GC;
 - 2> derive the K_{RRCenc} key and the K_{UPenc} key associated with the previously configured ciphering algorithm, as specified in TS 33.401 [32] for EPC and TS 33.501 [86] for 5GC;
 - 2> configure lower layers to resume integrity protection using the previously configured algorithm and the K_{RRCint} key derived in this clause to all subsequent messages received and sent by the UE;
 - 2> configure lower layers to resume ciphering and to apply the ciphering algorithm and the K_{RRCenc} key derived in this clause to all subsequent messages received and sent by the UE;
 - 2> configure lower layers to resume ciphering and to apply the ciphering algorithm and the K_{UPenc} key derived in this clause immediately to the user data sent and received by the UE;
 - 2> if the UE is initiating UP-EDT for mobile originated calls in accordance with conditions in 5.3.3.1b:
 - 3> configure the lower layers to use EDT;
 - 2> else if the UE is initiating UP transmission using PUR in accordance with conditions in 5.3.3.1c:

3> configure, except *pur-TimeAlignmentTimer*, the lower layers to use transmission using PUR;

3> deliver the UL grant for transmission using PUR to the MAC entity;

1> else:

2> if SRB1 was configured with NR PDCP:

3> for SRB1, release the NR PDCP entity and establish an E-UTRA PDCP entity with the current (MCG) security configuration;

NOTE 1: The UE applies the LTE ciphering and integrity protection algorithms that are equivalent to the previously configured NR security algorithms.

2> else:

3> for SRB1, restore the PDCP state and re-establish the PDCP entity;

If the UE is resuming the RRC connection from RRC_INACTIVE, the UE shall set the contents of *RRConnectionResumeRequest* message as follows:

2> if field *useFullResumeID* is signalled in *SystemInformationBlockType2*:

3> set the *fullI-RNTI* to the stored *fullI-RNTI* value provided in suspend;

2> else:

3> set the *shortI-RNTI* to the stored *shortI-RNTI* value provided in suspend;

2> restore the RRC configuration, RoHC state, the stored QoS flow to DRB mapping rules and the K_{eNB} and K_{RRCint} keys from the UE Inactive AS context except for the following:

- MCG physical layer,
- MCG MAC configuration,
- NR *pdcp-Config*,
- MCG SCell configurations, if stored,
- nr-SecondaryCellGroupConfig, if stored;

2> set the *shortResumeMAC-I* to the 16 least significant bits of the MAC-I calculated:

3> over the ASN.1 encoded as per clause 8 (i.e., a multiple of 8 bits) *VarShortINACTIVE-MAC-Input*;

3> with the K_{RRCint} key in the UE Inactive AS Context and the previously configured integrity protection algorithm; and

3> with all input bits for COUNT, BEARER and DIRECTION set to binary ones;

2> derive the K_{eNB} key based on the current K_{eNB} or the NH, using the stored *nextHopChainingCount* value, as specified in TS 33.501 [86];

2> derive the K_{RRCenc} key, the K_{RRCint} and the K_{UPenc} key, as specified in TS 33.401 [32];

2> apply the default configuration for SRB1 as specified in 9.2.1.1;

2> apply the default NR PDCP configuration as specified in TS 38.331 [82], clause 9.2.1 for SRB1;

2> configure lower layers to resume integrity protection for all SRBs except SRB0 using the configured algorithm and the K_{RRCint} key derived in this clause immediately, i.e., integrity protection shall be applied to all subsequent messages received and sent by the UE;

2> configure lower layers to resume ciphering for all radio bearers except SRB0 and to apply the configured ciphering algorithm, the K_{RRCenc} key and the K_{UPenc} key derived in this clause, i.e. the ciphering configuration shall be applied to all subsequent messages received and sent by the UE;

Following procedures are applied for both suspended RRC connection and RRC_INACTIVE:

2> resume SRB1;

NOTE 2: Until successful connection resumption, the default physical layer configuration and the default MAC Main configuration are applied for the transmission of SRB0 and SRB1, and SRB1 is used only for the transfer of *RRCConnectionResume* message, and *RRCConnectionRelease* message if security has been re-activated.

The UE shall submit the *RRCConnectionResumeRequest* message to lower layers for transmission.

The UE shall continue cell re-selection related measurements as well as cell re-selection evaluation.

If the UE is resuming the RRC connection from RRC_INACTIVE and if lower layers indicate an integrity check failure while T300 is running, the UE shall perform actions specified in 5.3.3.16.

5.3.3.3b Actions related to transmission of *RRCEarlyDataRequest* message

The UE shall set the contents of *RRCEarlyDataRequest* message as follows:

1> if upper layers provide an S-TMSI:

2> set the *s-TMSI* to the value received from upper layers;

1> else if upper layers provide a 5G-S-TMSI:

2> set the *ng-5G-S-TMSI* to the value received from upper layers;

1> set the *establishmentCause* in accordance with the information received from upper layers;

1> if the UE is a NB-IoT UE:

2> if the UE supports DL channel quality reporting and *cqi-Reporting* is present in *SystemInformationBlockType2-NB*:

3> set the *cqi-NPDCCH* to include the latest results of the downlink channel quality measurements of the carrier where the random access response is received as specified in TS 36.133 [16];

NOTE: The downlink channel quality measurements may use measurement period T1 or T2, as defined in TS 36.133 [16]. In case period T2 is used the RRC-MAC interactions are left to UE implementation.

1> set the *dedicatedInfoNAS* to include the information received from upper layers;

The UE shall:

1> if the UE is initiating CP-EDT in accordance with conditions in 5.3.3.1b:

2> configure the lower layers to use EDT;

1> else if the UE is initiating CP transmission using PUR in accordance with conditions in 5.3.3.1c:

2> configure, except *pur-TimeAlignmentTimer*, the lower layers to use transmission using PUR;

2> deliver the UL grant for transmission using PUR to the MAC entity;

1> submit the *RRCEarlyDataRequest* message to the lower layers for transmission.

5.3.3.3c UE actions upon receiving EDT fallback indication from lower layers

Upon indication from lower layers that EDT is cancelled, the UE shall:

1> start or restart timer T300;

1> if the fallback is indicated by lower layers in response to the *RRCEarlyDataRequest*:

2> initiate transmission of *RRCConnectionRequest* message in accordance with 5.3.3.3;

1> else if the fallback is indicated by lower layers in response to the *RRCConnectionResumeRequest* for EDT when connected to EPC and the fallback is not due to the UL grant provided in Random Access Response not being for EDT:

2> perform the actions as specified in 5.3.3.9a;

2> initiate transmission of the *RRCConnectionResumeRequest* message in accordance with 5.3.3.3a;

NOTE: It is up to UE implementation to avoid data loss due to EDT fallback.

5.3.3.3d UE actions upon receiving PUR indications from lower layers

The UE shall:

1> if repetition adjustment is indicated by lower layers:

2> update *numRepetitions* (*npusch-NumRepetitionsIndex* in NB-IoT) in previously stored *pur-Config* in accordance with the received indication;

1> if *pur-RSRP-ChangeThreshold* (*pur-NRSRP-ChangeThreshold* in NB-IoT) is configured and timing advance adjustment is indicated by lower layers:

2> replace the serving cell reference (N)RSRP value with the current serving cell (N)RSRP value (see 5.3.3.19);

For CP transmission using PUR, upon indication from lower layers that transmission using PUR is successfully completed, the UE shall perform the actions as specified in 5.3.3.4b as if an empty *RRCEarlyDataComplete* message was received.

Upon reception of PUR fallback or PUR failure indication from lower layers, the procedure ends.

NOTE: For transmission using PUR, further UE actions upon reception of PUR fallback or PUR failure indication from lower layers (see TS 36.321 [6]) is left up to implementation.

5.3.3.4 Reception of the *RRCConnectionSetup* by the UE

NOTE 1: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> except when the UE connected to 5GC is a BL UE or UE in CE, if the *RRCConnectionSetup* is received in response to an *RRCConnectionResumeRequest* from a suspended RRC connection:

2> if the UE is resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18:

3> discard any current AS security context including the $K_{RRC_{enc}}$ key, the $K_{RRC_{int}}$ key, the $K_{UP_{int}}$ key and the $K_{UP_{enc}}$ key;

2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established or suspended RBs, except for SRB0;

2> discard the stored UE AS context and *resumeIdentity*;

2> if stored, discard the stored *nextHopChainingCount*;

2> if stored, discard the stored *drb-ContinueROHC*;

2> indicate to upper layers fallback of the RRC connection;

1> if the *RRCConnectionSetup* is received in response to an *RRCConnectionResumeRequest* from RRC_INACTIVE:

2> stop T380 if running;

2> discard the stored UE Inactive AS context;

- 2> release *rrc-InactiveConfig*, if configured;
- 1> if the UE connected to 5GC is a BL UE or UE in CE, and the *RRConnectionSetup* is received in response to an *RRConnectionResumeRequest* from a suspended RRC connection:
 - 2> discard the stored UE AS context and *resumeIdentity*;
 - 2> if stored, discard the stored *nextHopChainingCount*;
 - 2> if stored, discard the stored *drb-ContinueROHC*;
- 1> if the *RRConnectionSetup* is received in response to an *RRConnectionResumeRequest* from **RRC_INACTIVE**; or
- 1> if the UE connected to 5GC is a BL UE or UE in CE, and the *RRConnectionSetup* is received in response to an *RRConnectionResumeRequest* from a suspended RRC connection:
 - 2> discard any current AS security context including the $K_{RRC_{enc}}$ key, the $K_{RRC_{int}}$ key, the $K_{UP_{int}}$ key and the $K_{UP_{enc}}$ key;
 - 2> release radio resources for all established RBs except SRB0, including release of the RLC entities, of the associated PDCP entities and of SDAP entities;
 - 2> release the RRC configuration except for the default L1 parameter values, default MAC main configuration and CCCH;
 - 2> apply the default NR PDCP configuration as specified in TS 38.331 [82], clause 9.2.1.1 for SRB1;
 - 2> use NR PDCP for all subsequent messages received and sent by the UE via SRB1;
 - 2> indicate to upper layers fallback of the RRC connection;
- 1> if the *RRConnectionSetup* is received in response to an *RRCEarlyDataRequest* or *RRConnectionResumeRequest* for transmission using PUR:
 - 2> instruct the associated MAC entity to start *timeAlignmentTimer*;
- 1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10.0;
- 1> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo* or inherited from another RAT;
- 1> if stored, discard the *altFreqPriorities* provided by the *RRConnectionRelease*;
- 1> if stored, discard the dedicated offset provided by the *redirectedCarrierOffsetDedicated*;
- 1> stop timer T300;
- 1> if T302 is running:
 - 2> stop timer T302;
 - 2> if the UE is connected to 5GC:
 - 3> perform the actions as specified in 5.3.16.4;
- 1> stop timer T303, if running;
- 1> stop timer T305, if running;
- 1> stop timer T306, if running;
- 1> stop timer T308, if running;
- 1> perform the actions as specified in 5.3.3.7;
- 1> stop timer T320, if running;

- 1> stop timer T350, if running;
- 1> perform the actions as specified in 5.6.12.4;
- 1> release *rclwi-Configuration*, if configured, as specified in 5.6.16.2;
- 1> stop timer T360, if running;
- 1> stop timer T322, if running;
- 1> if timer T331 is running:
 - 2> stop timer T331;
 - 2> perform the actions as specified in 5.6.20.3;
- 1> stop timer T323, if running;
- 1> forward the *dedicatedInfoNAS*, if received, to the upper layers;
- 1> if T309 is running:
 - 2> stop timer T309 for all access categories;
 - 2> perform the actions as specified in 5.3.16.4.
- 1> enter RRC_CONNECTED;
- 1> stop the cell re-selection procedure;
- 1> consider the current cell to be the PCell;
- 1> except for NB-IoT:
 - 2> if the UE supports RLF report for inter-RAT MRO EUTRA as defined in TS 38.306 [87], and if the UE has radio link failure or handover failure information available in *VarRLF-Report* of TS 38.331 [82] and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report* of TS 38.331 [82]:
 - 3> if *reconnectCellId* in *VarRLF-Report* of TS 38.331 [82] is not set, and if the UE failed to perform reestablishment; or
 - 3> if *reconnectCellId* in *VarRLF-Report* of TS 38.331 [82] is not set, and if the UE selected the current PCell immediately after failure in performing *MobilityFromNRCommand*:
 - 4> if the selected PCell is an acceptable cell as defined in TS 36.304 [4]:
 - 5> set *timeUntilReconnection* in *VarRLF-Report* of TS 38.331 [82] to the time that elapsed since the *MobilityFromNRCommand* failure;
 - 4> if the selected PCell is a suitable cell as defined in TS 36.304 [4]:
 - 5> set *timeUntilReconnection* in *VarRLF-Report* of TS 38.331 [82] to the time that elapsed since the last radio link failure or handover failure;
 - 5> set *eutraReconnectCellId* in *reconnectCellId* in *VarRLF-Report* of TS 38.331 [82] to the global cell identity and the tracking area code of the PCell;
 - 2> if the UE radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 3> if *reconnectCellId* in *VarRLF-Report* is not set, and if the UE failed to perform reestablishment:
 - 4> set *timeUntilReconnection* in *VarRLF-Report* to the time that elapsed since the last radio link failure or handover failure;
 - 4> set *eutraReconnectCellId* in *reconnectCellId* in *VarRLF-Report* to the global cell identity and the tracking area code of the PCell;

- 1> set the content of *RRConnectionSetupComplete* message as follows:
- 2> if the *RRConnectionSetup* is received in response to an *RRConnectionResumeRequest*:
 - 3> if upper layers provide an S-TMSI:
 - 4> set the *s-TMSI* to the value received from upper layers;
 - 3> else if upper layers provide a 5G-S-TMSI:
 - 4> if the UE is a NB-IoT UE:
 - 5> set the *ng-5G-S-TMSI* to the value received from upper layers;
 - 4> else:
 - 5> set the *ng-5G-S-TMSI-Bits* to *ng-5G-S-TMSI* with the value received from upper layers;
 - 2> else if upper layers provide a 5G-S-TMSI:
 - 3> except for NB-IoT, set the *ng-5G-S-TMSI-Bits* to *ng-5G-S-TMSI-Part2* to the leftmost 8 bits of 5G-S-TMSI received from upper layers;
 - 2> set the *selectedPLMN-Identity* to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35] for E-UTRA/EPC and TS 24.501 [95] for E-UTRA/5GC) from the PLMN(s) included in the *plmn-IdentityList* in *SystemInformationBlockType1* (or *SystemInformationBlockType1-NB* in NB-IoT);
 - 2> if upper layers provide the 'Registered MME', include and set the *registeredMME* as follows:
 - 3> if the PLMN identity of the 'Registered MME' is different from the PLMN selected by the upper layers:
 - 4> include the *plmnIdentity* in the *registeredMME* and set it to the value of the PLMN identity in the 'Registered MME' received from upper layers;
 - 3> set the *mmei* and the *mmeec* to the value received from upper layers;
 - 2> if upper layers provided the 'Registered MME':
 - 3> include and set the *gummei-Type* to the value provided by the upper layers;
 - 2> if upper layers provide the 'Registered AMF', include and set the *registeredAMF* as follows:
 - 3> if the PLMN identity of the 'Registered AMF' is different from the PLMN selected by the upper layers:
 - 4> include the *plmnIdentity* in the *registeredAMF* and set it to the value of the PLMN identity in the 'Registered AMF' received from upper layers;
 - 3> set the *amf-Identifier* to AMF Identifier of the 'Registered AMF' received from upper layers;
 - 2> if upper layers provided the 'Registered AMF':
 - 3> include and set the *guami-Type* to the value provided by the upper layers;
 - 2> if upper layers provide one or more S-NSSAI (see TS 23.003 [27]):
 - 3> include the *s-NSSAI-list* and set the content to the values provided by the upper layers;
 - 2> if the UE supports CIoT EPS optimisation(s):
 - 3> include *attachWithoutPDN-Connectivity* if received from upper layers;
 - 3> include *up-CIoT-EPS-Optimisation* if received from upper layers;
 - 3> except for NB-IoT, include *cp-CIoT-EPS-Optimisation* if received from upper layers;
 - 2> if the UE supports CIoT 5GS optimisation(s):
 - 3> for NB-IoT, include *ng-U-DataTransfer* if received from upper layers;

3> except for NB-IoT, include *cp-CIoT-5GS-Optimisatoin* if received from upper layers;

2> if connecting as an RN:

- 3> include the *rn-SubframeConfigReq*;

2> if the *RRConnectionSetup* is received in response to *RRCEarlyDataRequest*:

- 3> set the *dedicatedInfoNAS* to a zero-length octet string;

2> else:

- 3> set the *dedicatedInfoNAS* to include the information received from upper layers;

2> if the *RRConnectionSetup* is not in response to transmission using PUR and the UE has a stored *pur-Config* including *pur-ConfigID*:

- 3> include the stored *pur-ConfigID*;

2> if the UE is connected to EPC:

- 3> except for NB-IoT:
 - 4> include the *mobilityState* and set it to the mobility state (as specified in TS 36.304 [4]) of the UE just prior to entering RRC_CONNECTED state;
- 3> for NB-IoT:
 - 4> if the UE has radio link failure information available in *VarRLF-Report-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report-NB*:
 - 5> include *rlf-InfoAvailable*;
 - 4> if the UE has ANR measurements information available in *VarANR-MeasReport-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarANR-MeasReport-NB*:
 - 5> include *anr-InfoAvailable*;
 - 3> include *dcn-ID* if a DCN-ID value (see TS 23.401 [41]) is received from upper layers;

2> else (i.e. the UE is connected to 5GC):

- 3> if the UE is a BL UE:
 - 4> include *lte-M*;
- 2> except for NB-IoT:
 - 3> if the UE has radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 4> include *rlf-InfoAvailable*;
 - 3> if the UE has MBSFN logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 4> include *logMeasAvailableMBSFN*;
 - 3> if the UE has logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 4> include *logMeasAvailable*;
 - 4> if Bluetooth measurement results are included in the logged measurements the UE has available:
 - 5> include *logMeasAvailableBT*;
 - 4> if WLAN measurement results are included in the logged measurements the UE has available:
 - 5> include *logMeasAvailableWLAN*;

- 5> include *logMeasAvailableWLAN*;
- 3> if the UE has connection establishment failure information available in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 4> include *connEstFailInfoAvailable*;
 - 3> if the UE has flight path information available:
 - 4> include *flightPathInfoAvailable*;
 - 3> if the UE supports storage of mobility history information and the UE has mobility history information available in *VarMobilityHistoryReport*:
 - 4> include the *mobilityHistoryAvail*;
 - 3> if the SIB2 contains *idleModeMeasurements* and the UE has E-UTRA idle/inactive measurement information concerning cells other than the PCell available in *VarMeasIdleReport*; or
 - 3> if the SIB2 contains *idleModeMeasurementsNR* and the UE has NR idle/inactive measurement information available in *VarMeasIdleReport*:
 - 4> include the *idleMeasAvailable*;
 - 3> if upper layers indicate that access to RLOS is initiated (see TS 23.401 [41] clause 4.3.8.3):
 - 4> set *rlos-Request* to *true*;
 - 2> if UE needs UL gaps during continuous uplink transmission:
 - 3> include *ue-CE-NeedULGaps*;
 - 2> for NB-IoT:
 - 3> if the UE supports serving cell idle mode measurements reporting and *servingCellMeasInfo* is present in *SystemInformationBlockType2-NB*:
 - 4> set the *measResultServCell* to include the measurements of the serving cell;
 - NOTE 2: The UE includes the latest results of the serving cell measurements as used for cell selection/ reselection evaluation, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].
 - 2> if connecting as an IAB-node:
 - 3> include *iab-NodeIndication*;
 - 2> if the UE is connected to NTN:
 - 3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;
 - 3> if UE supports GNSS position fix in RRC_CONNECTED and *gnss-PositionFixDurationReporting* is present in *SystemInformationBlockType2(-NB)*:
 - 4> include *gnss-PositionFixDuration* in accordance with the time duration required for the UE to acquire a GNSS position;
 - 2> if UE supports uplink RRC Segmentation of *UECapabilityInformation*:
 - 3> except for NB-IoT, may include *ul-RRC-Segmentation* if upper layers indicate that they are performing an Attach or TA Update;
 - 1> submit the *RRConnectionSetupComplete* message to lower layers for transmission;
 - 1> for NB-IoT:
 - 2> if the UE supports connected mode measurements and *connMeasConfig* is present in *SystemInformationBlockType3-NB*:

3> perform measurements as specified in 5.5.8.

1> the procedure ends.

5.3.3.4a Reception of the *RRCConnectionResume* by the UE

The UE shall:

1> stop timer T300;

1> if T309 is running:

2> stop timer T309 for all access categories;

2> perform the actions as specified in 5.3.16.4.

1> stop T380 if running;

1> if the *RRCConnectionResume* is received in response to an *RRCConnectionResumeRequest* for EDT or for transmission using PUR:

2> discard the stored UE AS context and *resumeIdentity*;

2> if the *RRCConnectionResume* is received in response to an *RRCConnectionResumeRequest* for transmission using PUR:

3> instruct the associated MAC entity to start *timeAlignmentTimer*;

1> else:

2> if resuming an RRC connection from a suspended RRC connection in EPC; or

2> for NB-IoT, if resuming an RRC connection from a suspended RRC connection in 5GC and *fullConfig* is not present in the *RRCConnectionResume* message:

3> restore the PDCP state and re-establish PDCP entities for SRB2, if configured with E-UTRA PDCP, and for all DRBs that are configured with E-UTRA PDCP;

3> if *drb-ContinueROHC* is included:

4> indicate to lower layers that stored UE AS context is used and that *drb-ContinueROHC* is configured;

4> continue the header compression protocol context for the DRBs configured with the header compression protocol;

3> else:

4> indicate to lower layers that stored UE AS context is used;

4> reset the header compression protocol context for the DRBs configured with the header compression protocol;

3> if *restoreMCG-SCells* is included:

4> restore the MCG SCell(s) configuration, if stored;

3> else:

4> release the MCG SCell(s) from the UE AS context, if stored;

3> if *restoreSCG* is included:

4> restore *nr-SecondaryCellGroupConfig*, if stored;

3> else if the UE was configured with EN-DC:

4> perform MR-DC release, as specified in TS 38.331 [82], clause 5.3.5.10;

- 4> release *tdm-PatternConfig* or *tdm-PatternConfig2*, if configured;
- 3> discard the stored UE AS context and *resumeIdentity*;
- 3> configure lower layers to consider the restored MCG and SCG SCell(s) (if any) to be in deactivated state;
- 2> else if the *RRCConnectionResume* message includes the *fullConfig* (i.e., for resuming an RRC connection from RRC_INACTIVE or for resuming a suspended RRC connection in 5GC):
 - 3> perform the radio configuration procedure as specified in 5.3.5.8;
- 2> else if resuming an RRC connection from RRC_INACTIVE:
 - 3> restore the following from the stored UE Inactive AS context:
 - MCG physical layer configuration,
 - MCG MAC configuration,
 - MCG RLC configuration,
 - PDCP configuration;
 - 3> if *restoreMCG-SCells* is included:
 - 4> restore the MCG SCell(s) configuration, if stored;
 - 3> else:
 - 4> release the MCG SCell(s) from the UE Inactive AS context, if stored;
 - 3> if *restoreSCG* is included:
 - 4> restore *nr-SecondaryCellGroupConfig*, if stored;
 - 3> else if the UE was configured with NGEN-DC:
 - 4> perform MR-DC release, as specified in TS 38.331 [82], clause 5.3.5.10;
 - 4> release *tdm-PatternConfig* or *tdm-PatternConfig2*, if configured;
 - 3> discard the stored UE Inactive AS context;
 - 3> configure lower layers to consider the restored MCG and SCG SCell(s) (if any) to be in deactivated state;
 - 3> release the *rrc-InactiveConfig*, except *ran-NotificationAreaInfo*;
- 2> else (i.e., except for NB-IoT for resuming a suspended RRC connection in 5GC):
 - 3> restore the physical layer configuration, the MAC configuration, the RLC configuration and the PDCP configuration from the stored UE AS context;
 - 3> discard the stored UE AS context and *resumeIdentity*;

1> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10.0;

NOTE 1: When performing the radio resource configuration procedure, for the physical layer configuration and the MAC Main configuration, the restored RRC configuration from the stored UE AS context is used as basis for the reconfiguration.

1> if the received *RRCConnectionResume* includes the *sCellToReleaseList*:

2> perform SCell release as specified in 5.3.10.3a;

1> if the received *RRCConnectionResume* includes the *sCellToAddModList*:

2> perform SCell addition or modification as specified in 5.3.10.3b;

- 1> if the received *RRCConnectionResume* includes the *sCellGroupToReleaseList*:
 - 2> perform SCell group release as specified in 5.3.10.3d;
 - 1> if the received *RRCConnectionResume* includes the *sCellGroupToAddModList*:
 - 2> perform SCell group addition or modification as specified in 5.3.10.3e;
 - 1> if the received *RRCConnectionResume* message includes the *nr-SecondaryCellGroupConfig*:
 - 2> perform NR RRC Reconfiguration as specified in TS 38.331 [82], clause 5.3.5.3;
 - 1> if the received *RRCConnectionResume* message includes the *sk-Counter*:
 - 2> perform key update procedure as specified in TS 38.331 [82], clause 5.3.5.8;
 - 1> if the received *RRCConnectionResume* message includes the *nr-RadioBearerConfig1*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
 - 1> if the received *RRCConnectionResume* message includes the *nr-RadioBearerConfig2*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
 - 1> except if the *RRCConnectionResume* is received in response to an *RRCConnectionResumeRequest* for EDT or for transmission using PUR:
 - 2> resume SRB2, SRB3 (if configured), and all DRBs, if any, including RBs configured with NR PDCP;
- NOTE 1a: If the NR SCG is deactivated, resuming SRB3 and all DRBs does not imply that PDCP or RRC PDUs can be transmitted or received on SCG RLC bearers.
- 1> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo* or inherited from another RAT;
 - 1> if stored, discard the *altFreqPriorities* provided by the *RRCConnectionRelease*;
 - 1> if stored, discard the dedicated offset provided by the *redirectedCarrierOffsetDedicated*;
 - 1> if the *RRCConnectionResume* message includes the *measConfig*:
 - 2> perform the measurement configuration procedure as specified in 5.5.2;
 - 1> if T302 is running:
 - 2> stop timer T302;
 - 2> if the UE is connected to 5GC:
 - 3> perform the actions as specified in 5.3.16.4;
 - 1> stop timer T303, if running;
 - 1> stop timer T305, if running;
 - 1> stop timer T306, if running;
 - 1> stop timer T308, if running;
 - 1> perform the actions as specified in 5.3.3.7;
 - 1> stop timer T320, if running;
 - 1> stop timer T350, if running;
 - 1> perform the actions as specified in 5.6.12.4;
 - 1> stop timer T360, if running;

- 1> stop timer T322, if running;
- 1> stop timer T323, if running;
- 1> if timer T331 is running:
 - 2> stop timer T331;
 - 2> perform the actions as specified in 5.6.20.3;
- 1> if the UE is resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18 or *RRConnectionResume* is received in response to an *RRConnectionResumeRequest* from RRC_INACTIVE:
 - 2> ignore the *nextHopChainingCount* value indicated in the *RRConnectionResume* message;
- 1> else:
 - 2> if resuming an RRC connection from a suspended RRC connection in EPC:
 - 3> update the K_{eNB} key based on the K_{ASME} key to which the current K_{eNB} is associated, using the *nextHopChainingCount* value indicated in the *RRConnectionResume* message, as specified in TS 33.401 [32];
 - 3> store the *nextHopChainingCount* value;
 - 3> derive the K_{RRCint} key associated with the previously configured integrity algorithm, as specified in TS 33.401 [32];
 - 3> request lower layers to verify the integrity protection of the *RRConnectionResume* message, using the previously configured algorithm and the K_{RRCint} key;
 - 3> if the integrity protection check of the *RRConnectionResume* message fails:
 - 4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other', upon which the procedure ends;
 - 3> derive the K_{RRCenc} key and the K_{UPenc} key associated with the previously configured ciphering algorithm, as specified in TS 33.401 [32];
 - 3> configure lower layers to resume integrity protection using the previously configured algorithm and the K_{RRCint} key immediately, i.e., integrity protection shall be applied to all subsequent messages received and sent by the UE;
 - 3> configure lower layers to resume ciphering and to apply the ciphering algorithm, the K_{RRCenc} key and the K_{UPenc} key, i.e. the ciphering configuration shall be applied to all subsequent messages received and sent by the UE;
 - 1> enter RRC_CONNECTED;
 - 1> indicate to upper layers that the suspended RRC connection has been resumed;
 - 1> stop the cell re-selection procedure;
 - 1> consider the current cell to be the PCell;
 - 1> set the content of *RRConnectionResumeComplete* message as follows:
 - 2> set the *selectedPLMN-Identity* to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35] for E-UTRA/EPC and TS 24.501 [95] for E-UTRA/5GC) from the PLMN(s) included in the *plmn-IdentityList* in *SystemInformationBlockType1*;
 - 2> set the *dedicatedInfoNAS* to include the information received from upper layers;
 - 2> except for NB-IoT:
 - 3> if resuming an RRC connection from a suspended RRC connection:

- 4> if the UE has radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 5> include *rlf-InfoAvailable*;
- 4> if the UE has MBSFN logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 5> include *logMeasAvailableMBSFN*;
- 4> else if the UE has logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 5> include *logMeasAvailable*;
 - 5> if Bluetooth measurement results are included in the logged measurements the UE has available:
 - 6> include *logMeasAvailableBT*;
 - 5> if WLAN measurement results are included in the logged measurements the UE has available:
 - 6> include *logMeasAvailableWLAN*;
- 4> if the UE has connection establishment failure information available in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 5> include *connEstFailInfoAvailable*;
- 4> include the *mobilityState* and set it to the mobility state (as specified in TS 36.304 [4]) of the UE just prior to entering RRC_CONNECTED state;
- 4> if the UE has flight path information available:
 - 5> include *flightPathInfoAvailable*;
- 3> if the *idleModeMeasurementReq* is included in the *RRCConnectionResume* message:
 - 4> if the UE has idle/inactive measurement information concerning cells other than the PCell available in *VarMeasIdleReport*:
 - 5> set the *measResultListIdle-r16* in the *RRCConnectionResumeComplete* message to the value of *measReportIdle-r15* in the *VarMeasIdleReport*;
 - 5> set the *measResultListExtIdle* in the *RRCConnectionResumeComplete* message to the value of *measReportIdle-r16* in the *VarMeasIdleReport*, if available;
 - 5> set the *measResultListIdleNR* in the *RRCConnectionResumeComplete* message to the value of *measReportIdleNR* in the *VarMeasIdleReport*, if available;
 - 5> discard the *VarMeasIdleReport* upon successful delivery of the *RRCConnectionResumeComplete* message is confirmed by lower layers;
 - 3> else:
 - 4> if the SIB2 contains *idleModeMeasurements* and the UE has E-UTRA idle/inactive measurement information concerning cells other than the PCell available in *VarMeasIdleReport*; or
 - 4> if the SIB2 contains *idleModeMeasurementsNR* and the UE has NR idle/inactive measurement information available in *VarMeasIdleReport*:
 - 5> include the *idleMeasAvailable*;

3> if the *RRConnectionResume* message includes *nr-SecondaryCellGroupConfig*:

4> include *scg-ConfigResponseNR* in accordance with TS 38.331 [82], clause 5.3.5.3;

2> for NB-IoT:

3> if the UE supports serving cell idle mode measurements reporting and *servingCellMeasInfo* is present in *SystemInformationBlockType2-NB*:

4> set the *measResultServCell* to include the measurements of the serving cell;

NOTE 2: The UE includes the latest results of the serving cell measurements as used for cell selection/ reselection evaluation, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].

3> if the UE is connected to EPC:

4> if the UE has radio link failure information available in *VarRLF-Report-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report-NB*:

5> include *rlf-InfoAvailable*;

4> if the UE has ANR measurements information available in *VarANR-MeasReport-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarANR-MeasReport-NB*:

5> include *anr-InfoAvailable*;

2> if the UE is connected to NTN:

3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;

3> if UE supports GNSS position fix in RRC_CONNECTED and *gnss-PositionFixDurationReporting* is present in *SystemInformationBlockType2(-NB)*:

4> include *gnss-PositionFixDuration* in accordance with the time duration required for the UE to acquire a GNSS position;

1> if the UE is configured to operate in EN-DC as result of this procedure, forward *upperLayerIndication* to upper layers as if the UE has received this field from SIB2, otherwise indicate to upper layers the absence of this field;

1> submit the *RRConnectionResumeComplete* message to lower layers for transmission;

1> for NB-IoT:

2> if the UE supports connected mode measurements and *connMeasConfig* is present in *SystemInformationBlockType3-NB*:

3> perform measurements as specified in 5.5.8.

2> if the received *RRConnectionResume* message includes the *obtainLocationNB*:

3> attempt to have detailed location information available for any RLF report;

NOTE 3: The UE is requested to attempt to have valid detailed location information available at the time of RLF.

The UE may not succeed e.g. because the user manually disabled the GPS hardware, due to no/poor satellite coverage. Further details, e.g. regarding when to activate GNSS, are up to UE implementation.

1> the procedure ends.

5.3.3.4b Reception of the *RRCEarlyDataComplete* by the UE

The UE shall:

1> indicate to upper layers that the RRC connection has been established;

1> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo* or inherited from another RAT;

- 1> if stored, discard the *altFreqPriorities* provided by the *RRConnectionRelease*;
- 1> if stored, discard the dedicated offset provided by the *redirectedCarrierOffsetDedicated*;
- 1> stop timer T300;
- 1> stop timer T302, if running;
- 1> stop timer T303, if running;
- 1> stop timer T305, if running;
- 1> stop timer T306, if running;
- 1> stop timer T308, if running;
- 1> perform the actions as specified in 5.3.3.7;
- 1> stop timer T320, if running;
- 1> stop timer T322, if running;
- 1> stop timer T323, if running;
- 1> forward the *dedicatedInfoNAS*, if received, to the upper layers;
- 1> reset MAC and release the MAC configuration;
- 1> if the *RRCEarlyDataComplete* message includes *redirectedCarrierInfo* indicating redirection to *geran*, *utra-FDD* or *utra-TDD*; and
- 1> if upper layers indicate that redirect to GERAN or UTRAN without AS security is not allowed:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other', upon which the procedure ends;
- 1> if the *RRCEarlyDataComplete* message includes *idleModeMobilityControlInfo*:
 - 2> store the cell reselection priority information provided by the *idleModeMobilityControlInfo*;
 - 2> if the *t320* is included:
 - 3> start timer T320, with the timer value set according to the value of *t320*;
- 1> else:
 - 2> apply the cell reselection priority information broadcast in the system information;
- 1> for NB-IoT, if the *RRCEarlyDataComplete* message includes *redirectedCarrierInfo*:
 - 2> if the *redirectedCarrierOffsetDedicated* is included in the *redirectedCarrierInfo*:
 - 3> store the dedicated offset for the frequency in *redirectedCarrierInfo*;
 - 3> start timer T322, with the timer value set according to the value of *T322* in *redirectedCarrierInfo*;
- 1> if the *extendedWaitTime* is present; and
- 1> if the UE supports delay tolerant access or the UE is a NB-IoT UE:
 - 2> forward the *extendedWaitTime* to upper layers;
- 1> indicate the release of the RRC connection to upper layers together with the release cause 'other', upon which the procedure ends;

5.3.3.5 Cell re-selection or cell selection while T300, T302, T303, T305, T306, T308 or T309 is running

The UE shall:

- 1> if cell selection or reselection occurs while T309 or T302 is running and if the UE is connected to 5GC:
 - 2> stop timer T309 for all access categories, if running;
 - 2> if in RRC_INACTIVE and T302 is running:
 - 3> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12 with release cause 'RRC Resume failure';
 - 2> else:
 - 3> stop timer T302, if running;
 - 3> perform the actions as specified in 5.3.16.4;
- 1> if in RRC_INACTIVE:
 - 2> if cell reselection occurs while T300 is running:
 - 3> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12 with release cause 'RRC Resume failure';
 - 1> else if cell reselection occurs while T300, T302, T303, T305, T306, or T308 is running:
 - 2> if timer T302, T303, T305, T306, and/or T308 is running and if the UE is connected to EPC:
 - 3> stop timer T302, T303, T305, T306, and T308, whichever ones were running;
 - 3> perform the actions as specified in 5.3.3.7;
 - 2> if timer T300 is running:
 - 3> stop timer T300;
 - 3> if UE has sent *RRConnectionResumeRequest* message and has not received *RRConnectionResume* message:
 - 4> reset MAC;
 - 4> if UE is resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18:
 - 5> perform the actions as specified in 5.3.3.9a;
 - 4> else:
 - 5> re-establish RLC for all RBs that are established;
 - 5> suspend SRB1;
 - 3> else:
 - 4> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;
 - 3> inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication;

5.3.3.6 T300 expiry

The UE shall:

- 1> if timer T300 expires:

- 2> if UE has sent *RRCConnectionResumeRequest* message and has not received *RRCConnectionResume* message:
- 3> reset MAC;
 - 3> if UE is resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18:
 - 4> perform the actions as specified in 5.3.3.9a;
 - 3> else:
 - 4> re-establish RLC for all RBs that are established;
 - 4> suspend SRB1;
- 2> else:
- 3> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;
- 2> if the UE is a NB-IoT UE:
- 3> if *connEstFailOffset* is included in *SystemInformationBlockType2-NB*:
 - 4> use *connEstFailOffset* for the parameter *Qoffset_{temp}* for the concerned cell when performing cell selection and reselection according to TS 36.304 [4];
 - 3> else:
 - 4> use value of infinity for the parameter *Qoffset_{temp}* for the concerned cell when performing cell selection and reselection according to TS 36.304 [4];

NOTE 0: For NB-IoT, the number of times that the UE detects T300 expiry on the same cell before applying *connEstFailOffset* and the amount of time that the UE applies *connEstFailOffset* before removing the offset from evaluation of the cell is up to UE implementation.

- 2> else if the UE supports RRC Connection Establishment failure temporary *Qoffset* and T300 has expired a consecutive *connEstFailCount* times on the same cell for which *txFailParams* is included in *SystemInformationBlockType2*:
- 3> for a period as indicated by *connEstFailOffsetValidity*:
 - 4> use *connEstFailOffset* for the parameter *Qoffset_{temp}* for the concerned cell when performing cell selection and reselection according to TS 36.304 [4] and TS 25.304 [40];

NOTE 1: When performing cell selection, if no suitable or acceptable cell can be found, it is up to UE implementation whether to stop using *connEstFailOffset* for the parameter *Qoffset_{temp}* during *connEstFailOffsetValidity* for the concerned cell.

- 2> except for NB-IoT, store the following connection establishment failure information in the *VarConnEstFailReport* by setting its fields as follows:
- 3> clear the information included in *VarConnEstFailReport*, if any;
 - 3> set the *plmn-Identity* to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]) from the PLMN(s) included in the *plmn-IdentityList* in *SystemInformationBlockType1*;
 - 3> set the *failedCellId* to the global cell identity of the cell where connection establishment failure is detected;
 - 3> set the *measResultFailedCell* to include the RSRP and RSRQ, if available, of the cell where connection establishment failure is detected and based on measurements collected up to the moment the UE detected the failure;
 - 3> if available, set the *measResultNeighCells*, in order of decreasing ranking-criterion as used for cell re-selection, to include neighbouring cell measurements for at most the following number of neighbouring

cells: 6 intra-frequency and 3 inter-frequency neighbours per frequency as well as 3 inter-RAT neighbours, per frequency/ set of frequencies (GERAN) per RAT and according to the following:

4> for each neighbour cell included, include the optional fields that are available;

NOTE 2: The UE includes the latest results of the available measurements as used for cell reselection evaluation, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].

3> if available, set the *logMeasResultListWLAN* to include the WLAN measurement results, in order of decreasing RSSI for WLAN APs;

3> if available, set the *logMeasResultListBT* to include the Bluetooth measurement results, in order of decreasing RSSI for Bluetooth beacons;

3> if detailed location information is available, set the content of the *locationInfo* as follows:

4> include the *locationCoordinates*;

4> include the *horizontalVelocity*, if available;

NOTE 3: Which location information related configuration is used by the UE to make the *logMeasResultListWLAN*, *logMeasResultListBT* and *locationInfo* available for inclusion in the *VarConnEstFailReport* is left to UE implementation.

3> set the *numberOfPreamblesSent* to indicate the number of preambles sent by MAC for the failed random access procedure;

3> set *contentionDetected* to indicate whether contention resolution was not successful as specified in TS 36.321 [6] for at least one of the transmitted preambles for the failed random access procedure;

3> set *maxTxPowerReached* to indicate whether or not the maximum power level was used for the last transmitted preamble, see TS 36.321 [6];

2> if in RRC_INACTIVE:

3> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12, with release cause 'RRC Resume failure';

2> else inform upper layers about the failure to establish the RRC connection or failure to resume the RRC connection with suspend indication, upon which the procedure ends;

The UE may discard the connection establishment failure information, i.e. release the UE variable *VarConnEstFailReport*, 48 hours after the failure is detected, upon power off or upon detach.

5.3.3.7 T302, T303, T305, T306, or T308 expiry or stop

If the UE is connected to EPC, the UE shall:

1> if timer T302 expires or is stopped:

2> inform upper layers about barring alleviation for mobile terminating access;

2> if timer T303 is not running:

3> inform upper layers about barring alleviation for mobile originating calls;

2> if timer T305 is not running:

3> inform upper layers about barring alleviation for mobile originating signalling;

2> if timer T306 is not running:

3> inform upper layers about barring alleviation for mobile originating CS fallback;

2> if timer T308 is not running:

3> inform upper layers about barring alleviation for ACDC;

- 1> if timer T303 expires or is stopped:
- 2> if timer T302 is not running:
 - 3> inform upper layers about barring alleviation for mobile originating calls;
- 1> if timer T305 expires or is stopped:
- 2> if timer T302 is not running:
 - 3> inform upper layers about barring alleviation for mobile originating signalling;
- 1> if timer T306 expires or is stopped:
- 2> if timer T302 is not running:
 - 3> inform upper layers about barring alleviation for mobile originating CS fallback;
- 1> if timer T308 expires or is stopped:
- 2> if timer T302 is not running:
 - 3> inform upper layers about barring alleviation for ACDC;

5.3.3.8 Reception of the *RRCCoNNECTIONREJECT* by the UE

The UE shall:

- 1> stop timer T300;
- 1> stop timer T302, if running;
- 1> reset MAC;
- 1> except for NB-IoT, start timer T302, with the timer value set to the *waitTime*;
- 1> if the UE is a NB-IoT UE; or
- 1> if the *extendedWaitTime* is present and the UE supports delay tolerant access:
 - 2> forward the *extendedWaitTime* to upper layers;
- 1> if *deprioritisationReq* is included and the UE supports RRC Connection Reject with deprioritisation:
 - 2> start or restart timer T325 with the timer value set to the *deprioritisationTimer* signalled;
 - 2> store the *deprioritisationReq* until T325 expiry;

NOTE: The UE stores the deprioritisation request irrespective of any cell reselection absolute priority assignments (by dedicated or common signalling) and regardless of RRC connections in E-UTRAN or other RATs unless specified otherwise.

- 1> if the *RRCCoNNECTIONREJECT* is received in response to an *RRCCoNNECTIONRESUMEREQUEST* sent to resume a suspended RRC connection:
 - 2> if the *rrc-SuspendIndication* is not present:
 - 3> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity for all established or suspended RBs;
 - 3> discard the stored UE AS context and *resumeIdentity*;
 - 3> inform upper layers about the failure to resume the RRC connection without suspend indication and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT for mobile originating CS fallback is applicable, upon which the procedure ends;
 - 2> else:

- 3> if the *RRConnectionReject* is received in response to an *RRConnectionResumeRequest* sent after early security reactivation in accordance with conditions in 5.3.3.18:
 - 4> perform the actions as specified in 5.3.3.9a;
- 3> else:
 - 4> suspend SRB1;
- 3> inform upper layers about the failure to resume the RRC connection with suspend indication and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT for mobile originating CS fallback is applicable, upon which the procedure ends;
- 1> else if the *RRConnectionReject* is received in response to an *RRConnectionResumeRequest* sent while in RRC_INACTIVE:
 - 2> release the default MAC configuration;
 - 2> if *RRConnectionReject* is received in response to a request from upper layers:
 - 3> inform the upper layer that access barring is applicable for all access categories except categories '0' and '2';
 - 2> if *RRConnectionReject* is received in response to an *RRConnectionResumeRequest*:
 - 3> if resume is triggered by upper layers:
 - 4> inform upper layers about the failure to resume the RRC connection;
 - 3> if resume is triggered due to an RNA update:
 - 4> set the variable *pendingRnaUpdate* to 'TRUE';
 - 3> discard the current K_{eNB} , K_{RRCenc} key, K_{RRCint} , K_{UPint} key and K_{UPenc} key;
 - 3> suspend SRB1, upon which the procedure ends;
 - 2> The UE shall continue to monitor RAN and CN paging while the timer T302 is running.
- 1> else:
 - 2> release the default MAC configuration;
 - 2> inform upper layers about the failure to establish the RRC connection and that access barring for mobile originating calls, mobile originating signalling, mobile terminating access and except for NB-IoT, for mobile originating CS fallback is applicable, upon which the procedure ends;

5.3.3.9 Abortion of RRC connection establishment

If upper layers abort the RRC connection establishment procedure while the UE has not yet entered RRC_CONNECTED, the UE shall:

- 1> stop timer T300, if running;
- 1> reset MAC, release the MAC configuration and re-establish RLC for all RBs that are established;

5.3.3.9a Abortion of early security reactivation

The UE shall:

- 1> delete the K_{eNB} , K_{RRCint} , K_{RRCenc} and K_{UPenc} keys derived in accordance with 5.3.3.3a;
- 1> re-establish RLC entities for all SRBs and DRBs;
- 1> suspend all SRB(s) and DRB(s) except SRB0;

1> configure lower layers to suspend integrity protection and ciphering.

5.3.3.10 Handling of SSAC related parameters

Upon request from the upper layers, the UE shall:

1> if *SystemInformationBlockType2* includes *ac-BarringPerPLMN-List* and the *ac-BarringPerPLMN-List* contains an *AC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]):

2> select the *AC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers;

2> in the remainder of this procedure, use the selected *AC-BarringPerPLMN* entry (i.e. presence or absence of access barring parameters in this entry) irrespective of the common access barring parameters included in *SystemInformationBlockType2*;

1> else:

2> in the remainder of this procedure use the common access barring parameters (i.e. presence or absence of these parameters) included in *SystemInformationBlockType2*;

1> set the local variables *BarringFactorForMMTEL-Voice* and *BarringTimeForMMTEL-Voice* as follows:

2> if *ssac-BarringForMMTEL-Voice* is present:

3> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and

NOTE: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

3> if, for at least one of these Access Classes, the corresponding bit in the *ac-BarringForSpecialAC* contained in *ssac-BarringForMMTEL-Voice* is set to zero:

4> set *BarringFactorForMMTEL-Voice* to one and *BarringTimeForMMTEL-Voice* to zero;

3> else:

4> set *BarringFactorForMMTEL-Voice* and *BarringTimeForMMTEL-Voice* to the value of *ac-BarringFactor* and *ac-BarringTime* included in *ssac-BarringForMMTEL-Voice*, respectively;

2> else set *BarringFactorForMMTEL-Voice* to one and *BarringTimeForMMTEL-Voice* to zero;

1> set the local variables *BarringFactorForMMTEL-Video* and *BarringTimeForMMTEL-Video* as follows:

2> if *ssac-BarringForMMTEL-Video* is present:

3> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and

3> if, for at least one of these Access Classes, the corresponding bit in the *ac-BarringForSpecialAC* contained in *ssac-BarringForMMTEL-Video* is set to zero:

4> set *BarringFactorForMMTEL-Video* to one and *BarringTimeForMMTEL-Video* to zero;

3> else:

4> set *BarringFactorForMMTEL-Video* and *BarringTimeForMMTEL-Video* to the value of *ac-BarringFactor* and *ac-BarringTime* included in *ssac-BarringForMMTEL-Video*, respectively;

2> else set *BarringFactorForMMTEL-Video* to one and *BarringTimeForMMTEL-Video* to zero;

1> forward the variables *BarringFactorForMMTEL-Voice*, *BarringTimeForMMTEL-Voice*, *BarringFactorForMMTEL-Video* and *BarringTimeForMMTEL-Video* to the upper layers;

5.3.3.11 Access barring check

1> if timer T302 or "Tbarring" is running:

2> consider access to the cell as barred;

1> else if *SystemInformationBlockType2* includes "AC barring parameter":

2> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11], and

NOTE: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

2> for at least one of these valid Access Classes the corresponding bit in the *ac-BarringForSpecialAC* contained in "AC barring parameter" is set to *zero*:

3> consider access to the cell as not barred;

2> else if the establishment of the RRC connection is the result of release with redirect with *mpsPriorityIndication* (either in NR or E-UTRAN); and

2> if the corresponding bit for any of the Access Classes 12, 13 or 14 in the *ac-BarringForSpecialAC* contained in "AC barring parameter" is set to *zero*:

3> consider access to the cell as not barred;

2> else:

3> draw a random number '*rand*' uniformly distributed in the range: $0 \leq \text{rand} < 1$;

3> if '*rand*' is lower than the value indicated by *ac-BarringFactor* included in "AC barring parameter":

4> consider access to the cell as not barred;

3> else:

4> consider access to the cell as barred;

1> else:

2> consider access to the cell as not barred;

1> if access to the cell is barred and both timers T302 and "Tbarring" are not running:

2> draw a random number '*rand*' that is uniformly distributed in the range $0 \leq \text{rand} < 1$;

2> start timer "Tbarring" with the timer value calculated as follows, using the *ac-BarringTime* included in "AC barring parameter":

"Tbarring" = $(0.7 + 0.6 * \text{rand}) * \text{ac-BarringTime}$;

5.3.3.12 EAB check

The UE shall:

1> if *SystemInformationBlockType14* is present:

2> if *eab-PerRSRP* is included:

3> if the *establishmentCause* received from higher layers is set to a value other than *emergency*; and

3> if the UE has no Access Class, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] :

4> if *eab-PerRSRP* is set to *thresh0*:

- 5> consider access to the cell as barred when in enhanced coverage as specified in TS 36.304 [4];
- 4> else if *eab-PerRSRP* is set to *thresh1*:
- 5> if the measured RSRP is less than the first entry in *rsrp-ThresholdsPrachInfoList*:
- 6> consider access to the cell as barred;
- 5> else:
- 6> consider that only the resources indicated for the first CE level are configured;
- 4> else if *eab-PerRSRP* is set to *thresh2*:
- 5> if the measured RSRP is less than the second entry in *rsrp-ThresholdsPrachInfoList*:
- 6> consider access to the cell as barred;
- 5> else:
- 6> consider that only the resources indicated for the first and second CE levels are configured;
- 4> else if *eab-PerRSRP* is set to *thresh3*:
- 5> if the measured RSRP is less than the third entry in *rsrp-ThresholdsPrachInfoList*:
- 6> consider access to the cell as barred;
- 5> else:
- 6> consider that only the resources indicated for the first, second, and third CE levels are configured;
- 2> if access to the cell is not barred due to *eab-PerRSRP* and *eab-Param* is included:
- 3> if the *eab-Common* is included in the *eab-Param*:
- 4> if the UE belongs to the category of UEs as indicated in the *eab-Category* contained in *eab-Common*; and
- 4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *eab-BarringBitmap* contained in *eab-Common* is set to *one*:
- 5> consider access to the cell as barred;
- 4> else:
- 5> consider access to the cell as not barred due to EAB;
- 3> else (the *eab-PerPLMN-List* is included in the *eab-Param*):
- 4> select the entry in the *eab-PerPLMN-List* corresponding to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]);
- 4> if the *eab-Config* for that PLMN is included:
- 5> if the UE belongs to the category of UEs as indicated in the *eab-Category* contained in *eab-Config*; and
- 5> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *eab-BarringBitmap* contained in *eab-Config* is set to *one*:
- 6> consider access to the cell as barred;
- 5> else:
- 6> consider access to the cell as not barred due to EAB;

4> else:
 5> consider access to the cell as not barred due to EAB;

1> else:
 2> consider access to the cell as not barred due to EAB;

5.3.3.13 Access barring check for ACDC

The UE shall:

1> if timer T302 is running:
 2> consider access to the cell as barred;
 1> else if *SystemInformationBlockType2* includes "ACDC barring parameter":
 2> draw a random number '*rand*' uniformly distributed in the range: $0 \leq \text{rand} < 1$;
 2> if '*rand*' is lower than the value indicated by *ac-BarringFactor* included in "ACDC barring parameter":
 3> consider access to the cell as not barred;
 2> else:
 3> consider access to the cell as barred;
 1> else:
 2> consider access to the cell as not barred;
 1> if access to the cell is barred and timer T302 is not running:
 2> draw a random number '*rand*' that is uniformly distributed in the range $0 \leq \text{rand} < 1$;
 2> start timer "Tbarring" with the timer value calculated as follows, using the *ac-BarringTime* included in "ACDC barring parameter":

$$\text{"Tbarring"} = (0.7 + 0.6 * \text{rand}) * \text{ac-BarringTime}.$$

5.3.3.14 Access Barring check for NB-IoT

The UE shall:

1> if the UE is connected to 5GC, *ab-Enabled-5GC* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to TRUE and *SystemInformationBlockType14-NB* is broadcast, or
 1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to TRUE and *SystemInformationBlockType14-NB* is broadcast:
 2> if *ab-PerNRSRP* is included:
 3> if the *establishmentCause* received from higher layers is set to a value other than *mo-ExceptionData*; and
 3> if the UE has no Access Class, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11];
 4> if *ab-PerNRSRP* is set to *thresh1*:
 5> if the measured RSRP is less than the first entry in *rsrp-ThresholdsPrachInfoList*;
 6> consider access to the cell as barred;
 5> else:
 6> consider that only the resources indicated for the first NPRACH repetition level are configured;

- 4> if *ab-PerNRSRP* is set to *thresh2*:
 - 5> if the measured RSRP is less than the second entry in *rsrp-ThresholdsPrachInfoList*;
 - 6> consider access to the cell as barred;
 - 5> else:
 - 6> consider that only the resources indicated for the first and second NPRACH repetition levels are configured;
- 1> if the UE is connected to EPC, *ab-Enabled* included in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *TRUE* and *SystemInformationBlockType14-NB* is broadcast:
 - 2> if access to the cell is not barred due to *ab-PerNRSRP* and *ab-Param* is included:
 - 3> if the *ab-Common* is included in *ab-Param*:
 - 4> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Common*; and
 - 4> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Common* is set to *one*:
 - 5> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Common*:
 - 6> consider access to the cell as not barred;
 - 5> else:
 - 6> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Common* is set to *zero*:
 - NOTE 1: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.
 - 7> consider access to the cell as not barred;
 - 6> else:
 - 7> consider access to the cell as barred;
 - 4> else:
 - 5> consider access to the cell as not barred;
 - 3> else (the *ab-PerPLMN-List* is included in the *ab-Param*):
 - 4> select the *ab-PerPLMN* entry in *ab-PerPLMN-List* corresponding to the PLMN selected by upper layers (see TS 23.122 [11], TS 24.301 [35]);
 - 4> if the *ab-Config* for that PLMN is included:
 - 5> if the UE belongs to the category of UEs as indicated in the *ab-Category* contained in *ab-Config*; and
 - 5> if for the Access Class of the UE, as stored on the USIM and with a value in the range 0..9, the corresponding bit in the *ab-BarringBitmap* contained in *ab-Config* is set to *one*:
 - 6> if the *establishmentCause* received from higher layers is set to *mo-ExceptionData* and *ab-BarringForExceptionData* is set to *FALSE* in the *ab-Config*:
 - 7> consider access to the cell as not barred;

6> else:

7> if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11] and for at least one of these valid Access Classes for the UE, the corresponding bit in the *ab-BarringForSpecialAC* contained in *ab-Config* is set to *zero*:

NOTE 2: ACs 12, 13, 14 are only valid for use in the home country and ACs 11, 15 are only valid for use in the HPLMN/ EHPLMN.

8> consider access to the cell as not barred;

7> else:

8> consider access to the cell as barred;

5> else:

6> consider access to the cell as not barred;

4> else:

5> consider access to the cell as not barred;

1> else:

2> consider access to the cell as not barred;

5.3.3.15 Failure to deliver NAS information in RRCConnectionSetupComplete message

The UE shall:

1> if the UE is a NB-IoT UE and radio link failure occurs before the successful delivery of *RRCConnectionSetupComplete* message has been confirmed by lower layers:

2> inform upper layers about the possible failure to deliver the NAS information contained in the *RRCConnectionSetupComplete* message;

5.3.3.16 Integrity check failure from lower layers while T300 is running

The UE shall:

1> upon receiving integrity check failure indication from lower layers concerning SRB1 or SRB2 while T300 is running and if the UE is resuming the RRC connection after early security reactivation in accordance with conditions in 5.3.3.18:

2> discard the stored UE AS context and *resumeIdentity*;

2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

1> upon receiving integrity check failure indication from lower layers while T300 is running and if the UE is resuming the RRC connection from RRC_INACTIVE:

2> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12, with release cause 'RRC Resume failure';

5.3.3.17 Inability to comply with RRCConnectionResume

The UE shall:

1> if the UE is unable to comply with (part of) the configuration included in the *RRCConnectionResume* message;

2> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12 with release cause 'RRC Resume failure'.

NOTE 1: The UE may apply above failure handling also in case the *RRConnectionResume* message causes a protocol error for which the generic error handling as defined in 5.7 specifies that the UE shall ignore the message.

NOTE 2: If the UE is unable to comply with part of the configuration, it does not apply any part of the configuration, i.e. there is no partial success/failure.

5.3.3.18 Early security reactivation

The UE shall use early security reactivation when resuming a suspended RRC connection and at least one of the following conditions is met:

- the UE is initiating UP-EDT in accordance with conditions in 5.3.3.1b;
- the UE is initiating UP transmission using PUR in accordance with conditions in 5.3.3.1c;
- the UE is resuming a suspended RRC connection in 5GC;
- the UE supports early security reactivation, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *earlySecurityReactivation*, and the UE has a stored value of the *nextHopChainingCount* provided in the *RRConnectionRelease* message with suspend indication during the preceding suspend procedure;

5.3.3.19 Timing alignment validation for transmission using PUR

The UE shall consider the timing alignment value for transmission using PUR to be valid when the following conditions are fulfilled:

- 1> either *pur-TimeAlignmentTimer* is not configured or *pur-TimeAlignmentTimer* is running as confirmed by lower layers; and
- 1> either *pur-RSRP-ChangeThreshold* (*pur-NRSRP-ChangeThreshold* in NB-IoT) is not configured or the following conditions are fulfilled:
 - 2> compared to the stored serving cell reference (N)RSRP value, the serving cell (N)RSRP has not increased by more than *increaseThresh*; and
 - 2> compared to the stored serving cell reference (N)RSRP value, the serving cell (N)RSRP has not decreased by more than *decreaseThresh*;

5.3.3.20 Maintenance of PUR occasions

The UE configured with *pur-Config* shall:

- 1> consider that the first PUR occasion occurs at the H-SFN/SFN/subframe given by:
 - H-SFN = (H-SFN_{Ref} + offset) mod 1024 occurring after FLOOR (offset/1024) H-SFN cycles;
 - SFN and subframe indicated by *startSFN* and *startSubframe*;

where:

 - offset is given by *periodicityAndOffset*;
 - H-SFN_{Ref} corresponds to the last subframe of the first transmission of *RRConnectionRelease* message containing *pur-Config*, taking into account *hsfn-LSB-Info*;
 - H-SFN cycle corresponds to the duration of 1024 H-SFNs;
- 1> if the *pur-NumOccasions* is set to *one*, for the first PUR occasion:
 - 2> if transmission using PUR in accordance with conditions in 5.3.3.1c is not initiated; or
 - 2> if transmission using PUR in accordance with conditions in 5.3.3.1c has been initiated, after the completion of the transmission using PUR:

- 3> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
- 3> release *pur-Config*;
- 3> discard previously stored *pur-Config*;
- 1> else:
 - 2> consider that the subsequent PUR occasions occur periodically after the occurrence of the first PUR occasion at the SFN/subframe indicated by *startSubframe* and *startSFN* and periodicity given by *periodicityAndOffset*;
 - 2> if the *pur-ImplicitReleaseAfter* is configured, for each PUR occasion occurring while the UE is in RRC_IDLE:
 - 3> if transmission using PUR in accordance with conditions in 5.3.3.1c is not initiated; or
 - 3> if PUR failure indication is received from lower layers:
 - 4> consider the PUR occasion as skipped;
 - 4> if *pur-ImplicitReleaseAfter* number of consecutive PUR occasions have been skipped:
 - 5> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
 - 5> release *pur-Config*;
 - 5> discard previously stored *pur-Config*.

5.3.3.21 UE actions upon indication of out-of-date GNSS position

Upon indication that the GNSS position has become out-of-date while in RRC_CONNECTED, the UE shall:

- 1> if the UE does not support performing GNSS position fix in RRC_CONNECTED and *ul-TransmissionExtensionEnabled* is not configured:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';
- 1> else if *ul-TransmissionExtensionEnabled* is configured:
 - 2> if *timeAlignmentTimer* is configured to be *infinity*:
 - 3> start timer T390 with the timer value set to *ul-TransmissionExtensionValue*;
 - 3> restart timer T390 upon indication from lower layers to extend the UL transmission;
 - 2> else:
 - 3> start timer T390 with the timer value set to the remaining time of *timeAlignmentTimer*;
 - 3> restart timer T390 upon indication from lower layers to extend the UL transmission, with the timer value set to the remaining time of *timeAlignmentTimer*;
 - 2> if timer T390 expires and no indication of network triggered GNSS measurement has been received from lower layer:
 - 3> if *gnss-AutonomousEnabled* is configured:
 - 4> perform GNSS measurement using autonomous gaps as specified in clause 5.5.9;
 - 3> else:
 - 4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other'.

- 1> else if *ul-TransmissionExtensionEnabled* is not configured and no indication of network triggered GNSS measurement is received from lower layer:
- 2> if *gnss-AutonomousEnabled* is configured:
 - 3> perform GNSS measurement using autonomous gaps as specified in clause 5.5.9;
- 2> else:
 - 3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other'.

5.3.3.22 Void

5.3.3.23 UE actions upon detecting discontinuous coverage

In discontinuous coverage scenario, upon expiry of *t-Service* or being out of the current serving cell coverage, the UE shall:

- 1> if timer T310 is running:
- 2> stop timer T310, and perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other'.

5.3.4 Initial security activation

5.3.4.1 General

Figure 5.3.4.1-1: Security mode command, successful

Figure 5.3.4.1-2: Security mode command, failure

The purpose of this procedure is to activate AS security upon RRC connection establishment.

5.3.4.2 Initiation

E-UTRAN initiates the security mode command procedure to a UE in RRC_CONNECTED. Moreover, E-UTRAN applies the procedure as follows:

- when only SRB1, or for NB-IoT SRB1 and SRB1bis, is established, i.e. prior to establishment of SRB2 and/or DRBs.

5.3.4.3 Reception of the *SecurityModeCommand* by the UE

The UE shall:

- 1> derive the K_{eNB} key, as specified in TS 33.401 [32] for E-UTRA/EPC, and TS 33.501 [86] for E-UTRA/5GC;
- 1> derive the K_{RRCint} key associated with the *integrityProtAlgorithm* indicated in the *SecurityModeCommand* message, as specified in TS 33.401 [32];
- 1> request lower layers to verify the integrity protection of the *SecurityModeCommand* message, using the algorithm indicated by the *integrityProtAlgorithm* as included in the *SecurityModeCommand* message and the K_{RRCint} key;
- 1> if the *SecurityModeCommand* message passes the integrity protection check:
 - 2> derive the K_{RRCenc} key and the K_{UPenc} key associated with the *cipheringAlgorithm* indicated in the *SecurityModeCommand* message, as specified in TS 33.401 [32];
 - 2> if connected as an RN; or
 - 2> if capable of user plane integrity protection:
 - 3> derive the K_{UPint} key associated with the *integrityProtAlgorithm* indicated in the *SecurityModeCommand* message, as specified in TS 33.401 [32];
 - 2> configure lower layers to apply integrity protection using the indicated algorithm and the K_{RRCint} key immediately, i.e. integrity protection shall be applied to all subsequent messages received and sent by the UE, including the *SecurityModeComplete* message;
 - 2> configure lower layers to apply ciphering using the indicated algorithm, the K_{RRCenc} key and the K_{UPenc} key after completing the procedure, i.e. ciphering shall be applied to all subsequent messages received and sent by the UE, except for the *SecurityModeComplete* message which is sent unciphered;
 - 2> if connected as an RN:
 - 3> configure lower layers to apply integrity protection using the indicated algorithm and the K_{UPint} key, for DRBs that are subsequently configured to apply integrity protection, if any;
 - 2> consider AS security to be activated;
 - 2> upon RRC connection establishment, if UE does not need UL gaps during continuous uplink transmission:
 - 3> configure lower layers to stop using UL gaps during continuous uplink transmission in FDD for *SecurityModeComplete* message and subsequent uplink transmission in RRC_CONNECTED except for UL transmissions as specified in TS 36.211 [21];
 - 2> submit the *SecurityModeComplete* message to lower layers for transmission, upon which the procedure ends;
- 1> else:
 - 2> continue using the configuration used prior to the reception of the *SecurityModeCommand* message, i.e. neither apply integrity protection nor ciphering.
 - 2> submit the *SecurityModeFailure* message to lower layers for transmission, upon which the procedure ends;

5.3.5 RRC connection reconfiguration

5.3.5.1 General

Figure 5.3.5.1-1: RRC connection reconfiguration, successful

Figure 5.3.5.1-2: RRC connection reconfiguration, failure

The purpose of this procedure is to modify an RRC connection, e.g. to establish/ modify/ release RBs, to perform handover, to setup/ modify/ release measurements, to add/ modify/ release SCells, to add/modify/release conditional reconfigurations. As part of the procedure, NAS dedicated information may be transferred from E-UTRAN to the UE.

5.3.5.2 Initiation

E-UTRAN may initiate the RRC connection reconfiguration procedure to a UE in RRC_CONNECTED. E-UTRAN applies the procedure as follows:

- the *mobilityControlInfo* is included only when AS-security has been activated, and SRB2 with at least one DRB are setup and not suspended;
- the establishment of RBs (other than SRB1, that is established during RRC connection establishment) is included only when AS security has been activated;
- the addition of SCells is performed only when AS security has been activated;
- the addition, release or modification of conditional reconfigurations is performed only when AS security has been activated, and SRB2 with at least one DRB are setup and not suspended;

The UE initiates the RRC connection reconfiguration procedure while in RRC_CONNECTED when a conditional reconfiguration (e.g. CHO, CPA, or inter-SN CPC) is executed i.e. upon the fulfilment of an execution condition, an associated *RRConnectionReconfiguration* that is stored is applied.

NOTE: Embedding in an NR Reconfiguration is used for the transfer of IRAT DL DCCH information as used for V2X sidelink communication related information specified by NR RRC e.g. to configure dedicated pool related information, CBR measurements, provision of grant assistance.

5.3.5.3 Reception of an *RRCConnectionReconfiguration* not including the *mobilityControlInfo* by the UE

If the *RRCConnectionReconfiguration* message does not include the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

- 1> if the UE is in (NG)EN-DC and;
- 1> if the *RRCConnectionReconfiguration* does not include the *nr-SecondaryCellGroupConfig*:
- 2> if the *RRCConnectionReconfiguration* includes the *scg-State*:
 - 3> perform SCG deactivation as specified in TS 38.331 [82], clause 5.3.5.13b;
- 2> else:
 - 3> perform SCG activation without SN message as specified in TS 38.331 [82], clause 5.3.5.13b1;
- 1> if the received *RRCConnectionReconfiguration* includes the *daps-SourceRelease*:
 - 2> reset source MCG MAC and release the source MCG MAC configuration;
 - 2> for each DAPS bearer:
 - 3> re-establish the RLC entity or entities for the source PCell;
 - 3> release the RLC entity or entities and the associated DTCH logical channel for the source PCell;
 - 3> reconfigure the PDCP entity to release DAPS, as specified in TS 36.323 [8];
 - 2> for each SRB:
 - 3> release the PDCP entity for the source PCell;
 - 3> release the RLC entity and the associated DCCH logical channel for the source PCell;
 - 2> release the physical channel configuration for the source PCell;
- 1> if this is the first *RRCConnectionReconfiguration* message after successful completion of the RRC connection re-establishment procedure:
 - 2> re-establish PDCP for SRB2 configured with E-UTRA PDCP entity and for all DRBs that are established and configured with E-UTRA PDCP, if any;
 - 2> re-establish RLC for SRB2 and for all DRBs that are established and configured with E-UTRA RLC, if any;
 - 2> if the *RRCConnectionReconfiguration* message includes the *fullConfig*:
 - 3> perform the radio configuration procedure as specified in 5.3.5.8;
 - 2> if the *RRCConnectionReconfiguration* message includes the *radioResourceConfigDedicated*:
 - 3> perform the radio resource configuration procedure as specified in 5.3.10.0;

NOTE 1: Void

NOTE 2: Void

1> else:

- 2> if the *RRCConnectionReconfiguration* message includes the *radioResourceConfigDedicated*:
 - 3> perform the radio resource configuration procedure as specified in 5.3.10.0;

NOTE 3: If the *RRCConnectionReconfiguration* message includes the establishment of radio bearers other than SRB1, the UE may start using these radio bearers immediately, i.e. there is no need to wait for an outstanding acknowledgment of the *SecurityModeComplete* message.

- 1> if the received *RRCConnectionReconfiguration* includes the *sCellToReleaseList*:
 - 2> perform SCell release as specified in 5.3.10.3a;
- 1> if the received *RRCConnectionReconfiguration* includes the *sCellToAddModList*:
 - 2> perform SCell addition or modification as specified in 5.3.10.3b;
- 1> if the received *RRCConnectionReconfiguration* includes the *sCellGroupToReleaseList*:
 - 2> perform SCell group release as specified in 5.3.10.3d;
- 1> if the received *RRCConnectionReconfiguration* includes the *sCellGroupToAddModList*:
 - 2> perform SCell group addition or modification as specified in 5.3.10.3e;
- 1> if the received *RRCConnectionReconfiguration* includes the *scg-Configuration*; or
- 1> if the current UE configuration includes one or more split DRBs configured with *pdcp-Config* and the received *RRCConnectionReconfiguration* includes *radioResourceConfigDedicated* including *drb-ToAddModList*:
 - 2> perform SCG reconfiguration as specified in 5.3.10.10;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-Config* and it is set to *release*: or
- 1> if the received *RRCConnectionReconfiguration* includes *endc-ReleaseAndAdd* and it is set to *TRUE*:
 - 2> perform MR-DC release as specified in TS 38.331 [82], clause 5.3.5.10;
- 1> if the received *RRCConnectionReconfiguration* includes the *sk-Counter*:
 - 2> perform key update procedure as specified in TS 38.331 [82], clause 5.3.5.7;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-SecondaryCellGroupConfig*:
 - 2> perform NR RRC Reconfiguration as specified in TS 38.331 [82], clause 5.3.5.3;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-RadioBearerConfig1*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-RadioBearerConfig2*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
- 1> if this is the first *RRCConnectionReconfiguration* message after successful completion of the RRC connection re-establishment procedure:
 - 2> resume SRB2 and all DRBs that are suspended, if any, including RBs configured with NR PDCP;

NOTE 4: The handling of the radio bearers after the successful completion of the PDCP re-establishment, e.g. the re-transmission of unacknowledged PDCP SDUs (as well as the associated status reporting), the handling of the SN and the HFN, is specified in TS 36.323 [8].

NOTE 5: The UE may discard SRB2 messages and data that it receives prior to completing the reconfiguration used to resume these bearers.

- 1> if the received *RRCConnectionReconfiguration* includes the *systemInformationBlockType1Dedicated*:
 - 2> perform the actions upon reception of the *SystemInformationBlockType1* message as specified in 5.2.2.7;
- 1> if the received *RRCConnectionReconfiguration* includes the *systemInformationBlockType2Dedicated*:
 - 2> perform the actions upon reception of the *SystemInformationBlockType2* message as specified in 5.2.2.9;
- 1> if the received *RRCConnectionReconfiguration* includes the *systemInformationBlockType31Dedicated*:
 - 2> perform the actions upon reception of the *SystemInformationBlockType31* message as specified in 5.2.2.39;

- 1> if the *RRCConnectionReconfiguration* message includes the *dedicatedInfoNASList*:
 - 2> forward each element of the *dedicatedInfoNASList* to upper layers in the same order as listed;
- 1> if the *RRCConnectionReconfiguration* message includes the *measConfig*:
 - 2> perform the measurement configuration procedure as specified in 5.5.2;
- 1> perform the measurement identity autonomous removal as specified in 5.5.2.2a;
- 1> if the *RRCConnectionReconfiguration* message includes the *otherConfig*:
 - 2> perform the other configuration procedure as specified in 5.3.10.9;
- 1> if the received *RRCConnectionReconfiguration* message includes the *obtainLocationNB*:
 - 2> attempt to have detailed location information available for any RLF report;

NOTE 5a1: The UE is requested to attempt to have valid detailed location information available at the time of RLF. The UE may not succeed e.g. because the user manually disabled the GPS hardware, due to no/poor satellite coverage. Further details, e.g. regarding when to activate GNSS, are up to UE implementation.

- 1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:
 - 2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;
- 1> if the *RRCConnectionReconfiguration* message includes the *sl-V2X-ConfigDedicated*:
 - 2> perform the V2X sidelink communication dedicated configuration procedure as specified in 5.3.10.15a;

NOTE 5a: If the *sl-V2X-ConfigDedicated* was received embedded within an NR *RRCReconfiguration* message, the UE does not build an E-UTRA *RRCConnectionReconfigurationComplete* message for the received *sl-V2X-ConfigDedicated*.

- 1> if the *RRCConnectionReconfiguration* message includes the *sl-ConfigDedicatedForNR*:
 - 2> perform the related procedures for NR sidelink communication in accordance with TS 38.331 [82], clause 5.3.5.14 and clause 5.5.2;
- 1> if the *RRCConnectionReconfiguration* message includes *wlan-OffloadInfo*:
 - 2> perform the dedicated WLAN offload configuration procedure as specified in 5.6.12.2;
- 1> if the *RRCConnectionReconfiguration* message includes *rclwi-Configuration*:
 - 2> perform the WLAN traffic steering command procedure as specified in 5.6.16.2;
- 1> if the *RRCConnectionReconfiguration* message includes *lwa-Configuration*:
 - 2> perform the LWA configuration procedure as specified in 5.6.14.2;
- 1> if the *RRCConnectionReconfiguration* message includes *lwip-Configuration*:
 - 2> perform the LWIP reconfiguration procedure as specified in 5.6.17.2;

- 1> upon RRC connection establishment, if UE does not need UL gaps during continuous uplink transmission:
 - 2> configure lower layers to stop using UL gaps during continuous uplink transmission in FDD for *RRCConnectionReconfigurationComplete* message and subsequent uplink transmission in RRC_CONNECTED except for UL transmissions as specified in TS36.211 [21];

- 1> if the *RRCConnectionReconfiguration* message includes the *conditionalReconfiguration*:
 - 2> perform conditional reconfiguration as specified in 5.3.5.9;

NOTE 6: In case of conditional reconfiguration the text "if the received *RRCConnectionReconfiguration* . . ." corresponds to applying the stored *RRCConnectionReconfiguration* message (according to 5.3.5.9.5).

- 1> set the content of *RRCConnectionReconfigurationComplete* message as follows:
 - 2> if the *RRCConnectionReconfiguration* message includes *perCC-GapIndicationRequest*:
 - 3> include *perCC-GapIndicationList* and *numFreqEffective*;
 - 2> if the frequencies are configured for reduced measurement performance:
 - 3> include *numFreqEffectiveReduced*;
 - 2> if the received *RRCConnectionReconfiguration* message included *nr-SecondaryCellGroupConfig*:
 - 3> include *scg-ConfigResponseNR* in accordance with TS 38.331 [82], clause 5.3.5.3;
 - 3> if the *RRCConnectionReconfiguration* message is applied due to a conditional reconfiguration execution and the *RRCConnectionReconfiguration* message does not include the *mobilityControlInfo*:
 - 4> include in *selectedCondReconfigurationToApply* the *condReconfigurationId* of the conditional reconfiguration which has been executed;
 - 1> if the UE is configured to operate in EN-DC as result of this procedure, forward *upperLayerIndication*, as if the UE receives this field from SIB2, to upper layers, otherwise indicate upper layers absence of this field;
 - 1> if the UE is configured with NE-DC:
 - 2> if the received *RRCConnectionReconfiguration* message was included in an NR *RRCResume* message:
 - 3> transfer the *RRCConnectionReconfigurationComplete* message via SRB1 embedded in NR RRC message *RRCResumeComplete* as specified in TS 38.331 [82], clause 5.3.13.4;
 - 2> else:
 - 3> transfer the *RRCConnectionReconfigurationComplete* message via SRB1 embedded in NR RRC message *RRCReconfigurationComplete* as specified in TS 38.331 [82], clause 5.3.5.3;
 - 1> else:
 - 2> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission using the new configuration, upon which the procedure ends;

5.3.5.4 Reception of an *RRCConnectionReconfiguration* including the *mobilityControlInfo* by the UE (handover)

If the *RRCConnectionReconfiguration* message includes the *mobilityControlInfo* and the UE is able to comply with the configuration included in this message, the UE shall:

- 1> if the *RRCConnectionReconfiguration* is applied due to a conditional reconfiguration execution upon cell selection performed while timer T311 was running, as defined in 5.3.7.3:
 - 2> remove all the entries within *VarConditionalReconfiguration*, if any;
- 1> if *daps-HO* is not configured for any DRB:
 - 2> stop timer T310, if running;
 - 2> if timer T316 is running:
 - 3> stop timer T316;
 - 3> clear the information included in *VarRLF-Report*, if any;
 - 2> resume MCG transmission, if suspended;
- 1> stop timer T312, if running;
- 1> stop timer T317, if running;

- 1> start timer T304 with the timer value set to $t304$, as included in the *mobilityControlInfo*;
- 1> stop timer T370, if running;
- 1> if the *carrierFreq* is included:
 - 2> consider the target PCell to be one on the frequency indicated by the *carrierFreq* with a physical cell identity indicated by the *targetPhysCellId*;
- 1> else:
 - 2> consider the target PCell to be one on the frequency of the source PCell with a physical cell identity indicated by the *targetPhysCellId*;
- 1> if T309 is running:
 - 2> stop timer T309 for all access categories;
 - 2> perform the actions as specified in 5.3.16.4.

1> start synchronising to the DL of the target PCell;

NOTE 1: The UE should perform the handover as soon as possible following the reception of the RRC message triggering the handover, which could be before confirming successful reception (HARQ and ARQ) of this message.

- 1> if BL UE or UE in CE:
 - 2> if *sameSFN-Indication* is not present in *mobilityControlInfo*:
 - 3> acquire the *MasterInformationBlock* in the target PCell;
- 1> if *makeBeforeBreak* is configured:
 - 2> perform the remainder of this procedure including and following resetting MAC after the UE has stopped the uplink transmission/downlink reception with the source PCell;

NOTE 1a: It is up to UE implementation when to stop the uplink transmission/ downlink reception with the source PCell to initiate re-tuning for connection to the target cell, as specified in TS 36.133 [16], if *makeBeforeBreak* is configured.

NOTE 1b: It is up to UE implementation when to stop the uplink transmission/ downlink reception with the source SCell(s) after receiving *RRCConnectionReconfiguration* message.

- 1> if *daps-HO* is configured for any DRB:
 - 2> establish a MAC entity for the target PCell, with the same configuration as the MAC entity for the source PCell;
 - 2> for each DRB configured with *daps-HO*:
 - 3> establish the RLC entity or entities and the associated DTCH logical channel for the target PCell, with the same configurations as for the source PCell;
 - 3> reconfigure the PDCP entity to configure DAPS as specified in TS36.323 [8].
 - 2> for each DRB not configured with *daps-HO*:
 - 3> re-establish PDCP;
 - 3> re-establish the RLC entity and associate it, and the associated DTCH logical channel, to the target PCell;
 - 2> for each SRB:
 - 3> establish a PDCP entity for the target PCell, with the same configuration as the PDCP entity for the source PCell;

3> establish an RLC entity and an associated DCCH logical channel for the target PCell, with the same configuration as for the source PCell;

2> suspend the SRBs for the source PCell;

NOTE 1c: In order to understand if a *daps-HO* is configured, the UE needs to check the presence of the field *daps-HO* within the received *RadioResourceConfigDedicated* IE.

NOTE 1d: In DAPS handover, the UE may re-establish PDCP and RLC entity for a DRB not configured with *daps-HO* when MAC successfully completes the random access procedure. In this case, the UE suspends data transmission and reception for all DRBs not configured with *daps-HO* in the source PCell for the duration of the DAPS handover.

1> else (if *daps-HO* is not configured):

2> reset MCG MAC and SCG MAC, if configured;

2> release *uplinkDataCompression*, if configured;

2> re-establish PDCP for all RBs configured with *pdcp-config* that are established;

NOTE 2: The handling of the radio bearers after the successful completion of the PDCP re-establishment, e.g. the re-transmission of unacknowledged PDCP SDUs (as well as the associated status reporting), the handling of the SN and the HFN, is specified in TS 36.323 [8].

NOTE 2a: At handover the *reestablishPDCP* flag will be set for all RBs configured with NR PDCP in *nr-RadioBearerConfig1* or *nr-RadioBearerConfig2* TS 38.331 [82] which will cause the PDCP entity to be re-established also for these RBs.

2> re-establish MCG RLC and SCG RLC, if configured, for all RBs that are established;

1> for each SCell configured for the UE other than the PSCell:

2> if the received *RRCConnectionReconfiguration* message includes *sCellState* for the SCell and indicates *activated*:

3> configure lower layers to consider the SCell to be in activated state;

2> else if the received *RRCConnectionReconfiguration* message includes *sCellState* for the SCell and indicates *dormant*:

3> configure lower layers to consider the SCell to be in dormant state;

2> else:

3> configure lower layers to consider the SCell to be in deactivated state;

1> apply the value of the *newUE-Identity* as the C-RNTI in the target MCG;

1> if the *RRCConnectionReconfiguration* message includes the *fullConfig*:

2> perform the radio configuration procedure as specified in 5.3.5.8;

1> configure lower layers in accordance with the received *radioResourceConfigCommon*;

1> if the received *RRCConnectionReconfiguration* message includes the *rach-Skip*:

2> configure lower layers to apply the *rach-Skip* for the target MCG, as specified in TS 36.213 [23] and 36.321 [6];

1> if UE supports timing advance reporting and the received *radioResourceConfigCommon* includes the *ta-Report*:

2> instruct the associated MAC entity to trigger Timing Advance reporting;

1> configure lower layers in accordance with any additional fields, not covered in the previous, if included in the received *mobilityControlInfo*;

- 1> if the received *RRCConnectionReconfiguration* includes the *sCellToReleaseList*:
 - 2> perform SCell release as specified in 5.3.10.3a;
 - 1> if the received *RRCConnectionReconfiguration* includes the *sCellGroupToReleaseList*:
 - 2> perform SCell group release as specified in 5.3.10.3d;
 - 1> if the received *RRCConnectionReconfiguration* includes the *scg-Configuration*; or
 - 1> if the current UE configuration includes one or more split DRBs and the received *RRCConnectionReconfiguration* includes *radioResourceConfigDedicated* including *drb-ToAddModList*:
 - 2> perform SCG reconfiguration as specified in 5.3.10.10;
 - 1> if the *RRCConnectionReconfiguration* message includes the *radioResourceConfigDedicated*:
 - 2> perform the radio resource configuration procedure as specified in 5.3.10.0;
 - 1> if the *securityConfigHO* (without suffix) is included in the *RRCConnectionReconfiguration*:
 - 2> if the *keyChangeIndicator* received in the *securityConfigHO* is set to *TRUE*:
 - 3> update the K_{eNB} key based on the K_{ASME} key taken into use with the latest successful NAS SMC procedure, as specified in TS 33.401 [32];
 - 2> else:
 - 3> update the K_{eNB} key based on the current K_{eNB} or the NH, using the *nextHopChainingCount* value indicated in the *securityConfigHO*, as specified in TS 33.401 [32];
- NOTE 2b: If the UE needs to update the S- K_{eNB} key as specified in 5.3.10.10, the UE updates the S- K_{eNB} after updating the K_{eNB} key.
- 2> store the *nextHopChainingCount* value;
 - 2> if the *securityAlgorithmConfig* is included in the *securityConfigHO*:
 - 3> derive the K_{RRCint} key associated with the *integrityProtAlgorithm*, as specified in TS 33.401 [32];
 - 3> if connected as an RN; or
 - 3> if capable of user plane integrity protection:
 - 4> derive the K_{UPint} key associated with the *integrityProtAlgorithm*, as specified in TS 33.401 [32];
 - 3> derive the K_{RRCenc} key and the K_{UPenc} key associated with the *cipheringAlgorithm*, as specified in TS 33.401 [32];
 - 2> else:
 - 3> derive the K_{RRCint} key associated with the current integrity algorithm, as specified in TS 33.401 [32];
 - 3> if connected as an RN; or
 - 3> if capable of user plane integrity protection:
 - 4> derive the K_{UPint} key associated with the current integrity algorithm, as specified in TS 33.401 [32];
 - 3> derive the K_{RRCenc} key and the K_{UPenc} key associated with the current ciphering algorithm, as specified in TS 33.401 [32];
 - 2> configure lower layers to apply the integrity protection algorithm and the K_{RRCint} key, i.e. the integrity protection configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;

2> configure lower layers to apply the ciphering algorithm, the K_{RRCenc} key and the K_{UPenc} key, i.e. the ciphering configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;

NOTE 2c: For a DRB configured for DAPS HO, the new ciphering algorithm and the K_{UPenc} key is applied for traffic exchange between the UE and the target MCG while the old ciphering algorithm and K_{UPenc} key is applied for traffic exchange between the UE and the source MCG.

1> else if the *securityConfigHO-v1530* is included in the *RRConnectionReconfiguration*:

2> if the *nas-Container* is received:

3> forward the *nas-Container* to upper layers;

2> if the *keyChangeIndicator-r15* is received and is set to *TRUE*:

3> update the K_{eNB} key based on the K_{AMF} key, as specified in TS 33.501 [86];

2> else:

3> update the K_{eNB} key based on the current K_{eNB} or the NH, using the received *nextHopChainingCount-r15*, as specified in TS 33.501 [86];

2> store the *nextHopChainingCount-r15* value;

2> if the *securityAlgorithmConfig-r15* is received:

3> derive the K_{RRCint} key associated with the *integrityProtAlgorithm*, as specified in TS 33.401 [32];

3> derive the K_{RRCenc} key and the K_{UPenc} key associated with the *cipheringAlgorithm*, as specified in TS 33.401 [32];

2> else:

3> derive the K_{RRCint} key associated with the current integrity algorithm, as specified in TS 33.401 [32];

3> derive the K_{RRCenc} key and the K_{UPenc} key associated with the current ciphering algorithm, as specified in TS 33.401 [32];

1> if the received *RRConnectionReconfiguration* includes the *nr-Config* and it is set to *release*; or

1> if the received *RRConnectionReconfiguration* includes *endc-ReleaseAndAdd* and it is set to *TRUE*:

2> perform MR-DC release as specified in TS 38.331 [82], clause 5.3.5.10;

1> if the received *RRConnectionReconfiguration* includes the *sk-Counter*:

2> perform key update procedure as specified in TS 38.331 [82], clause 5.3.5.7;

1> if the received *RRConnectionReconfiguration* includes the *nr-SecondaryCellGroupConfig*:

2> perform NR RRC Reconfiguration as specified in TS 38.331 [82], clause 5.3.5.3.

1> if the received *RRConnectionReconfiguration* includes the *nr-RadioBearerConfig1*:

2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;

1> if the received *RRConnectionReconfiguration* includes the *nr-RadioBearerConfig2*:

2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6.

1> if connected as an RN:

2> configure lower layers to apply the integrity protection algorithm and the K_{UPint} key, for current or subsequently established DRBs that are configured to apply integrity protection, if any;

1> if the received *RRConnectionReconfiguration* includes the *sCellToAddModList*:

- 2> perform SCell addition or modification as specified in 5.3.10.3b;
- 1> if the received *RRCConnectionReconfiguration* includes the *sCellGroupToAddModList*:
 - 2> perform SCell group addition or modification as specified in 5.3.10.3e;
- 1> if the received *RRCConnectionReconfiguration* includes the *systemInformationBlockType1Dedicated*:
 - 2> perform the actions upon reception of the *SystemInformationBlockType1* message as specified in 5.2.2.7;
- 1> if the received *RRCConnectionReconfiguration* includes the *systemInformationBlockType31Dedicated*:
 - 2> perform the actions upon reception of the *SystemInformationBlockType31* message as specified in 5.2.2.39;
- 1> perform the measurement related actions as specified in 5.5.6.1;
- 1> if the *RRCConnectionReconfiguration* message includes the *measConfig*:
 - 2> perform the measurement configuration procedure as specified in 5.5.2;
- 1> perform the measurement identity autonomous removal as specified in 5.5.2.2a;
- 1> release *reportProximityConfig* and clear any associated proximity status reporting timer;
- 1> if the *RRCConnectionReconfiguration* message includes the *otherConfig*:
 - 2> perform the other configuration procedure as specified in 5.3.10.9;
- 1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig* or *sl-CommConfig*:
 - 2> perform the sidelink dedicated configuration procedure as specified in 5.3.10.15;
- 1> if the *RRCConnectionReconfiguration* message includes *wlan-OffloadInfo*:
 - 2> perform the dedicated WLAN offload configuration procedure as specified in 5.6.12.2;
- 1> if *handoverWithoutWT-Change* is not configured:
 - 2> release the LWA configuration, if configured, as described in 5.6.14.3;
- 1> release the LWIP configuration, if configured, as described in 5.6.17.3;
- 1> if the *RRCConnectionReconfiguration* message includes *rclwi-Configuration*:
 - 2> perform the WLAN traffic steering command procedure as specified in 5.6.16.2;
- 1> if the *RRCConnectionReconfiguration* message includes *lwa-Configuration*:
 - 2> perform the LWA configuration procedure as specified in 5.6.14.2;
- 1> if the *RRCConnectionReconfiguration* message includes *lwip-Configuration*:
 - 2> perform the LWIP reconfiguration procedure as specified in 5.6.17.2;
- 1> if the *RRCConnectionReconfiguration* message includes the *sl-V2X-ConfigDedicated* or *mobilityControlInfoV2X*:
 - 2> perform the V2X sidelink communication dedicated configuration procedure as specified in 5.3.10.15a;

NOTE 2d: In case of conditional reconfiguration the text "if the received *RRCConnectionReconfiguration* . . ." corresponds to applying the stored *RRCConnectionReconfiguration* message (according to 5.3.5.9.5).

- 1> if the UE is configured to operate in EN-DC as result of this procedure, forward *upperLayerIndication*, as if the UE receives this field from SIB2, to upper layers, otherwise indicate upper layers absence of this field;
- 1> set the content of *RRCConnectionReconfigurationComplete* message as follows:
 - 2> if the UE has radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:

- 3> include *rlf-InfoAvailable*;
- 2> if the UE has MBSFN logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport* and if T330 is not running:
 - 3> include *logMeasAvailableMBSFN*;
 - 2> else if the UE has logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 3> include the *logMeasAvailable*;
 - 3> if Bluetooth measurement results are included in the logged measurements the UE has available:
 - 4> include *logMeasAvailableBT*;
 - 3> if WLAN measurement results are included in the logged measurements the UE has available:
 - 4> include *logMeasAvailableWLAN*;
 - 2> if the UE has connection establishment failure information available in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 3> include *connEstFailInfoAvailable*;
 - 2> if the *RRCConnectionReconfiguration* message includes *perCC-GapIndicationRequest*:
 - 3> include *perCC-GapIndicationList* and *numFreqEffective*;
 - 2> if the frequencies are configured for reduced measurement performance:
 - 3> include *numFreqEffectiveReduced*;
 - 2> if the UE has flight path information available:
 - 3> include *flightPathInfoAvailable*;
 - 2> if the received *RRCConnectionReconfiguration* message included *nr-SecondaryCellGroupConfig*:
 - 3> include *scg-ConfigResponseNR* in accordance with TS 38.331 [82], clause 5.3.5.3;
 - 2> if the target cell is an NTN cell:
 - 3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;
 - 3> if the *RRCConnectionReconfiguration* message includes *gnss-PositionFixDurationReporting*:
 - 4> include *gnss-PositionFixDuration* in accordance with the time duration required for the UE to acquire a GNSS position;
 - 1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission;
 - 1> if MAC successfully completes the random access procedure; or
 - 1> if MAC indicates the successful reception of a PDCCH transmission addressed to C-RNTI and if *rach-Skip* is configured:
 - 2> stop timer T304;
 - 2> if *daps-HO* is configured for any DRB:
 - 3> stop timer T310 for the source PCell, if running;
 - 3> for each DAPS bearer trigger UL data switching, as specified in TS 36.323 [8];
 - 2> release *rach-Skip*;

- 2> apply the parts of the CQI reporting configuration, the scheduling request configuration and the sounding RS configuration that do not require the UE to know the SFN of the target PCell, if any;
- 2> apply the parts of the measurement and the radio resource configuration that require the UE to know the SFN of the target PCell (e.g. measurement gaps, periodic CQI reporting, scheduling request configuration, sounding RS configuration), if any, upon acquiring the SFN of the target PCell;

NOTE 3: Whenever the UE shall setup or reconfigure a configuration in accordance with a field that is received it applies the new configuration, except for the cases addressed by the above statements.

- 2> if the UE is configured to provide IDC indications:
 - 3> if the UE has initiated the transmission of an *InDeviceCoexIndication* message during the last 1 second preceding reception of the *RRConnectionReconfiguration* message including *mobilityControlInfo*; or
 - 3> if the *RRConnectionReconfiguration* message is applied due to a conditional reconfiguration execution and the UE has initiated transmission of an *InDeviceCoexIndication* message since it was configured to do so in accordance with 5.6.9.2:
 - 4> initiate transmission of the *InDeviceCoexIndication* message in accordance with 5.6.9.3;
- 2> if the UE is configured to provide power preference indications, overheating assistance information, SPS assistance information, delay budget report or maximum bandwidth preference indications:
 - 3> if the UE has initiated the transmission of a *UEAssistanceInformation* message during the last 1 second preceding reception of the *RRConnectionReconfiguration* message including *mobilityControlInfo*; or
 - 3> if the *RRConnectionReconfiguration* message is applied due to a conditional reconfiguration execution, and the UE has initiated transmission of a *UEAssistanceInformation* message for the corresponding cell group since it was configured to do so in accordance with 5.6.10.2:
 - 4> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 2> if *SystemInformationBlockType15* is broadcast by the PCell:
 - 3> if the UE has initiated the transmission of a *MBMSInterestIndication* message during the last 1 second preceding reception of the *RRConnectionReconfiguration* message including *mobilityControlInfo*; or
 - 3> if the *RRConnectionReconfiguration* message is applied due to a conditional reconfiguration execution and the UE supports MBMS reception and the UE has initiated transmission of an *MBMSInterestIndication* message since it was configured to do so in accordance with 5.8.5.2:
 - 4> ensure having a valid version of *SystemInformationBlockType15* for the PCell;
 - 4> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;
 - 4> determine the set of MBMS services of interest in accordance with 5.8.5.3a;
 - 4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;
- 2> if *SystemInformationBlockType18* is broadcast by the target PCell; and the UE initiated the transmission of a *SidelinkUEInformation* message indicating a change of sidelink communication related parameters relevant in target PCell (i.e. change of *commRxInterestedFreq* or *commTxResourceReq*, *commTxResourceReqUC* if *SystemInformationBlockType18* includes *commTxResourceUC-ReqAllowed* or *commTxResourceInfoReqRelay* if PCell broadcasts *SystemInformationBlockType19* including *discConfigRelay*) during the last 1 second preceding reception of the *RRConnectionReconfiguration* message including *mobilityControlInfo*; or
- 2> if *SystemInformationBlockType19* is broadcast by the target PCell; and the UE initiated the transmission of a *SidelinkUEInformation* message indicating a change of sidelink discovery related parameters relevant in target PCell (i.e. change of *discRxInterest* or *discTxResourceReq*, *discTxResourceReqPS* if *SystemInformationBlockType19* includes *discConfigPS* or *discRxGapReq* or *discTxGapReq* if the UE is configured with *gapRequestsAllowedDedicated* set to *true* or if the UE is not configured with *gapRequestsAllowedDedicated* and *SystemInformationBlockType19* includes *gapRequestsAllowedCommon*) during the last 1 second preceding reception of the *RRConnectionReconfiguration* message including *mobilityControlInfo*; or

- 2> if *SystemInformationBlockType21* is broadcast by the target PCell; and the UE initiated the transmission of a *SidelinkUEInformation* message indicating a change of V2X sidelink communication related parameters relevant in target PCell (i.e. change of *v2x-CommRxInterestedFreqList* or *v2x-CommTxResourceReq*) during the last 1 second preceding reception of the *RRCConnectionReconfiguration* message including *mobilityControlInfo*; or
- 2> if the *RRCConnectionReconfiguration* message is applied due to a conditional reconfiguration execution, and at least one of *SystemInformationBlockType18*, *SystemInformationBlockType19*, and *SystemInformationBlockType21* is broadcast by the target PCell, and the UE has initiated transmission of a *SidelinkUEInformation* message since it was configured to do so in accordance with 5.10.2.2:
 - 3> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;
 - 2> remove all the entries within *VarConditionalReconfiguration*, if any;
 - 2> for each *measId*, if the associated *reportConfig* is *condReconfigurationTriggerEUTRA*:
 - 3> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;
 - 3> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;
 - 3> if the *measObjectId* is only included in a *MeasIdToAddMod*:
 - 4> remove the entry with the matching *measObjectId* from the *measObjectIdList* within the *VarMeasConfig*;
 - 2> the procedure ends;

NOTE 4: The UE is not required to determine the SFN of the target PCell by acquiring system information from that cell before performing RACH access in the target PCell, except for BL UEs or UEs in CE when *sameSFN-Indication* is not present in *mobilityControlInfo*.

5.3.5.5 Reconfiguration failure

The UE shall:

- 1> if the UE is unable to comply with (part of) the configuration included in the *RRCConnectionReconfiguration* message or if the upper layers indicate that the *nas-Container* is invalid:
 - 2> continue using the configuration used prior to the reception of *RRCConnectionReconfiguration* message;
 - 2> if the UE is in NE-DC:
 - 3> perform the actions as specified in TS 38.331 [82], clause 5.3.7;
 - 2> else if security has not been activated:
 - 3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause other;
 - 2> else:
 - 3> initiate the connection re-establishment procedure as specified in 5.3.7, upon which the connection reconfiguration procedure ends;

NOTE 1: The UE may apply above failure handling also in case the *RRCConnectionReconfiguration* message causes a protocol error for which the generic error handling as defined in 5.7 specifies that the UE shall ignore the message.

NOTE 2: If the UE is unable to comply with part of the configuration, it does not apply any part of the configuration, i.e. there is no partial success/ failure.

NOTE 3: The compliance also covers the NR configuration carried within octet strings e.g. field *nr-SecondaryCellGroupConfig*. I.e. the failure behaviour defined also applies in case the UE cannot comply with the NR configuration or with the combination of (parts of) the LTE and NR configurations.

NOTE 4: The compliance also covers the NR sidelink configuration carried within an octet string, e.g. field *sl-ConfigDedicatedNR*, i.e. the failure behaviour defined also applies in case the UE cannot comply with the embedded NR sidelink configuration.

5.3.5.6 T304 expiry (handover failure)

If T304 expires (handover failure), the UE shall:

NOTE 1: Following T304 expiry any dedicated preamble, if provided within the *rach-ConfigDedicated*, is not available for use by the UE anymore.

1> if no DAPS bearer is configured; or

1> if any DAPS bearer is configured and radio link failure has been detected for the source MCG in accordance with 5.3.11.3:

2> if *attemptCondReconf* is not configured:

3> revert back to the configuration used in the source PCell, excluding the configuration configured by the *physicalConfigDedicated*, the *mac-MainConfig* and the *sps-Config*;

2> else:

3> revert back to the configuration used in the source PCell;

NOTE 1a: In the context above, "the configuration" includes state variables and parameters of each radio bearer. PDCP entities associated with RLC UM and SRB bearers are reset after the successful RRC connection re-establishment procedure according to clause 5.2 in TS 36.323 [8]. In the above, "the configuration" includes the RB configuration using NR PDCP, if configured (i.e. by *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2*).

2> store the following handover failure information in *VarRLF-Report* by setting its fields as follows:

3> clear the information included in *VarRLF-Report*, if any;

3> set the *plmn-IdentityList* to include the list of EPLMN stored by the UE (i.e. includes the RPLMN);

3> set the *measResultLastServCell* to include the RSRP and RSRQ, if available, of the source PCell based on measurements collected up to the moment the UE detected handover failure and in accordance with the following;

4> if the UE includes *rsrqResult*, include the *lastServCellRSRQ-Type*;

3> set the *measResultNeighCells* to include the best measured cells, other than the source PCell, ordered such that the best cell is listed first, and based on measurements collected up to the moment the UE detected handover failure, and set its fields as follows;

4> if the UE was configured to perform measurements for one or more EUTRA frequencies, include the *measResultListEUTRA*;

4> if the UE includes *rsrqResult*, include the *rsrq-Type*;

4> if the UE was configured to perform measurement reporting for one or more neighbouring UTRA frequencies, include the *measResultListUTRA*;

4> if the UE was configured to perform measurement reporting for one or more neighbouring GERAN frequencies, include the *measResultListGERAN*;

4> if the UE was configured to perform measurement reporting for one or more neighbouring CDMA2000 frequencies, include the *measResultsCDMA2000*;

4> if the UE was configured to perform measurement reporting, not related to NR sidelink communication, for one or more neighbouring NR frequencies, include the *measResultListNR*;

4> for each neighbour cell included, include the optional fields that are available;

NOTE 2: The measured quantities are filtered by the L3 filter as configured in the mobility measurement configuration. The measurements are based on the time domain measurement resource restriction, if configured. Exclude-listed cells are not required to be reported.

- 3> if available, set the *logMeasResultListWLAN* to include the WLAN measurement results, in order of decreasing RSSI for WLAN APs;
- 3> if available, set the *logMeasResultListBT* to include the Bluetooth measurement results, in order of decreasing RSSI for Bluetooth beacons;
- 3> if detailed location information is available, set the content of the *locationInfo* as follows:
 - 4> include the *locationCoordinates*;
 - 4> include the *horizontalVelocity*, if available;
- 3> if last *RRConnectionReconfiguration* message including *mobilityControlInfo* concerned a failed intra-RAT handover (E-UTRA to E-UTRA):
 - 4> set the *failedPCellId* to the global cell identity, if available, and otherwise to the physical cell identity and carrier frequency of the target PCell of the failed handover;
 - 4> include *previousPCellId* and set it to the global cell identity of the PCell where the last *RRConnectionReconfiguration* message including *mobilityControlInfo* was received;
 - 4> set the *timeConnFailure* to the elapsed time since reception of the last *RRConnectionReconfiguration* message including the *mobilityControlInfo*;
- 3> else if last *MobilityFromEUTRACmd* concerned a failed inter-RAT handover from E-UTRA to NR:
 - 4> set the *failedNR-PCellId* to the global cell identity and tracking area code, if available, and otherwise to the physical cell identity and carrier frequency of the target PCell of the failed handover;
 - 4> include *previousPCellId* and set it to the global cell identity of the PCell where the last *MobilityFromEUTRACmd* message was received;
 - 4> set the *timeConnFailure* to the elapsed time since reception of the last *MobilityFromEUTRACmd* message;
- 3> set the *connectionFailureType* to 'hof';
- 3> set the *c-RNTI* to the C-RNTI used in the source PCell;
- 2> initiate the connection re-establishment procedure as specified in 5.3.7, upon which the RRC connection reconfiguration procedure ends;
- 1> else (any DAPS bearer is configured and radio link failure has not been detected for the source MCG):
 - 2> release the MAC entity for the target PCell;
 - 2> for each DAPS bearer:
 - 3> re-establish the RLC entity for the target PCell;
 - 3> release the RLC entity or entities and the associated DTCH logical channel for the target PCell;
 - 3> reconfigure the PDCP entity to release DAPS as specified in TS 36.323 [8];
 - 2> for each non-DAPS bearer:
 - 3> revert back to the configuration used for the DRB in the source PCell, including PDCP and RLC states and the security configuration;
 - 2> for each SRB:
 - 3> discard any PDCP SDUs along with the PDCP data PDUs for the source PCell;

- 3> re-establish the RLC entity for the source PCell;
- 3> release the PDCP entity for the target PCell;
- 3> release the RLC entity and the associated DCCH logical channel for the target PCell;
- 2> release the physical channel configuration for the target PCell;
- 2> resume the SRBs for the source PCell;
- 2> initiate the failure information procedure as specified in 5.6.21 to report a DAPS HO failure.

The UE may discard the handover failure information, i.e. release the UE variable *VarRLF-Report*, 48 hours after the failure is detected, upon power off or upon detach.

NOTE 3: E-UTRAN may retrieve the handover failure information using the UE information procedure with *rlf-ReportReq* set to *true*, as specified in 5.6.5.3.

5.3.5.7 Void

5.3.5.7a T307 expiry (SCG change failure)

The UE shall:

- 1> if T307 expires:
 - NOTE 1: Following T307 expiry any dedicated preamble, if provided within the *rach-ConfigDedicatedSCG*, is not available for use by the UE anymore.
 - 2> if the UE is configured with DC; or
 - 2> if the UE is configured with NE-DC and MCG transmission is not suspended:
 - 3> initiate the SCG failure information procedure as specified in 5.6.13 to report SCG change failure;
 - 2> else:
 - 3> initiate the connection re-establishment procedure as specified in TS 38.331 [82] 5.3.7;

5.3.5.8 Radio Configuration involving full configuration option

The UE shall:

- 1> if the UE is connected to EPC:
 - 2> release/ clear all current dedicated radio configurations except for the following:
 - the MCG C-RNTI,
 - the MCG security configuration,
 - the PDCP, RLC, logical channel configurations for the RBs,
 - the logged measurement configuration;
 - the *serviceType*;
- 1> else if the UE is connected to 5GC:
 - 2> release/ clear all current dedicated radio configurations except for the following:
 - the MCG C-RNTI,
 - the MCG security configuration,
 - the configurations (SDAP if configured, PDCP, RLC and logical channel) for the RBs;

- the logged measurement configuration;

NOTE 1: Radio configuration is not just the resource configuration but includes other configurations like *MeasConfig* and *OtherConfig*. In case (NG)EN-DC is configured, this also includes the entire NR SCG configuration. Such NR SCG configuration does not include the DRB configuration as configured by *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2*).

1> if the *RRConnectionReconfiguration* message includes the *measConfigAppLayer* set to *setup* and the *measConfigAppLayer* includes the *serviceType* stored in the current UE configuration:

2> discard the *measConfigAppLayer*;

2> consider the *measConfigAppLayer* as not received;

1> else if a *serviceType* is stored in the current UE configuration:

2> release the stored *serviceType*;

2> inform upper layers to clear the stored application layer measurement configuration;

2> discard received application layer measurement report information from upper layers;

2> consider itself not to be configured to send application layer measurement report;

1> if the *RRConnectionReconfiguration* message includes the *mobilityControlInfo*:

2> release/ clear all current common radio configurations;

2> use the default values specified in 9.2.5 for timer T310, T311 and constant N310, N311;

1> else:

2> use values for timers T301, T310, T311 and constants N310, N311, as included in *ue-TimersAndConstants* received in *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT);

1> apply the default physical channel configuration as specified in 9.2.4;

1> apply the default semi-persistent scheduling configuration as specified in 9.2.3;

1> apply the default MAC main configuration as specified in 9.2.2;

1> if the UE is a NB-IoT UE; or

1> for each *srB-Identity* value included in the *srB-ToAddModList* (SRB reconfiguration):

2> apply the specified configuration defined in 9.1.2 for the corresponding SRB;

2> apply the corresponding default RLC configuration for the SRB specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;

2> apply the corresponding default logical channel configuration for the SRB as specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;

2> if the corresponding SRB was configured with NR PDCP and the UE is connected to EPC:

3> release the NR PDCP entity and establish it with an E-UTRA PDCP entity and with the current (MCG) security configuration;

NOTE 1a: The UE applies the LTE ciphering and integrity protection algorithms that are equivalent to the previously configured NR security algorithms.

3> associate the RLC bearer of this SRB with the established PDCP entity;

NOTE 2: This is to get the SRBs (SRB1 and SRB2 for handover and SRB2 for reconfiguration after reestablishment) to a known state from which the reconfiguration message can do further configuration.

2> else if the UE is connected to 5GC:

- 3> apply the corresponding default PDCP configuration for the SRB as specified in TS 38.331 [82], clause 9.2.1;
- 1> for each *srb-Identity* value which was configured in the *srb-ToAddModListExt* but is not added in the RRC message configuring the full configuration:
 - 2> release the RLC entity or entities;
 - 2> release the DCCH logical channel;
 - 2> release the PDCP entity;
- 1> if the UE is connected to EPC:
 - 2> for each *eps-BearerIdentity* value included in the *drb-ToAddModList* or *nr-RadioBearerConfig1* or *nr-RadioBearerConfig2* that is part of the current E-UTRA and NR UE configuration:
 - 3> release the E-UTRA or NR PDCP entity;
 - 3> release the RLC entity or entities;
 - 3> release the DTCH logical channel;
 - 3> release the *drb-identity*;
- NOTE 3: This will retain the *eps-bearerIdentity* but remove the DRBs including *drb-identity* of these bearers from the current UE configuration and trigger the setup of the DRBs within the AS in clause 5.3.10.3 using the new configuration. The *eps-bearerIdentity* acts as the anchor for associating the released and re-setup DRB. In the AS the DRB re-setup is equivalent with a new DRB setup (including new PDCP and logical channel configurations).
- 2> for each *eps-BearerIdentity* value that is part of the current E-UTRA and NR UE configuration but not added with same *eps-BearerIdentity* in *drb-ToAddModList* nor in *nr-RadioBearerConfig1* nor in *nr-RadioBearerConfig2*:
 - 3> perform DRB release as specified in 5.3.10.2;
- 1> if the UE is connected to 5GC:
 - 2> except for NB-IoT:
 - 3> for each *pdu-Session* that is part of the current NR UE configuration:
 - 4> release the SDAP entity (clause 5.1.2 in TS 37.324 [97]);
 - 4> release the NR PDCP entity for each DRB associated to the *pdu-Session*;
 - 4> release the RLC entity or entities for each DRB associated to the *pdu-Session*;
 - 4> release the DTCH logical channel for each DRB associated to the *pdu-Session*;
 - 4> release the *drb-identity* for each DRB associated to the *pdu-Session*;
- NOTE 4: This will retain the *pdu-Session* but remove the DRBs including *drb-identity* of these bearers from the current NR UE configuration and trigger the setup of the DRBs within the AS in clause 5.3.10.3 using the new configuration. The *pdu-Session* acts as the anchor for associating the released and re-setup DRB. In the AS the DRB re-setup is equivalent with a new DRB setup (including new PDCP and logical channel configurations).
- 3> for each *pdu-Session* that is part of the current NR UE configuration but not added with same *pdu-Session* in *nr-RadioBearerConfig1* nor in *nr-RadioBearerConfig2*:
 - 4> if the procedure was triggered due to handover:
 - 5> indicate the release of the user plane resources for the *pdu-Session* to upper layers after successful handover;

- 4> else:
 - 5> indicate the release of the user plane resources for the *pdu-Session* to upper layers immediately;
- 2> for NB-IoT UE:
 - 3> for each *pdu-Session* that is part of the current UE configuration:
 - 4> release the PDCP entity for the DRB associated to the *pdu-Session*;
 - 4> release the RLC entity for the DRB associated to the *pdu-Session*;
 - 4> release the DTCH logical channel for the DRB associated to the *pdu-Session*;
 - 4> release the *drb-identity* for the DRB associated to the *pdu-Session*;
 - 3> for each *pdu-Session* that is part of the current UE configuration but not added with same *pdu-Session* in *drb-ToAddModList*:
 - 4> indicate the release of the user plane resources for the *pdu-Session* to upper layers;

5.3.5.9 Conditional reconfiguration

5.3.5.9.1 General

The network configures the UE with conditional reconfiguration (i.e. conditional handover, conditional PSCell addition, or inter-SN conditional PSCell change) including per candidate target cell an *RRCConnectionReconfiguration* to be stored and to be applied upon the fulfilment of an associated execution condition.

The UE shall:

- 1> if the received *conditionalReconfiguration* includes the *condReconfigurationToRemoveList*:
 - 2> perform the conditional reconfiguration removal procedure as specified in 5.3.5.9.2;
- 1> if the received *conditionalReconfiguration* includes the *condReconfigurationToAddModList*:
 - 2> perform the conditional reconfiguration addition/modification procedure as specified in 5.3.5.9.3;

5.3.5.9.2 Conditional reconfiguration removal

The UE shall:

- 1> for each *CondReconfigurationId* included in the *condReconfigurationToRemoveList* that is part of the current UE configuration in *VarConditionalReconfiguration*:
 - 2> remove the entry with the matching *condReconfigurationId* from the *condReconfigurationList* within the *VarConditionalReconfiguration*.

NOTE: The UE does not consider the message as erroneous if the *condReconfigurationToRemoveList* includes any *CondReconfigurationId* value that is not part of the current UE configuration.

5.3.5.9.3 Conditional reconfiguration addition/modification

The UE shall:

- 1> for each *condReconfigurationId* included in the *condReconfigurationToAddModList*:
 - 2> if an entry with the matching *condReconfigurationId* exists in the *condReconfigurationList* within the *VarConditionalReconfiguration*:
 - 3> if the entry in *condReconfigurationToAddModList* includes a *triggerCondition* or *triggerConditionSN*:
 - 4> replace *triggerCondition* or *triggerConditionSN* within the *VarConditionalReconfiguration* with the value received for this *condReconfigurationId*

- 3> if the entry in *condReconfigurationToAddModList* includes an *condReconfigurationToApply*;
- 4> replace *condReconfigurationToApply* within the *VarConditionalReconfiguration* with the value received for this *condReconfigurationId*;
- 2> else:
 - 3> add a new entry for this *condReconfigurationId* within the *VarConditionalReconfiguration*;
 - 3> store the associated *RRCConnectionReconfiguration* in *VarConditionalReconfiguration*.

5.3.5.9.4 Conditional reconfiguration evaluation

If AS security has been activated successfully, the UE shall:

- 1> if *VarConditionalReconfiguration* includes at least one *condReconfigurationId*:
- 2> perform conditional reconfiguration evaluation;
- 1> for each *condReconfigurationId* within the *VarConditionalReconfiguration*:
 - 2> if the *RRCConnectionReconfiguration* within *condReconfigurationToApply* includes the *MobilityControlInfo*:
 - 3> consider the cell which has a physical cell identity matching the value indicated in the *MobilityControlInfo* within *condReconfigurationToApply* to be an applicable cell;
 - 2> else if the *RRCConnectionReconfiguration* within *condReconfigurationToApply* includes the *nr-SecondaryCellGroupConfig*:
 - 3> consider the cell which has a physical cell identity matching the value indicated in the *nr-SecondaryCellGroupConfig* within the received *condReconfigurationToApply* to be an applicable cell;
 - 2> if *triggerConditionSN* is configured (in case of SN initiated inter-SN CPC for EN-DC):
 - 3> perform the conditional reconfiguration evaluation as specified in TS 38.331 [82], clause 5.3.5.13.4a;
 - 3> the procedure ends;
 - 2> for each *measId* included in the *measIdList* within *VarMeasConfig* indicated in the *triggerCondition* associated to *condReconfigurationId*:
 - 3> if the *condEventId* is associated with *condEventD1* or *condEventD2*, and if the entry conditions applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, are fulfilled for the applicable cell during the corresponding *timeToTrigger* defined for this event within the *VarConditionalReconfig*; or
 - 3> if the *condEventId* is associated with *condEventT1*, and if the entry condition applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, is fulfilled for the applicable cell; or
 - 3> if the *condEventId* is associated with *condEventA3*, *condEventA4*, *condEventA5* or *condEventB1*, and if the entry condition(s) applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, or the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerNR* within *VarConditionalReconfiguration*, is fulfilled for the applicable cell for all measurements after layer 3 filtering taken during the corresponding *timeToTrigger* defined for this event within the *VarConditionalReconfiguration*:
 - 4> consider the entry condition for the associated *measId* within *triggerCondition* as fulfilled;
 - 3> if the *measId* for this event associated with the *condReconfigurationId* has been modified; or
 - 3> if the *condEventId* is associated with *condEventD1* or *condEventD2*, and if the leaving condition(s) applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the

- condEventId* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, is fulfilled for the applicable cell during the corresponding *timeToTrigger* defined for this event within the *VarConditionalReconfig*; or
- 3> if the *condEventId* is associated with *condEventT1*, and if the leaving condition applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, is fulfilled for the applicable cell; or
 - 3> if the *condEventId* is associated with *condEventA3*, *condEventA4*, *condEventA5* or *condEventB1*, and if the leaving condition(s) applicable for this event associated with the *condReconfigurationId*, i.e. the event corresponding with the *condEventId(s)* of the corresponding *condReconfigurationTriggerEUTRA* within *VarConditionalReconfiguration*, or the event corresponding with the *condEventId* of the corresponding *condReconfigurationTriggerNR* within *VarConditionalReconfiguration*, is fulfilled for the applicable cells for all measurements after layer 3 filtering taken during the corresponding *timeToTrigger* defined for this event within the *VarConditionalReconfiguration*:
 - 4> consider the event associated to that *measId* to be not fulfilled;
- 2> if trigger conditions for all associated *measId(s)* within *triggerCondition* are fulfilled:
- 3> consider the target cell candidate within the stored *condReconfigurationToApply*, associated to that *condReconfigurationId*, as a triggered cell;
 - 3> initiate the conditional reconfiguration execution, as specified in 5.3.5.9.5;

5.3.5.9.5 Conditional reconfiguration execution

The UE shall:

- 1> if more than one triggered cell exists:
- 2> select one of the triggered cells as the selected cell for conditional reconfiguration;
- 1> else:
- 2> consider the triggered cell as the selected cell for conditional reconfiguration;
- 1> for the selected cell of conditional reconfiguration:
- 2> apply the stored *condReconfigurationToApply* associated to that *condReconfigurationId* and perform the actions as specified in 5.3.5.4, or perform the actions as specified in 5.3.5.3;

5.3.5.9.6 VarConditionalReconfiguration remove

The UE shall:

- 1> remove all the entries within *VarConditionalReconfiguration*;
- 1> for each *measId*, that is part of the current UE configuration in *VarMeasConfig*, if the associated *reportConfig* has *condReconfigurationTriggerEUTRA/condReconfigurationTriggerNR* configured:
 - 2> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;
 - 2> if the associated *measObjectId* is only associated with *condReconfigurationTriggerEUTRA/condReconfigurationTriggerNR*:
 - 3> remove the entry with the matching *measObjectId* from the *measObjectList* within the *VarMeasConfig*;
 - 2> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;

5.3.5.9.7 VarConditionalReconfiguration CPC remove

The UE shall:

1> remove all the entries within *VarConditionalReconfiguration* for which the *RRConnectionReconfiguration* within *condReconfigurationToApply* does not include the *MobilityControlInfo*.

5.3.6 Counter check

5.3.6.1 General

Figure 5.3.6.1-1: Counter check procedure

The counter check procedure is used by E-UTRAN to request the UE to verify the amount of data sent/ received on each DRB. More specifically, the UE is requested to check if, for each DRB, the most significant bits of the COUNT match with the values indicated by E-UTRAN.

NOTE: The procedure enables E-UTRAN to detect packet insertion by an intruder (a 'man in the middle').

5.3.6.2 Initiation

E-UTRAN initiates the procedure by sending a *CounterCheck* message.

NOTE: E-UTRAN may initiate the procedure when any of the COUNT values reaches a specific value.

5.3.6.3 Reception of the *CounterCheck* message by the UE

Upon receiving the *CounterCheck* message, the UE shall:

- 1> for each DRB that is established:
 - 2> if no COUNT exists for a given direction (uplink or downlink) because it is a uni-directional bearer configured only for the other direction:
 - 3> assume the COUNT value to be 0 for the unused direction;
 - 2> if the *drb-Identity* is not included in the *drb-CountMSB-InfoList*:
 - 3> if the DRB is configured with E-UTRA PDCP:
 - 4> include the DRB in the *drb-CountInfoList* in the *CounterCheckResponse* message by including the *drb-Identity*, the *count-Uplink* and the *count-Downlink* set to the value of the corresponding COUNT;
 - 3> else if the DRB is configured with NR PDCP:
 - 4> include the DRB in the *drb-CountInfoList* in the *CounterCheckResponse* message by including the *drb-Identity*, the *count-Uplink* and the *count-Downlink* set to the value of TX_NEXT – 1 and RX_NEXT – 1 (specified in TS 38.323 [83]), respectively;
 - 2> else if, for at least one direction, the most significant bits of the COUNT are different from the value indicated in the *drb-CountMSB-InfoList*:
 - 3> if the DRB is configured with E-UTRA PDCP:

- 4> include the DRB in the *drb-CountInfoList* in the *CounterCheckResponse* message by including the *drb-Identity*, the *count-Uplink* and the *count-Downlink* set to the value of the corresponding COUNT;
- 3> else if the DRB is configured with NR PDCP:
- 4> include the DRB in the *drb-CountInfoList* in the *CounterCheckResponse* message by including the *drb-Identity*, the *count-Uplink* and the *count-Downlink* set to the value of TX_NEXT – 1 and RX_NEXT – 1 (specified in TS 38.323 [83]), respectively;
- 1> for each DRB that is included in the *drb-CountMSB-InfoList* in the *CounterCheck* message that is not established:
- 2> include the DRB in the *drb-CountInfoList* in the *CounterCheckResponse* message by including the *drb-Identity*, the *count-Uplink* and the *count-Downlink* with the most significant bits set identical to the corresponding values in the *drb-CountMSB-InfoList* and the least significant bits set to zero;
- 1> submit the *CounterCheckResponse* message to lower layers for transmission upon which the procedure ends;

5.3.7 RRC connection re-establishment

5.3.7.1 General

Figure 5.3.7.1-1: RRC connection re-establishment, successful

Figure 5.3.7.1-2: RRC connection re-establishment, failure

The purpose of this procedure is to re-establish the RRC connection, which involves the resumption of SRB1 (SRB1bis for a NB-IoT UE for which AS security has not been activated) operation, the re-activation of security (except for a NB-IoT UE for which AS security has not been activated) and the configuration of only the PCell.

Except for a NB-IoT UE for which AS security has not been activated, a UE in RRC_CONNECTED, for which security has been activated, may initiate the procedure in order to continue the RRC connection. The connection re-establishment succeeds only if the concerned cell is prepared i.e. has a valid UE context. In case E-UTRAN accepts the re-establishment, SRB1 operation resumes while the operation of other radio bearers remains suspended. If AS security has not been activated, the UE does not initiate the procedure but instead moves to RRC_IDLE directly.

When AS security has not been activated, a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS/5GS optimisation in RRC_CONNECTED may initiate the procedure in order to continue the RRC connection.

E-UTRAN applies the procedure as follows:

- When AS security has been activated:
 - to reconfigure SRB1 and to resume data transfer only for this RB;
 - to re-activate AS security without changing algorithms.
- For a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS/5GS optimisation, when AS security has not been activated:
 - to re-establish SRB1bis and to continue data transfer for this RB.

5.3.7.1a Condition for re-establishing RRC Connection in NTN

If *systemInformationBlockType31* (*systemInformationBlockType31-NB* in NB-IoT) is broadcast, a RRC connection re-establishment is initiated only if the UE has a valid GNSS position.

NOTE: The UE may need to re-acquire the GNSS position before re-establishing the connection to avoid interruption during the connection.

5.3.7.2 Initiation

The UE shall only initiate the procedure either when AS security has been activated or for a NB-IoT UE supporting RRC connection re-establishment for the Control Plane CIoT EPS/5GS optimisation. The UE initiates the procedure when one of the following conditions is met:

- 1> upon detecting radio link failure and T316 is not configured, in accordance with 5.3.11; or
- 1> upon detecting radio link failure of the MCG while SCG transmission is suspended, in accordance with 5.3.11; or
- 1> upon detecting radio link failure of the MCG while NR PSCell change or PSCell addition is ongoing, in accordance with 5.3.11; or
- 1> upon handover failure, in accordance with 5.3.5.6; or
- 1> upon mobility from E-UTRA failure, in accordance with 5.4.3.5; or
- 1> except when resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18, upon integrity check failure indication from lower layers concerning SRB1 or SRB2; or
- 1> upon an RRC connection reconfiguration failure, in accordance with 5.3.5.5; or
- 1> upon an RRC connection reconfiguration failure, in accordance with TS38.331 [82], clause 5.3.5.8; or
- 1> upon detecting radio link failure for the SCG while MCG transmission is suspended, in accordance with TS 38.331 [82] clause 5.3.10.3 in (NG)EN-DC; or
- 1> upon SCG change failure while MCG transmission is suspended, in accordance with TS 38.331 [82] clause 5.3.5.8.3 in (NG)EN-DC; or
- 1> upon SCG configuration failure while MCG transmission is suspended in accordance with clause TS 38.331 [82] clause 5.3.5.8.2 in (NG)EN-DC; or
- 1> upon integrity check failure indication from SCG lower layers concerning SRB3 while MCG transmission is suspended; or
- 1> upon T316 expiry, in accordance with clause 5.6.26.5.

NOTE: When resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18, integrity check failure indication from lower layers is handled in accordance with clause 5.3.3.16.

Upon initiation of the procedure, the UE shall:

- 1> stop timer T310, if running;
- 1> stop timer T312, if running;
- 1> stop timer T313, if running;
- 1> stop timer T316, if running;
- 1> stop timer T307, if running;
- 1> start timer T311;
- 1> stop timer T370, if running;
- 1> if the UE is not configured with *attemptCondReconf*.
 - 2> release *uplinkDataCompression*, if configured;
 - 2> suspend all RBs, including RBs configured with NR PDCP, except SRB0;
 - 2> reset MAC;
 - 2> release the MCG SCell(s), if configured, in accordance with 5.3.10.3a;
 - 2> release the SCell group(s), if configured, in accordance with 5.3.10.3d;
 - 2> apply the default physical channel configuration as specified in 9.2.4;
 - 2> except for NB-IoT, for the MCG, apply the default semi-persistent scheduling configuration as specified in 9.2.3;
 - 2> for NB-IoT, release *schedulingRequestConfig*, if configured;
 - 2> for NB-IoT, release *obtainLocationNB*, if configured;
 - 2> for the MCG, apply the default MAC main configuration as specified in 9.2.2;
 - 2> release *powerPrefIndicationConfig*, if configured and stop timer T340, if running;
 - 2> release *reportProximityConfig*, if configured and clear any associated proximity status reporting timer;
 - 2> release *obtainLocationConfig*, if configured;
 - 2> release *idc-Config*, if configured;
 - 2> release *sps-AssistanceInfoReport*, if configured;
 - 2> release *scg-DeactivationPreferenceConfig*, if configured and stop timer T346, if running;
 - 2> release *measSubframePatternPCell*, if configured;
 - 2> release the entire SCG configuration, if configured, except for the DRB configuration (as configured by *drb-ToAddModListSCG*);
 - 2> if (NG)EN-DC is configured:
 - 3> perform MR-DC release, as specified in TS 38.331[82], clause 5.3.5.10;
 - 3> release *p-MaxEUTRA*, if configured;
 - 3> release *p-MaxUE-FR1*, if configured;
 - 3> release *tdm-PatternConfig* or *tdm-PatternConfig2*, if configured;

- 2> release *naics-Info* for the PCell, if configured;
- 2> if connected as an RN and configured with an RN subframe configuration:
 - 3> release the RN subframe configuration;
 - 2> release the LWA configuration, if configured, as described in 5.6.14.3;
 - 2> release the LWIP configuration, if configured, as described in 5.6.17.3;
 - 2> release *delayBudgetReportingConfig*, if configured and stop timer T342, if running;
 - 2> release *bw-PreferenceIndicationTimer*, if configured and stop timer T341, if running;
 - 2> release *overheatingAssistanceConfig* and *overheatingAssistanceConfigForSCG*, if configured and stop timer T345, if running;
 - 2> release *ailc-BitConfig*, if configured;
 - 2> if the UE has a stored *pur-Config* and the cell is different from the cell where *pur-Config* was provided:
 - 3> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;
 - 3> release *pur-Config*;
 - 3> discard previously stored *pur-Config*.
- 1> if any DAPS bearer is configured:
 - 2> release the MAC entity for the source PCell;
 - 2> for each DAPS bearer:
 - 3> re-establish the RLC entity for the source PCell;
 - 3> release the RLC entity and the associated DTCH logical channel for the source PCell;
 - 3> reconfigure the PDCP entity to release DAPS, as specified in TS 36.323 [8];
 - 2> for each SRB:
 - 3> release the PDCP entity for the source PCell;
 - 3> release the RLC entity and the associated DCCH logical channel for the source PCell;
 - 2> release the physical channel configuration for the source PCell;
- 1> perform cell selection in accordance with the cell selection process as specified in TS 36.304 [4];

5.3.7.3 Actions following cell selection while T311 is running

Upon selecting a suitable E-UTRA cell, the UE shall:

- 1> if T309 is running:
 - 2> stop timer T309 for all access categories;
 - 2> perform the actions as specified in 5.3.16.4.
- 1> if the UE is connected to 5GC and the selected cell is only connected to EPC; or
- 1> if the UE is connected to EPC and the selected cell is only connected to 5GC:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';
- 1> else:

- 2> stop timer T311;
- 2> if the cell selection is triggered by detecting radio link failure of the MCG or handover failure (including intra-E-UTRA handover and mobility from E-UTRA); and
- 2> if *attemptCondReconf* is configured; and
- 2> if the selected cell is not configured with *condEventT1*, or the selected cell is configured with *condEventT1* and leaving condition has not been fulfilled; and
- 2> if the selected cell is one of the target candidate cells in *VarConditionalReconfiguration*:
- 3> apply the stored *condReconfigurationToApply* of the selected cell and perform the actions as specified in 5.3.5.4;
- 2> else:
 - 3> if the UE is configured with *attemptCondReconf*:
 - 4> release *uplinkDataCompression*, if configured;
 - 4> suspend all RBs, including RBs configured with NR PDCP, except SRB0;
 - 4> reset MAC;
 - 4> release the MCG SCell(s), if configured, in accordance with 5.3.10.3a;
 - 4> release the SCell group(s), if configured, in accordance with 5.3.10.3d;
 - 4> apply the default physical channel configuration as specified in 9.2.4;
 - 4> for the MCG, apply the default semi-persistent scheduling configuration as specified in 9.2.3;
 - 4> for the MCG, apply the default MAC main configuration as specified in 9.2.2;
 - 4> release *powerPrefIndicationConfig*, if configured and stop timer T340, if running;
 - 4> release *reportProximityConfig*, if configured and clear any associated proximity status reporting timer;
 - 4> release *obtainLocationConfig*, if configured;
 - 4> release *idc-Config*, if configured;
 - 4> release *sps-AssistanceInfoReport*, if configured;
 - 4> release *scg-DeactivationPreferenceConfig*, if configured and stop timer T346, if running;
 - 4> release *measSubframePatternPCell*, if configured;
 - 4> release the entire SCG configuration, if configured, except for the DRB configuration (as configured by *drb-ToAddModListSCG*);
 - 4> if (NG)EN-DC is configured:
 - 5> perform MR-DC release, as specified in TS 38.331[82], clause 5.3.5.10;
 - 5> release *p-MaxEUTRA*, if configured;
 - 5> release *p-MaxUE-FRI*, if configured;
 - 5> release *tdm-PatternConfig* or *tdm-PatternConfig2*, if configured;
 - 4> release *naics-Info* for the PCell, if configured;
 - 4> if connected as an RN and configured with an RN subframe configuration:
 - 5> release the RN subframe configuration;
 - 4> release the LWA configuration, if configured, as described in 5.6.14.3;

- 4> release the LWIP configuration, if configured, as described in 5.6.17.3;
- 4> release *delayBudgetReportingConfig*, if configured and stop timer T342, if running;
- 4> release *bw-PreferenceIndicationTimer*, if configured and stop timer T341, if running;
- 4> release *overheatingAssistanceConfig* and *overheatingAssistanceConfigForSCG*, if configured and stop timer T345, if running;
- 4> release *ailc-BitConfig*, if configured;
- 3> remove all the entries within *VarConditionalReconfiguration*, if any;
- 3> for each *measId*, that is part of the current UE configuration in *VarMeasConfig*, if the associated *reportConfig* has *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR* configured:
 - 4> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;
 - 4> if the associated *measObjectId* is only associated with *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR*:
 - 5> remove the entry with the matching *measObjectId* from the *measObjectList* within the *VarMeasConfig*;
 - 4> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;
- 3> start timer T301;
- 3> apply the *timeAlignmentTimerCommon* included in *SystemInformationBlockType2*;
- 3> if UE supports timing advance reporting and *ta-Report* is included in *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT):
 - 4> instruct the associated MAC entity to trigger Timing Advance reporting;
- 3> if the UE is a NB-IoT UE connected to EPC, the UE supports RRC connection re-establishment for the Control Plane CIoT EPS optimisation and AS security has not been activated; and
- 3> if *cp-reestablishment* is not included in *SystemInformationBlockType2-NB*:
 - 4> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';
- 3> else:
 - 4> initiate transmission of the *RRCCConnectionReestablishmentRequest* message in accordance with 5.3.7.4;

NOTE: This procedure applies also if the UE returns to the source PCell.

Upon selecting an inter-RAT cell, the UE shall:

- 1> if the selected cell is a UTRA cell, and if the UE supports Radio Link Failure Report for Inter-RAT MRO, include *selectedUTRA-CellId* in the *VarRLF-Report* and set it to the physical cell identity and carrier frequency of the selected UTRA cell;
- 1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.7.4 Actions related to transmission of *RRCCConnectionReestablishmentRequest* message

If the procedure was initiated due to radio link failure or handover failure, the UE shall:

- 1> set the *reestablishmentCellId* in the *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT) to the global cell identity of the selected cell;

The UE shall set the contents of *RRCConnectionReestablishmentRequest* message as follows:

- 1> except for a NB-IoT UE for which AS security has not been activated, set the *ue-Identity* as follows:
 - 2> set the *c-RNTI* to the C-RNTI used in the source PCell (handover and mobility from E-UTRA failure) or used in the PCell in which the trigger for the re-establishment occurred (other cases);
 - 2> set the *physCellId* to the physical cell identity of the source PCell (handover and mobility from E-UTRA failure) or of the PCell in which the trigger for the re-establishment occurred (other cases);
 - 2> set the *shortMAC-I* to the 16 least significant bits of the MAC-I calculated:
 - 3> over the ASN.1 encoded as per clause 8 (i.e., a multiple of 8 bits) *VarShortMAC-Input* (or *VarShortMAC-Input-NB* in NB-IoT);
 - 3> with the K_{RRCint} key and integrity protection algorithm that was used in the source PCell (handover and mobility from E-UTRA failure) or of the PCell in which the trigger for the re-establishment occurred (other cases); and
 - 3> with all input bits for COUNT, BEARER and DIRECTION set to binary ones;
- 1> for a NB-IoT UE for which AS security has not been activated, set the *ue-Identity* as follows:
 - 2> request upper layers for calculated ul-NAS-MAC and ul-NAS-Count using the *cellIdentity* indicated in *SystemInformationBlockType1-NB* of the current cell;
 - 2> if the UE is connected to 5GC:
 - 3> set the *truncated5G-S-TMSI* to the truncated 5G-S-TMSI provided by higher layers;
 - 2> else:
 - 3> set the *s-TMSI* to the S-TMSI provided by upper layers;
 - 2> set the *ul-NAS-MAC* to the ul-NAS-MAC value provided by upper layers;
 - 2> set the *ul-NAS-Count* to the ul-NAS-Count value provided by upper layers;
- 1> set the *reestablishmentCause* as follows:
 - 2> if the re-establishment procedure was initiated due to reconfiguration failure as specified in 5.3.5.5 (the UE is unable to comply with the reconfiguration):
 - 3> set the *reestablishmentCause* to the value *reconfigurationFailure*;
 - 2> else if the re-establishment procedure was initiated due to handover failure as specified in 5.3.5.6 (intra-LTE handover failure) or 5.4.3.5 (inter-RAT mobility from EUTRA failure):
 - 3> set the *reestablishmentCause* to the value *handoverFailure*;
 - 2> else:
 - 3> set the *reestablishmentCause* to the value *otherFailure*;
- 1> if the UE is a NB-IoT UE:
 - 2> if the UE supports DL channel quality reporting in MSG3 and *cqi-Reporting* is present in *SystemInformationBlockType2-NB*:
 - 3> set the *cqi-NPDCCH* to include the latest results of the downlink channel quality measurements of the carrier where the random access response is received as specified in TS 36.133 [16];

NOTE: The downlink channel quality measurements use measurement period T1 or T2, as defined in TS 36.133 [16].

2> if the UE is connected to EPC, set *earlyContentionResolution* to TRUE;

The UE shall submit the *RRCConnectionReestablishmentRequest* message to lower layers for transmission.

5.3.7.5 Reception of the *RRCConnectionReestablishment* by the UE

NOTE 1: Prior to this, lower layer signalling is used to allocate a C-RNTI. For further details see TS 36.321 [6];

The UE shall:

1> stop timer T301;

1> consider the current cell to be the PCell;

1> except for a NB-IoT UE for which AS security has not been activated:

2> if SRB1 was configured with NR PDCP and the UE is connected to EPC:

3> for SRB1, release the NR PDCP entity and establish an E-UTRA PDCP entity with the current (MCG) security configuration;

NOTE 1a: The UE applies the LTE ciphering and integrity protection algorithms that are equivalent to the previously configured NR security algorithms.

2> else:

3> for SRB1, re-establish the PDCP entity;

2> re-establish RLC for SRB1;

2> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10.0;

2> resume SRB1;

NOTE 2: E-UTRAN should not transmit any message on SRB1 prior to receiving the *RRCConnectionReestablishmentComplete* message.

2> if UE is connected to EPC, update the K_{eNB} key based on the K_{ASME} key to which the current K_{eNB} is associated, using the *nextHopChainingCount* value indicated in the *RRCConnectionReestablishment* message, as specified in TS 33.401 [32];

2> else if UE is connected to 5GC, update the K_{eNB} key based on the K_{AMF} key to which the current K_{eNB} is associated, using the *nextHopChainingCount* value indicated in the *RRCConnectionReestablishment* message, as specified in TS 33.501 [86];

2> store the *nextHopChainingCount* value;

2> derive the K_{RRCint} key associated with the previously configured integrity algorithm, as specified in TS 33.401 [32];

2> derive the K_{RRCenc} key and the K_{UPenc} key associated with the previously configured ciphering algorithm, as specified in TS 33.401 [32];

2> if connected as an RN; or

2> if capable of user plane integrity protection:

3> derive the K_{UPint} key associated with the previously configured integrity algorithm, as specified in TS 33.401 [32];

2> configure lower layers to activate integrity protection using the previously configured algorithm and the K_{RRCint} key immediately, i.e., integrity protection shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;

2> if connected as an RN:

- 3> configure lower layers to apply integrity protection using the previously configured algorithm and the K_{UPint} key, for subsequently resumed or subsequently established DRBs that are configured to apply integrity protection, if any;
 - 2> configure lower layers to apply ciphering using the previously configured algorithm, the K_{RRCenc} key and the K_{UPenc} key immediately, i.e., ciphering shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
 - 2> if the UE is not a NB-IoT UE:
 - 3> set the content of *RRConnectionReestablishmentComplete* message as follows:
 - 4> if the UE has radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 5> include the *rlf-InfoAvailable*;
 - 4> if the UE has MBSFN logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport* and if T330 is not running:
 - 5> include *logMeasAvailableMBSFN*;
 - 4> else if the UE has logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 5> include the *logMeasAvailable*;
 - 5> if Bluetooth measurement results are included in the logged measurements the UE has available:
 - 6> include the *logMeasAvailableBT*;
 - 5> if WLAN measurement results are included in the logged measurements the UE has available:
 - 6> include the *logMeasAvailableWLAN*;
 - 4> if the UE has connection establishment failure information available in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 5> include the *connEstFailInfoAvailable*;
 - 4> if the UE has flight path information available:
 - 5> include *flightPathInfoAvailable*;
 - 3> perform the measurement related actions as specified in 5.5.6.1;
 - 3> perform the measurement identity autonomous removal as specified in 5.5.2.2a;
 - 2> else:
 - 3> if the UE supports serving cell idle mode measurements reporting and *servingCellMeasInfo* is present in *SystemInformationBlockType2-NB*:
 - 4> set the *measResultServCell* to include the measurements of the serving cell;
- NOTE 2a: The UE includes the latest results of the serving cell measurements as used for cell selection/ reselection evaluation, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].
- 3> if the UE is connected to EPC:
 - 4> if the UE has radio link failure information available in *VarRLF-Report-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report-NB*:
 - 5> include the *rlf-InfoAvailable*;

- 4> if the UE has ANR measurements information available in *VarANR-MeasurementReport-NB* and if the RPLMN is included in *plmn-IdentityList* stored in *VarANR-MeasurementReport-NB*:
 - 5> include the *anr-InfoAvailable*;
- 2> if the UE is connected to NTN:
 - 3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;
 - 3> if UE supports GNSS position fix in RRC_CONNECTED and *gnss-PositionFixDurationReporting* is present in *SystemInformationBlockType2(-NB)*:
 - 4> include *gnss-PositionFixDuration* in accordance with the time duration required for the UE to acquire a GNSS position;
 - 2> submit the *RRCConnectionReestablishmentComplete* message to lower layers for transmission;
 - 2> if *SystemInformationBlockType15* is broadcast by the PCell:
 - 3> if the UE has transmitted an *MBMSInterestIndication* message during the last 1 second preceding detection of radio link failure:
 - 4> ensure having a valid version of *SystemInformationBlockType15* for the PCell;
 - 4> determine the set of MBMS frequencies of interest in accordance with 5.8.5.3;
 - 4> determine the set of MBMS services of interest in accordance with 5.8.5.3a;
 - 4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;
 - 2> if *SystemInformationBlockType18* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message indicating a change of sidelink communication related parameters relevant in PCell (i.e. change of *commRxInterestedFreq* or *commTxResourceReq*, *commTxResourceReqUC* if *SystemInformationBlockType18* includes *commTxResourceUC-ReqAllowed* or *commTxResourceInfoReqRelay* if PCell broadcasts *SystemInformationBlockType19* including *discConfigRelay*) during the last 1 second preceding detection of radio link failure; or
 - 2> if *SystemInformationBlockType19* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message indicating a change of sidelink discovery related parameters relevant in PCell (i.e. change of *discRxInterest* or *discTxResourceReq*, *discTxResourceReqPS* if *SystemInformationBlockType19* includes *discConfigPS* or *discRxGapReq* or *discTxGapReq* if the UE is configured with *gapRequestsAllowedDedicated* set to *true* or if the UE is not configured with *gapRequestsAllowedDedicated* and *SystemInformationBlockType19* includes *gapRequestsAllowedCommon*) during the last 1 second preceding detection of radio link failure; or
 - 2> if *SystemInformationBlockType21* including *sl-V2X-ConfigCommon* is broadcast by the PCell; and the UE transmitted a *SidelinkUEInformation* message indicating a change of V2X sidelink communication related parameters relevant in PCell (i.e. change of *v2x-CommRxInterestedFreqList* or *v2x-CommTxResourceReq*) during the last 1 second preceding detection of radio link failure:
 - 3> initiate transmission of the *SidelinkUEInformation* message in accordance with 5.10.2.3;
 - 1> for a NB-IoT UE for which AS security has not been activated:
 - 2> validate *dl-NAS-MAC*, as specified in TS 33.401 [32];
 - 2> if *dl-NAS-MAC* check fails:
 - 3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure', upon which the procedure ends;
 - 2> except for a UE that only supports the Control Plane CIoT EPS/5GS optimisation:
 - 3> re-establish PDCP for SRB1;
 - 3> re-establish RLC for SRB1;

- 2> re-establish RLC for SRB1bis;
- 2> perform the radio resource configuration procedure in accordance with the received *radioResourceConfigDedicated* and as specified in 5.3.10.0;
- 2> except for a UE that only supports the Control Plane CIoT EPS/5GS optimisation:
 - 3> resume SRB1;
 - 2> resume SRB1bis;

NOTE 3: E-UTRAN should not transmit any message on SRB1bis prior to receiving the *RRConnectionReestablishmentComplete* message.

- 2> if the UE supports serving cell idle mode measurements reporting and *servingCellMeasInfo* is present in *SystemInformationBlockType2-NB*:
 - 3> set the *measResultServCell* to include the measurements of the serving cell;

NOTE 4: The UE includes the latest results of the serving cell measurements as used for cell selection/ reselection evaluation, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].

- 2> if the UE is connected to NTN:
 - 3> include *gnss-validityDuration* in accordance with the remaining time of the GNSS validity duration;
 - 3> if UE supports GNSS position fix in RRC_CONNECTED and *gnss-PositionFixDurationReporting* is present in *SystemInformationBlockType2(-NB)*:
 - 4> include *gnss-PositionFixDuration* in accordance with the time duration required for the UE to acquire a GNSS position;
- 2> submit the *RRConnectionReestablishmentComplete* message to lower layers for transmission;

1> for NB-IoT:

- 2> if the UE supports connected mode measurements and *connMeasConfig* is present in *SystemInformationBlockType3-NB*:
 - 3> perform measurements as specified in 5.5.8.

1> the procedure ends;

5.3.7.6 T311 expiry

Upon T311 expiry, the UE shall:

- 1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.7.7 T301 expiry or selected cell no longer suitable

The UE shall:

- 1> if timer T301 expires; or
- 1> if the selected cell becomes no longer suitable according to the cell selection criteria as specified in TS 36.304 [4]:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.7.8 Reception of *RRCCoNnectionReestablishmentReject* by the UE

Upon receiving the *RRCCoNnectionReestablishmentReject* message, the UE shall:

- 1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.8 RRC connection release

5.3.8.1 General

Figure 5.3.8.1-1: RRC connection release, successful

The purpose of this procedure is:

- to release the RRC connection, which includes the release of the established radio bearers as well as all radio resources; or
- to suspend the RRC connection for both suspended RRC connection or RRC_INACTIVE, which includes the suspension of the established radio bearers;
- to configure, reconfigure or release radio resources for transmission using PUR;
- to complete the UP-EDT procedure and UP transmission using PUR, which includes the release or suspension of the established radio bearers.

5.3.8.2 Initiation

E-UTRAN initiates the RRC connection release procedure to a UE in RRC_CONNECTED or in RRC_INACTIVE or to complete UP-EDT or UP transmission using PUR.

5.3.8.3 Reception of the *RRCCoNnectionRelease* by the UE

The UE shall:

- 1> except for NB-IoT, BL UEs or UEs in CE, delay the following actions defined in this clause 60 ms from the moment the *RRCCoNnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCCoNnectionRelease* message has been successfully acknowledged, whichever is earlier;
- 1> for BL UEs or UEs in CE, delay the following actions defined in this clause 1.25 seconds from the moment the *RRCCoNnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCCoNnectionRelease* message has been successfully acknowledged, whichever is earlier;
- 1> for NB-IoT, delay the following actions defined in this clause 10 seconds from the moment the *RRCCoNnectionRelease* message was received or optionally when lower layers indicate that the receipt of the *RRCCoNnectionRelease* message has been successfully acknowledged, whichever is earlier.

NOTE 0: For BL UEs, UEs in CE and NB-IoT, when STATUS reporting, as defined in TS 36.322 [7], has not been triggered and the UE has sent positive HARQ feedback (ACK), as defined in TS 36.321 [6], the lower layers can be considered to have indicated that the receipt of the *RRCCoNnectionRelease* message has been successfully acknowledged.

NOTE 0a: For BL UEs, UEs in CE and NB-IoT, when the *RRCConnectionRelease* message is received on a HARQ process with disabled HARQ feedback, and when STATUS reporting, as defined in TS 36.322 [7], has not been triggered, the lower layers can be considered to have indicated that the receipt of the *RRCConnectionRelease* message has been successfully acknowledged.

- 1> stop T380, if running;
- 1> if timer T316 is running;
 - 2> stop timer T316;
 - 2> clear the information included in *VarRLF-Report*, if any;
- 1> for NB-IoT:
 - 2> if the UE has reported *anr-InfoAvailable*, clear *VarANR-MeasConfig-NB* and *VarANR-MeasReport-NB*;
 - 2> if the UE has reported *rlf-InfoAvailable*, clear *VarRLF-Report-NB*;
- 1> if the *RRCConnectionRelease* message is received in response to an *RRCConnectionResumeRequest* for EDT or for UP transmission using PUR:
 - 2> indicate to upper layers that the suspended RRC connection has been resumed;
 - 2> discard the stored UE AS context and *resumeIdentity*;
 - 2> stop timer T300;
 - 2> stop timer T302, if running;
 - 2> stop timer T303, if running;
 - 2> stop timer T305, if running;
 - 2> stop timer T306, if running;
 - 2> stop timer T308, if running;
 - 2> perform the actions as specified in 5.3.3.7;
 - 2> stop timer T320, if running;
 - 2> stop timer T322, if running;
 - 2> stop timer T323, if running;
- 1> except for UEs using the Control Plane CIoT 5GS optimisation, if AS security is not activated and if UE is connected to 5GC:
 - 2> ignore any field included in *RRCConnectionRelease* message except *waitTime*;
 - 2> perform the actions upon leaving RRC_CONNECTED or RRC_INACTIVE as specified in 5.3.12 with the release cause 'other' upon which the procedure ends;
- 1> if the *RRCConnectionRelease* message includes *redirectedCarrierInfo* indicating redirection to *geran*, *utra-FDD*, *utra-TDD* or *utra-TDD-r10*; or
- 1> if the *RRCConnectionRelease* message includes *idleModeMobilityControlInfo* including *freqPriorityListGERAN* or *freqPriorityListUTRA-FDD* or *freqPriorityListUTRA-TDD*:
 - 2> if AS security has not been activated; and
 - 2> if upper layers indicate that redirect to GERAN or UTRAN without AS security is not allowed (see TS 24.301 [35]);
 - 3> ignore the content of the *RRCConnectionRelease*;

3> perform the actions upon leaving RRC_CONNECTED or RRC_INACTIVE as specified in 5.3.12, with release cause 'other', upon which the procedure ends;

1> if AS security has not been activated:

2> ignore the content of *redirectedCarrierInfo*, if included and indicating redirection to *nr*;

2> ignore the content of *idleModeMobilityControlInfo*, if included and including *freqPriorityListNR*;

2> ignore the *altFreqPriorities* and T323, if included;

2> if the UE ignores the content of *redirectedCarrierInfo* or of *idleModeMobilityControlInfo*, or of *altFreqPriorities* and T323:

3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other', upon which the procedure ends;

1> if the *RRCConnectionRelease* message includes *redirectedCarrierInfo* indicating redirection to *eutra* and if UE is connected to 5GC:

2> if *cn-Type* is included:

3> after the cell selection, indicate the available CN Type(s) and the received *cn-Type* to upper layers;

NOTE 1: Handling the case if the E-UTRA cell selected after the redirection does not support the core network type specified by the *cn-Type*, is up to UE implementation.

1> if the *RRCConnectionRelease* message includes the *idleModeMobilityControlInfo*:

2> store the cell reselection priority information provided by the *idleModeMobilityControlInfo*;

2> if the *t320* is included:

3> start timer T320, with the timer value set according to the value of *t320*;

1> else if the *RRCConnectionRelease* message includes the *altFreqPriorities*:

2> store the received *altFreqPriorities*;

2> for E-UTRA frequency, apply the alternative cell reselection priority information broadcast in the system information if available, otherwise apply the cell reselection priority broadcast in the system information;

2> for inter-RAT frequency, apply the cell reselection priority broadcast in the system information;

2> if the *t323* is included:

3> start timer T323, with the timer value set according to the value of *t323*;

1> else:

2> apply the cell reselection priority information broadcast in the system information;

1> if the *RRCConnectionRelease* message includes the *releaseMeasIdleConfig*:

2> if timer T331 is running:

3> stop timer T331;

3> perform the actions as specified in 5.6.20.3;

1> if the *RRCConnectionRelease* message includes the *measIdleConfig*:

2> clear *VarMeasIdleConfig* and *VarMeasIdleReport*;

2> store the received *measIdleDuration* in *VarMeasIdleConfig*;

2> start or restart T331 with the value of *measIdleDuration*;

2> if the *measIdleConfig* contains *measIdleCarrierListEUTRA*:

3> store the received *measIdleCarrierListEUTRA* in *VarMeasIdleConfig*;

2> if the *measIdleConfig* contains *measIdleCarrierListNR*:

3> store the received *measIdleCarrierListNR* in *VarMeasIdleConfig*;

2> if the *measIdleConfig* contains *validityAreaList*:

3> store the received *validityAreaList* in *VarMeasIdleConfig*;

NOTE 2: If the *measIdleConfig* contains neither *measIdleCarrierListEUTRA* nor *measIdleCarrierListNR*, UE may receive *measIdleCarrierListEUTRA* and/or *measIdleCarrierListNR* as specified in 5.6.20.1a.

1> for NB-IoT, if the *RRCConnectionRelease* message includes the *anr-MeasConfig*:

2> clear *VarANR-MeasConfig-NB* and *VarANR-MeasReport-NB*;

2> store the received *anr-QualityThreshold* in *VarANR-MeasConfig-NB*;

2> if the *anr-MeasConfig* contains *anr-CarrierList*:

3> store the received *anr-CarrierList* in *VarANR-MeasConfig-NB*;

2> set *plmn-IdentityList* in *VarANR-MeasReport-NB* to include the list of EPLMN stored by the UE (i.e. includes the RPLMN);

2> set *servCellIdentity* in *VarANR-MeasReport-NB* to the global cell identity of the Pcell;

2> start performing ANR measurements as specified in 5.6.24;

1> if the *RRCConnectionRelease* message includes the *pur-Config*:

2> if *pur-Config* is set to *setup*:

3> store or replace the PUR configuration provided by the *pur-Config*;

3> if *pur-TimeAlignmentTimer* is included in the received *pur-Config*:

4> configure lower layers in accordance with *pur-TimeAlignmentTimer*;

3> else:

4> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;

3> if *pur-RSRP-ChangeThreshold* (*pur-NRSRP-ChangeThreshold* in NB-IoT) is included in the received *pur-Config* and set to *setup*; or

3> if *pur-RSRP-ChangeThreshold* (*pur-NRSRP-ChangeThreshold* in NB-IoT) is configured and *pur-TimeAlignmentTimer* is included in the received *pur-Config*:

4> store or replace the serving cell reference (N)RSRP value with the current serving cell (N)RSRP value (see 5.3.3.19);

3> start maintenance of PUR occasions as specified in 5.3.3.20;

2> else:

3> if *pur-TimeAlignmentTimer* is configured, indicate to lower layers that *pur-TimeAlignmentTimer* is released;

3> release *pur-Config*, if configured;

3> discard previously stored *pur-Config*;

1> for NB-IoT, if the *RRCConnectionRelease* message includes the *redirectedCarrierInfo*:

- 2> if the *redirectedCarrierOffsetDedicated* is included in the *redirectedCarrierInfo*:
 - 3> store the dedicated offset for the frequency in *redirectedCarrierInfo*;
 - 3> start timer T322, with the timer value set according to the value of *T322* in *redirectedCarrierInfo*;
- 1> if the *releaseCause* received in the *RRConnectionRelease* message indicates *loadBalancingTAURequired*:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'load balancing TAU required';
- 1> else if the *releaseCause* received in the *RRConnectionRelease* message indicates *cs-FallbackHighPriority*:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'CS Fallback High Priority';
- 1> else:
 - 2> if the *extendedWaitTime* is present; and
 - 2> if the UE supports delay tolerant access or the UE is a NB-IoT UE:
 - 3> forward the *extendedWaitTime* to upper layers;
 - 2> if the *extendedWaitTime-CPdata* is present and the NB-IoT UE only supports the Control Plane CIoT EPS optimisation:
 - 3> forward the *extendedWaitTime-CPdata* to upper layers;
 - 2> if the *releaseCause* received in the *RRConnectionRelease* message indicates *rrc-Suspend*:
 - 3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC suspension';
 - 2> else if *rrc-InactiveConfig* is included:
 - 3> perform the actions upon entering RRC_INACTIVE as specified in 5.3.8.7;
 - 2> else:
 - 3> perform the actions upon leaving RRC_CONNECTED or RRC_INACTIVE as specified in 5.3.12, with release cause 'other';

5.3.8.4 T320 expiry

The UE shall:

- 1> if T320 expires:
 - 2> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo* or inherited from another RAT;
 - 2> apply the cell reselection priority information broadcast in the system information;

5.3.8.5 T322 expiry or stop

The UE shall:

- 1> if T322 expires or is stopped:
 - 2> discard the *redirectedCarrierOffsetDedicated* provided in *RRConnectionRelease* message;

5.3.8.6 UE actions upon receiving the expiry of *DataInactivityTimer*

Upon receiving the expiry of *DataInactivityTimer* from lower layers while in RRC_CONNECTED, the UE shall:

1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

5.3.8.7 UE actions upon entering RRC_INACTIVE

Upon entering RRC_INACTIVE, the UE shall:

1> reset MAC and release the default MAC configuration if any;

1> stop all timers that are running except T302, T309, T320, T323, T325 and T330;

1> re-establish RLC entities for all SRBs and DRBs;

1> if the *RRCConnectionRelease* message is including the *waitTime*:

2> start timer T302, with the timer value set according to the *waitTime*;

2> inform the upper layer that access barring is applicable for all access categories except categories '0' and '2';

1> if T309 is running:

2> stop timer T309 for all access categories;

2> perform the actions as specified in 5.3.16.4.

1> apply the received *rrc-InactiveConfig*;

1> derive the DRX cycle as specified in TS 36.304 [4], clause 7.1;

1> if the *RRCConnectionRelease* message was received in response to an *RRCConnectionResumeRequest*:

2> in the stored UE Inactive AS context:

3> replace the K_{eNB} and K_{RRCint} keys with the current K_{eNB} and K_{RRCint} keys;

3> replace the C-RNTI with the temporary C-RNTI which the UE has used to receive the *RRCConnectionRelease* message;

3> replace the *cellIdentity* with the *cellIdentity* of the PCell at the time the UE has received the *RRCConnectionRelease* message;

3> replace the previously stored physical cell identity with the physical cell identity of the PCell at the time the UE has received the *RRCConnectionRelease* message;

1> else:

2> store in the UE Inactive AS Context, the current K_{eNB} and K_{RRCint} keys, the ROHC state, the stored QoS flow to DRB mapping rules, the C-RNTI used in the source PCell, the *cellIdentity* and the physical cell identity of the source PCell, the *spCellConfigCommon* within *ReconfigurationWithSync* of the PSCell (if configured), and all other parameters configured;

1> if the *periodic-RNAU-timer* is included:

2> start timer T380, with the timer value set to the *periodic-RNAU-timer*;

1> suspend all SRB(s) and DRB(s), except SRB0;

1> indicate PDCP suspend to lower layers of all DRBs;

1> indicate the suspension of the RRC connection to upper layers;

1> enter RRC_INACTIVE and perform procedures as specified in TS 36.304 [4], clause 5.2.7;

Upon selecting to an inter-RAT cell or switching to another CN type, the UE shall:

1> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12, with release cause 'other';

5.3.8.8 T323 expiry

The UE shall:

- 1> if T323 expires:
- 2> if stored, discard the *altFreqPriorities* provided by the *RRConnectionRelease*;
- 2> apply the cell reselection priority information broadcast in the system information via *cellReselectionPriority* and *cellReselectionSubPriority*;

5.3.9 RRC connection release requested by upper layers

5.3.9.1 General

The purpose of this procedure is to release the RRC connection. Access to the current PCell may be barred as a result of this procedure.

5.3.9.2 Initiation

The UE initiates the procedure when upper layers request the release of the RRC connection as specified in TS 24.301 [35] for E-UTRA/EPC and TS 24.501 [95] for E-UTRA/5GC. The UE shall not initiate the procedure for power saving purposes.

The UE shall:

- 1> if the upper layers indicate barring of the PCell:
- 2> treat the PCell used prior to entering RRC_IDLE as barred according to TS 36.304 [4];
- 1> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

5.3.10 Radio resource configuration

5.3.10.0 General

The UE shall:

- 1> if the received *radioResourceConfigDedicated* includes the *srB-ToAddModList*:
 - 2> perform the SRB addition or reconfiguration as specified in 5.3.10.1;
- 1> if the received *radioResourceConfigDedicated* includes the *drB-ToReleaseList*:
 - 2> perform DRB release as specified in 5.3.10.2;
- 1> if the received *radioResourceConfigDedicated* includes the *drB-ToAddModList*:
 - 2> perform DRB addition or reconfiguration as specified in 5.3.10.3;
- 1> if the received *radioResourceConfigDedicated* includes the *mac-MainConfig*:
 - 2> perform MAC main reconfiguration as specified in 5.3.10.4;
- 1> if the received *radioResourceConfigDedicated* includes *sps-Config*:
 - 2> perform SPS reconfiguration according to 5.3.10.5;
- 1> if the received *radioResourceConfigDedicated* includes the *physicalConfigDedicated*:
 - 2> reconfigure the physical channel configuration as specified in 5.3.10.6.
- 1> if the received *radioResourceConfigDedicated* includes the *rlf-TimersAndConstants* or the *rlf-TimersAndConstantsMCG-Failure*:

- 2> reconfigure the values of timers and constants as specified in 5.3.10.7;
- 1> if the received *radioResourceConfigDedicated* includes the *measSubframePatternPCell*:
 - 2> reconfigure the time domain measurement resource restriction for the serving cell as specified in 5.3.10.8;
- 1> if the received *radioResourceConfigDedicated* includes the *naics-Info*:
 - 2> perform NAICS neighbour cell information reconfiguration for the PCell as specified in 5.3.10.13;
- 1> if the received *RadioResourceConfigDedicatedPSCell* includes the *naics-Info*:
 - 2> perform NAICS neighbour cell information reconfiguration for the PSCell as specified in 5.3.10.13;
- 1> if the received *RadioResourceConfigDedicatedSCell-r10* includes the *naics-Info*:
 - 2> perform NAICS neighbour cell information reconfiguration for the SCell as specified in 5.3.10.13;
- 1> if the received *radioResourceConfigDedicated* includes the *srb-ToReleaseList*:
 - 2> perform SRB release as specified in 5.3.10.17;
- 1> if the received *radioResourceConfigDedicated* includes the *schedulingRequestConfig*:
 - 2> perform scheduling request reconfiguration for the SCell as specified in 5.3.10.18;
- 1> if the UE has initiated transmission using PUR in accordance with conditions in 5.3.3.1c:
 - 2> if the received *radioResourceConfigDedicated* includes *newUE-Identity*:
 - 3> apply the value of the *newUE-Identity* as the C-RNTI;
 - 2> else:
 - 3> apply the value of the *pur-RNTI* as the C-RNTI.

5.3.10.1 SRB addition/ modification

The UE shall:

- 1> if the UE is a NB-IoT UE and SRB1 is not established; or
- 1> for each *srб-Identity* value included in the *srб-ToAddModList* that is not part of the current UE configuration (SRB establishment):
 - 2> if the UE is not a NB-IoT UE that only supports the Control Plane CIoT EPS optimisation or the Control Plane CIoT 5GS optimisation:
 - 3> apply the specified configuration defined in 9.1.2 for the corresponding SRB;
 - 3> establish a primary (MCG) RLC entity in accordance with the received *rlc-Config*;
 - 3> establish a primary (MCG) DCCH logical channel in accordance with the received *logicalChannelConfig* and with the logical channel identity set in accordance with 9.1.2;
 - 3> if the same *srб-Identity* is included in NR *srб-ToAddModList*:
 - 4> after processing *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2* if present in the *RRCConnectionReconfiguration* message which triggered the execution of the SRB addition/modification procedure, associate MCG RLC bearer with the NR PDCP entity associated with the same value of *srб-Identity* in the current UE configuraton as specified in TS 38.331 [82];
 - 3> else:
 - 4> establish a PDCP entity and configure it with the current (MCG) security configuration, if applicable;
 - 3> if *rlc-BearerConfigSecondary* is received with value *setup*:

- 4> establish a secondary MCG RLC entity or entities and an associated DCCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srб-Identity* within the current UE configuration;
 - 4> configure the E-UTRA PDCP entity to activate duplication with *t-Reordering* set to *infinity*;
 - 2> if the UE is a NB-IoT UE:
 - 3> apply the specified configuration defined in 9.1.2 for SRB1bis;
 - 3> establish an (MCG) RLC entity in accordance with the received *rlc-Config*;
 - 3> establish a (MCG) DCCH logical channel in accordance with the received *logicalChannelConfig* and with the logical channel identity set in accordance with 9.1.2.1a;
 - 1> if the UE is a NB-IoT UE and SRB1 is established; or
 - 1> for each *srб-Identity* value included in the *srб-ToAddModList* that is part of the current UE configuration (SRB reconfiguration):
 - 2> if *pdcp-verChange* is included (i.e, NR PDCP to E-UTRA PDCP change):
 - 3> establish an (E-UTRA) PDCP entity and configure it with the current (MCG) security configuration;
- NOTE 1: The UE applies the LTE ciphering and integrity protection algorithms that are equivalent to the previously configured NR security algorithms.
- 3> associate the primary RLC bearer of this SRB with the established PDCP entity;
 - 3> release the NR PDCP entity of this SRB;
 - 2> reconfigure the primary RLC entity in accordance with the received *rlc-Config*;
 - 2> reconfigure the primary DCCH logical channel in accordance with the received *logicalChannelConfig*;
 - 2> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 3> release the secondary MCG RLC entity or entities as well as the associated DCCH logical channel;
 - 2> if *rlc-BearerConfigSecondary* is received with value *setup*:
 - 3> if the current SRB configuration does not include a secondary RLC bearer:
 - 4> establish a secondary MCG RLC entity or entities and an associated DCCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srб-Identity* within the current UE configuration;
 - 4> configure the E-UTRA PDCP entity to activate duplication with *t-Reordering* set to *infinity*;
 - 3> else:
 - 4> reconfigure the secondary MCG RLC entity or entities and the associated DCCH logical channel in accordance with the received *rlc-BearerConfigSecondary*;

NOTE 2: In case of SRB reconfiguration at a DAPS HO, the reconfiguration is applied to the entities/resources for the target MCG.

5.3.10.1a SCG RLC bearer addition or reconfiguration for SRBs

The UE shall:

- 1> for each *srб-Identity* value included in the *srб-ToAddModListSCG* that is not part of the current UE E-UTRA SCG configuration (i.e. SCG RLC bearer establishment):
 - 2> apply the specified configuration defined in 9.1.2 for the corresponding SRB;
 - 2> establish an (SCG) RLC entity in accordance with the received *rlc-Config*;

- 2> establish a (SCG) DCCH logical channel in accordance with the received *logicalChannelConfig* and with the logical channel identity set in accordance with 9.1.2;
- 2> if the UE is configured with DC:
 - 3> associate the established SCG RLC bearer and DCCH logical channel with the E-UTRA PDCP entity with the same value of *srб-Identity* within the current UE configuration;
 - 3> configure the E-UTRA PDCP entity to activate duplication with *t-Reordering* set to *infinity*;
- 2> else (i.e. the UE is configured with NE-DC):
 - 3> associate the SCG RLC bearer and DCCH logical channel with the NR PDCP entity, i.e. as configured by NR see TS 38.331 [82], identified with the same *srб-Identity* within the current UE configuration;
- 1> for each *srб-Identity* value included in the *srб-ToAddModListSCG* that is part of the current UE SCG configuration (SCG RLC bearer reconfiguration):
 - 2> re-establish the SCG RLC entity, if *reestablishRLC* is included;
 - 2> reconfigure the RLC entity in accordance with the received *rlc-Config*;
 - 2> reconfigure the DCCH logical channel in accordance with the received *logicalChannelConfig*;

5.3.10.2 DRB release

The UE shall:

- 1> for each *drb-Identity* value included in the *drb-ToReleaseList* or *drb-ToReleaseListSCG* that is part of the current UE configuration (DRB or RLC bearer release); or
- 1> for each *drb-identity* value that is to be released as the result of full configuration option according to 5.3.5.8:
 - 2> if release of this DRB is result of full configuration option according to 5.3.5.8:
 - 3> release the E-UTRA or NR PDCP entity;
 - 2> else if this DRB is configured with *pdcp-config*:
 - 3> release the E-UTRA PDCP entity;
 - 2> else (release the RLC bearer configuration of MCG or of SCG):
 - 3> re-establish the RLC entity as specified in 36.322 for this DRB;
 - 2> release the RLC entity or entities;
 - 2> release the DTCH logical channel;
 - 2> if the UE is connected to EPC:
 - 3> if the DRB was configured with *pdcp-config* and new DRB is not added with same *eps-BearerIdentity* in *drb-ToAddModList* nor *nr-radioBearerConfig1* nor in *nr-radioBearerConfig2*:
 - 4> if the procedure was triggered due to handover:
 - 5> indicate the release of the DRB and the *eps-BearerIdentity* of the released DRB to upper layers after successful handover;
 - 4> else:
 - 5> indicate the release of the DRB and the *eps-BearerIdentity* of the released DRB to upper layers immediately.
 - 2> if the UE is a NB-IoT UE connected to 5GC:

3> if the DRB was configured with *pdu-session* and new DRB is not added with same *pdu-Session* in *drb-ToAddModList*:

4> indicate the release of the DRB and the *pdu-Session* of the released DRB to upper layers immediately;

NOTE 1: The UE does not consider the message as erroneous if the *drb-ToReleaseList* includes any *drb-Identity* value that is not part of the current UE configuration.

NOTE 2: The association of *eps-BearerIdentity* to an NR PDCP configuration as defined in TS 38.331 [82] can be included in the same message that releases an DRB associated to the same *eps-BearerIdentity*.

5.3.10.3 DRB addition/ modification

The UE shall:

1> for each *drb-Identity* value included in the *drb-ToAddModList* that is not part of the current UE configuration (DRB establishment including the case when full configuration option is used):

2> if the concerned entry of *drb-ToAddModList* includes the *drb-TypeLWA* set to *TRUE* (i.e. add LWA DRB):

3> perform the LWA specific DRB addition or reconfiguration as specified in 5.3.10.3a2;

2> if the concerned entry of *drb-ToAddModList* includes the *drb-TypeLWIP* (i.e. add LWIP DRB):

3> perform LWIP specific DRB addition or reconfiguration as specified in 5.3.10.3a3;

2> else if *drb-ToAddModListSCG* is not received or does not include the *drb-Identity* value (i.e. add MCG DRB or MCG RLC bearer):

3> if *pdcp-Config* is received, establish a PDCP entity and configure it with the current MCG security configuration and in accordance with the received *pdcp-Config*;

3> if *rlc-Config* is received, establish a (primary) MCG RLC entity or entities in accordance with the received *rlc-Config*;

3> if *logicalChannelIdentity* and *logicalChannelConfig* are received, establish a (primary) MCG DTCH logical channel in accordance with the received *logicalChannelIdentity* and the received *logicalChannelConfig*;

3> if *rlc-BearerConfigSecondary* is received with value *setup*:

4> establish a secondary MCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *drb-Identity* within the current UE configuration;

3> if *pdcp-Config* is not received, after processing *nr-RadioBearerConfig1* and *nr-RadioBearerConfig2* if present in the *RRCConnectionReconfiguration* message which triggered the execution of the DRB addition/modification procedure, associate MCG RLC bearer with the NR PDCP entity associated with the same value of *drb-Identity* in the current UE configuration as specified in TS 38.331 [82];

2> if the UE is a NB-IoT UE connected to 5GC:

3> if *cipheringDisabled* is included in *pdcp-Config*:

4> instruct the PDCP entity not to apply ciphering;

3> if a DRB was configured with the same *pdu-Session* (fullConfig):

4> associate the established DRB with corresponding included *pdu-Session*;

3> else if the entry of *drb-ToAddModList* includes *pdcp-config* (establishment of bearer):

4> indicate the establishment of the DRB(s) and the *pdu-Session* of the established DRB(s) to upper layers;

2> else:

- 3> if a DRB was configured with the same *eps-BearerIdentity* (fullConfig or change to E-UTRA PDCP):
 - 4> associate the established DRB with corresponding included *eps-BearerIdentity*;
- 3> else if the entry of *drb-ToAddModList* includes *pdcp-config* (establishment of bearer with E-UTRA PDCP):
 - 4> indicate the establishment of the DRB(s) and the *eps-BearerIdentity* of the established DRB(s) to upper layers;
- 1> for each *drb-Identity* value included in the *drb-ToAddModList* that is part of the current UE configuration (DRB reconfiguration):
 - 2> if the DRB indicated by *drb-Identity* is an LWA DRB (i.e. LWA to LTE only or reconfigure LWA DRB):
 - 3> perform the LWA specific DRB reconfiguration as specified in 5.3.10.3a2;
 - 2> else if the concerned entry of *drb-ToAddModList* includes the *drb-TypeLWA* set to *TRUE* (i.e. LTE only to LWA DRB):
 - 3> perform the LWA specific DRB reconfiguration as specified in 5.3.10.3a2;
 - 2> if the concerned entry of *drb-ToAddModList* includes the *drb-TypeLWIP* (i.e. add or reconfigure LWIP DRB):
 - 3> perform LWIP specific DRB addition or reconfiguration as specified in 5.3.10.3a3;
 - 2> if *drb-ToAddModListSCG* is not received or does not include the *drb-Identity* value:
 - 3> if the DRB indicated by *drb-Identity* is an MCG DRB or configured with MCG RLC bearer (reconfigure MCG RLC bearer or reconfigure MCG DRB):
 - 4> if the *pdcp-Config* is included:
 - 5> reconfigure the PDCP entity in accordance with the received *pdcp-Config*;
 - 4> if the *rlc-Config* is included:
 - 5> if *reestablishRLC* is received:
 - 6> re-establish the primary RLC entity of this DRB;
 - 6> if the *logicalChannelIdentity* is included and the DRB indicated by *drb-Identity* is configured with MCG RLC bearer (reconfigure logical channel identity of MCG RLC bearer):
 - 7> reconfigure the primary DTCH logical channel identity in accordance with the received *logicalChannelIdentity*;
 - 5> reconfigure the primary RLC entity or entities in accordance with the received *rlc-Config*;
 - 4> if the *logicalChannelConfig* is included:
 - 5> reconfigure the primary DTCH logical channel in accordance with the received *logicalChannelConfig*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 5> release the secondary MCG RLC entity or entities as well as the associated DTCH logical channel;
 - 4> if *rlc-BearerConfigSecondary* is included with value *setup*;
 - 5> if the current DRB configuration does not include a secondary RLC bearer:
 - 6> establish a secondary MCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *drb-Identity* within the current UE configuration;
 - 5> else:

6> reconfigure the secondary MCG RLC entity or entities and the associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary*;

NOTE 1: Removal and addition of DRB with *pdcp-Config* with the same *drb-Identity* in a single *radioResourceConfigDedicated* is not supported. In case *drb-Identity* is removed and added due to handover or re-establishment with the full configuration option, the eNB can use the same value of *drb-Identity*.

NOTE 2: In case of DRB reconfiguration at a DAPS HO, the reconfiguration is applied to the entities/resources for the target MCG

5.3.10.3a1 DC specific DRB addition or reconfiguration

For the *drb-Identity* value for which this procedure is initiated, the UE shall:

- 1> if *drb-ToAddModListSCG* is received and includes the *drb-Identity* value; and *drb-Identity* value is not part of the current UE configuration (i.e. DC specific DRB establishment):
 - 3> establish a PDCP entity and configure it with the current MCG security configuration and in accordance with the *pdcp-Config* included in *drb-ToAddModList*;
 - 3> establish an MCG RLC entity and an MCG DTCH logical channel in accordance with the *rlc-Config*, *logicalChannelIdentity* and *logicalChannelConfig* included in *drb-ToAddModList*;
 - 3> establish an SCG RLC entity and an SCG DTCH logical channel in accordance with the *rlc-ConfigSCG*, *logicalChannelIdentitySCG* and *logicalChannelConfigSCG* included in *drb-ToAddModListSCG*;
- 2> else (i.e. add SCG DRB):
 - 3> establish a PDCP entity and configure it with the current SCG security configuration and in accordance with the *pdcp-Config* included in *drb-ToAddModListSCG*;
 - 3> establish a primary SCG RLC entity or entities and a primary SCG DTCH logical channel in accordance with the *rlc-ConfigSCG*, *logicalChannelIdentitySCG* and *logicalChannelConfigSCG* included in *drb-ToAddModListSCG*;
 - 3> if *rlc-BearerConfigSecondary* is included with value *setup*;
 - 4> establish a secondary SCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srB-Identity* within the current UE configuration;
- 2> indicate the establishment of the DRB(s) and the *eps-BearerIdentity* of the established DRB(s) to upper layers;
- 1> else (i.e. DC specific DRB modification; *drb-ToAddModList* and/ or *drb-ToAddModListSCG* received):
 - 2> if the DRB indicated by *drb-Identity* is a split DRB:
 - 3> if *drb-ToAddModList* is received and includes the *drb-Identity* value, while for this entry *drb-TypeChange* is included and set to *toMCG* (i.e. split to MCG):
 - 4> release the SCG RLC entity or entities and the SCG DTCH logical channel(s);
 - 4> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 4> reconfigure the primary MCG RLC entity and/ or the primary MCG DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *setup*;
 - 5> establish a secondary MCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srB-Identity* within the current UE configuration;

- 3> else (i.e. reconfigure split):
- 4> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 4> reconfigure the MCG RLC entity and/ or the MCG DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 4> reconfigure the SCG RLC entity and/ or the SCG DTCH logical channel in accordance with the *rlc-ConfigSCG* and *logicalChannelConfigSCG*, if included in *drb-ToAddModListSCG*;
- 2> if the DRB indicated by *drb-Identity* is an SCG DRB:
- 3> if *drb-ToAddModList* is received and includes the *drb-Identity* value, while for this entry *drb-TypeChange* is included and set to *toMCG* (i.e. SCG to MCG):
 - 4> reconfigure the PDCP entity with the current MCG security configuration and in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 4> reconfigure the SCG RLC entity or entities (both primary and secondary, if configured) and the SCG DTCH logical channel (both primary and secondary, if configured) to be an MCG RLC entity or entities and an MCG DTCH logical channel;
 - 4> reconfigure the primary MCG RLC entity or entities and/ or the primary MCG DTCH logical channel in accordance with the *rlc-Config*, *logicalChannelIdentity* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 5> release the secondary MCG RLC entity or entities as well as the associated DTCH logical channel;
 - 4> if *rlc-BearerConfigSecondary* is included with value *setup*:
 - 5> if the current DRB configuration does not include a secondary RLC bearer:
 - 6> establish a secondary MCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srn-Identity* within the current UE configuration; - 5> else:
 - 6> reconfigure the secondary MCG RLC entity or entities and the associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary*; - 3> else (i.e. *drb-ToAddModListSCG* is received and includes the *drb-Identity* value i.e. reconfigure SCG):
 - 4> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModListSCG*;
 - 4> reconfigure the primary SCG RLC entity or entities and/ or the primary SCG DTCH logical channel in accordance with the *rlc-ConfigSCG* and *logicalChannelConfigSCG*, if included in *drb-ToAddModListSCG*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 5> release the secondary SCG RLC entity or entities as well as the associated DTCH logical channel;
 - 4> if *rlc-BearerConfigSecondary* is included with value *setup*:
 - 5> if the current DRB configuration does not include a secondary RLC bearer:
 - 6> establish a secondary SCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srn-Identity* within the current UE configuration; - 5> else:

- 6> reconfigure the secondary SCG RLC entity or entities and the associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary*;
- 2> if the DRB indicated by *drb-Identity* is an MCG DRB:
 - 3> if *drb-ToAddModListSCG* is received and includes the *drb-Identity* value, while for this entry *drb-Type* is included and set to *split* (i.e. MCG to split):
 - 4> reconfigure the PDCP entity in accordance with the *pdcn-Config*, if included in *drb-ToAddModList*;
 - 4> reconfigure the primary MCG RLC entity and/ or the primary MCG DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 5> release the secondary MCG RLC entity or entities as well as the associated DTCH logical channel;
 - 4> establish an SCG RLC entity and an SCG DTCH logical channel in accordance with the *rlc-ConfigSCG*, *logicalChannelIdentitySCG* and *logicalChannelConfigSCG*, included in *drb-ToAddModListSCG*;
 - 3> else (i.e. *drb-Type* is included and set to *scg* i.e. MCG to SCG):
 - 4> reconfigure the PDCP entity with the current SCG security configuration and in accordance with the *pdcn-Config*, if included in *drb-ToAddModListSCG*;
 - 4> reconfigure the MCG RLC entity or entities (both primary and secondary, if configured) and the MCG DTCH logical channel (both primary and secondary, if configured) to be an SCG RLC entity or entities and an SCG DTCH logical channel;
 - 4> reconfigure the primary SCG RLC entity or entities and/ or the primary SCG DTCH logical channel in accordance with the *rlc-ConfigSCG*, *logicalChannelIdentitySCG* and *logicalChannelConfigSCG*, if included in *drb-ToAddModListSCG*;
 - 4> if *rlc-BearerConfigSecondary* is included with value *release*:
 - 5> release the secondary SCG RLC entity or entities as well as the associated DTCH logical channel;
 - 4> if *rlc-BearerConfigSecondary* is included with value *setup*:
 - 5> if the current DRB configuration does not include a secondary RLC bearer:
 - 6> establish a secondary SCG RLC entity or entities and an associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary* and associate these with the E-UTRA PDCP entity with the same value of *srn-Identity* within the current UE configuration;
 - 5> else:
 - 6> reconfigure the secondary SCG RLC entity or entities and the associated DTCH logical channel in accordance with the received *rlc-BearerConfigSecondary*;

5.3.10.3a2 LWA specific DRB addition or reconfiguration

For the *drb-Identity* value for which this procedure is initiated, the UE shall:

- 1> if the *drb-Identity* value is not part of the current UE configuration (i.e. add LWA DRB):
 - 2> establish a PDCP entity and configure it with the current security configuration and in accordance with the *pdcn-Config* included in *drb-ToAddModList*;
 - 2> establish an RLC entity and an DTCH logical channel in accordance with the *rlc-Config*, *logicalChannelIdentity* and *logicalChannelConfig* included in *drb-ToAddModList*;
 - 2> enable data handling for this DRB at the LWAAP entity;
 - 2> if *lwa-WLAN-AC* is configured:

- 3> apply the received *lwa-WLAN-AC* when performing transmissions of packets for this DRB over WLAN;
- 2> indicate the establishment of the DRB and the *eps-BearerIdentity* of the established DRB to upper layers;
- 1> else if the DRB indicated by *drb-Identity* is not an LWA DRB (i.e. LTE only to LWA DRB):
 - 2> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 2> reconfigure the RLC entity and/ or the DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 2> enable data handling for this DRB at the LWAAP entity;
 - 2> if *lwa-WLAN-AC* is configured:
 - 3> apply the received *lwa-WLAN-AC* when performing transmissions of packets for this DRB over WLAN;
 - 1> else if the concerned entry of *drb-ToAddModList* includes the *drb-TypeLWA* set to *FALSE* (i.e. LWA to LTE only DRB):
 - 2> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 2> reconfigure the RLC entity and/ or the DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 2> perform PDCP data recovery as specified in TS 36.323 [8] if bearer is configured with RLC AM;
 - 2> disable data handling for this DRB at the LWAAP entity;
 - 1> else (i.e. reconfigure LWA DRB):
 - 2> reconfigure the PDCP entity in accordance with the *pdcp-Config*, if included in *drb-ToAddModList*;
 - 2> reconfigure the RLC entity and/ or the DTCH logical channel in accordance with the *rlc-Config* and *logicalChannelConfig*, if included in *drb-ToAddModList*;
 - 2> if *lwa-WLAN-AC* is configured:
 - 3> apply the received *lwa-WLAN-AC* when performing transmissions of packets for this DRB over WLAN;

5.3.10.3a3 LWIP specific DRB addition or reconfiguration

For the *drb-Identity* value for which this procedure is initiated, the UE shall:

- 1> if the *drb-TypeLWIP* is set to *lwip*:
 - 2> indicate to higher layers to use LWIP resources in both UL and DL for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-DL-Aggregation* is set to TRUE:
 - 3> indicate to higher layers to apply decoding of LWIPEP header with GRE sequence number for both LTE and WLAN DL reception for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-DL-Aggregation* is set to FALSE:
 - 3> indicate to higher layers to stop decoding of LWIPEP header with GRE sequence number for both LTE and WLAN DL reception for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-UL-Aggregation* is set to TRUE:
 - 3> indicate to higher layers to insert LWIPEP header with GRE sequence number for both LTE and WLAN UL transmissions for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-UL-Aggregation* is set to FALSE:

- 3> indicate to higher layers to stop inserting LWIPEP header with GRE sequence number for both LTE and WLAN UL transmissions for the DRB associated with the *drb-Identity*;
- 1> if the *drb-TypeLWIP* is set to *lwip-DL-only*:
 - 2> indicate to higher layers to use LWIP resources in the DL only for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-DL-Aggregation* is set to TRUE:
 - 3> indicate to higher layers to apply decoding of LWIPEP header with GRE sequence number for both LTE and WLAN DL reception for the DRB associated with the *drb-Identity*;
- 1> if the *drb-TypeLWIP* is set to *lwip-UL-only*:
 - 2> indicate to higher layers to use LWIP resources in the UL only for the DRB associated with the *drb-Identity*;
 - 2> if *lwip-UL-Aggregation* is set to TRUE:
 - 3> indicate to higher layers to insert LWIPEP header with GRE sequence number for both LTE and WLAN UL transmissions for the DRB associated with the *drb-Identity*;
- 1> if the *drb-TypeLWIP* is set to *eutran*:
 - 2> indicate to higher layers to stop using LWIP resources for the DRB associated with the *drb-Identity*;

5.3.10.3a4 SCG RLC bearer addition or reconfiguration for DRBs in NE-DC

The UE shall:

- 1> for each *drb-Identity* value included in *drb-ToAddModListSCG*:
 - 2> if *drb-Identity* value is not part of the current UE E-UTRA SCG configuration (SCG RLC bearer establishment):
 - 3> establish an SCG RLC entity or entities and an SCG DTCH logical channel in accordance with the *rlc-ConfigSCG*, *logicalChannelIdentitySCG* and *logicalChannelConfigSCG* included in *drb-ToAddModListSCG*;
 - 3> associate the SCG RLC bearer and DTCH logical channel with the NR PDCP entity, i.e. as configured by NR see TS 38.331 [82], identified with the same *drb-Identity* within the current UE configuration;
 - 2> else:
 - 3> re-establish the SCG RLC entity of this DRB, if *reestablishRLC* is included in *rlc-Config*;
 - 3> reconfigure the SCG RLC entity or entities and/ or the SCG DTCH logical channel in accordance with the *rlc-ConfigSCG* and *logicalChannelConfigSCG*, if included in *drb-ToAddModListSCG*;

5.3.10.3a SCell release

The UE shall:

- 1> if the release is triggered by reception of the *sCellToReleaseList* or the *sCellToReleaseListSCG*:
 - 2> for each *sCellIndex* value included either in the *sCellToReleaseList* or in the *sCellToReleaseListSCG*:
 - 3> if the current UE configuration includes an SCell with value *sCellIndex*:
 - 4> release the SCell;
 - 1> if the release is triggered by RRC connection re-establishment; or
 - 1> if the release is triggered when the UE is resuming an RRC connection from a suspended RRC connection or from RRC_INACTIVE as specified in clause 5.3.3.2:
 - 2> release all SCells that are part of the current UE configuration;

5.3.10.3b SCell addition/ modification

The UE shall:

- 1> for each *sCellIndex* value included either in the *sCellToAddModList* or in the *sCellToAddModListSCG* that is not part of the current UE configuration (SCell addition):
 - 2> add the SCell, corresponding to the *cellIdentification*, in accordance with the *radioResourceConfigCommonSCell* and *radioResourceConfigDedicatedSCell*, both included either in the *sCellToAddModList* or in the *sCellToAddModListSCG*;
- 2> if *sCellState* is configured for the SCell and indicates *activated*:
 - 3> configure lower layers to consider the SCell to be in activated state;
- 2> else if *sCellState* is configured for the SCell and indicates *dormant*:
 - 3> configure lower layers to consider the SCell to be in dormant state;
- 2> else:
 - 3> configure lower layers to consider the SCell to be in deactivated state;
- 2> for each *measId* included in the *measIdList* within *VarMeasConfig*:
 - 3> if SCells are not applicable for the associated measurement; and
 - 3> if the concerned SCell is included in *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*:
 - 4> remove the concerned SCell from *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
- 1> for each *sCellIndex* value included either in the *sCellToAddModList* or in the *sCellToAddModListSCG* that is part of the current UE configuration (SCell modification):
 - 2> modify the SCell configuration in accordance with the *radioResourceConfigDedicatedSCell*, included either in the *sCellToAddModList* or in the *sCellToAddModListSCG*;
 - 2> if the *sCellToAddModList* was received within an *RRCConnectionResume* or *sCellToAddModListSCG* was received within *RRCConnectionReconfiguration* with *mobilityControlInfoSCG* embedded in an NR *RRCResume* or embedded in an NR *RRCReconfiguration* message:
 - 3> if the *sCellState* is configured for the SCell and indicates *activated*:
 - 4> configure lower layers to consider the SCell to be in activated state;
 - 3> else if *sCellState* is configured for the SCell and indicates *dormant*:
 - 4> configure lower layers to consider the SCell to be in dormant state;
 - 3> else:
 - 4> configure lower layers to consider the SCell to be in deactivated state;

5.3.10.3c PSCell addition or modification

The UE shall:

- 1> if the PSCell is not part of the current UE configuration (i.e. PSCell addition):
 - 2> add the PSCell, corresponding to the *cellIdentification*, in accordance with the received *radioResourceConfigCommonPSCell* and *radioResourceConfigDedicatedPSCell*;
 - 2> configure lower layers to consider the PSCell to be in activated state;
- 1> if the PSCell is part of the current UE configuration (i.e. PSCell modification):
 - 2> configure lower layers to consider the PSCell to be in activated state;

2> modify the PSCell configuration in accordance with the received *radioResourceConfigDedicatedPSCell*;

5.3.10.3d SCell group release

The UE shall:

1> if the release is triggered by reception of the *sCellGroupToReleaseList*:

2> for each *sCellGroupIndex* value included in the *sCellGroupToReleaseList*:

3> if the current UE configuration includes an SCell with value *sCellGroupIndex*:

4> consider the SCell not to be part of the SCell group indicated by *sCellGroupIndex*;

4> consider the *sCellConfigCommon* of the SCell group to be not applicable for the SCell;

3> release the SCell group;

1> if the release is triggered by RRC connection re-establishment:

2> release all SCell groups that are part of the current UE configuration;

5.3.10.3e SCell group addition/ modification

The UE shall:

1> for each *sCellGroupIndex* value included in the *sCellGroupToAddModList* that is part of the current UE configuration (SCell group modification):

2> for each *sCellIndex* value included in the *sCellToReleaseList* that is part of the SCell group indicated by *sCellGroupIndex* (SCell deletion from SCell group):

3> consider the *sCellConfigCommon* of the SCell group to be not applicable for the SCell;

3> consider the SCell not to be part of the SCell group indicated by *sCellGroupIndex*

2> for each *sCellIndex* value included in the *sCellToAddModList* that is not part of the SCell group indicated by *sCellGroupIndex* (SCell addition to SCell group):

3> consider the SCell to be part of the SCell group indicated by *sCellGroupIndex*;

3> apply the SCell configuration for parameters not already configured as part of the current SCell configuration in accordance with the *sCellConfigCommon* for the SCell group;

2> if *sCellConfigCommon* is included (modify the SCell group configuration):

3> for each SCell that is part of the current SCell group indicated by *sCellGroupIndex*:

4> apply the SCell configuration for parameters not already configured as part of the current SCell configuration in accordance with the *sCellConfigCommon* for the SCell group;

1> for each *sCellGroupIndex* value included in the *sCellGroupToAddModList* that is not part of the current UE configuration (SCell group addition):

2> for each *sCellIndex* value included in the *sCellToAddModList* (SCell addition to the group):

3> consider the SCell to be part of the SCell group indicated by *sCellGroupIndex*

3> apply the SCell configuration for parameters not already configured as part of the current SCell configuration in accordance with the *sCellConfigCommon* for the SCell group;

5.3.10.4 MAC main reconfiguration

Except for NB-IoT, the UE shall:

1> if the procedure is triggered to perform SCG MAC main reconfiguration:

- 2> if SCG MAC is not part of the current UE configuration (i.e. SCG establishment):
 - 3> create an SCG MAC entity;
 - 2> reconfigure the SCG MAC main configuration as specified in the following i.e. assuming it concerns the SCG MAC whenever MAC main configuration is referenced and that it is based on the received *mac-MainConfigSCG* instead of *mac-MainConfig*:
- 1> reconfigure the MAC main configuration in accordance with the received *mac-MainConfig* other than *stag-ToReleaseList* and *stag-ToAddModList*;
- 1> if the received *mac-MainConfig* includes the *stag-ToReleaseList*:
 - 2> for each *STAG-Id* value included in the *stag-ToReleaseList* that is part of the current UE configuration:
 - 3> release the STAG indicated by *STAG-Id*;
- 1> if the received *mac-MainConfig* includes the *stag-ToAddModList*:
 - 2> for each *stag-Id* value included in *stag-ToAddModList* that is not part of the current UE configuration (STAG addition):
 - 3> add the STAG, corresponding to the *stag-Id*, in accordance with the received *timeAlignmentTimerSTAG*;
 - 2> for each *stag-Id* value included in *stag-ToAddModList* that is part of the current UE configuration (STAG modification):
 - 3> reconfigure the STAG, corresponding to the *stag-Id*, in accordance with the received *timeAlignmentTimerSTAG*;

NOTE: In case of MAC main reconfiguration at a DAPS HO, the reconfiguration is applied to the MAC entity for the target MCG.

For NB-IoT, the UE shall:

- 1> reconfigure the MAC main configuration in accordance with the received *mac-MainConfig*;

5.3.10.5 Semi-persistent scheduling reconfiguration

The UE shall:

- 1> reconfigure the semi-persistent scheduling in accordance with the received *sps-Config*;

5.3.10.6 Physical channel reconfiguration

Except for NB-IoT, the UE shall:

- 1> if the *antennaInfo-r10* is included in the received *physicalConfigDedicated* and the previous version of this field that was received by the UE was *antennaInfo* (without suffix i.e. the version defined in REL-8):
 - 2> apply the default antenna configuration as specified in 9.2.4;
- 1> if the *cqi-ReportConfig-r10* is included in the received *physicalConfigDedicated* and the previous version of this field that was received by the UE was *cqi-ReportConfig* (without suffix i.e. the version defined in REL-8):
 - 2> apply the default CQI reporting configuration as specified in 9.2.4;

NOTE 1: Application of the default configuration involves release of all extensions introduced in REL-9 and later.

- 1> reconfigure the physical channel configuration in accordance with the received *physicalConfigDedicated*;

- 1> if the *antennaInfo* is included and set to *explicitValue*:

- 2> if the configured *transmissionMode* is *tm1*, *tm2*, *tm5*, *tm6* or *tm7*; or

- 2> if the configured *transmissionMode* is *tm8* and *pmi-RI-Report* is not present; or

- 2> if the configured *transmissionMode* is *tm9* and *pmi-RI-Report* is not present; or
- 2> if the configured *transmissionMode* is *tm9* and *pmi-RI-Report* is present and *antennaPortsCount* within *csi-RS* is set to *an1*:
 - 3> release *ri-ConfigIndex* in *cqi-ReportPeriodic*, if previously configured;
- 1> else if the *antennaInfo* is included and set to *defaultValue*:
 - 2> release *ri-ConfigIndex* in *cqi-ReportPeriodic*, if previously configured;
- 1> if the *pusch-EnhancementsConfig* is included in the received *physicalConfigDedicated*, for the associated serving cell:
 - 2> if PUSCH enhancement mode is previously released or not configured and *pusch-EnhancementsConfig* is set to *setup*, or
 - 2> if PUSCH enhancement mode is previously configured and *pusch-EnhancementConfig* is set to *release*:
 - 3> instruct the associated MAC entity to perform partial reset;
- 1> if the procedure was not triggered due to handover and *ce-Mode* is included in the received *physicalConfigDedicated*, for the associated serving cell:
 - 2> if *ce-Mode* is not currently configured and *ce-Mode* is set to *setup*, or
 - 2> if *ce-Mode* is currently configured and *ce-Mode* is set to *release*:
 - 3> instruct the associated MAC entity to perform partial reset;

For NB-IoT, the UE shall:

- 1> if the *carrierConfigDedicated* is not included in the received *physicalConfigDedicated*:
- 2> if the UE is configured with a carrier configuration previously received in *carrierConfigDedicated*:
 - 3> use the carrier configuration received in *carrierConfigDedicated*;
- 2> else:
 - 3> use the carrier configuration received in system information for the uplink and downlink carrier used during the random access procedure;
- 1> else:
 - 2> if *schedulingRequestConfig* is not received or does not include the *sr-SPS-BSR-Config*:
 - 3> instruct lower layers to clear existing configured uplink grants for BSR (if any);
 - 2> use the carrier configuration received in *carrierConfigDedicated*;
 - 2> start to use the new carrier immediately after the last transport block carrying the RRC message has been acknowledged by the MAC layer, and any subsequent RRC response message sent for the current RRC procedure is therefore sent on the new carrier;
- 1> reconfigure the physical channel configuration in accordance with the received *physicalConfigDedicated*.

NOTE 2: In case of physical channel reconfiguration at a DAPS HO, the reconfiguration is applied for the target PCell.

5.3.10.7 Radio Link Failure Timers and Constants reconfiguration

The UE shall:

- 1> if the received *rlf-TimersAndConstants* is set to *release*:

2> use values for timers T301, T310, T311 and constants N310, N311, as included in *ue-TimersAndConstants* received in *SystemInformationBlockType2* (or *SystemInformationBlockType2-NB* in NB-IoT);

1> else:

2> reconfigure the value of timers and constants in accordance with received *rlf-TimersAndConstants*;

NOTE: In case of a DAPS HO, the timer and constant values are to be applied in the target MCG after timer T304 has been stopped.

1> if the received *rlf-TimersAndConstantsSCG* is set to *release*:

2> stop timer T313, if running, and

2> release the value of timer *t313* as well as constants *n313* and *n314*;

1> else:

2> reconfigure the value of timers and constants in accordance with received *rlf-TimersAndConstantsSCG*;

1> if the received *rlf-TimersAndConstantsMCG-Failure* is set to *release*:

2> stop timer T316, if running, and

2> release the value of timer *t316*;

1> else:

2> reconfigure the value of the timer in accordance with received *rlf-TimersAndConstantsMCG-Failure*;

5.3.10.8 Time domain measurement resource restriction for serving cell

The UE shall:

1> if the received *measSubframePatternPCell* is set to *release*:

2> release the time domain measurement resource restriction for the PCell, if previously configured;

1> else:

2> apply the time domain measurement resource restriction for the PCell in accordance with the received *measSubframePatternPCell*;

5.3.10.9 Other configuration

The UE shall:

1> if the received *otherConfig* includes the *reportProximityConfig*:

2> if *proximityIndicationEUTRA* is set to *enabled*:

3> consider itself to be configured to provide proximity indications for E-UTRA frequencies in accordance with 5.3.14;

2> else:

3> consider itself not to be configured to provide proximity indications for E-UTRA frequencies;

2> if *proximityIndicationUTRA* is set to *enabled*:

3> consider itself to be configured to provide proximity indications for UTRA frequencies in accordance with 5.3.14;

2> else:

3> consider itself not to be configured to provide proximity indications for UTRA frequencies;

1> if the received *otherConfig* includes the *obtainLocation*:

2> attempt to have detailed location information available for any subsequent measurement report;

NOTE 1: The UE is requested to attempt to have valid detailed location information available whenever sending a measurement report for which it is configured to include available detailed location information. The UE may not succeed e.g. because the user manually disabled the GPS hardware, due to no/poor satellite coverage. Further details, e.g. regarding when to activate GNSS, are up to UE implementation.

NOTE 1a: Any subsequent measurement report includes RLF report and SCGFailureInformationNR.

1> if the received *otherConfig* includes the *bt-NameListConfig*:

2> if *bt-NameListConfig* is set to *setup*, attempt to have Bluetooth measurement results available for subsequent measurement report;

1> if the received *otherConfig* includes the *wlan-NameListConfig*:

2> if *wlan-NameListConfig* is set to *setup*, attempt to have WLAN measurement results available for subsequent measurement report;

1> if the received *otherConfig* includes the *measUncomBarPre*:

2> if *measUncomBarPre* is set to *true*, attempt to have barometer measurement results available for subsequent measurement report;

NOTE 2: The UE is requested to attempt to have valid Bluetooth measurements, WLAN measurements and Uncompensated Barometric Pressure Sensor measurements whenever sending a measurement report for which it is configured to include these measurements. The UE may not succeed e.g. because the user manually disabled the WLAN, Bluetooth or Sensor hardware. Further details, e.g. regarding when to activate WLAN, Bluetooth or Sensor, are up to UE implementation.

1> if the received *otherConfig* includes the *idc-Config*:

2> if *idc-Indication* is included (i.e. set to *setup*):

3> consider itself to be configured to provide IDC indications in accordance with 5.6.9;

3> if *idc-Indication-UL-CA* is included (i.e. set to *setup*):

4> consider itself to be configured to indicate UL CA related information in IDC indications in accordance with 5.6.9;

3> if *idc-HardwareSharingIndication* is included (i.e. set to *setup*):

4> consider itself to be configured to indicate IDC hardware sharing problem indications in IDC indications in accordance with 5.6.9;

3> if *idc-Indication-MRDC* is included (i.e. set to *setup*):

4> consider itself to be configured to provide IDC indications for MR-DC in accordance with 5.6.9;

2> else:

3> consider itself not to be configured to provide IDC indications;

2> if *autonomousDenialParameters* is included:

3> consider itself to be allowed to deny any transmission in a particular UL subframe if during the number of subframes indicated by *autonomousDenialValidity*, preceding and including this particular subframe, it autonomously denied fewer UL subframes than indicated by *autonomousDenialSubframes*;

2> else:

3> consider itself not to be allowed to deny any UL transmission;

1> if the received *otherConfig* includes the *powerPrefIndicationConfig*:

- 2> if *powerPrefIndicationConfig* is set to *setup*:
 - 3> consider itself to be configured to provide power preference indications in accordance with 5.6.10;
- 2> else:
 - 3> consider itself not to be configured to provide power preference indications;
- 1> if the received *otherConfig* includes the *sps-AssistanceInfoReport*:
 - 2> if *sps-AssistanceInfoReport* is set to TRUE:
 - 3> consider itself to be configured to provide SPS assistance information in accordance with 5.6.10;
 - 2> else
 - 3> consider itself not to be configured to provide SPS assistance information;
- 1> if the received *otherConfig* includes the *bw-PreferenceIndicationTimer*:
 - 2> consider itself to be configured to provide maximum PDSCH/PUSCH bandwidth preference indication in accordance with 5.6.10;
- 1> else:
 - 2> consider itself not to be configured to provide maximum PDSCH/PUSCH bandwidth indication preference;
- 1> if the received *otherConfig* includes the *delayBudgetReportingConfig*:
 - 2> if *delayBudgetReportingConfig* is set to *setup*:
 - 3> consider itself to be configured to send delay budget reports in accordance with 5.6.10;
 - 2> else:
 - 3> consider itself not to be configured to send delay budget reports and stop timer T342, if running;
- 1> if the received *otherConfig* includes the *overheatingAssistanceConfig*:
 - 2> if *overheatingAssistanceConfig* is set to *setup*:
 - 3> consider itself to be configured to provide overheating assistance information in accordance with 5.6.10;
 - 3> if *overheatingAssistanceConfigForSCG* is included:
 - 4> if *overheatingAssistanceConfigForSCG* is set to true:
 - 5> consider itself to be configured to provide overheating assistance information for NR SCG in accordance with 5.6.10;
 - 4> else if *overheatingAssistanceConfigForSCG* is set to false:
 - 5> consider itself not to be configured to provide overheating assistance information for NR SCG and stop timer T345, if running;
 - 2> else:
 - 3> consider itself not to be configured to provide overheating assistance information and stop timer T345, if running;
 - 1> for BL UEs or UEs in CE, if the received *otherConfig* includes the *rlm-ReportConfig*:
 - 2> if *rlm-ReportConfig* is set to *setup*:
 - 3> consider itself to be configured to detect "early-out-of-sync" and "early-in-sync" RLM events as specified in 5.3.11;
 - 3> if *rlmReportRep-MPDCCCH* is set to *setup*:

- 4> consider itself to be configured to report *rlmReportRep-MPDCCH* in accordance with 5.6.10;
- 2> else:
 - 3> consider itself not to be configured to detect "early-out-of-sync" and "early-in-sync" RLM events and stop timer T343, timer T344, timer T314 and timer T315 if running;
- 1> if the received *otherConfig* includes the *measConfigAppLayer*:
 - 2> if *measConfigAppLayer* is set to setup:
 - 3> forward *measConfigAppLayerContainer* to upper layers considering the *serviceType*;
 - 3> consider itself to be configured to send application layer measurement report in accordance with 5.6.19;
 - 2> else:
 - 3> inform upper layers to clear the stored application layer measurement configuration;
 - 3> discard received application layer measurement report information from upper layers;
 - 3> consider itself not to be configured to send application layer measurement report.
- 1> if the received *otherConfig* includes the *ailc-BitConfig*:
 - 2> if *ailc-BitConfig* is set to TRUE:
 - 3> consider itself to be configured to provide assistance information bit for local cache as specified in TS 36.323 [8], clause 6.2.3;
 - 2> else:
 - 3> consider itself not to be configured to provide assistance information bit for local cache;

5.3.10.10 SCG reconfiguration

The UE shall:

- 1> if *makeBeforeBreakSCG* is configured:
 - 2> stop timer T313, if running;
 - 2> start timer T307 with the timer value set to t307, as included in the *mobilityControlInfoSCG*;
 - 2> start synchronising to the DL of the target PSCell, if needed;
 - 2> perform the remainder of this procedure including and following resetting MAC after the UE has stopped the uplink transmission/downlink reception with the source PSCell;

NOTE 0a: It is up to UE implementation when to stop the uplink transmission/ downlink reception with the source PSCell to initiate re-tuning for the connection to the target cell, as specified in TS 36.133 [16], if *makeBeforeBreakSCG* is configured.

NOTE 0b: It is up to UE implementation when to stop the uplink transmission/ downlink reception with the source SCG SCell(s) after receiving *mobilityControlInfoSCG*.

- 1> if *scg-Configuration* is received and is set to *release* or includes the *mobilityControlInfoSCG* (i.e. SCG release/ change):
 - 2> if *mobilityControlInfo* is not received (i.e. SCG release/ change without HO):
 - 3> reset SCG MAC, if configured;
 - 3> if the UE is not configured with NE-DC:
 - 4> for each *drb-Identity* value that is part of the current UE configuration:

- 5> if the DRB indicated by *drb-Identity* is an SCG DRB:
 - 6> re-establish the PDCP entity and the SCG RLC entity or entities;
- 5> if the DRB indicated by *drb-Identity* is a split DRB:
 - 6> perform PDCP data recovery and re-establish the SCG RLC entity;
- 5> if the DRB indicated by *drb-Identity* is an MCG DRB; and
 - 5> *drb-ToAddModListSCG* is received and includes the *drb-Identity* value, while for this entry *drb-Type* is included and set to *scg* (i.e. MCG to SCG):
 - 6> re-establish the PDCP entity and the MCG RLC entity or entities;
- 3> configure lower layers to consider the SCG SCell(s), except for the PSCell, to be in deactivated state;
- 1> if *scg-Configuration* is received and is set to *release*:
 - 2> release the entire SCG configuration, except for the DRB configuration (i.e. as configured by *drb-ToAddModListSCG*);
 - 2> if the current UE configuration includes one or more split or SCG DRBs and the received *RRCConnectionReconfiguration* message includes *radioResourceConfigDedicated* including *drb-ToAddModList*:
 - 3> reconfigure the SCG or split DRB by *drb-ToAddModList* as specified in 5.3.10.12;
 - 2> stop timer T313, if running;
 - 2> stop timer T307, if running;
- 1> else:
 - 2> if *scg-ConfigPartMCG* is received and includes the *scg-Counter*:
 - 3> update the S- K_{eNB} key based on the K_{eNB} key and using the received *scg-Counter* value, as specified in TS 33.401 [32];
 - 3> derive the K_{UPenc} key associated with the *cipheringAlgorithmSCG* included in *mobilityControlInfoSCG* within the received *scg-ConfigPartSCG*, as specified in TS 33.401 [32];
 - 3> configure lower layers to apply the ciphering algorithm and the K_{UPenc} key;
 - 2> if *scg-ConfigPartSCG* is received and includes the *radioResourceConfigDedicatedSCG*:
 - 3> reconfigure the dedicated radio resource configuration for the SCG as specified in 5.3.10.11;
 - 2> if the current UE configuration includes one or more split or SCG DRBs and the received *RRCConnectionReconfiguration* message includes *radioResourceConfigDedicated* including *drb-ToAddModList*:
 - 3> reconfigure the SCG or split DRB by *drb-ToAddModList* as specified in 5.3.10.12;
 - 2> if *scg-ConfigPartSCG* is received and includes *measConfigSN*:
 - 3> for *measConfigSN* perform the actions as specified in 5.5.2 for *measConfig* unless explicitly stated otherwise;
 - 2> if *scg-ConfigPartSCG* is received and includes the *sCellToReleaseListSCG*:
 - 3> perform SCell release for the SCG as specified in 5.3.10.3a;
 - 2> if *scg-ConfigPartSCG* is received and includes the *pSCellToAddMod*:
 - 3> perform PSCell addition or modification as specified in 5.3.10.3c;

NOTE 0: This procedure is also used to release the PSCell e.g. PSCell change, SI change for the PSCell.

- 2> if *scg-ConfigPartSCG* is received and includes the *sCellToAddModListSCG*:
 - 3> perform SCell addition or modification as specified in 5.3.10.3b;
- 2> configure lower layers in accordance with *mobilityControlInfoSCG*, if received;
- 2> if *rach-SkipSCG* is configured:
 - 3> configure lower layers to apply the *rach-SkipSCG* for the target SCG, as specified in TS 36.213 [23] and TS 36.321 [6];
- 2> if *scg-ConfigPartSCG* is received and includes the *mobilityControlInfoSCG* (i.e. SCG change):
 - 3> resume all SCG DRBs and resume SCG transmission for split DRBs, if suspended;
 - 3> stop timer T313, if running;
 - 3> start timer T307 with the timer value set to *t307*, as included in the *mobilityControlInfoSCG*, if *makeBeforeBreakSCG* is not configured;
 - 3> start synchronising to the DL of the target PSCell;
 - 3> initiate the random access procedure on the PSCell, as specified in TS 36.321 [6], if *rach-SkipSCG* is not configured:

NOTE 1: The UE is not required to determine the SFN of the target PSCell by acquiring system information from that cell before performing RACH access in the target PSCell.

- 3> the procedure ends, except that the following actions are performed when MAC successfully completes the random access procedure on the PSCell or when MAC indicates the successful reception of a PDCCH transmission addressed to C-RNTI and if *rach-skipSCG* is configured:
 - 4> stop timer T307;
 - 4> release *rach-SkipSCG*;
 - 4> apply the parts of the CQI reporting configuration, the scheduling request configuration and the sounding RS configuration that do not require the UE to know the SFN of the target PSCell, if any;
 - 4> apply the parts of the measurement and the radio resource configuration that require the UE to know the SFN of the target PSCell (e.g. periodic CQI reporting, scheduling request configuration, sounding RS configuration), if any, upon acquiring the SFN of the target PSCell;

NOTE 2: Whenever the UE shall setup or reconfigure a configuration in accordance with a field that is received it applies the new configuration, except for the cases addressed by the above statements.

5.3.10.11 SCG dedicated resource configuration

The UE shall:

- 1> if the received *radioResourceConfigDedicatedSCG* includes the *srb-ToReleaseListSCG*:
 - 2> for each *srb-Identity* value included in the *srb-ToReleaseListSCG* perform the SCG RLC bearer release as specified in 5.3.10.17;
- 1> if the received *radioResourceConfigDedicatedSCG* includes the *srb-ToAddModListSCG*:
 - 2> for each *srb-Identity* value included in the *srb-ToAddModListSCG* perform the SCG RLC bearer addition or reconfiguration as specified in 5.3.10.1a;
- 1> if the received *radioResourceConfigDedicatedSCG* includes *drb-ToReleaseListSCG*:
 - 2> perform the DRB release as specified in 5.3.10.2;
- 1> if the received *radioResourceConfigDedicatedSCG* includes the *drb-ToAddModListSCG*:
 - 2> if the UE is configured with NE-DC:

3> for each *drb-Identity* value included in the *drb-ToAddModListSCG* perform the SCG RLC bearer addition or reconfiguration for DRBs in NE-DC as specified in 5.3.10.3a4;

2> else:

3> for each *drb-Identity* value included in the *drb-ToAddModListSCG* perform the DC specific DRB addition or reconfiguration as specified in 5.3.10.3a1;

1> if the received *radioResourceConfigDedicatedSCG* includes the *mac-MainConfigSCG*:

2> perform the SCG MAC main reconfiguration as specified in 5.3.10.4;

1> if the received *radioResourceConfigDedicatedSCG* includes the *rlf-TimersAndConstantsSCG*:

2> reconfigure the values of timers and constants as specified in 5.3.10.7;

5.3.10.12 Reconfiguration SCG or split DRB by *drb-ToAddModList*

The UE shall:

1> for each split or SCG DRBs that is part of the current configuration:

2> if the corresponding *drb-Identity* value is included in the received *drb-ToAddModList*; and

2> if the corresponding *drb-Identity* value is not included in the received *drb-ToAddModListSCG* (i.e. reconfigure split, split to MCG or SCG to MCG):

3> perform the DC specific DRB addition or reconfiguration as specified in 5.3.10.3a1;

5.3.10.13 Neighbour cell information reconfiguration

The UE shall:

1> if the received *naics-Info* is set to *release*:

2> instruct lower layer to release all the NAICS neighbour cell information for the concerned cell, if previously configured;

1> if the received *naics-Info* includes the *neighCellsToReleaseList-r12*:

2> for each *physCellId-r12* value included in the *neighCellsToReleaseList-r12* that is part of the current NAICS neighbour cell information of the concerned cell:

3> instruct lower layer to release the NAICS neighbour cell information for the concerned cell;

1> if the received *naics-Info* includes the *NeighCellsToAddModList-r12*:

2> for each *physCellId-r12* value included in the *neighCellsToAddModList-r12* that is not part of the current NAICS neighbour cell information of the concerned cell:

3> instruct lower layer to add the NAICS neighbour cell information for the concerned cell;

2> for each *physCellId-r12* value included in the *neighCellsToAddModList-r12* that is part of the current NAICS neighbour cell information of the concerned cell:

3> instruct lower layer to modify the NAICS neighbour cell information in accordance with the received *NeighCellsInfo* for the concerned cell;

5.3.10.14 Void

5.3.10.15 Sidelink dedicated configuration

The UE shall:

1> if the *RRCConnectionReconfiguration* message includes the *sl-CommConfig*:

- 2> if *commTxResources* is included and set to *setup*:
 - 3> from the next SC period use the resources indicated by *commTxResources* for sidelink communication transmission, as specified in 5.10.4;
- 2> else if *commTxResources* is included and set to *release*:
 - 3> from the next SC period, release the resources allocated for sidelink communication transmission previously configured by *commTxResources*;
- 1> if the *RRCConnectionReconfiguration* message includes the *sl-DiscConfig*:
 - 2> if *discTxResources* is included and set to *setup*:
 - 3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxResources* for sidelink discovery announcement, as specified in 5.10.6;
 - 2> else if *discTxResources* is included and set to *release*:
 - 3> from the next discovery period, as defined by *discPeriod*, release the resources allocated for sidelink discovery announcement previously configured by *discTxResources*;
 - 2> if *discTxResourcesPS* is included and set to *setup*:
 - 3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxResourcesPS* for sidelink discovery announcement, as specified in 5.10.6;
 - 2> else if *discTxResourcesPS* is included and set to *release*:
 - 3> from the next discovery period, as defined by *discPeriod*, release the resources allocated for sidelink discovery announcement previously configured by *discTxResourcesPS*;
 - 2> if *discTxInterFreqInfo* is included and set to *setup*:
 - 3> from the next discovery period, as defined by *discPeriod*, use the resources indicated by *discTxInterFreqInfo* for sidelink discovery announcement, as specified in 5.10.6;
 - 2> else if *discTxInterFreqInfo* is included and set to *release*:
 - 3> from the next discovery period, as defined by *discPeriod*, release the resources allocated for sidelink discovery announcement previously configured by *discTxInterFreqInfo*;
 - 2> if *discRxGapConfig* is included and set to *setup*:
 - 3> from the next gap period, as defined by *gapPeriod*, use the gaps indicated by *discRxGapConfig* for sidelink discovery monitoring, as specified in 5.10.5;
 - 2> else if *discRxGapConfig* is included and set to *release*:
 - 3> from the next gap period, as defined by *gapPeriod*, release the gaps configured for sidelink discovery monitoring previously configured by *discRxGapConfig*;
 - 2> if *discTxGapConfig* is included and set to *setup*:
 - 3> from the next gap period, as defined by *gapPeriod*, use the gaps indicated by *discTxGapConfig* for sidelink discovery announcement, as specified in 5.10.6;
 - 2> else if *discTxGapConfig* is included and set to *release*:
 - 3> from the next gap period, as defined by *gapPeriod*, release the gaps configured for sidelink discovery announcement previously configured by *discTxGapConfig*;
 - 2> if *discSysInfoToReportConfig* is included and set to *setup*:
 - 3> start timer T370 with the timer value set to 60s;
 - 2> else if *discSysInfoToReportConfig* is included and set to *release*:

3> stop timer T370 and release *discSysInfoToReportConfig*;

5.3.10.15a V2X sidelink Communication dedicated configuration

The UE shall:

1> if the *RRCConnectionReconfiguration* message includes the *sl-V2X-ConfigDedicated*:

2> if *commTxResources* is included and set to *setup*:

3> use the resources indicated by *commTxResources* for V2X sidelink communication transmission, as specified in 5.10.13;

3> perform CBR measurement on the transmission resource pool indicated in *commTxResources* for V2X sidelink communication transmission, as specified in 5.5.3;

2> else if *commTxResources* is included and set to *release*:

3> release the resources allocated for V2X sidelink communication transmission previously configured by *commTxResources*;

2> if *v2x-InterFreqInfoList* is included:

3> use the synchronization configuration and resource configuration parameters for V2X sidelink communication on frequencies included in *v2x-InterFreqInfoList*, as specified in 5.10.13;

3> perform CBR measurement on the transmission resource pool indicated in *v2x-InterFreqInfoList* for V2X sidelink communication transmission, as specified in 5.5.3;

1> if the *RRCConnectionReconfiguration* message includes the *mobilityControlInfoV2X*:

2> if *v2x-CommRxPool* is included:

3> use the resources indicated by *v2x-CommRxPool* for V2X sidelink communication reception, as specified in 5.10.12;

2> if *v2x-CommTxPoolExceptional* is included:

3> use the resources indicated by *v2x-CommTxPoolExceptional* for V2X sidelink communication transmission, as specified in 5.10.13;

3> perform CBR measurement on the transmission resource pool indicated by *v2x-CommTxPoolExceptional* for V2X sidelink communication transmission, as specified in 5.5.3;

5.3.10.16 T370 expiry

The UE shall:

1> if T370 expires:

2> release *discSysInfoToReportConfig*;

5.3.10.17 SRB release

The UE shall:

1> for each *srб-Identity* value included in *srб-ToReleaseList* or in *srб-ToReleaseListSCG* that is part of the current UE configuration:

2> if the SRB configuration does not include an E-UTRA PDCP entity (release the SCG RLC bearer configuration):

3> re-establish the RLC entity as specified in TS 36.322 [7] for this SRB;

3> configure the E-UTRA PDCP entity to deactivate duplication;

- 2> release the RLC entity or entities;
- 2> release the DCCH logical channel;
- 2> if *srb-Identity* value is set to 4, release the PDCP entity;

5.3.10.18 Scheduling Request Configuration for NB-IoT

The UE shall:

- 1> apply *sr-WithHARQ-ACK-Config*, if included;
- 1> apply *sr-WithoutHARQ-ACK-Config*, if included;
- 1> if *sr-SPS-BSR-Config* is included:
 - 2> instruct lower layers to clear existing configured uplink grants for BSR (if any);
 - 2> apply *sr-SPS-BSR-Config*.

5.3.10.19 NE-DC release

The UE shall:

- 1> if NE-DC release is triggered by NR:
 - 2> reset SCG MAC, if configured;
 - 2> for each RLC bearer that is part of the SCG configuration:
 - 3> perform RLC bearer release procedure as specified in 5.3.10.17 (SRBs) and in 5.3.10.2 (DRBs);
 - 2> release the measurement configuration;
 - 2> release the SCG configuration i.e. release the MAC and physical configuration for each cell that is part of the SCG configuration;
 - 2> stop timer T313 for the corresponding PSCell, if running;
 - 2> stop timer T307 for the corresponding PSCell, if running.

NOTE: Upon NE-DC release the UE releases all fields configured by the *RRConnectionReconfiguration* message.

5.3.11 Radio link failure related actions

5.3.11.1 Detection of physical layer problems in RRC_CONNECTED

The UE shall:

- 1> if any DAPS bearer is configured, upon receiving N310 consecutive "out-of-sync" indications for the source PCell from lower layers and T304 is running:
 - 2> start timer T310 for the source PCell;
- 1> upon receiving N310 consecutive "out-of-sync" indications for the PCell from lower layers while neither T300, T301, T304, T311, nor T316 is running:
 - 2> start timer T310;
- 1> upon receiving N313 consecutive "out-of-sync" indications for the PSCell from lower layers while T307 is not running:
 - 2> start T313;

NOTE: Physical layer monitoring and related autonomous actions do not apply to SCells except for the PSCell.

5.3.11.1a Early detection of physical layer problems in RRC_CONNECTED

The UE shall:

- 1> upon receiving N310 consecutive "early-out-of-sync" indications for the PCell from lower layers;
- 2> start timer T314 with the timer value set to the value of T310;

5.3.11.1b Detection of physical layer improvements in RRC_CONNECTED

The UE shall:

- 1> upon receiving N311 consecutive "early-in-sync" indications for the PCell from lower layers;
- 2> start timer T315 with the timer value set to the value of T310;

5.3.11.2 Recovery of physical layer problems

Upon receiving N311 consecutive "in-sync" indications for the PCell from lower layers while T310 is running, the UE shall:

- 1> stop timer T310;
- 1> stop timer T312, if running;

NOTE 1: In this case, the UE maintains the RRC connection without explicit signalling, i.e. the UE maintains the entire radio resource configuration.

NOTE 2: Periods in time where neither "in-sync" nor "out-of-sync" is reported by layer 1 do not affect the evaluation of the number of consecutive "in-sync" or "out-of-sync" indications.

Upon receiving N314 consecutive "in-sync" indications for the PSCell from lower layers while T313 is running, the UE shall:

- 1> stop timer T313;

5.3.11.2a Recovery of early detection of physical layer problems

Upon receiving N311 consecutive "in-sync" indications for the PCell from lower layers while T314 is running, the UE shall:

- 1> stop timer T314;

5.3.11.2b Cancellation of physical layer improvements in RRC_CONNECTED

Upon receiving N311 consecutive "in-sync" indications for the PCell from lower layers while T315 is running, the UE shall:

- 1> stop timer T315;

5.3.11.3 Detection of radio link failure

The UE shall:

- 1> in case any DAPS bearer is configured, only the target PCell is considered in the following;
- 1> upon T310 expiry; or
- 1> upon T312 expiry; or

- 1> upon T318 expiry and *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) not acquired; or
- 1> upon reaching *t-Service* if *t-Service* is broadcast; or
- 1> upon random access problem indication from MCG MAC while neither T300, T301, T304 nor T311 is running; or
- 1> upon indication from MCG RLC, which is allowed to be send on PCell, that the maximum number of retransmissions has been reached for an SRB or DRB:
- 2> consider radio link failure to be detected for the MCG i.e. RLF;
- 2> discard any segments of segmented RRC messages received;
- 2> if the last *RRConnectionReconfiguration* message including the *mobilityControlInfo* concerned a handover to E-UTRA from NR and if the UE supports successful handover report for Inter-RAT SHR NR and if the UE has successful handover related information available in *VarSuccessHO-Report* of TS 38.331 [82]:
- 3> set the *eutra-C-RNTI* in the *successHO-Report* in *VarSuccessHO-Report* of TS 38.331 [82] to the C-RNTI used in the PCell;
- 2> store the following radio link failure information in the *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT) by setting its fields as follows:
 - 3> clear the information included in *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT), if any;
 - 3> set the *plmn-IdentityList* to include the list of EPLMNs stored by the UE (i.e. includes the RPLMN);
 - 3> set the *measResultLastServCell* to include the RSRP and RSRQ, if available, of the PCell based on measurements collected up to the moment the UE detected radio link failure;
 - 3> except for NB-IoT, set the *measResultNeighCells* to include the best measured cells, other than the PCell, ordered such that the best cell is listed first, and based on measurements collected up to the moment the UE detected radio link failure, and set its fields as follows:
 - 4> if the UE was configured to perform measurements for one or more EUTRA frequencies, include the *measResultListEUTRA*;
 - 4> if the UE was configured to perform measurement reporting for one or more neighbouring UTRA frequencies, include the *measResultListUTRA*;
 - 4> if the UE was configured to perform measurement reporting for one or more neighbouring GERAN frequencies, include the *measResultListGERAN*;
 - 4> if the UE was configured to perform measurement reporting for one or more neighbouring CDMA2000 frequencies, include the *measResultsCDMA2000*;
 - 4> if the UE was configured to perform measurement reporting, not related to NR sidelink communication, for one or more neighbouring NR frequencies, include the *measResultListNR*;
 - 4> for each neighbour cell included, include the optional fields that are available;

NOTE 1: The measured quantities are filtered by the L3 filter as configured in the mobility measurement configuration. The measurements are based on the time domain measurement resource restriction, if configured. Exclude-listed cells are not required to be reported.

- 3> except for NB-IoT, if available, set the *logMeasResultListWLAN* to include the WLAN measurement results, in order of decreasing RSSI for WLAN APs;
- 3> except for NB-IoT, if available, set the *logMeasResultListBT* to include the Bluetooth measurement results, in order of decreasing RSSI for Bluetooth beacons;
- 3> if detailed location information is available, set the content of the *locationInfo* as follows:
 - 4> include the *locationCoordinates*;

- 4> include the *horizontalVelocity*, if available;
- 3> set the *failedPCellId* to the global cell identity, if available, and otherwise , except for NB-IoT, to the physical cell identity and carrier frequency of the PCell where radio link failure is detected;
- 3> except for NB-IoT, set the *tac-FailedPCell* to the tracking area code, if available, of the PCell where radio link failure is detected;
- 3> except for NB-IoT, if an *RRCConnectionReconfiguration* message including the *mobilityControlInfo* was received before the connection failure:
 - 4> if the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo* concerned an intra E-UTRA handover:
 - 5> include the *previousPCellId* and set it to the global cell identity of the PCell where the last *RRCConnectionReconfiguration* message including *mobilityControlInfo* was received;
 - 5> set the *timeConnFailure* to the elapsed time since reception of the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo*;
 - 4> if the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo* concerned a handover to E-UTRA from UTRA and if the UE supports Radio Link Failure Report for Inter-RAT MRO:
 - 5> include the *previousUTRA-CellId* and set it to the physical cell identity, the carrier frequency and the global cell identity, if available, of the UTRA Cell in which the last *RRCConnectionReconfiguration* message including *mobilityControlInfo* was received;
 - 5> set the *timeConnFailure* to the elapsed time since reception of the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo*;
 - 4> if the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo* concerned a handover to E-UTRA from NR and if the UE supports Radio Link Failure Report for Inter-RAT MRO NR:
 - 5> include the *previousNR-PCellId* and set it to the global cell identity of the PCell where the last *RRCConnectionReconfiguration* message including *mobilityControlInfo* was received embedded in NR RRC message *MobilityFromNRCommand* message as specified in TS 38.331 [82] clause 5.4.3.3;
 - 5> set the *timeConnFailure* to the elapsed time since reception of the last *RRCConnectionReconfiguration* message including the *mobilityControlInfo* embedded in NR RRC message *MobilityFromNRCommand* message as specified in TS 38.331 [82] clause 5.4.3.3.
 - 5> if the UE supports RLF Report for Inter-system HO for Voice Fallback as defined in TS 38.306 [87], and *voiceFallbackIndication* is included in the *MobilityFromNRCommand*:
 - 6> set *voiceFallbackHO* to *true*;
 - 3> except for NB-IoT, if the UE supports QCI1 indication in Radio Link Failure Report and has a DRB for which QCI is 1:
 - 4> include the *drb-EstablishedWithQCI-1*;
 - 3> except for NB-IoT, set the *connectionFailureType* to *rlf*;
 - 3> except for NB-IoT, set the *c-RNTI* to the C-RNTI used in the PCell;
 - 3> except for NB-IoT, set the *rlf-Cause* to the trigger for detecting radio link failure;
 - 2> if the UE is configured with (NG)EN-DC; and
 - 2> if T316 is configured; and
 - 2> if SCG transmission is not suspended; and
 - 2> if the SCG is not deactivated; and

2> if neither NR PSCell change nor NR PSCell addition is ongoing (i.e. T304 for the NR PSCell is not running as specified in TS 38.331 [82], clause 5.3.5.5.2, in (NG)EN-DC);

3> initiate the MCG failure information procedure as specified in 5.6.26 to report MCG radio link failure;

2> else:

3> if AS security has not been activated:

4> if the UE is a NB-IoT UE:

5> if the UE is connected to EPC and the UE supports RRC connection re-establishment for the Control Plane CIoT EPS optimisation; or

5> if the UE is connected to 5GC, the UE supports RRC connection re-establishment for the Control Plane CIoT 5GS optimisation and the UE is configured with a truncated 5G-S-TMSI;

6> initiate the RRC connection re-establishment procedure as specified in 5.3.7;

5> else:

6> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'RRC connection failure';

4> else:

5> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

3> else:

4> initiate the connection re-establishment procedure as specified in 5.3.7;

NOTE 2: BL UEs or UEs in CE or NB-IoT UEs that are connected to NTN may perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other' if the UE determines by implementation there is not enough time to finish the procedure of reestablishment due to the discontinuous coverage.

In case of DC or NE-DC, the UE shall:

1> upon T313 expiry; or

1> upon random access problem indication from SCG MAC; or

1> upon indication from SCG RLC, which is allowed to be sent on PSCell, that the maximum number of retransmissions has been reached for an SCG, for a split DRB or for a split SRB;

2> consider radio link failure to be detected for the SCG i.e. SCG-RLF;

2> if the UE is configured with DC; or

2> if the UE is configured with NE-DC and MCG transmission is not suspended:

3> initiate the SCG failure information procedure as specified in 5.6.13 to report SCG radio link failure;

2> else:

3> initiate the connection re-establishment procedure as specified in TS 38.331 [82], clause 5.3.7.

In case of CA PDCP duplication, the UE shall:

1> upon indication from an RLC entity, which is restricted to be sent on SCell only, that the maximum number of retransmissions has been reached:

2> initiate the failure information procedure as specified in 5.6.21 to report RLC failure of type duplication;

If any DAPS bearer is configured and T304 is running, the UE shall:

- 1> upon T310 expiry for the source PCell; or
- 1> upon random access problem indication from source MCG MAC; or
- 1> upon indication from source MCG RLC, which is allowed to be sent on source PCell, that the maximum number of retransmissions has been reached for an DRB:
 - 2> consider radio link failure to be detected for the source MCG;
 - 2> suspend the transmission of all DRBs in the source MCG;
 - 2> reset MAC for the source MCG;
 - 2> release the source connection;

The UE may discard the radio link failure information, i.e. release the UE variable *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT), 48 hours after the radio link failure is detected, upon power off or upon detach, and for NB-IoT, upon entering another RAT.

5.3.11.3a Detection of early-out-of-sync event

The UE shall:

- 1> upon T314 expiry;
- 2> consider "early-out-of-sync" event to be detected and initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10;

5.3.11.3b Detection of early-in-sync event

The UE shall:

- 1> upon T315 expiry;
- 2> consider "early-in-sync" event to be detected and initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10;

5.3.12 UE actions upon leaving RRC_CONNECTED or RRC_INACTIVE

Upon leaving RRC_CONNECTED or RRC_INACTIVE, the UE shall:

- 1> reset MAC;
- 1> if leaving RRC_INACTIVE was not triggered by the reception of *RRCConnectionRelease* including *idleModeMobilityControlInfo* or *altFreqPriorities*:
 - 2> stop the timer T320 and T323, if running;
 - 2> if stored, discard the cell reselection priority information provided by the *idleModeMobilityControlInfo*;
 - 2> if stored, discard the *altFreqPriorities* provided by the *RRCConnectionRelease*;
- 1> if entering RRC_IDLE was triggered by reception of the *RRCConnectionRelease* message including a *waitTime*:
 - 2> start timer T302, with the timer value set according to the *waitTime*;
 - 2> inform the upper layer that access barring is applicable for all access categories except categories '0' and '2';
- 1> else if T302 is running:
 - 2> stop timer T302;
 - 2> if the UE is connected to 5GC:
 - 3> perform the actions as specified in 5.3.16.4;

- 1> if T309 is running:
 - 2> stop timer T309 for all access categories;
 - 2> perform the actions as specified in 5.3.16.4.
- 1> stop all timers that are running except T302, T320, T322, T323, T325, T330, T331;
- 1> release *crs-ChEstMPDCCH-ConfigDedicated*, if configured;
- 1> if leaving RRC_CONNECTED was triggered by suspension of the RRC:
 - 2> re-establish RLC entities for all SRBs and DRBs, including RBs configured with NR PDCP;
 - 2> remove all entries within *VarConditionalReconfiguration*, if any;
 - 2> for each *measId*, that is part of the current UE configuration in *VarMeasConfig*, if the associated *reportConfig* has *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR* configured:
 - 3> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;
 - 3> if the associated *measObjectId* is only associated with *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR*:
 - 4> remove the entry with the matching *measObjectId* from the *measObjectList* within the *VarMeasConfig*;
 - 3> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;
 - 2> store the UE AS Context including the current RRC configuration, the current security context, the PDCP state including ROHC state, C-RNTI used in the source PCell, the *cellIdentity* and the physical cell identity of the source PCell, and the *spCellConfigCommon* within *ReconfigurationWithSync* of the PSCell (if configured);
 - 2> store the following information provided by E-UTRAN:
 - 3> if the UE connected to 5GC is a BL UE or UE in CE:
 - 4> the *fullI-RNTI*, if present;
 - 4> the *shortI-RNTI*, if present;
 - 3> else:
 - 4> the *resumeIdentity*;
 - 3> the *nextHopChainingCount*, if present. Otherwise discard any stored *nextHopChainingCount* that does not correspond to stored key *K_{RRCint}*;
 - 3> the *drb-ContinueROHC*, if present. Otherwise discard any stored *drb-ContinueROHC*;
 - 2> suspend all SRB(s) and DRB(s), including RBs configured with NR PDCP, except SRB0;
 - 2> if the UE connected to 5GC is a BL UE or UE in CE, indicate PDCP suspend to lower layers of all DRBs;
 - 2> if the UE is connected to 5GC:
 - 3> indicate the idle suspension of the RRC connection to upper layers;
 - 2> else:
 - 3> indicate the suspension of the RRC connection to upper layers;
 - 2> configure lower layers to suspend integrity protection and ciphering;

NOTE 1: Except when resuming an RRC connection after early security reactivation in accordance with conditions in 5.3.3.18, ciphering is not applied for the subsequent *RRCConnectionResume* message used to resume the connection and an integrity check is performed by lower layers, but merely upon request from RRC.

1> else:

2> upon leaving RRC_INACTIVE:

3> discard the UE Inactive AS context;

3> discard the K_{eNB} , the $K_{RRC_{enc}}$ key, the $K_{RRC_{int}}$ and the $K_{UP_{enc}}$ key;

2> release *rrc-InactiveConfig*, if configured;

2> remove all entries within *VarConditionalReconfiguration*, if any;

2> for each *measId*, that is part of the current UE configuration in *VarMeasConfig*, if the associated *reportConfig* has *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR* configured:

3> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;

3> if the associated *measObjectId* is only associated with *condReconfigurationTriggerEUTRA*/*condReconfigurationTriggerNR*:

4> remove the entry with the matching *measObjectId* from the *measObjectList* within the *VarMeasConfig*;

3> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;

2> release all radio resources, including release of the MAC configuration, the RLC entity and the associated PDCP entity and SDAP (if any) for all established RBs, except for the following:

- *pur-Config*, if stored;

2> indicate the release of the RRC connection to upper layers together with the release cause;

1> release the stored *serviceType*, if any;

1> inform upper layers to clear the stored application layer measurement configuration;

1> discard received application layer measurement report information from upper layers, if any;

1> consider itself not to be configured to send application layer measurement report;

1> if leaving RRC_CONNECTED was triggered neither by reception of the *MobilityFromEUTRACommand* message nor by selecting an inter-RAT cell while T311 was running; or

1> if leaving RRC_INACTIVE was not triggered by the inter-RAT cell reselection:

2> if timer T350 is configured:

3> start timer T350;

3> apply *rclwi-Configuration* if configured, otherwise apply the *wlan-Id-List* corresponding to the RPLMN included in *SystemInformationBlockType17*;

2> else:

3> release the *wlan-OffloadConfigDedicated*, if received;

3> if the *wlan-OffloadConfigCommon* corresponding to the RPLMN is broadcast by the cell:

4> apply the *wlan-OffloadConfigCommon* corresponding to the RPLMN included in *SystemInformationBlockType17*;

4> apply *steerToWLAN* if configured, otherwise apply the *wlan-Id-List* corresponding to the RPLMN included in *SystemInformationBlockType17*;

2> enter RRC_IDLE and perform procedures as specified in TS 36.304 [4], clause 5.2.7;

1> else:

2> release the *wlan-OffloadConfigDedicated*, if received;

NOTE 2: BL UEs or UEs in CE verifies validity of SI when released to RRC_IDLE.

1> discard any segments of segmented RRC messages received;

1> release the LWA configuration, if configured, as described in 5.6.14.3;

1> release the LWIP configuration, if configured, as described in 5.6.17.3;

5.3.13 UE actions upon PUCCH/ SPUCCH/ SRS release request

Upon receiving a PUCCH release request from lower layers, for an indicated serving cell the UE shall:

1> apply the default physical channel configuration for *cqi-ReportConfig* for the indicated serving cell as specified in 9.2.4 and release *cqi-ReportConfigSCell*, for each SCell that sends HARQ feedback on the indicated serving cell, if any;

1> apply the default physical channel configuration for *schedulingRequestConfig* as specified in 9.2.4, for the concerned CG;

Upon receiving a sPUCCH release request from lower layers, the UE shall:

1> for each serving cell in the UE configuration:

2> apply the value *release* to the field *schedulingRequest-SPUCCH*;

Upon receiving an SRS release request from lower layers, for an indicated serving cell the UE shall:

1> apply the default physical channel configuration for *soundingRS-UL-ConfigDedicated*, as specified in 9.2.4;

NOTE: Upon PUCCH/ SRS release request, the UE does not modify the *soundingRS-UL-ConfigDedicatedAperiodic* i.e. it does not apply the default for this field (release).

5.3.13a UE actions upon SR release request for NB-IoT

Upon receiving a SR release request from lower layers, the UE shall:

1> apply the value *FALSE* for *sr-WithHARQ-ACK-Config* and release *sr-WithHARQ-ACK-Config*, if configured;

1> apply the value *release* for *sr-WithoutHARQ-ACK-Config* and release *sr-WithoutHARQ-ACK-Config*, if configured;

1> apply the value *release* for *sr-SPS-BSR-Config* and release *sr-SPS-BSR-Config*, if configured;

5.3.13b UE actions upon PUR release request

Upon receiving a PUR release request from lower layers, the UE shall:

1> release *pur-Config*, if configured;

1> discard previously stored *pur-Config*, if any.

5.3.14 Proximity indication

5.3.14.1 General

Figure 5.3.14.1-1: Proximity indication

The purpose of this procedure is to indicate that the UE is entering or leaving the proximity of one or more CSG member cells. The detection of proximity is based on an autonomous search function as defined in TS 36.304 [4].

5.3.14.2 Initiation

A UE in RRC_CONNECTED shall:

- 1> if the UE enters the proximity of one or more CSG member cell(s) on an E-UTRA frequency while proximity indication is enabled for such E-UTRA cells; or
- 1> if the UE enters the proximity of one or more CSG member cell(s) on an UTRA frequency while proximity indication is enabled for such UTRA cells; or
- 1> if the UE leaves the proximity of all CSG member cell(s) on an E-UTRA frequency while proximity indication is enabled for such E-UTRA cells; or
- 1> if the UE leaves the proximity of all CSG member cell(s) on an UTRA frequency while proximity indication is enabled for such UTRA cells;
- 2> if the UE has previously not transmitted a *ProximityIndication* for the RAT and frequency during the current RRC connection, or if more than 5 s has elapsed since the UE has last transmitted a *ProximityIndication* (either entering or leaving) for the RAT and frequency;
- 3> initiate transmission of the *ProximityIndication* message in accordance with 5.3.14.3;

NOTE: In the conditions above, "if the UE enters the proximity of one or more CSG member cell(s)" includes the case of already being in the proximity of such cell(s) at the time proximity indication for the corresponding RAT is enabled.

5.3.14.3 Actions related to transmission of *ProximityIndication* message

The UE shall set the contents of *ProximityIndication* message as follows:

- 1> if the UE applies the procedure to report entering the proximity of CSG member cell(s):
 - 2> set *type* to *entering*;
- 1> else if the UE applies the procedure to report leaving the proximity of CSG member cell(s):
 - 2> set *type* to *leaving*;
- 1> if the proximity indication was triggered for one or more CSG member cell(s) on an E-UTRA frequency:
 - 2> set the *carrierFreq* to *eutra* with the value set to the E-ARFCN value of the E-UTRA cell(s) for which proximity indication was triggered;

- 1> else if the proximity indication was triggered for one or more CSG member cell(s) on a UTRA frequency:
- 2> set the *carrierFreq* to *utra* with the value set to the ARFCN value of the UTRA cell(s) for which proximity indication was triggered;

The UE shall submit the *ProximityIndication* message to lower layers for transmission.

5.3.15 Void

5.3.16 Unified Access Control

5.3.16.1 General

The purpose of this procedure is to perform access barring check for an access attempt associated with a given Access Category and one or more Access Identities upon request from upper layers according to TS 24.501 [95] or the RRC layer.

BL UE or UE in CE in RRC_CONNECTED uses *SystemInformationBlockType25*, if broadcasted, acquired when entering RRC_CONNECTED or acquired while T311 is running.

Except for BL UE and UE in CE, after a handover resulting in change of PCell in RRC_CONNECTED the UE shall defer access barring checks until it has obtained valid UAC information (from *SystemInformationBlockType25*) from the target cell if the *SystemInformationBlockType25* is broadcasted. For BL UE or UE in CE after a handover resulting in change of PCell, the UE shall consider *systemInformationBlockType25* is not broadcast in the target cell until the UE leaves RRC_CONNECTED.

In NB-IoT, in RRC_CONNECTED, the UE uses *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* and *SystemInformationBlockType14-NB*, if broadcasted, acquired when entering RRC_CONNECTED or acquired while T311 is running.

5.3.16.2 Initiation

Except for NB-IoT, upon initiation of the procedure, the UE shall:

- 1> if T309 is running for the Access Category:
- 2> consider the access attempt as barred;
- 1> else if timer T302 is running and the Access Category is neither '2' nor '0':
- 2> consider the access attempt as barred;
- 1> else:
- 2> if the Access Category is '0':
- 3> consider the access attempt as allowed;
- 2> else if *SystemInformationBlockType25* is not broadcasted:
- 3> consider the access attempt as allowed;
- 2> else if *ab-PerRSRP* is included:
- 3> if the *establishmentCause* received from higher layers is set to a value other than *emergency*:
- 4> if *ab-PerRSRP* is set to *thresh0*:
- 5> consider access to the cell as barred when in enhanced coverage as specified in TS 36.304 [4];
- 4> else if *ab-PerRSRP* is set to *thresh1*:
- 5> if the measured RSRP is less than the first entry in *rsrp-ThresholdsPrachInfoList*:

- 6> consider access to the cell as barred;
- 5> else:
 - 6> consider that only the resources indicated for the first CE level are configured;
- 4> else if *ab-PerRSRP* is set to *thresh2*:
 - 5> if the measured RSRP is less than the second entry in *rsrp-ThresholdsPrachInfoList*:
 - 6> consider access to the cell as barred;
 - 5> else:
 - 6> consider that only the resources indicated for the first and second CE levels are configured;
- 4> else if *ab-PerRSRP* is set to *thresh3*:
 - 5> if the measured RSRP is less than the third entry in *rsrp-ThresholdsPrachInfoList*:
 - 6> consider access to the cell as barred;
 - 5> else:
 - 6> consider that only the resources indicated for the first, second, and third CE levels are configured;
- 2> if the Access Category is not '0', and *SystemInformationBlockType25* is broadcasted, and access to the cell is not barred due to *ab-PerRSRP*:
 - 3> if *SystemInformationBlockType25* includes *uac-BarringPerPLMN-List* and the *uac-BarringPerPLMN-List* contains an *UAC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers (see TS 24.501 [95]):
 - 4> select the *UAC-BarringPerPLMN* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers;
 - 4> in the remainder of this procedure, use the selected *UAC-BarringPerPLMN* entry (i.e. presence or absence of access barring parameters in this entry) irrespective of the *uac-BarringForCommon* included in *SystemInformationBlockType25*;
 - 3> else if *SystemInformationBlockType25* includes *uac-BarringForCommon*:
 - 4> in the remainder of this procedure use the *uac-BarringForCommon* (i.e. presence or absence of these parameters) included in *SystemInformationBlockType25*;
 - 3> else:
 - 4> consider the access attempt as allowed;
 - 3> if *uac-BarringForCommon* is applicable or the *uac-AC-BarringListType* indicated that *uac-ExplicitAC-BarringList* is used:
 - 4> if the corresponding *UAC-BarringPerCatList* contains a *UAC-BarringPerCat* entry corresponding to the Access Category:
 - 5> select the *UAC-BarringPerCat* entry;
 - 5> if the *uac-BarringInfoSetList* contain a *UAC-BarringInfoSet* entry corresponding to the *uac-barringInfoSetIndex* in the *UAC-BarringPerCat*:
 - 6> select the *UAC-BarringInfoSet* entry;
 - 6> perform access barring check for the Access Category as specified in 5.3.16.5, using the *UAC-BarringInfoSet* as "UAC barring parameter";
 - 5> else:

- 6> consider the access attempt as allowed;
- 4> else:
 - 5> consider the access attempt as allowed;
- 3> else if the *uac-AC-BarringListType* indicated that *uac-ImplicitAC-BarringList* is indicated:
 - 4> select the *uac-BarringInfoSetIndex* corresponding to the Access Category in the *uac-ImplicitACBarringList*;
 - 4> if the *uac-BarringInfoSetList* contain the *UAC-BarringInfoSet* entry corresponding to the selected *uac-BarringInfoSetIndex*:
 - 5> select the *UAC-BarringInfoSet* entry;
 - 5> perform access barring check for the Access Category as specified in 5.3.16.5, using the *UAC-BarringInfoSet* as "UAC barring parameter";
 - 4> else:
 - 5> consider the access attempt as allowed;
 - 3> else:
 - 4> consider the access attempt as allowed;
- 1> if the access barring check was requested by upper layers:
 - 2> if the access attempt is considered as barred:
 - 3> if timer T302 is running:
 - 4> if timer T309 is running for Access Category '2':
 - 5> inform the upper layer that access barring is applicable for all access categories except categories '0', upon which the procedure ends;
 - 4> else:
 - 5> inform the upper layer that access barring is applicable for all access categories except categories '0' and '2', upon which the procedure ends;
 - 3> else:
 - 4> inform upper layers that the access attempt for the Access Category is barred, upon which the procedure ends;
 - 2> else:
 - 3> inform upper layers that the access attempt for the Access Category is allowed, upon which the procedure ends;
- 1> else:
 - 2> the procedure ends;

For NB-IoT, upon initiation of the procedure, the UE shall:

- 1> if T309 is running for the Access Category:
 - 2> consider the access attempt as barred;
- 1> else:
 - 2> if the Access Category is '0':
 - 3> consider the access attempt as allowed;

2> else if *ab-Barring-5GC* in *MasterInformationBlock-NB / MasterInformationBlock-TDD-NB* is set to *FALSE*:

3> consider the access attempt as allowed;

2> else:

3> if *SystemInformationBlockType14-NB* includes *uac-BarringCommon*:

4> in the remainder of this procedure, use the *UAC-BarringCommon* as *UAC-Barring*;

3> else if *SystemInformationBlockType14-NB* includes *uac-BarringPerPLMN-List* and the *uac-BarringPerPLMN-List* contains an *UAC-Barring* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers (see TS 24.501 [95]):

4> select the *UAC-Barring* entry with the *plmn-IdentityIndex* corresponding to the PLMN selected by upper layers;

4> in the remainder of this procedure, use the selected *UAC-Barring* entry as *UAC-Barring*;

3> else:

4> consider the access attempt as allowed;

3> if *UAC-Barring* is applicable:

4> if one or more Access Identities are indicated according to TS 24.501 [95]; and

4> if for at least one of these Access Identities the corresponding bit in the *uac-BarringForAccessIdentity* is set to zero:

5> consider the access attempt as allowed;

4> else if the *UAC-BarringPerCatList* contains a *UAC-BarringPerCat* entry corresponding to the Access Category:

5> select the *UAC-BarringPerCat* entry;

6> perform access barring check for the Access Category as specified in 5.3.16.5, using the *uac-BarringForAccessIdentity* and the *UAC-BarringPerCat* entry as "UAC barring parameter";

5> else:

6> consider the access attempt as allowed;

1> if the access barring check was requested by upper layers:

2> if the access attempt is considered as barred:

3> inform upper layers that the access attempt for the Access Category is barred, upon which the procedure ends;

2> else:

3> inform upper layers that the access attempt for the Access Category is allowed, upon which the procedure ends;

1> else:

2> the procedure ends;

5.3.16.3 Void

5.3.16.4 T302, T309 expiry or stop (Barring alleviation)

Except for NB-IoT, if the UE is connected to 5GC, the UE shall:

- 1> if timer T302 expires or is stopped;
- 2> for each Access Category for which T309 is not running:
 - 3> consider the barring for this Access Category to be alleviated;
- 1> else if timer T309 corresponding to an Access Category other than '2' expires or is stopped, and if timer T302 is not running:
 - 2> consider the barring for this Access Category to be alleviated;
- 1> else if timer T309 corresponding to the Access Category '2' expires or is stopped:
 - 2> consider the barring for this Access Category to be alleviated;
- 1> When barring for an access category is considered being alleviated:
 - 2> if the Access Category was informed to upper layers as barred:
 - 3> inform upper layers about barring alleviation for the Access Category;
 - 2> if barring is alleviated for Access Category '8'; or
 - 2> if barring is alleviated for Access Category '2':
 - 3> perform actions specified in 5.3.17;

For NB-IoT, if the UE is connected to 5GC, the UE shall:

- 1> if timer T309 expires or is stopped for one Access Category:
 - 2> consider the barring for this Access Category to be alleviated;
 - 2> if the Access Category was informed to upper layers as barred:
 - 3> inform upper layers about barring alleviation for the Access Category;

5.3.16.5 Access barring check

The UE shall:

- 1> if one or more Access Identities equal to 1, 2, 11, 12, 13, 14, or 15 are indicated according to TS 24.501 [95], and
- 1> if for at least one of these Access Identities the corresponding bit in the *uac-BarringForAccessIdentity* contained in "UAC barring parameter" is set to *zero*:
 - 2> consider the access attempt as allowed;
- 1> else:
 - 2> if the establishment of the RRC connection is the result of release with redirect with *mpsPriorityIndication* (either in NR or E-UTRAN); and
 - 2> if the bit corresponding to Access Identity 1 in the *uac-BarringForAccessIdentity* contained in the "UAC barring parameter" is set to *zero*:
 - 3> consider the access attempt as allowed;
 - 2> else if Access Identity 3 is indicated:
 - 3> draw a random number '*rand*' uniformly distributed in the range: $0 \leq \text{rand} < 1$;
 - 3> if '*rand*' is lower than the value indicated by *uac-BarringFactorForAI3* included in "UAC barring parameter":
 - 4> consider the access attempt as allowed;

```

3> else:
4>   consider the access attempt as barred;

2> else:
3>   draw a random number 'rand' uniformly distributed in the range:  $0 \leq rand < 1$ ;
3>   if 'rand' is lower than the value indicated by uac-BarringFactor included in "UAC barring parameter":
4>     consider the access attempt as allowed;
3>   else:
4>     consider the access attempt as barred;

1> if the access attempt is considered as barred:
2>   draw a random number 'rand' that is uniformly distributed in the range  $0 \leq rand < 1$ ;
2>   start timer T309 for the Access Category with the timer value calculated as follows, using the uac-BarringTime included in "UAC barring parameter":
   "Tbarring" =  $(0.7 + 0.6 * rand) * uac-BarringTime$ ;

```

5.3.17 RAN notification area update

5.3.17.1 General

The purpose of this procedure is:

- to notify the network that a UE in RRC_INACTIVE has re-selected to a cell not belonging to the configured RAN notification area; or
- to periodically notify the network by a UE in RRC_INACTIVE;

5.3.17.2 Initiation

When in RRC_INACTIVE state, the UE shall:

- 1> if T380 expires, or:
- 1> if RNA Update is triggered at reception of *SystemInformationBlockType1*, as specified in 5.2.2.7:
 - 2> initiate RRC connection resume procedure in 5.3.3 with cause value set to 'rna-Update';
- 1> if barring is alleviated for Access Category '8' or Access Category '2', as specified in 5.3.16.4:
 - 2> if upper layers do not request RRC the resumption of an RRC connection, and
 - 2> if the variable *pendingRnaUpdate* is set to 'TRUE':
 - 3> initiate RRC connection resume procedure in 5.3.3 with cause value set to 'rna-Update';

If the UE in RRC_INACTIVE state fails to find a suitable cell and camps on the acceptable cell to obtain limited service as defined in TS 36.304 [4], the UE shall:

- 1> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12 with release cause 'other'.

5.3.17.3 Inter RAT cell reselection or CN type change

Upon reselecting to an inter-RAT cell or to another CN type, the UE shall:

- 1> perform the actions upon leaving RRC_INACTIVE as specified in 5.3.12, with release cause 'other'.

5.3.18 T317 expiry

The UE shall:

- 1> if in RRC_CONNECTED and not performing GNSS measurement:
 - 2> inform lower layers that the UL synchronisation is lost;
 - 2> start timer T318;
 - 2> acquire *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) as specified in 5.2.2;
 - 2> if the UE acquires *SystemInformationBlockType33* (*SystemInformationBlockType33-NB* in NB-IoT) as specified in 5.2.2:
 - 3> inform lower layers when UL synchronisation is restored upon successful acquisition of *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT);
 - 3> stop timer T318 when both *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) and *SystemInformationBlockType33* (*SystemInformationBlockType33-NB* in NB-IoT) are acquired;
 - 2> else:
 - 3> upon successful acquisition of *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT):
 - 4> stop timer T318;
 - 4> inform lower layers when UL synchronisation is restored.

NOTE 1: *SystemInformationBlockType31* (*SystemInformationBlockType31-NB* in NB-IoT) may be broadcast on a different narrowband or different NB-IoT carrier than the one configured to the UE.

NOTE 2: The exact time when UL synchronisation is restored (after *SystemInformationBlockType31* or *SystemInformationBlockType31-NB* in NB-IoT is acquired) is left to UE implementation, which can be from the subframe indicated by *epochTime* and optionally before the subframe indicated by *epochTime*.

NOTE 3: For UEs not capable of performing system information acquisition and GNSS measurement at the same time, if the UE cannot complete acquisition of *SystemInformationBlockType31* (*SystemInformationBlockType31-NB*) before the start of GNSS measurement gap, acquisition of *SystemInformationBlockType31* (*SystemInformationBlockType31-NB*) may be postponed until GNSS measurement is completed, and T318 is restarted after GNSS measurement is completed.

5.4 Inter-RAT mobility

5.4.1 Introduction

The general principles of connected mode mobility are described in 5.3.1.3. The general principles of the security handling upon connected mode mobility are described in 5.3.1.2.

For the (network controlled) inter RAT mobility from E-UTRA for a UE in RRC_CONNECTED, a single procedure is defined that supports both handover, cell change order with optional network assistance (NACC) and enhanced CS fallback to CDMA2000 1xRTT. The same procedure also supports inter-system handover between E-UTRA/EPC and E-UTRA/5GC. In case of mobility to CDMA2000, the eNB decides when to move to the other RAT while the target RAT determines to which cell the UE shall move.

5.4.2 Handover to E-UTRA

5.4.2.1 General

Figure 5.4.2.1-1: Handover to E-UTRA, successful

The purpose of this procedure is to, under the control of the network, transfer a connection between the UE and another Radio Access Network (e.g. GERAN, UTRAN or NR) to E-UTRAN, or transfer a connection between the UE and the E-UTRAN with one type of CN to the E-UTRAN with a different type of CN.

The handover to E-UTRA procedure applies when SRBs, possibly in combination with DRBs, are established in another RAT or in E-UTRA connected to another type of CN. Handover from UTRAN to E-UTRAN applies only after integrity has been activated in UTRAN. Handover to E-UTRA connected to a different type of CN applies only after integrity has been activated in E-UTRAN. Handover from NR to E-UTRAN applies only after integrity has been activated in NR.

5.4.2.2 Initiation

The RAN using another RAT or the E-UTRA connected to a different type of CN initiates the handover to E-UTRA procedure, in accordance with the specifications applicable for the other RAT or for the E-UTRA connected to a different type of CN, by sending the *RRCConnectionReconfiguration* message via the radio access technology from which the inter-RAT handover is performed.

E-UTRAN applies the procedure as follows:

- to activate ciphering, possibly using NULL algorithm, if not yet activated in the other RAT or in the E-UTRA connected to a different type of CN;
- to establish SRB1, SRB2 and one or more DRBs, i.e. at least the DRB associated with the default EPS bearer is established if the target CN is EPC and at least one DRB is established if the target CN is 5GC.

5.4.2.3 Reception of the *RRCConnectionReconfiguration* by the UE

If the UE is able to comply with the configuration included in the *RRCConnectionReconfiguration* message, the UE shall:

- 1> if the *RRCConnectionReconfiguration* message does not include the *fullConfig* and the UE is connected to 5GC (i.e., delta signalling during intra 5GC handover):
- 2> re-use the source SDAP and PDCP configurations (i.e., current SDAP/PDCP configurations for all RBs from source RAT prior to the reception of the inter-RAT handover *RRCConnectionReconfiguration* message);
- 1> if the *RRCConnectionReconfiguration* message includes the *fullConfig* and the source RAT was E-UTRA (i.e., intra-RAT inter-system handover):
- 2> except the MCG C-RNTI, release/ clear all current dedicated radio resources and configurations, including all SDAP (if configured), PDCP, RLC, logical channel configurations for the DRBs and the logged measurement configuration (if configured);
- 2> release/ clear all current common radio configurations;

- 2> for each *srB-Identity* value included in the *srB-ToAddModList* (SRB reconfiguration):
 - 3> apply the specified configuration defined in 9.1.2 for the corresponding SRB;
 - 3> apply the corresponding default RLC configuration for the SRB specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;
 - 3> apply the corresponding default logical channel configuration for the SRB as specified in 9.2.1.1 for SRB1 or in 9.2.1.2 for SRB2;
 - 3> if the *handoverType* in *securityConfigHO* is set to *fivegc-ToEPC* (i.e, the UE is connecting to EPC):
 - 4> release the PDCP entity and establish it with an E-UTRA PDCP entity;
 - 3> else if the *handoverType* in *securityConfigHO* is set to *epc-To5GC* (i.e., the UE is connecting to 5GC):
 - 4> release the PDCP entity and establish it with an NR PDCP and apply the corresponding default PDCP configuration for the SRB as specified in TS 38.331 [82], clause 9.2.1;
 - 3> associate the RLC bearer of this SRB with the established PDCP entity;
- 1> apply the default physical channel configuration as specified in 9.2.4;
- 1> apply the default semi-persistent scheduling configuration as specified in 9.2.3;
- 1> apply the default MAC main configuration as specified in 9.2.2;
- 1> start timer T304 with the timer value set to *t304*, as included in the *mobilityControlInfo*;
- 1> consider the target PCell to be one on the frequency indicated by the *carrierFreq* with a physical cell identity indicated by the *targetPhysCellId*;
- 1> start synchronising to the DL of the target PCell;
- 1> set the C-RNTI to the value of the *newUE-Identity*;
- 1> for the target PCell, apply the downlink bandwidth indicated by the *dl-Bandwidth*;
- 1> for the target PCell, apply the uplink bandwidth indicated by (the absence or presence of) the *ul-Bandwidth*;
- 1> configure lower layers in accordance with the received *radioResourceConfigCommon*;
- 1> configure lower layers in accordance with any additional fields, not covered in the previous, if included in the received *mobilityControlInfo*;
- 1> perform the radio resource configuration procedure as specified in 5.3.10.0;
- 1> if the *handoverType* in *securityConfigHO* is set to *fivegc-ToEPC*:
 - 2> indicate to higher layer that the CN has changed from 5GC to EPC;
 - 2> derive the key K_{eNB} based on the mapped K_{ASME} key as specified for interworking between EPS and 5GS in TS 33.501 [86];
 - 2> store the *nextHopChainingCount-r15* value;
- 1> else if the *handoverType* in *securityConfigHO* is set to *intra5GC*:
 - 2> if the *keyChangeIndicator-r15* received in the *securityConfigHO* is set to *TRUE*:
 - 3> forward *nas-Container* to the upper layers, if included;
 - 3> update the K_{eNB} key based on the K_{AMF} key, as specified in TS 33.501 [86];
 - 2> else:
 - 3> update the K_{eNB} key based on the current K_{gNB} or the NH, using the *nextHopChainingCount-r15* value indicated in the *SecurityConfigHO*, as specified in TS 33.501 [86];

- 2> store the *nextHopChainingCount-r15* value;
- 1> else if the *handoverType* in *securityConfigHO* is set to *epc-To5GC*:
 - 2> forward the *nas-Container* to the upper layers;
 - 2> derive the K_{eNB} key, as specified in TS 33.501 [86];
- 1> else:
 - 2> forward the *nas-SecurityParamToEUTRA* to the upper layers;
 - 2> derive the K_{eNB} key, as specified in TS 33.401 [32];
- 1> derive the K_{RRCint} key associated with the *integrityProtAlgorithm*, as specified in TS 33.401 [32];
- 1> derive the K_{RRCenc} key and the K_{UPenc} key associated with the *cipheringAlgorithm*, as specified in TS 33.401 [32];
- 1> if capable of user plane integrity protection:
 - 2> derive the K_{UPint} key associated with the *integrityProtAlgorithm*, as specified in TS 33.401 [32];
- 1> if the received *RRCConnectionReconfiguration* includes the *sk-Counter*:
 - 2> perform key update procedure as specified in TS 38.331 [82], clause 5.3.5.7;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-SecondaryCellGroupConfig*:
 - 2> perform NR RRC Reconfiguration as specified in TS 38.331 [82], clause 5.3.5.3;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-RadioBearerConfig1*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
- 1> if the received *RRCConnectionReconfiguration* includes the *nr-RadioBearerConfig2*:
 - 2> perform radio bearer configuration as specified in TS 38.331 [82], clause 5.3.5.6;
- 1> if the *handoverType* in *securityConfigHO* is set to *fivegc-ToEPC* or if the *handoverType-v1530* is not present:
 - 2> configure lower layers to apply the indicated integrity protection algorithm and the K_{RRCint} key immediately, i.e. the indicated integrity protection configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
 - 2> configure lower layers to apply the indicated ciphering algorithm, the K_{RRCenc} key and the K_{UPenc} key immediately, i.e. the indicated ciphering configuration shall be applied to all subsequent messages received and sent by the UE, including the message used to indicate the successful completion of the procedure;
- 1> if the received *RRCConnectionReconfiguration* includes the *sCellToAddModList*:
 - 2> perform SCell addition as specified in 5.3.10.3b;
- 1> if the *RRCConnectionReconfiguration* message includes the *measConfig*:
 - 2> perform the measurement configuration procedure as specified in 5.5.2;
- 1> perform the measurement identity autonomous removal as specified in 5.5.2.2a;
- 1> if the *RRCConnectionReconfiguration* message includes the *otherConfig*:
 - 2> perform the other configuration procedure as specified in 5.3.10.9;
- 1> if the *RRCConnectionReconfiguration* message includes *wlan-OffloadInfo*:
 - 2> perform the dedicated WLAN offload configuration procedure as specified in 5.6.12.2;
- 1> if the *RRCConnectionReconfiguration* message includes *rclwi-Configuration*:
 - 2> perform the WLAN traffic steering command procedure as specified in 5.6.16.2;

- 1> if the *RRCConnectionReconfiguration* message includes *lwa-Configuration*:
 - 2> perform the LWA configuration procedure as specified in 5.6.14.2;
- 1> if the *RRCConnectionReconfiguration* message includes *lwip-Configuration*:
 - 2> perform the LWIP reconfiguration procedure as specified in 5.6.17.2;
- 1> set the content of *RRCConnectionReconfigurationComplete* message as follows:
 - 2> if the UE has radio link failure or handover failure information available in *VarRLF-Report* and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 3> include *rlf-InfoAvailable*;
 - 2> if the UE has MBSFN logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport* and if T330 is not running:
 - 3> include *logMeasAvailableMBSFN*;
 - 2> else if the UE has logged measurements available for E-UTRA and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 3> include the *logMeasAvailable*;
 - 3> if Bluetooth measurement results are included in the logged measurements the UE has available:
 - 4> include the *logMeasAvailableBT*;
 - 3> if WLAN measurement results are included in the logged measurements the UE has available:
 - 4> include the *logMeasAvailableWLAN*;
 - 2> if the UE has connection establishment failure information available in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 3> include *connEstFailInfoAvailable*;
 - 2> if the received *RRCConnectionReconfiguration* message included *nr-SecondaryCellGroupConfig*:
 - 3> include *scg-ConfigResponseNR* in accordance with TS 38.331 [82], clause 5.3.5.3;
 - 1> submit the *RRCConnectionReconfigurationComplete* message to lower layers for transmission using the new configuration;
 - 1> if the *RRCConnectionReconfiguration* message does not include *rlf-TimersAndConstants* set to *setup*:
 - 2> use the default values specified in 9.2.5 for timer T310, T311 and constant N310, N311;
 - 1> if MAC successfully completes the random access procedure:
 - 2> stop timer T304;
 - 2> apply the parts of the CQI reporting configuration, the scheduling request configuration and the sounding RS configuration that do not require the UE to know the SFN of the target PCell, if any;
 - 2> apply the parts of the measurement and the radio resource configuration that require the UE to know the SFN of the target PCell (e.g. measurement gaps, periodic CQI reporting, scheduling request configuration, sounding RS configuration), if any, upon acquiring the SFN of the target PCell;

NOTE 1: Whenever the UE shall setup or reconfigure a configuration in accordance with a field that is received it applies the new configuration, except for the cases addressed by the above statements.

2> enter E-UTRA RRC_CONNECTED, upon which the procedure ends;

NOTE 2: The UE is not required to determine the SFN of the target PCell by acquiring system information from that cell before performing RACH access in the target PCell.

NOTE 3: If the handover is from NR and target CN is 5GC, the delta configuration on PDCP and SDAP can be used for intra-system inter-RAT handover. For other cases, source RAT configuration is not considered when the UE applies the reconfiguration message of target RAT.

5.4.2.4 Reconfiguration failure

The UE shall:

1> if the UE is unable to comply with (part of) the configuration included in the *RRCConnectionReconfiguration* message or if the upper layers indicate that the *nas-Container* is invalid:

2> if the source RAT is E-UTRA:

3> perform the actions as specified in 5.3.5.5;

2> else:

3> perform the actions defined for this failure case as defined in the specifications applicable for the other RAT;

NOTE 1: The UE may apply above failure handling also in case the *RRCConnectionReconfiguration* message causes a protocol error for which the generic error handling as defined in 5.7 specifies that the UE shall ignore the message.

NOTE 2: If the UE is unable to comply with part of the configuration, it does not apply any part of the configuration, i.e. there is no partial success/ failure.

5.4.2.5 T304 expiry (handover to E-UTRA failure)

The UE shall:

1> upon T304 expiry (handover to E-UTRA failure):

2> if the source RAT is E-UTRA:

3> perform the actions as specified in 5.3.5.6;

2> else:

3> reset MAC;

3> perform the actions defined for this failure case as defined in the specifications applicable for the other RAT;

5.4.3 Mobility from E-UTRA

5.4.3.1 General

Figure 5.4.3.1-1: Mobility from E-UTRA, successful

Figure 5.4.3.1-2: Mobility from E-UTRA, failure

The purpose of this procedure is to move a UE in RRC_CONNECTED to a cell using another Radio Access Technology (RAT), e.g. GERAN, UTRA, CDMA2000 systems, NR, or handover a UE to an E-UTRA cell connected to another type of CN. The mobility from E-UTRA procedure covers the following type of mobility:

- handover, i.e. the *MobilityFromEUTRACmd* message includes radio resources that have been allocated for the UE in the target cell;
- cell change order, i.e. the *MobilityFromEUTRACmd* message may include information facilitating access of and/ or connection establishment in the target cell, e.g. system information. Cell change order is applicable only to GERAN; and
- enhanced CS fallback to CDMA2000 1xRTT, i.e. the *MobilityFromEUTRACmd* message includes radio resources that have been allocated for the UE in the target cell. The enhanced CS fallback to CDMA2000 1xRTT may be combined with concurrent handover or redirection to CDMA2000 HRPD.

NOTE: For the case of dual receiver/transmitter enhanced CS fallback to CDMA2000 1xRTT, the *DLInformationTransfer* message is used instead of the *MobilityFromEUTRACmd* message (see TS 36.300 [9]).

5.4.3.2 Initiation

E-UTRAN initiates the mobility from E-UTRA procedure to a UE in RRC_CONNECTED, possibly in response to a *MeasurementReport* message, in response to reception of CS fallback indication for the UE from MME, or in response to an *MCGFailureInformation* message by sending a *MobilityFromEUTRACmd* message. E-UTRAN applies the procedure as follows:

- the procedure is initiated only when AS-security has been activated, and SRB2 with at least one DRB are setup and not suspended;
- the procedure is not initiated if any DAPS bearer is configured;

5.4.3.3 Reception of the *MobilityFromEUTRACmd* by the UE

The UE shall be able to receive a *MobilityFromEUTRACmd* message and perform a cell change order to GERAN, even if no prior UE measurements have been performed on the target cell.

The UE shall:

- 1> stop timer T310, if running;
- 1> stop timer T312, if running;
- 1> if timer T316 is running:
 - 2> stop timer T316;
 - 2> clear the information included in *VarRLF-Report*, if any;
- 1> if T309 is running:
 - 2> stop timer T309 for all access categories;

2> perform the actions as specified in 5.3.16.4.

1> if the *MobilityFromEUTRACmd* message includes the *purpose* set to *handover*:

2> if the *targetRAT-Type* is set to *utra* or *geran*:

3> consider inter-RAT mobility as initiated towards the RAT indicated by the *targetRAT-Type* included in the *MobilityFromEUTRACmd* message;

3> forward the *nas-SecurityParamFromEUTRA* to the upper layers;

3> access the target cell indicated in the inter-RAT message in accordance with the specifications of the target RAT;

3> if the *targetRAT-Type* is set to *geran*:

4> use the contents of *systemInformation*, if provided for PS Handover, as the system information to begin access on the target GERAN cell;

NOTE 1: If there are DRBs for which no radio bearers are established in the target RAT as indicated in the *targetRAT-MessageContainer* in the message, the E-UTRA RRC part of the UE does not indicate the release of the concerned DRBs to the upper layers. Upper layers may derive which bearers are not established from information received from the AS of the target RAT.

NOTE 2: In case of SR-VCC, the DRB to be replaced is specified in TS 23.216 [61].

2> else if the *targetRAT-Type* is set to *eutra*:

3> consider inter-system mobility as initiated towards E-UTRA;

3> forward the *nas-SecurityParamFromEUTRA* to the upper layers, if included;

3> access the target cell indicated in the inter-RAT message in accordance with clause 5.4.2.3;

2> else if the *targetRAT-Type* is set to *nr*:

3> consider inter-RAT mobility as initiated towards NR;

3> access the target cell indicated in the inter-RAT message in accordance with the specifications in TS 38.331 [82];

2> else if the *targetRAT-Type* is set to *cdma2000-1XRTT* or *cdma2000-HRPD*:

3> forward the *targetRAT-Type* and the *targetRAT-MessageContainer* to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specifications of the CDMA2000 target-RAT;

1> else if the *MobilityFromEUTRACmd* message includes the *purpose* set to *cellChangeOrder*:

2> start timer T304 with the timer value set to *t304*, as included in the *MobilityFromEUTRACmd* message;

2> if the *targetRAT-Type* is set to *geran*:

3> if *networkControlOrder* is included in the *MobilityFromEUTRACmd* message:

4> apply the value as specified in TS 44.060 [36];

3> else:

4> acquire *networkControlOrder* and apply the value as specified in TS 44.060 [36];

3> use the contents of *systemInformation*, if provided, as the system information to begin access on the target GERAN cell;

2> establish the connection to the target cell indicated in the *CellChangeOrder*;

NOTE 3: The criteria for success or failure of the cell change order to GERAN are specified in TS 44.060 [36].

- 1> if the *MobilityFromEUTRACommand* message includes the *purpose* set to *e-CSFB*:
- 2> if *messageContCDMA2000-1XRTT* is present:
 - 3> forward the *messageContCDMA2000-1XRTT* to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specification of the target RAT;
- 2> if *mobilityCDMA2000-HRPD* is present and is set to *handover*:
 - 3> forward the *messageContCDMA2000-HRPD* to the CDMA2000 upper layers for the UE to access the cell(s) indicated in the inter-RAT message in accordance with the specification of the target RAT;
- 2> if *mobilityCDMA2000-HRPD* is present and is set to *redirection*:
 - 3> forward the *redirectCarrierCDMA2000-HRPD* to the CDMA2000 upper layers;

NOTE 4: When the CDMA2000 upper layers in the UE receive both the *messageContCDMA2000-1XRTT* and *messageContCDMA2000-HRPD* the UE performs concurrent access to both CDMA2000 1xRTT and CDMA2000 HRPD RAT.

NOTE 5: The UE should perform the handover, the cell change order or enhanced 1xRTT CS fallback as soon as possible following the reception of the RRC message *MobilityFromEUTRACommand*, which could be before confirming successful reception (HARQ and ARQ) of this message.

5.4.3.4 Successful completion of the mobility from E-UTRA

Upon successfully completing the handover, the cell change order or enhanced 1xRTT CS fallback, the UE shall:

- 1> if the *targetRAT-Type* in the received *MobilityFromEUTRACommand* is set to *eutra* (intra-E-UTRA inter-system HO):
 - 2> indicate to the upper layers associated to the source system the release of the RRC connection together with the release cause 'other';
 - 2> the procedure ends;
- 1> else if the UE was connected to 5GC prior to the reception of the *MobilityFromEUTRACommand* and the *targetRAT-Type* in the received *MobilityFromEUTRACommand* is set to *nr*:
 - 2> reset MAC;
 - 2> stop all timers that are running except T325, T330;
 - 2> release *ran-NotificationAreaInfo*, if stored;
 - 2> release the AS security context including the K_{RRCenc} key, the K_{RRCint}, the K_{UPint} key and the K_{UPenc} key, if stored;
 - 2> release all radio resources, including release of the RLC entity, the MAC configuration and the associated PDCP entity and SDAP entity for all established RBs;

NOTE 1: PDCP and SDAP configured by the source configurations RAT prior to the handover that are reconfigured and re-used by target RAT when delta signalling (i.e., during inter-RAT intra-system handover when *fullConfig* is not present) is used, are not released as part of this procedure.

- 1> else:
 - 2> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other';

NOTE 2: If the UE performs enhanced 1xRTT CS fallback along with concurrent mobility to CDMA2000 HRPD and the connection to either CDMA2000 1xRTT or CDMA2000 HRPD succeeds, then the mobility from E-UTRA is considered successful.

5.4.3.5 Mobility from E-UTRA failure

The UE shall:

- 1> if T304 configured in the *MobilityFromEUTRACmd* message expires (mobility from E-UTRA failure); or
- 1> if the UE does not succeed in establishing the connection to the target radio access technology; or
- 1> if the UE is unable to comply with (part of) the configuration included in the *MobilityFromEUTRACmd* message; or
- 1> if there is a protocol error in the inter RAT information included in the *MobilityFromEUTRACmd* message, causing the UE to fail the procedure according to the specifications applicable for the target RAT (i.e. according to clause 5.3.5.6 if the *targetRAT-Type* in the received *MobilityFromEUTRACmd* is set to *eutra*):
- 2> stop T304, if running;
- 2> if the *cs-FallbackIndicator* in the *MobilityFromEUTRACmd* message was set to *TRUE* or *e-CSFB* was present:
 - 3> indicate to upper layers that the CS fallback procedure has failed;
- 2> revert back to the configuration used in the source PCell, excluding the configuration configured by the *physicalConfigDedicated*, *mac-MainConfig* and *sps-Config*;
- 2> if *MobilityFromEUTRACmd* concerned a failed inter-RAT handover from E-UTRA to NR and if the UE supports Radio Link Failure Report for Inter-RAT MRO NR:
 - 3> store handover failure information in *VarRLF-Report* according to 5.3.5.6;
- 2> initiate the connection re-establishment procedure as specified in 5.3.7;

NOTE: For enhanced CS fallback to CDMA2000 1xRTT, the above UE behavior applies only when the UE is attempting the enhanced 1xRTT CS fallback and connection to the target radio access technology fails or if the UE is attempting enhanced 1xRTT CS fallback along with concurrent mobility to CDMA2000 HRPD and connection to both the target radio access technologies fails.

5.4.4 Handover from E-UTRA preparation request (CDMA2000)

5.4.4.1 General

Figure 5.4.4.1-1: Handover from E-UTRA preparation request

The purpose of this procedure is to trigger the UE to prepare for handover or enhanced 1xRTT CS fallback to CDMA2000 by requesting a connection with this network. The UE may use this procedure to concurrently prepare for handover to CDMA2000 HRPD along with preparation for enhanced CS fallback to CDMA2000 1xRTT. This procedure applies to CDMA2000 capable UEs only.

This procedure is also used to trigger the UE which supports dual Rx/Tx enhanced 1xCSFB to redirect its second radio to CDMA2000 1xRTT.

The handover from E-UTRA preparation request procedure applies when signalling radio bearers are established.

5.4.4.2 Initiation

E-UTRAN initiates the handover from E-UTRA preparation request procedure to a UE in RRC_CONNECTED, possibly in response to a *MeasurementReport* message or CS fallback indication for the UE, by sending a *HandoverFromEUTRAPreparationRequest* message. E-UTRA initiates the procedure only when AS security has been activated.

5.4.4.3 Reception of the *HandoverFromEUTRAPreparationRequest* by the UE

Upon reception of the *HandoverFromEUTRAPreparationRequest* message, the UE shall:

- 1> if *dualRxTxRedirectIndicator* is present in the received message:
 - 2> forward *dualRxTxRedirectIndicator* to the CDMA2000 upper layers;
 - 2> forward *redirectCarrierCDMA2000-1XRTT* to the CDMA2000 upper layers, if included;
- 1> else:
 - 2> indicate the request to prepare handover or enhanced 1xRTT CS fallback and forward the *cdma2000-Type* to the CDMA2000 upper layers;
 - 2> if *cdma2000-Type* is set to *type1XRTT*:
 - 3> forward the *rand* and the *mobilityParameters* to the CDMA2000 upper layers;
 - 2> if *concurrPrepCDMA2000-HRPD* is present in the received message:
 - 3> forward *concurrPrepCDMA2000-HRPD* to the CDMA2000 upper layers;
 - 2> else:
 - 3> forward *concurrPrepCDMA2000-HRPD*, with its value set to *FALSE*, to the CDMA2000 upper layers;

5.4.5 UL handover preparation transfer (CDMA2000)

5.4.5.1 General

Figure 5.4.5.1-1: UL handover preparation transfer

The purpose of this procedure is to tunnel the handover related CDMA2000 dedicated information or enhanced 1xRTT CS fallback related CDMA2000 dedicated information from UE to E-UTRAN when requested by the higher layers. The procedure is triggered by the higher layers on receipt of *HandoverFromEUTRAPreparationRequest* message. If preparing for enhanced CS fallback to CDMA2000 1xRTT and handover to CDMA2000 HRPD, the UE sends two consecutive *ULHandoverPreparationTransfer* messages to E-UTRAN, one per addressed CDMA2000 RAT Type. This procedure applies to CDMA2000 capable UEs only.

5.4.5.2 Initiation

A UE in RRC_CONNECTED initiates the UL handover preparation transfer procedure whenever there is a need to transfer handover or enhanced 1xRTT CS fallback related non-3GPP dedicated information. The UE initiates the UL handover preparation transfer procedure by sending the *ULHandoverPreparationTransfer* message.

5.4.5.3 Actions related to transmission of the *ULHandoverPreparationTransfer* message

The UE shall set the contents of the *ULHandoverPreparationTransfer* message as follows:

- 1> include the *cdma2000-Type* and the *dedicatedInfo*;
- 1> if the *cdma2000-Type* is set to *type1XRTT*:

- 2> include the *meid* and set it to the value received from the CDMA2000 upper layers;
- 1> submit the *ULHandoverPreparationTransfer* message to lower layers for transmission, upon which the procedure ends;

5.4.5.4 Failure to deliver the *ULHandoverPreparationTransfer* message

The UE shall:

- 1> if the UE is unable to guarantee successful delivery of *ULHandoverPreparationTransfer* messages:
- 2> inform upper layers about the possible failure to deliver the information contained in the concerned *ULHandoverPreparationTransfer* message;

5.4.6 Inter-RAT cell change order to E-UTRAN

5.4.6.1 General

The purpose of the inter-RAT cell change order to E-UTRAN procedure is to transfer, under the control of the source radio access technology, a connection between the UE and another radio access technology (e.g. GSM/ GPRS) to E-UTRAN.

5.4.6.2 Initiation

The procedure is initiated when a radio access technology other than E-UTRAN, e.g. GSM/GPRS, using procedures specific for that RAT, orders the UE to change to an E-UTRAN cell. In response, upper layers request the establishment of an RRC connection as specified in clause 5.3.3.

NOTE: Within the message used to order the UE to change to an E-UTRAN cell, the source RAT should specify the identity of the target E-UTRAN cell as specified in the specifications for that RAT.

The UE shall:

- 1> upon receiving an *RRCConnectionSetup* message:
- 2> consider the inter-RAT cell change order procedure to have completed successfully;

5.4.6.3 UE fails to complete an inter-RAT cell change order

If the inter-RAT cell change order fails the UE shall return to the other radio access technology and proceed as specified in the appropriate specifications for that RAT.

The UE shall:

- 1> upon failure to establish the RRC connection as specified in clause 5.3.3:
- 2> consider the inter-RAT cell change order procedure to have failed;

NOTE: The cell change was network ordered. Therefore, failure to change to the target PCell should not cause the UE to move to UE-controlled cell selection.

5.5 Measurements

5.5.1 Introduction

For NB-IoT in RRC_CONNECTED state measurements see clause 5.5.8.

For BL UEs or UEs in CE or NB-IoT UEs that are connected to NTN, GNSS measurement triggering and reporting related procedures are defined in 5.5.9.

The UE reports measurement information in accordance with the measurement configuration and performs conditional reconfiguration evaluation in accordance with conditional reconfiguration as provided by E-UTRAN. E-UTRAN provides the measurement configuration or the conditional reconfiguration applicable for a UE in RRC_CONNECTED by means of dedicated signalling, i.e. using the *RRConnectionReconfiguration* or *RRConnectionResume* message.

The UE can be requested to perform the following types of measurements:

- Intra-frequency measurements: measurements at the downlink carrier frequency(ies) of the serving cell(s).
- Inter-frequency measurements: measurements at frequencies that differ from any of the downlink carrier frequency(ies) of the serving cell(s).
- Inter-RAT measurements of NR frequencies.
- Inter-RAT measurements of UTRA frequencies.
- Inter-RAT measurements of GERAN frequencies.
- Inter-RAT measurements of CDMA2000 HRPD or CDMA2000 1xRTT or WLAN frequencies.
- CBR measurements for V2X sidelink communication.
- Sensing measurements for V2X sidelink communication.

The measurement configuration includes the following parameters:

1. Measurement objects: The objects on which the UE shall perform the measurements.

- For intra-frequency and inter-frequency measurements a measurement object is a single E-UTRA carrier frequency. Associated with this carrier frequency, E-UTRAN can configure a list of cell specific offsets, a list of 'exclude-listed' cells and a list of 'allow-listed' cells. Exclude-listed cells are not considered in event evaluation or measurement reporting.
- For inter-RAT NR measurements a measurement object is a single NR carrier frequency. Associated with this carrier frequency, E-UTRAN can configure a list of 'exclude-listed' cells. Exclude-listed cells are not considered in event evaluation or measurement reporting.
- For inter-RAT UTRA measurements a measurement object is a set of cells on a single UTRA carrier frequency.
- For inter-RAT GERAN measurements a measurement object is a set of GERAN carrier frequencies.
- For inter-RAT CDMA2000 measurements a measurement object is a set of cells on a single (HRPD or 1xRTT) carrier frequency.
- For inter-RAT WLAN measurements a measurement object is a set of WLAN identifiers and optionally a set of WLAN frequencies.
- For CBR measurements and sensing measurements a measurement object is a set of transmission resource pools for V2X sidelink communication.

NOTE 1: Some measurements using the above mentioned measurement objects, only concern a single cell, e.g. measurements used to report neighbouring cell system information, PCell UE Rx-Tx time difference, or a pair of cells, e.g. SSTD measurements between the PCell and the PSCell.

2. Reporting configurations: A list of measurement reporting configurations where each measurement reporting configuration consists of the following:

- Reporting criterion: The criterion that triggers the UE to send a measurement report. This can either be periodical or a single event description.
- Reporting format: The quantities that the UE includes in the measurement report and associated information (e.g. number of cells to report).

In case of conditional handover, conditional PSCell addition or MN initiated inter-SN conditional PSCell change triggering configuration, each configuration consists of the following:

- Execution criteria: The criteria that triggers the UE to perform conditional handover, conditional PSCell addition or MN initiated inter-SN conditional PSCell change.
3. **Measurement identities:** For measurement reporting, a list of measurement identities where each measurement identity links one measurement object with one measurement reporting configuration. By configuring multiple measurement identities it is possible to link more than one measurement object to the same reporting configuration, as well as to link more than one reporting configuration to the same measurement object. The measurement identity is used as a reference number in the measurement report. For conditional reconfiguration triggering, one measurement identity links to exactly one conditional reconfiguration trigger configuration. And up to two measurement identities can be linked to one conditional reconfiguration execution condition.
 4. **Quantity configurations:** One quantity configuration is configured per RAT type. The quantity configuration defines the measurement quantities and associated filtering used for all event evaluation and related reporting of that measurement type. One filter can be configured per measurement quantity, except for NR where the network may configure up to 2 sets of quantity configurations each comprising per measurement quantity separate filters for cell and RS index measurement results. The quantity configuration set that applies for a given measurement is indicated within the NR measurement object.
 5. **Measurement gaps:** Periods that the UE may use to perform measurements, i.e. no (UL, DL) transmissions are scheduled.

E-UTRAN only configures a single measurement object for a given frequency (except for WLAN and except for CBR measurements), i.e. it is not possible to configure two or more measurement objects for the same frequency with different associated parameters, e.g. different offsets and/ or exclude-lists. E-UTRAN may configure multiple instances of the same event e.g. by configuring two reporting configurations with different thresholds.

The UE maintains a single measurement object list, a single reporting configuration list, and a single measurement identities list. The measurement object list includes measurement objects, that are specified per RAT type, possibly including intra-frequency object(s) (i.e. the object(s) corresponding to the serving frequency(ies)), inter-frequency object(s) and inter-RAT objects. Similarly, the reporting configuration list includes E-UTRA and inter-RAT reporting configurations. Any measurement object can be linked to any reporting configuration of the same RAT type. Some reporting configurations may not be linked to a measurement object. Likewise, some measurement objects may not be linked to a reporting configuration.

The measurement procedures distinguish the following types of cells:

1. The serving cell(s) - these are the PCell and one or more SCells, if configured for a UE supporting CA or DC. Likewise, NR serving cell(s) are the NR PCell, NR PSCell and NR SCells, if the UE is configured with MR-DC.
2. Listed cells - these are cells listed within the measurement object(s) or, for inter-RAT WLAN, the WLANs matching the WLAN identifiers configured in the measurement object or the WLAN the UE is connected to.
3. Detected cells - these are cells that are not listed within the measurement object(s) but are detected by the UE on the carrier frequency(ies) indicated by the measurement object(s) or, for inter-RAT WLAN, the WLANs not included in the *measObjectWLAN* but meeting the triggering requirements.

For E-UTRA, the UE measures and reports on the serving cell(s), listed cells, detected cells, transmission resource pools for V2X sidelink communication, and, for RSSI and channel occupancy measurements, the UE measures and reports on any reception on the indicated frequency. For inter-RAT NR, the UE measures and reports on detected cells and, if configured with MR-DC, on NR serving cell(s) and, for RSSI and channel occupancy measurements, the UE measures and reports on the indicated frequency. For inter-RAT UTRA, the UE measures and reports on listed cells and optionally on cells that are within a range for which reporting is allowed by E-UTRAN. For inter-RAT GERAN, the UE measures and reports on detected cells. For inter-RAT CDMA2000, the UE measures and reports on listed cells. For inter-RAT WLAN, the UE measures and reports on listed cells.

NOTE 2: For inter-RAT UTRA and CDMA2000, the UE measures and reports also on detected cells for the purpose of SON.

NOTE 3: This specification is based on the assumption that typically CSG cells of home deployment type are not indicated within the neighbour list. Furthermore, the assumption is that for non-home deployments, the physical cell identity is unique within the area of a large macro cell (i.e. as for UTRAN).

Whenever the procedural specification, other than contained in clause 5.5.2, refers to a field it concerns a field included in the *VarMeasConfig* unless explicitly stated otherwise i.e. only the measurement configuration procedure covers the direct UE action related to the received *measConfig*.

5.5.2 Measurement configuration

5.5.2.1 General

E-UTRAN applies the procedure as follows:

- to ensure that, whenever the UE has a *measConfig*, it includes a *measObject* for each LTE serving frequency;
- to configure at most one measurement identity using a reporting configuration with the *purpose* set to *reportCGI*;
- for E-UTRA serving frequencies, set the EARFCN within the corresponding *measObject* according to the band as used for reception/ transmission;
- to configure at most one measurement identity using a reporting configuration with *ul-DelayConfig*;
- to configure at most one measurement identity using a reporting configuration with *ul-DelayValueConfig*;
- to configure at most one measurement identity using a reporting configuration with *reportSFTD-Meas*;
- to configure at most one *MeasObjectNR* with the same *carrierFreq*;

The UE shall:

- 1> if the received *measConfig* includes the *measObjectToRemoveList*:
2> perform the measurement object removal procedure as specified in 5.5.2.4;
- 1> if the received *measConfig* includes the *measObjectToAddModList*:
2> perform the measurement object addition/ modification procedure as specified in 5.5.2.5;
- 1> if the received *measConfig* includes the *reportConfigToRemoveList*:
2> perform the reporting configuration removal procedure as specified in 5.5.2.6;
- 1> if the received *measConfig* includes the *reportConfigToAddModList*:
2> perform the reporting configuration addition/ modification procedure as specified in 5.5.2.7;
- 1> if the received *measConfig* includes the *quantityConfig*:
2> perform the quantity configuration procedure as specified in 5.5.2.8;
- 1> if the received *measConfig* includes the *measIdToRemoveList*:
2> perform the measurement identity removal procedure as specified in 5.5.2.2;
- 1> if the received *measConfig* includes the *measIdToAddModList*:
2> perform the measurement identity addition/ modification procedure as specified in 5.5.2.3;
- 1> if the received *measConfig* includes the *measGapConfig* or *measGapConfigPerCC-List*:
2> perform the measurement gap configuration procedure as specified in 5.5.2.9;
- 1> if the received *measConfig* includes the *measGapConfigDensePRS*:
2> perform the measurement gap configuration procedure for RSTD measurements with dense PRS configuration as specified in 5.5.2.9a;
- 1> if the received *measConfig* includes the *measGapSharingConfig*:

- 2> perform the measurement gap sharing configuration procedure as specified in 5.5.2.12;
- 1> if the received *measConfig* includes the *s-Measure*:
 - 2> set the parameter *s-Measure* within *VarMeasConfig* to the lowest value of the RSRP ranges indicated by the received value of *s-Measure*;
 - 1> if the received *measConfig* includes the *preRegistrationInfoHRPD*:
 - 2> forward the *preRegistrationInfoHRPD* to CDMA2000 upper layers;
 - 1> if the received *measConfig* includes the *speedStatePars*:
 - 2> set the parameter *speedStatePars* within *VarMeasConfig* to the received value of *speedStatePars*;
 - 1> if the received *measConfig* includes the *allowInterruptions*:
 - 2> set the parameter *allowInterruptions* within *VarMeasConfig* to the received value of *allowInterruptions*;

5.5.2.2 Measurement identity removal

The UE shall:

- 1> for each *measId* included in the received *measIdToRemoveList* that is part of the current UE configuration in *VarMeasConfig*:
 - 2> remove the entry with the matching *measId* from the *measIdList* within the *VarMeasConfig*;
 - 2> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
 - 2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

NOTE: The UE does not consider the message as erroneous if the *measIdToRemoveList* includes any *measId* value that is not part of the current UE configuration.

5.5.2.2a Measurement identity autonomous removal

The UE shall:

- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
 - 2> if the associated *reportConfig* concerns an event involving a serving cell while the concerned serving cell is not configured; or
 - 2> if the associated *reportConfig* concerns an event involving a WLAN mobility set while the concerned WLAN mobility set is not configured; or
 - 2> if the associated *reportConfig* concerns an event involving a transmission resource pool for V2X sidelink communication while the concerned resource pool is not configured; or
 - 2> if the associated *reportConfig* concerns an event involving *reportSFTD-Meas* set to *pSCell* while the *nr-Config* is not configured:
 - 3> remove the *measId* from the *measIdList* within the *VarMeasConfig*;
 - 3> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
 - 3> stop the periodical reporting timer if running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

NOTE 1: The above UE autonomous removal of *measId*'s applies only for measurement events A1, A2, A6, and also applies for events A3 and A5 if configured for PSCell and W2 and W3 and V1 and V2 and event involving *reportSFTD-Meas* set to *pSCell*, if configured.

NOTE 2: When performed during re-establishment, the UE is only configured with a primary frequency (i.e. the SCell(s) and WLAN mobility set are released, if configured).

5.5.2.3 Measurement identity addition/ modification

E-UTRAN applies the procedure as follows:

- configure a *measId* only if the corresponding measurement object, the corresponding reporting configuration and the corresponding quantity configuration, are configured;

The UE shall:

- 1> for each *measId* included in the received *measIdToAddModList*:
- 2> if an entry with the matching *measId* exists in the *measIdList* within the *VarMeasConfig*:
 - 3> replace the entry with the value received for this *measId*;
- 2> else:
 - 3> add a new entry for this *measId* within the *VarMeasConfig*;
- 2> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
- 2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

NOTE: If the *measId* associated with *reportConfig* for conditional reconfiguration is modified, the conditions need to be set to non-fulfilled as specified in 5.3.5.9.4.

- 2> if the *triggerType* is set to *periodical* and the *purpose* is set to *reportCGI* in the *reportConfig* associated with this *measId*:
 - 3> if the *measObject* associated with this *measId* concerns E-UTRA:
 - 4> if the *si-RequestForHO* is included in the *reportConfig* associated with this *measId*:
 - 5> if the UE is a category 0 UE according to TS 36.306 [5]:
 - 6> start timer T321 with the timer value set to 190 ms for this *measId*;
 - 5> else:
 - 6> start timer T321 with the timer value set to 150 ms for this *measId*;
 - 4> else:
 - 5> start timer T321 with the timer value set to 1 second for this *measId*;
 - 3> else if the *measObject* associated with this *measId* concerns UTRA:
 - 4> if the *si-RequestForHO* is included in the *reportConfig* associated with this *measId*:
 - 5> for UTRA FDD, start timer T321 with the timer value set to 2 seconds for this *measId*;
 - 5> for UTRA TDD, start timer T321 with the timer value set to [1 second] for this *measId*;
 - 4> else:
 - 5> start timer T321 with the timer value set to 8 seconds for this *measId*;
 - 3> else if the *measObject* associated with this *measId* concerns NR:
 - 4> if the *measObject* associated with this *measId* concerns FR1:
 - 5> start timer T321 with the timer value set to 2 seconds for this *measId*;
 - 4> if the *measObject* associated with this *measId* concerns FR2:

5> if the *useAutonomousGapsNR* is included in the *reportConfig* associated with this *measId*:

6> start timer T321 with the timer value set to 5 seconds for this *measId*;

5> else:

6> start timer T321 with the timer value set to 16 seconds for this *measId*;

3> else:

4> start timer T321 with the timer value set to 8 seconds for this *measId*;

5.5.2.4 Measurement object removal

The UE shall:

1> for each *measObjectId* included in the received *measObjectToRemoveList* that is part of the current UE configuration in *VarMeasConfig*:

2> remove the entry with the matching *measObjectId* from the *measObjectList* within the *VarMeasConfig*;

2> remove all *measId* associated with this *measObjectId* from the *measIdList* within the *VarMeasConfig*, if any;

2> if a *measId* is removed from the *measIdList*:

3> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;

3> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

NOTE: The UE does not consider the message as erroneous if the *measObjectToRemoveList* includes any *measObjectId* value that is not part of the current UE configuration.

5.5.2.5 Measurement object addition/ modification

The UE shall:

1> for each *measObjectId* included in the received *measObjectToAddModList*:

2> if an entry with the matching *measObjectId* exists in the *measObjectList* within the *VarMeasConfig*, for this entry:

3> reconfigure the entry with the value received for this *measObject*, except for the fields *cellsToAddModList*, *excludedCellsToAddModList*, *allowedCellsToAddModList*, *altTTT-CellsToAddModList*, *cellsToRemoveList*, *excludedCellsToRemoveList*, *allowedCellsToRemoveList*, *altTTT-CellsToRemoveList*, *measSubframePatternConfigNeigh*, *measDS-Config*, *wlan-ToAddModList*, *wlan-ToRemoveList*, *tx-ResourcePoolToRemoveList*, *tx-ResourcePoolToAddList*, *ssb-PositionQCL-CellsToAddModListNR*, and *ssb-PositionQCL-CellsToRemoveListNR*;

3> if the received *measObject* includes the *cellsToRemoveList*:

4> for each *cellIndex* included in the *cellsToRemoveList*:

5> remove the entry with the matching *cellIndex* from the *cellsToAddModList*;

3> if the received *measObject* includes the *cellsToAddModList*:

4> for each *cellIndex* value included in the *cellsToAddModList*:

5> if an entry with the matching *cellIndex* exists in the *cellsToAddModList*:

6> replace the entry with the value received for this *cellIndex*;

5> else:

6> add a new entry for the received *cellIndex* to the *cellsToAddModList*;

3> if the received *measObject* includes the *excludedCellsToRemoveList*:

4> for each *cellIndex* included in the *excludedCellsToRemoveList*:

5> remove the entry with the matching *cellIndex* from the *excludedCellsToAddModList*;

NOTE 1: For each *cellIndex* included in the *excludedCellsToRemoveList* that concerns overlapping ranges of cells, a cell is removed from the exclude-listed cells only if all cell indexes containing it are removed.

3> if the received *measObject* includes the *excludedCellsToAddModList*:

4> for each *cellIndex* included in the *excludedCellsToAddModList*:

5> if an entry with the matching *cellIndex* is included in the *excludedCellsToAddModList*:

6> replace the entry with the value received for this *cellIndex*;

5> else:

6> add a new entry for the received *cellIndex* to the *excludedCellsToAddModList*;

3> if the received *measObject* includes the *allowedCellsToRemoveList*:

4> for each *cellIndex* included in the *allowedCellsToRemoveList*:

5> remove the entry with the matching *cellIndex* from the *allowedCellsToAddModList*;

NOTE 2: For each *cellIndex* included in the *allowedCellsToRemoveList* that concerns overlapping ranges of cells, a cell is removed from the allow-listed cells only if all cell indexes containing it are removed.

3> if the received *measObject* includes the *allowedCellsToAddModList*:

4> for each *cellIndex* included in the *allowedCellsToAddModList*:

5> if an entry with the matching *cellIndex* is included in the *allowedCellsToAddModList*:

6> replace the entry with the value received for this *cellIndex*;

5> else:

6> add a new entry for the received *cellIndex* to the *allowedCellsToAddModList*;

3> if the received *measObject* includes the *altTTT-CellsToRemoveList*:

4> for each *cellIndex* included in the *altTTT-CellsToRemoveList*:

5> remove the entry with the matching *cellIndex* from the *altTTT-CellsToAddModList*;

NOTE 3: For each *cellIndex* included in the *altTTT-CellsToRemoveList* that concerns overlapping ranges of cells, a cell is removed from the list of cells only if all cell indexes containing it are removed.

3> if the received *measObject* includes the *altTTT-CellsToAddModList*:

4> for each *cellIndex* value included in the *altTTT-CellsToAddModList*:

5> if an entry with the matching *cellIndex* exists in the *altTTT-CellsToAddModList*:

6> replace the entry with the value received for this *cellIndex*;

5> else:

6> add a new entry for the received *cellIndex* to the *altTTT-CellsToAddModList*;

3> if the received *measObject* includes *measSubframePatternConfigNeigh*:

4> set *measSubframePatternConfigNeigh* within the *VarMeasConfig* to the value of the received field

3> if the received *measObject* includes *measDS-Config*:

- 4> if *measDS-Config* is set to *setup*:
 - 5> if the received *measDS-Config* includes the *measCSI-RS-ToRemoveList*:
 - 6> for each *measCSI-RS-Id* included in the *measCSI-RS-ToRemoveList*:
 - 7> remove the entry with the matching *measCSI-RS-Id* from the *measCSI-RS-ToAddModList*;
 - 5> if the received *measDS-Config* includes the *measCSI-RS-ToAddModList*, for each *measCSI-RS-Id* value included in the *measCSI-RS-ToAddModList*:
 - 6> if an entry with the matching *measCSI-RS-Id* exists in the *measCSI-RS-ToAddModList*:
 - 7> replace the entry with the value received for this *measCSI-RS-Id*;
 - 6> else:
 - 7> add a new entry for the received *measCSI-RS-Id* to the *measCSI-RS-ToAddModList*;
 - 5> set other fields of the *measDS-Config* within the *VarMeasConfig* to the value of the received fields;
 - 5> perform the discovery signals measurement timing configuration procedure as specified in 5.5.2.10;
 - 4> else:
 - 5> release the discovery signals measurement configuration;
 - 3> if the received *measObject* modifies fields other than *cellsForWhichToReportSFTD*:
 - 4> for each *measId* associated with this *measObjectId* in the *measIdList* within the *VarMeasConfig*, if any:
 - 5> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
 - 5> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;
 - 3> if the received *measObject* includes the *wlan-ToRemoveList*:
 - 4> for each *WLAN-Identifiers* included in the *wlan-ToRemoveList*:
 - 5> remove the entry with the matching *WLAN-Identifiers* from the *wlan-ToAddModList*;

NOTE 3a: Matching of *WLAN-Identifiers* requires that all WLAN identifier fields should be same.

- 3> if the received *measObject* includes the *wlan-ToAddModList*:
 - 4> for each *WLAN-Identifiers* included in the *wlan-ToAddModList*:
 - 5> add a new entry for the received *WLAN-Identifiers* to the *wlan-ToAddModList*;
- 3> if the received *measObject* includes the *tx-ResourcePoolToRemoveList*:
 - 4> for each transmission resource pool indicated in *tx-ResourcePoolToRemoveList*:
 - 5> remove the entry with the matching identity of the transmission resource pool from the *tx-ResourcePoolToAddList*;
- 3> if the received *measObject* includes the *tx-ResourcePoolToAddList*:
 - 4> for each transmission resource pool indicated in *tx-ResourcePoolToAddList*:
 - 5> add a new entry for the received identity of the transmission resource pool to the *tx-ResourcePoolToAddList*;
- 3> if the received *measObject* includes the *ssb-PositionQCL-CellsToRemoveListNR*:

- 4> for each *physCellId* included in the *ssb-PositionQCL-CellsToRemoveListNR*:
 - 5> remove the entry with the matching *physCellId* from the *ssb-PositionQCL-CellsToAddModListNR*;
- 3> if the received *measObject* includes the *ssb-PositionQCL-CellsToAddModListNR*:
 - 4> for each *physCellId* included in the *ssb-PositionQCL-CellsToAddModListNR*:
 - 5> if an entry with the matching *physCellId* exists in the *ssb-PositionQCL-CellsToAddModListNR*:
 - 6> replace the entry with the value received for this *physCellId*;
 - 5> else:
 - 6> add a new entry for the received *physCellId* to the *ssb-PositionQCL-CellsToAddModListNR*;
 - 2> else:
 - 3> add a new entry for the received *measObject* to the *measObjectList* within *VarMeasConfig*;

NOTE 4: UE does not need to retain *cellForWhichToReportCGI* in the *measObject* after reporting *cgi-Info*.

5.5.2.6 Reporting configuration removal

The UE shall:

- 1> for each *reportConfigId* included in the received *reportConfigToRemoveList* that is part of the current UE configuration in *VarMeasConfig*:
 - 2> remove the entry with the matching *reportConfigId* from the *reportConfigList* within the *VarMeasConfig*;
 - 2> remove all *measId* associated with the *reportConfigId* from the *measIdList* within the *VarMeasConfig*, if any;
 - 2> if a *measId* is removed from the *measIdList*:
 - 3> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
 - 3> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

NOTE: The UE does not consider the message as erroneous if the *reportConfigToRemoveList* includes any *reportConfigId* value that is not part of the current UE configuration.

5.5.2.7 Reporting configuration addition/ modification

The UE shall:

- 1> for each *reportConfigId* included in the received *reportConfigToAddModList*:
 - 2> if an entry with the matching *reportConfigId* exists in the *reportConfigList* within the *VarMeasConfig*, for this entry:
 - 3> reconfigure the entry with the value received for this *reportConfig*;
 - 3> for each *measId* associated with this *reportConfigId* included in the *measIdList* within the *VarMeasConfig*, if any:
 - 4> remove the measurement reporting entry for this *measId* from in *VarMeasReportList*, if included;
 - 4> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;
 - 2> else:
 - 3> add a new entry for the received *reportConfig* to the *reportConfigList* within the *VarMeasConfig*;

5.5.2.8 Quantity configuration

The UE shall:

- 1> for each RAT for which the received *quantityConfig* includes parameter(s):
 - 2> set the corresponding parameter(s) in *quantityConfig* within *VarMeasConfig* to the value of the received *quantityConfig* parameter(s);
- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
 - 2> remove the measurement reporting entry for this *measId* from the *VarMeasReportList*, if included;
 - 2> stop the periodical reporting timer or timer T321, whichever one is running, and reset the associated information (e.g. *timeToTrigger*) for this *measId*;

5.5.2.9 Measurement gap configuration

The UE shall:

- 1> if *measGapConfig* is set to *setup*:
 - 2> if a measurement gap configuration *measGapConfig* or *measGapConfigPerCC-List* is already setup, release the measurement gap configuration;
 - 2> if the *gapOffset* in *measGapConfig* indicates a non-uniform gap pattern:
 - 3> setup the measurement gap configuration indicated by the *measGapConfig* in accordance with the received *gapOffset*, i.e., the first subframe of the first gap of each non-uniform gap pattern occurs at an SFN and subframe meeting the following condition (SFN and subframe of MCG cells):

$$\text{SFN mod } T = \text{FLOOR}(\text{gapOffset}/10);$$

$$\text{subframe} = \text{gapOffset} \bmod 10;$$

with $T = \text{LMGRP}/10$ as defined in TS 36.133 [16];
 - 2> else:
 - 3> setup the measurement gap configuration indicated by the *measGapConfig* in accordance with the received *gapOffset*, i.e., the first subframe of each gap occurs at an SFN and subframe meeting the following condition (SFN and subframe of MCG cells):

$$\text{SFN mod } T = \text{FLOOR}(\text{gapOffset}/10);$$

$$\text{subframe} = \text{gapOffset} \bmod 10;$$

with $T = \text{MGRP}/10$ as defined in TS 36.133 [16];
 - 2> if (NG)EN-DC is configured:
 - 3> if the UE is configured with *fr1-Gap* set to *TRUE*:
 - 4> apply the gap configuration for LTE serving cells and for NR serving cells on FR1;
 - 3> else:
 - 4> apply the gap configuration for all LTE and NR serving cells;
 - 2> if *mgta* is set to *TRUE*, apply a timing advance value of 0.5ms to the gap occurrences calculated above according to TS 38.133 [84];

NOTE 1: The UE applies a single gap, which timing is relative to the MCG cells, even when configured with DC. In case of (NG)EN-DC, the UE may either be configured with a single (common) gap or with two separate gaps i.e. a first one for FR1 (configured by E-UTRA RRC) and a second one for FR2 (configured by NR RRC).

- 1> else if *measGapConfig* is set to *release*:
- 2> release the measurement gap configuration *measGapConfig*;
- 1> if *measGapConfigPerCC-List* is set to *setup*:
- 2> if a measurement gap configuration *measGapConfig* is already setup, release *measGapConfig*;
- 2> if *measGapConfigToRemoveList* is included:
 - 3> for each *ServCellIndex* included in the *measGapConfigToRemoveList*:
 - 4> release *measGapConfigCC* for the serving cell indicated by *servCellId*;
- 2> if *measGapConfigToAddModList* is included:
 - 3> for each *ServCellIndex* included in the *measGapConfigToAddModList*:
 - 4> store *measGapConfigCC* for the serving cell indicated by *servCellId*;
- 2> for each serving cell with stored *measGapConfigCC* indicating a non-uniform gap pattern, setup the measurement gap configuration indicated by the *measGapConfigCC* in accordance with the received *gapOffset*, i.e., the first subframe of the first gap of each non-uniform gap pattern occurs at an SFN and subframe meeting the following condition (SFN and subframe of MCG cells):
 - SFN mod $T = \text{FLOOR}(gapOffset/10)$;
 - subframe = *gapOffset* mod 10;

with $T = \text{LMGRP}/10$ as defined in TS 36.133 [16];
- 2> for each serving cell with stored *measGapConfigCC* not indicating a non-uniform gap pattern, setup the measurement gap configuration indicated by the *measGapConfigCC* in accordance with the received *gapOffset*, i.e., the first subframe of each gap occurs at an SFN and subframe meeting the following condition (SFN and subframe of MCG cells):
 - SFN mod $T = \text{FLOOR}(gapOffset/10)$;
 - subframe = *gapOffset* mod 10;

with $T = \text{MGRP}/10$ as defined in TS 36.133 [16];

NOTE 2: The UE applies gap timing relative to the MCG cells, even when configured with DC.

- 1> else (*measGapConfigPerCC-List* is set to *release*):
- 2> release the measurement gap configuration *measGapConfigPerCC-List*;

NOTE 3: When a SCell is released, the UE is not required to apply a per CC measurement gap configuration associated to the SCell.

5.5.2.9a Measurement gap configuration for RSTD measurements with dense PRS configuration

The UE shall:

- 1> if *measGapConfigDensePRS* is set to *setup*:
- 2> setup the measurement gap configuration indicated by the *measGapConfigDensePRS* in accordance with the received *gapOffsetDensePRS*, i.e., the first subframe of each gap occurs at an SFN and subframe meeting the following condition:
 - SFN mod $T = \text{FLOOR}(gapOffsetDensePRS/10)$;
 - subframe = *gapOffsetDensePRS* mod 10;

with $T = \text{MGRP}/10$ as defined in TS 36.133 [16];

5.5.2.10 Discovery signals measurement timing configuration

The UE shall setup the discovery signals measurement timing configuration (DMTC) in accordance with the received *dmtc-PeriodOffset*, i.e., the first subframe of each DMTC occasion occurs at an SFN and subframe of the PCell meeting the following condition:

SFN mod $T = \text{FLOOR}(dmtc\text{-}Offset/10);$

subframe = *dmtc-Offset* mod 10;

with $T = dmtc\text{-Periodicity}/10;$

On the concerned frequency, the UE shall not consider discovery signals transmission in subframes outside the DMTC occasion for measurements including RRM measurements.

5.5.2.11 RSSI measurement timing configuration

The UE shall setup the RSSI measurement timing configuraton (RMTC) in accordance with the received *rmtc-Period*, *rmtc-SubframeOffset* if configured otherwise determined by the UE randomly, i.e. the first symbol of each RMTC occasion occurs at first symbol of an SFN and subframe of the PCell meeting the following condition:

SFN mod $T = \text{FLOOR}(rmtc\text{-}SubframeOffset/10);$

subframe = *rmtc-SubframeOffset* mod 10;

with $T = rmtc\text{-Period}/10;$

On the concerned frequency, the UE shall not consider RSSI measurements outside the configured RMTC occasion which lasts for *measDuration* for RSSI and channel occupancy measurements.

For inter-RAT NR measurements, the UE shall setup the RMTC in accordance with the received *rmtc-PeriodicityNR*, and, if configured, with *rmtc-SubframeOffsetNR*, i.e. the first symbol of each RMTC occasion occurs at first symbol of an SFN and subframe of the PCell meeting the following condition:

SFN mod $T = \text{FLOOR}(rmtc\text{-}SubframeOffsetNR/10);$

subframe = *rmtc-SubframeOffsetNR* mod 10;

with $T = rmtc\text{-PeriodicityNR}/10;$

The UE derives the RSSI measurement duration from a combination of *measDurationNR* and *refSCS-CP-NR*. On the frequency configured by *rmtc-FrequencyNR*, the UE shall not consider RSSI measurements outside the configured RMTC occasion which lasts for *measDurationNR* for RSSI and channel occupancy measurements.

5.5.2.12 Measurement gap sharing configuration

The UE shall:

1> if *measGapSharingConfig* is set to *setup*:

2> if a measurement gap sharing configuration is already setup, release the measurement gap sharing configuration;

2> setup the measurement gap sharing configuration indicated by the *measGapSharingConfig* in accordance with the received *measGapSharingScheme* as defined in TS 36.133 [16];

NOTE: In case of (NG)EN-DC, the UE may either be configured with a single (common) gap sharing or with two separate gap sharing configurations, i.e. a first one for FR1 (configured by E-UTRA RRC) and a second one for FR2 (configured by NR RRC). For the case of per FR gap configuration, the gap sharing configured here (i.e. E-UTRA RRC) is applicable only for FR1 gap.

1> else:

2> release the measurement gap sharing configuration;

5.5.2.13 NR measurement timing configuration

The UE shall setup the first SS/PBCH block measurement timing configuration (SMTTC) in accordance with the received *periodicityAndOffset* (providing *Periodicity* and *Offset* value for the following condition) in the *MTC-SSB-NR* configuration i.e., the first subframe of each SMTTC occasion occurs at an SFN and subframe of the PCell meeting the following condition:

SFN mod $T = \text{FLOOR}(\text{Offset}/10)$;

if the *Periodicity* is larger than *sf5*:

subframe = *Offset* mod 10;

else:

subframe = *Offset* or (*Offset* + 5);

with $T = \text{CEIL}(\text{Periodicity}/10)$.

On the concerned frequency, the UE shall not consider SS/PBCH block transmission in subframes outside the SMTTC occasion which lasts for *ssb-Duration* for measurements including RRM measurements except for SFTD measurement (see TS 36.133 [16], clause 8.1.2.4.25.2 and 8.1.2.4.26.1).

If *smtc2-LP* is present, for cells indicated in the *pci-List* parameter in *smtc2-LP* for inter-RAT cell reselection, the UE shall setup an additional SS/PBCH block measurement timing configuration (SMTTC) in accordance with the received *periodicity* parameter in the *smtc2-LP* configuration and use the *Offset* (derived from parameter *periodicityAndOffset*) and *ssb-Duration* parameter from the *measTimingConfig* configuration for that frequency. The first subframe of each SMTTC occasion occurs at an SFN and subframe of the NR SpCell or serving cell (for cell reselection) meeting the above condition.

5.5.3 Performing measurements

5.5.3.1 General

For all measurements, except for UE Rx–Tx time difference measurements, RSSI, UL PDCP Packet Delay per QCI measurement, UL PDCP Packet Delay Value per DRB measurement, channel occupancy measurements, CBR measurement, sensing measurement and except for WLAN measurements of Band, Carrier Info, Available Admission Capacity, Backhaul Bandwidth, Channel Utilization, and Station Count, the UE applies the layer 3 filtering as specified in 5.5.3.2, before using the measured results for evaluation of reporting criteria, for measurement reporting or for evaluation of fulfilment of the criteria to trigger conditional reconfiguration execution. When performing measurements on NR carriers, the UE derives the cell quality as specified in 5.5.3.3 and the beam quality as specified in 5.5.3.4.

The UE shall:

- 1> whenever the UE has a *measConfig*, perform RSRP and RSRQ measurements for each serving cell as follows:
 - 2> for the PCell, apply the time domain measurement resource restriction in accordance with *measSubframePatternPCell*, if configured;
 - 2> if the UE supports CRS based discovery signals measurement:
 - 3> for each SCell in deactivated state, apply the discovery signals measurement timing configuration in accordance with *measDS-Config*, if configured within the *measObject* corresponding to the frequency of the SCell;
- 1> if the UE has a *measConfig* with *rs-sinr-Config* configured, perform RS-SINR (as indicated in the associated *reportConfig*) measurements as follows:
 - 2> perform the corresponding measurements on the frequency indicated in the associated *measObject* using available idle periods or using autonomous gaps as necessary;
- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
 - 2> if the *purpose* for the associated *reportConfig* is set to *reportCGI*:

- 3> if the RAT indicated in the associated *measObject* is not NR:
 - 4> if *si-RequestForHO* is configured for the associated *reportConfig*:
 - 5> perform the corresponding measurements on the frequency and RAT indicated in the associated *measObject* using autonomous gaps as necessary;
 - 4> else:
 - 5> perform the corresponding measurements on the frequency and RAT indicated in the associated *measObject* using available idle periods or using autonomous gaps as necessary;
- 3> else:
 - 4> if *useAutonomousGapsNR* is configured for the associated *reportConfig*:
 - 5> perform the corresponding measurements on the NR frequency indicated in the associated *measObject* using autonomous gaps as necessary;
 - 4> else:
 - 5> perform the corresponding measurements on the NR frequency indicated in the associated *measObject* using available idle periods;

NOTE 1: If autonomous gaps are used to perform measurements, the UE is allowed to temporarily abort communication with all serving cell(s), i.e. create autonomous gaps to perform the corresponding measurements within the limits specified in TS 36.133 [16]. Otherwise, the UE only supports the measurements with the purpose set to *reportCGI* only if E-UTRAN has provided sufficient idle periods.

- 3> try to acquire the global cell identity of the cell indicated by the *cellForWhichToReportCGI* in the associated *measObject* by acquiring the relevant system information from the concerned cell;
- 3> if an entry in the *cellAccessRelatedInfoList* includes the selected PLMN, acquire the relevant system information from the concerned cell;
- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *measObject* is an E-UTRAN cell:
 - 4> try to acquire the CSG identity, if the CSG identity is broadcast in the concerned cell;
 - 4> try to acquire the *trackingAreaCode* in the concerned cell;
 - 4> try to acquire the list of additional PLMN Identities, as included in the *plmn-IdentityList*, if multiple PLMN identities are broadcast in the concerned cell;
 - 4> if *cellAccessRelatedInfoList* is included, use *trackingAreaCode* and *plmn-IdentityList* from the entry of *cellAccessRelatedInfoList* containing the selected PLMN;
 - 4> if the *includeMultiBandInfo* is configured:
 - 5> try to acquire the *freqBandIndicator* in the *SystemInformationBlockType1* of the concerned cell;
 - 5> try to acquire the list of additional frequency band indicators, as included in the *multiBandInfoList*, if multiple frequency band indicators are included in the *SystemInformationBlockType1* of the concerned cell;
 - 5> try to acquire the *freqBandIndicatorPriority*, if the *freqBandIndicatorPriority* is included in the *SystemInformationBlockType1* of the concerned cell;
 - 4> if *cellAccessRelatedInfoList-5GC* is broadcast in the concerned cell and the UE is E-UTRA/5GC capable:
 - 5> try to acquire the *cellAccessRelatedInfoList-5GC*;

NOTE 2: The 'primary' PLMN is part of the global cell identity.

- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *measObject* is a UTRAN cell:
 - 4> try to acquire the LAC, the RAC and the list of additional PLMN Identities, if multiple PLMN identities are broadcast in the concerned cell;
 - 4> try to acquire the CSG identity, if the CSG identity is broadcast in the concerned cell;
- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *measObject* is a GERAN cell:
 - 4> try to acquire the RAC in the concerned cell;
- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *measObject* is a CDMA2000 cell and the *cdma2000-Type* included in the *measObject* is *typeHRPD*:
 - 4> try to acquire the Sector ID in the concerned cell;
- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *measObject* is a CDMA2000 cell and the *cdma2000-Type* included in the *measObject* is *type1XRTT*:
 - 4> try to acquire the BASE ID, SID and NID in the concerned cell;
- 3> if the cell indicated by the *cellForWhichToReportCGI* included in the associated *MeasObject* is an NR cell:
 - 4> if the indicated cell is broadcasting *SIB1* (see TS 38.213 [88], clause 13):
 - 5> try to acquire the *plmn-IdentityInfoList* including *plmn-IdentityList*, *trackingAreaCode* (if available), *ran-AreaCode* (if available) and *cellIdentity* for each entry of the *plmn-IdentityInfoList*;
 - 5> try to acquire the *frequencyBandList*, if multiple frequency bands are broadcasted in the concerned cell;
- 2> if the *ul-DelayConfig* is configured for the associated *reportConfig*:
 - 3> ignore the *measObject*;
 - 3> configure the PDCP layer to perform UL PDCP Packet Delay per QCI measurement;
- 2> if the *ul-DelayValueConfig* is configured for the associated *reportConfig*:
 - 3> ignore the *measObject*;
 - 3> configure the PDCP layer to perform UL PDCP Packet Delay value per DRB measurement;
- 2> else:
 - 3> if a measurement gap configuration is setup; or
 - 3> if the UE does not require measurement gaps to perform the concerned measurements:
 - 4> if *s-Measure* is not configured; or
 - 4> if the UE is not in NE-DC and the PCell RSRP, after layer 3 filtering, is lower than *s-Measure*; or
 - 4> if the UE is in NE-DC and the PSCell RSRP, after layer 3 filtering, is lower than *s-Measure*; or
 - 4> if the associated *measObject* concerns NR; or
 - 4> if *timeMeasConfig* is configured and *t-Service* is configured in *SystemInformationBlockType3*; or
 - 4> if *locationMeasConfig* is configured and *referenceLocation* and *distanceThresh* are present in *SystemInformationBlockType3I*, and the distance between UE and serving cell *referenceLocation* is above *distanceThresh*; or
 - 4> if *measDS-Config* is configured in the associated *measObject*:

- 5> if the UE supports CSI-RS based discovery signals measurement; and
- 5> if the *eventId* in the associated *reportConfig* is set to *eventC1* or *eventC2*, or if *reportStrongestCSIRSSs* is set to *true* in the associated *reportConfig*:
- 6> perform the corresponding measurements of CSI-RS resources on the frequency indicated in the concerned *measObject*, applying the discovery signals measurement timing configuration in accordance with *measDS-Config* in the concerned *measObject*;
- 6> if *reportCRS-Meas* is set to *true* in the associated *reportConfig*, perform the corresponding measurements of neighbouring cells on the frequencies indicated in the concerned *measObject* as follows:
 - 7> for neighbouring cells on the primary frequency, apply the time domain measurement resource restriction in accordance with *measSubframePatternConfigNeigh*, if configured in the concerned *measObject*;
 - 7> apply the discovery signals measurement timing configuration in accordance with *measDS-Config* in the concerned *measObject*;
- 5> else:
 - 6> perform the corresponding measurements of neighbouring cells on the frequencies and RATs indicated in the concerned *measObject* as follows:
 - 7> for neighbouring cells on the primary frequency, apply the time domain measurement resource restriction in accordance with *measSubframePatternConfigNeigh*, if configured in the concerned *measObject*;
 - 7> if the UE supports CRS based discovery signals measurement, apply the discovery signals measurement timing configuration in accordance with *measDS-Config*, if configured in the concerned *measObject*;

NOTE 2A: If *timeMeasConfig* is configured and *t-Service* is configured in SystemInformationBlockType3, the exact time to start measurements before *t-Service* is left up to UE implementation and *t-ServiceStartNeigh* may be used to decide when to start measurements.

- 4> if the *ue-RxTxTimeDiffPeriodical* is configured in the associated *reportConfig*:
 - 5> perform the UE Rx–Tx time difference measurements on the PCell;
- 4> if the *reportSSTD-Meas* is set to *true* or *pSCell* in the associated *reportConfig*:
 - 5> perform SSTD measurements between the PCell and the PSCell;
- 4> if the *reportSFTD-Meas* is set to *pSCell* in the associated *reportConfig*:
 - 5> perform SFTD measurements between the PCell and the NR PSCell;
- 4> if the *reportSFTD-Meas* is set to *neighborCells* in the associated *reportConfig*:
 - 5> perform SFTD measurements between the PCell and NR cell(s) on the frequency indicated in the associated *measObject*;
- 4> if the *measRSSI-ReportConfig* is configured in the associated *reportConfig*:
 - 5> perform the RSSI and channel occupancy measurements on the frequency indicated in the associated *measObject*;
- 2> perform the evaluation of reporting criteria as specified in 5.5.4, except if *reportConfig* is *condReconfigurationTriggerEUTRA* or *condReconfigurationTriggerNR*;

NOTE 2c: The evaluation of conditional reconfiguration execution criteria is specified in 5.3.5.9.4.

The UE capable of CBR measurement when configured to transmit non-P2X related V2X sidelink communication shall:

- 1> if in coverage on the frequency used for V2X sidelink communication transmission as defined in TS 36.304 [4], clause 11.4; or
- 1> if the concerned frequency is included in *v2x-InterFreqInfoList* in *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26*:
- 2> if the UE is in RRC_IDLE:
 - 3> if the concerned frequency is the camped frequency:
 - 4> perform CBR measurement on the pools in *v2x-CommTxPoolNormalCommon* and *v2x-CommTxPoolExceptional* if included in *SystemInformationBlockType21*;
 - 3> else if *v2x-CommTxPoolNormal* or *v2x-CommTxPoolExceptional* is included in *v2x-InterFreqInfoList* for the concerned frequency within *SystemInformationBlockType21* or *SystemInformationBlockType26*:
 - 4> perform CBR measurement on pools in *v2x-CommTxPoolNormal* and *v2x-CommTxPoolExceptional* in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType21* or *SystemInformationBlockType26*;
 - 3> else if the concerned frequency broadcasts *SystemInformationBlockType21*:
 - 4> perform CBR measurement on pools in *v2x-CommTxPoolNormalCommon* and *v2x-CommTxPoolExceptional* if included in *SystemInformationBlockType21* broadcast on the concerned frequency;
- 2> if the UE is in RRC_CONNECTED:
 - 3> if *tx-ResourcePoolToAddList* is included in *VarMeasConfig*:
 - 4> perform CBR measurements on each resource pool indicated in *tx-ResourcePoolToAddList*;
 - 3> if the concerned frequency is the PCell's frequency:
 - 4> perform CBR measurement on the pools in *v2x-CommTxPoolNormalDedicated* or *v2x-SchedulingPool* if included in *RRCConnectionReconfiguration*, *v2x-CommTxPoolExceptional* if included in *SystemInformationBlockType21* for the concerned frequency and *v2x-CommTxPoolExceptional* if included in *mobilityControlInfoV2X*;
 - 3> else if *v2x-CommTxPoolNormal*, *v2x-SchedulingPool* or *v2x-CommTxPoolExceptional* is included in *v2x-InterFreqInfoList* for the concerned frequency within *RRCConnectionReconfiguration*:
 - 4> perform CBR measurement on pools in *v2x-CommTxPoolNormal*, *v2x-SchedulingPool*, and *v2x-CommTxPoolExceptional* if included in *v2x-InterFreqInfoList* for the concerned frequency in *RRCConnectionReconfiguration*;
 - 3> else if the concerned frequency broadcasts *SystemInformationBlockType21*:
 - 4> perform CBR measurement on pools in *v2x-CommTxPoolNormalCommon* and *v2x-CommTxPoolExceptional* if included in *SystemInformationBlockType21* for the concerned frequency;
- 1> else:
 - 2> perform CBR measurement on pools in *v2x-CommTxPoolList* in *SL-V2X-Preconfiguration* for the concerned frequency;

The UE capable of sensing measurement, with *commTxResources* set to *scheduled*, shall:

- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
- 2> if *measSensing-Config* is configured in the associated *measObject*
- 3> perform the sensing measurement in accordance with TS 36.213 [23] on the pools of *v2x-SchedulingPool* and also indicated in *tx-ResourcePoolToAddList* in the associated *measObject*, using *sensingSubchannelNumber*, *sensingPeriodicity*, *sensingReselectionCounter* and *sensingPriority*.

If a UE that is configured by upper layers to transmit NR sidelink communication is configured by EUTRA with transmission resource pool(s) in *SystemInformationBlockType28* or by *sl-ConfigDedicatedForNR* and the measurements concerning NR sidelink communication (i.e. by *sl-ConfigDedicatedForNR*), it shall perform CBR measurement as specified in clause 5.5.3 of TS 38.331 [82], based on the transmission resource pool(s) in *SystemInformationBlockType28* or *sl-ConfigDedicatedForNR*.

NOTE 2a: *SIB12* specified in clause 5.5.3 of TS 38.331 is provided in *SystemInformationBlockType28*.

NOTE 2b: For NR sidelink communication, each of the CBR measurement results is associated with a resource pool, as indicated by the *sl-poolReportIdentity* (see TS 38.331 [82]), that refers to a pool as included in *sl-ConfigDedicatedForNR* or *SystemInformationBlockType28*.

NOTE 3: The *s-Measure* defines when the UE is required to perform measurements. The UE is however allowed to perform measurements also when the PCell RSRP (or PSCell RSRP, if the UE is in NE-DC) exceeds *s-Measure*, e.g., to measure cells broadcasting a CSG identity following use of the autonomous search function as defined in TS 36.304 [4].

NOTE 4: The UE may not perform the WLAN measurements it is configured with e.g. due to connection to another WLAN based on user preferences as specified in TS 23.402 [75] or due to turning off WLAN.

NOTE 5: In case the configurations for V2X sidelink communication are acquired from NR, the configurations for V2X sidelink communication in *SystemInformationBlockType21*, *SystemInformationBlockType26*, *SL-V2X-ConfigDedicated* within *RRCConnectionReconfiguration* used in this clause can be provided by *SIB13*, *SIB14*, *sl-ConfigDedicatedEUTRA* within *RRCReconfiguration* as specified in TS 38.331 [82], respectively.

5.5.3.2 Layer 3 filtering

The UE shall:

1> for each measurement quantity that the UE performs measurements according to 5.5.3.1:

NOTE 1: This does not include quantities configured solely for UE Rx-Tx time difference, SSTD measurements and RSSI, channel occupancy measurements, WLAN measurements of Band, Carrier Info, Available Admission Capacity, Backhaul Bandwidth, Channel Utilization, and Station Count, CBR measurement, sensing measurement, UL PDCP Packet Delay per QCI measurement and UL PDCP Packet Delay Value per DRB measurement i.e. for those types of measurements the UE ignores the *triggerQuantity* and *reportQuantity*.

2> filter the measured result, before using for evaluation of reporting criteria or for measurement reporting, by the following formula:

$$F_n = (1 - a) \cdot F_{n-1} + a \cdot M_n$$

where

M_n is the latest received measurement result from the physical layer;

F_n is the updated filtered measurement result, that is used for evaluation of reporting criteria or for measurement reporting;

F_{n-1} is the old filtered measurement result, where F_0 is set to M_1 when the first measurement result from the physical layer is received; and

except for NR, $a = 1/2^{(k/4)}$, where k is the *filterCoefficient* for the corresponding measurement quantity received by the *quantityConfig*; for NR, $a = 1/2^{(ki/4)}$, where k_i is the *filterCoefficient* for the corresponding measurement quantity of the i :th *QuantityConfigNR* in *quantityConfigNRLList*, and i is indicated by *quantityConfigSet* in *MeasObjectNR*;

2> adapt the filter such that the time characteristics of the filter are preserved at different input rates, observing that the *filterCoefficient* k assumes a sample rate equal to 200 ms;

NOTE 2: If k is set to 0, no layer 3 filtering is applicable.

NOTE 3: The filtering is performed in the same domain as used for evaluation of reporting criteria or for measurement reporting, i.e., logarithmic filtering for logarithmic measurements.

NOTE 4: The filter input rate is implementation dependent, to fulfil the performance requirements set in TS 36.133 [16]. For further details about the physical layer measurements, see TS 36.133 [16].

5.5.3.3 Derivation of NR cell quality

The UE shall:

- 1> if the associated *measObject*, in RRC_CONNECTED, or the associated entry in *measIdleCarrierListNR* within *VarMeasIdleConfig*, for measurements performed according to 5.6.20.2 in RRC_IDLE or RRC_INACTIVE, includes *maxRS-IndexCellQual*; and
- 1> if there are multiple detected NR-SS beams associated to the cell; and
- 1> if *threshRS-Index* is configured and if for more than one of the NR-SS beams the measured result exceeds this threshold:
 - 2> consider the cell quality to be the linear average of the power values of the, up to *maxRS-IndexCellQual*, best of the detected NR-SS beams exceeding *threshRS-Index*;
- 1> else:
 - 2> consider the cell quality to be the measurement result of the detected NR-SS beam, associated to the cell, with the highest measurement result;

5.5.3.4 Derivation of NR beam quality

The UE shall:

- 1> consider the beam quality to be the value resulting after layer 3 filtering, as specified in 5.5.3.2, of the measurement results of the concerned beam, where each result is averaged as described in TS 38.215 [89];

5.5.4 Measurement report triggering

5.5.4.1 General

If security has been activated successfully, the UE shall:

- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
- 2> if the corresponding *reportConfig* includes a purpose set to *reportStrongestCellsForSON*:
 - 3> consider any neighbouring cell detected on the associated frequency to be applicable;
- 2> else if the corresponding *reportConfig* includes a purpose set to *reportCGI*:
 - 3> consider any neighbouring cell detected on the associated frequency/ set of frequencies (GERAN) which has a physical cell identity matching the value of the *cellForWhichToReportCGI* included in the corresponding *measObject* within the *VarMeasConfig* to be applicable;
- 2> else:
 - 3> if the corresponding *measObject* concerns E-UTRA:
 - 4> if the *ue-RxTxTimeDiffPeriodical* is configured in the corresponding *reportConfig*:
 - 5> consider only the PCell to be applicable;
 - 4> else if the *reportSSTD-Meas* is set to *true* in the corresponding *reportConfig*:
 - 5> consider the PSCell to be applicable;

- 4> else if the *eventA1* or *eventA2* is configured in the corresponding *reportConfig*:
 - 5> consider only the serving cell to be applicable;
- 4> else if *eventC1* or *eventC2* is configured in the corresponding *reportConfig*; or if *reportStrongestCSI-RSs* is set to *true* in the corresponding *reportConfig*:
 - 5> consider a CSI-RS resource on the associated frequency to be applicable when the concerned CSI-RS resource is included in the *measCSI-RS-ToAddModList* defined within the *VarMeasConfig* for this *measId*;
- 4> else if *measRSSI-ReportConfig* is configured in the corresponding *reportConfig*:
 - 5> consider the resource indicated by the *rmtc-Config* on the associated frequency to be applicable;
- 4> else if the corresponding *reportConfig* includes *reportType* set to *periodical* or the *eventId* is set to measurement events other than *eventD1* and *eventD2*:
 - 5> if *useAllowedCellList* is set to *TRUE*:
 - 6> consider any neighbouring cell detected on the associated frequency to be applicable when the concerned cell is included in the *allowedCellsToAddModList* defined within the *VarMeasConfig* for this *measId*;
 - 5> else:
 - 6> consider any neighbouring cell detected on the associated frequency to be applicable when the concerned cell is not included in the *excludedCellsToAddModList* defined within the *VarMeasConfig* for this *measId*;
 - 5> for events involving a serving cell on one frequency and neighbours on another frequency, consider the serving cell on the other frequency as a neighbouring cell;
- 4> if the corresponding *reportConfig* includes *alternativeTimeToTrigger* and if the UE supports *alternativeTimeToTrigger*:
 - 5> use the value of *alternativeTimeToTrigger* as the time to trigger instead of the value of *timeToTrigger* in the corresponding *reportConfig* for cells included in the *altTTT-CellsToAddModList* of the corresponding *measObject*;
- 3> else if the corresponding *measObject* concerns UTRA or CDMA2000:
 - 4> consider a neighbouring cell on the associated frequency to be applicable when the concerned cell is included in the *cellsToAddModList* defined within the *VarMeasConfig* for this *measId* (i.e. the cell is included in the allow-list);
- NOTE 0: The UE may also consider a neighbouring cell on the associated UTRA frequency to be applicable when the concerned cell is included in the *csg-allowedReportingCells* within the *VarMeasConfig* for this *measId*, if configured in the corresponding *measObjectUTRA* (i.e. the cell is included in the range of physical cell identities for which reporting is allowed).
- 3> else if the corresponding *measObject* concerns GERAN:
 - 4> consider a neighbouring cell on the associated set of frequencies to be applicable when the concerned cell matches the *ncc-Permitted* defined within the *VarMeasConfig* for this *measId*;
- 3> else if the corresponding *measObject* concerns WLAN:
 - 4> consider a WLAN on the associated set of frequencies, as indicated by *carrierFreq* or on all WLAN frequencies when *carrierFreq* is not present, to be applicable if the WLAN matches all WLAN identifiers of at least one entry within *wlan-Id-List* for this *measId*;
- 3> else if the corresponding *measObject* concerns NR:
 - 4> if the *reportSFTD-Meas* is set to *pSCell* in the corresponding *reportConfigInterRAT*:
 - 5> consider the PSCell to be applicable;

4> else if the *reportSFTD-Meas* is set to *neighborCells* in the corresponding *reportConfigInterRAT*:

5> if *cellsForWhichToReportSFTD* is configured in the corresponding *measObjectNR*:

6> consider any neighbouring NR cell on the associated frequency that is included in *cellsForWhichToReportSFTD* to be applicable;

5> else:

6> consider up to 3 strongest neighbouring NR cells detected on the associated frequency to be applicable when the concerned cells are not included in the *excludedCellsToAddModList* defined within the *VarMeasConfig* for this *measId*;

4> else if *measRSSI-ReportConfigNR* is configured in the corresponding *reportConfigInterRAT*:

5> consider the resource indicated by the *rmtc-ConfigNR* on the associated frequency to be applicable;

4> else:

5> if the *eventB1* or *eventB2* is configured in the corresponding *reportConfig*:

6> consider a serving cell, if any, on the associated NR frequency as neighbouring cell;

5> consider any neighbouring cell detected on the associated frequency to be applicable when the concerned cell is not included in the *excludedCellsToAddModList* defined within the *VarMeasConfig* for this *measId*;

2> if *tx-ResourcePoolToAddList* is configured in the *measObject*, and if the corresponding *reportConfig* includes a purpose set to *sidelink* or includes *eventV1* or *eventV2*:

3> consider the transmission resource pools indicated by the *tx-ResourcePoolToAddList* defined within the *VarMeasConfig* for this *measId* to be applicable;

2> if the corresponding *reportConfig* includes a purpose set to *reportLocation*:

3> consider only the PCell to be applicable;

2> if the *triggerType* is set to *event*, and if the corresponding *reportConfig* does not include *numberOfTriggeringCells*, and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable cells for all measurements after layer 3 filtering taken during *timeToTrigger* defined for this event within the *VarMeasConfig*, while the *VarMeasReportList* does not include a measurement reporting entry for this *measId* (a first cell triggers the event):

3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> include the concerned cell(s) in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;

3> if the UE supports T312 and if *useT312* is set to *true* for this event and if T310 is running:

4> if T312 is not running:

5> start timer T312 with the value configured in the corresponding *measObject*;

3> initiate the measurement reporting procedure, as specified in 5.5.5;

2> if the *triggerType* is set to *event*, and if the corresponding *reportConfig* does not include *numberOfTriggeringCells*, and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable cells not included in the *cellsTriggeredList* for all measurements after layer 3 filtering taken during *timeToTrigger* defined for this event within the *VarMeasConfig* (a subsequent cell triggers the event):

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

- 3> include the concerned cell(s) in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
- 3> if the UE supports T312 and if *useT312* is set to *true* for this event and if T310 is running:
 - 4> if T312 is not running:
 - 5> start timer T312 with the value configured in the corresponding *measObject*;
 - 3> initiate the measurement reporting procedure, as specified in 5.5.5;
- 2> if the *triggerType* is set to *event* and if the corresponding *reportConfig* includes *numberOfTriggeringCells*, and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable cells for all measurements after layer 3 filtering taken during *timeToTrigger* defined for this event within the *VarMeasConfig*:
 - 3> If the *VarMeasReportList* does not include a measurement reporting entry for this *measId* (a first cell triggers the event):
 - 4> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 3> If the number of cell(s) in the *cellsTriggeredList* is larger than or equal to *numberOfTriggeringCells*:
 - 4> include the concerned cell(s) in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> else:
 - 4> include the concerned cell(s) in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 4> If the number of cell(s) in the *cellsTriggeredList* is larger than or equal to *numberOfTriggeringCells*:
 - 5> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5;
 - 2> if the *triggerType* is set to *event* and if the leaving condition applicable for this event is fulfilled for one or more of the cells included in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId* for all measurements after layer 3 filtering taken during *timeToTrigger* defined within the *VarMeasConfig* for this event:
 - 3> remove the concerned cell(s) in the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> if *reportOnLeave* is set to *TRUE* for the corresponding reporting configuration or if *a6-ReportOnLeave* is set to *TRUE* or if *a4-a5-ReportOnLeave* is set to *TRUE* for the corresponding reporting configuration:
 - 4> initiate the measurement reporting procedure, as specified in 5.5.5;
 - 3> if the *cellsTriggeredList* defined within the *VarMeasReportList* for this *measId* is empty:
 - 4> remove the measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 4> stop the periodical reporting timer for this *measId*, if running;
 - 2> if the *triggerType* is set to *event* and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable CSI-RS resources for all measurements after layer 3 filtering taken during *timeToTrigger* defined for this event within the *VarMeasConfig*, while the *VarMeasReportList* does not include a measurement reporting entry for this *measId* (i.e. a first CSI-RS resource triggers the event):
 - 3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

- 3> include the concerned CSI-RS resource(s) in the *csi-RS-TriggeredList* defined within the *VarMeasReportList* for this *measId*;
- 3> initiate the measurement reporting procedure, as specified in 5.5.5;
- 2> if the *triggerType* is set to *event* and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable CSI-RS resources not included in the *csi-RS-TriggeredList* for all measurements after layer 3 filtering taken during *timeToTrigger* defined for this event within the *VarMeasConfig* (i.e. a subsequent CSI-RS resource triggers the event):
 - 3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;
 - 3> include the concerned CSI-RS resource(s) in the *csi-RS-TriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> initiate the measurement reporting procedure, as specified in 5.5.5;
 - 2> if the *triggerType* is set to *event* and if the leaving condition applicable for this event is fulfilled for one or more of the CSI-RS resources included in the *csi-RS-TriggeredList* defined within the *VarMeasReportList* for this *measId* for all measurements after layer 3 filtering taken during *timeToTrigger* defined within the *VarMeasConfig* for this event:
 - 3> remove the concerned CSI-RS resource(s) in the *csi-RS-TriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> if *c1-ReportOnLeave* is set to *TRUE* for the corresponding reporting configuration or if *c2-ReportOnLeave* is set to *TRUE* for the corresponding reporting configuration:
 - 4> initiate the measurement reporting procedure, as specified in 5.5.5;
 - 3> if the *csi-RS-TriggeredList* defined within the *VarMeasReportList* for this *measId* is empty:
 - 4> remove the measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 4> stop the periodical reporting timer for this *measId*, if running;
 - 2> if the *triggerType* is set to *event* and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable transmission resource pools for all measurements taken during *timeToTrigger* defined for this event within the *VarMeasConfig*, while the *VarMeasReportList* does not include a measurement reporting entry for this *measId* (a first transmission resource pool triggers the event):
 - 3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;
 - 3> include the concerned transmission resource pool(s) in the *poolsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> initiate the measurement reporting procedure, as specified in 5.5.5;
 - 2> if the *triggerType* is set to *event* and if the entry condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled for one or more applicable transmission resource pools not included in the *poolsTriggeredList* for all measurements taken during *timeToTrigger* defined for this event within the *VarMeasConfig* (a subsequent transmission resource pool triggers the event):
 - 3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;
 - 3> include the concerned transmission resource pool(s) in the *poolsTriggeredList* defined within the *VarMeasReportList* for this *measId*;
 - 3> initiate the measurement reporting procedure, as specified in 5.5.5;

2> if the *triggerType* is set to *event* and if the leaving condition applicable for this event is fulfilled for one or more applicable transmission resource pools included in the *poolsTriggeredList* defined within the *VarMeasReportList* for this *measId* for all measurements taken during *timeToTrigger* defined within the *VarMeasConfig* for this event:

3> remove the concerned transmission resource pool(s) from the *poolsTriggeredList* defined within the *VarMeasReportList* for this *measId*;

3> if the *poolsTriggeredList* defined within the *VarMeasReportList* for this *measId* is empty:

4> remove the measurement reporting entry within the *VarMeasReportList* for this *measId*;

4> stop the periodical reporting timer for this *measId*, if running;

NOTE 1: Void.

2> if the *triggerType* is set to *event* and if the *eventId* is set to *eventD1* or *eventD2* or *eventH1* or *eventH2* and if the entering condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled during *timeToTrigger* defined within the *VarMeasConfig* for this event, while the *VarMeasReportList* does not include a measurement reporting entry for this *measId*:

3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> initiate the measurement reporting procedure, as specified in 5.5.5;

2> if the *triggerType* is set to *event* and if the *eventId* is set to *eventD1* or *eventD2* or *eventH1* or *eventH2* and if the leaving condition applicable for this event, i.e. the event corresponding with the *eventId* of the corresponding *reportConfig* within *VarMeasConfig*, is fulfilled during *timeToTrigger* defined within the *VarMeasConfig* for this event:

3> remove the measurement reporting entry within the *VarMeasReportList* for this *measId*;

2> if *measRSSI-ReportConfig* is included and if a (first) measurement result is available:

3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> initiate the measurement reporting procedure as specified in 5.5.5 immediately when RSSI sample values are reported by the physical layer after the first L1 measurement duration;

2> if *measRSSI-ReportConfigNR* is included and if a (first) measurement result is available:

3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> initiate the measurement reporting procedure as specified in 5.5.5 immediately when RSSI sample values are reported by the physical layer after the first L1 measurement duration;

2> else if the *purpose* is included and set to *reportStrongestCells*, *reportStrongestCellsForSON*, *reportLocation*, *sidelink* or *sensing* and if a (first) measurement result is available:

3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> if the *purpose* is set to *reportStrongestCells* and *reportStrongestCSI-RSS* is set to *FALSE*:

4> if the *triggerType* is set to *periodical* and the corresponding *reportConfig* includes the *ul-DelayConfig*:

5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after a first measurement result is provided by lower layers;

- 4> if the *triggerType* is set to *periodical* and the corresponding *reportConfig* includes the *ul-DelayValueConfig*:
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after a first measurement result is provided by lower layers of the associated DRB identity;
- 4> else if the corresponding measurement object concerns WLAN:
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after the quantity to be reported becomes available for the PCell and for the applicable WLAN(s);
- 4> else if the *reportAmount* exceeds 1:
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after the quantity to be reported becomes available for the PCell;
- 4> else (i.e. the *reportAmount* is equal to 1):
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after the quantity to be reported becomes available for the PCell and for the strongest cell among the applicable cells, or becomes available for the pair of PCell and the PSCell in case of SSTD measurements, or becomes available for each requested pair of PCell and NR cell or the maximal measurement reporting delay as specified in TS 36.133 [16], clause 8.17.2.3 in case of SFTD measurements;
- 3> if the *purpose* is set to *reportLocation*, *sidelink* or *sensing*:
 - 4> if the *purpose* is set to *reportLocation*:
 - 5> initiate the measurement reporting procedure, as specified in 5.5.5, immediately after both the quantity to be reported for the PCell and the location information become available;
 - 4> else if the *purpose* is set to *sidelink*:
 - 5> initiate the measurement reporting procedure as specified in 5.5.5 immediately after both the quantity to be reported for the PCell and the CBR measurement result become available;
 - 4> else if the *purpose* is set to *sensing*:
 - 5> initiate the measurement reporting procedure as specified in 5.5.5 immediately after both the quantity to be reported for the PCell and the sensing measurement result become available;
- 3> else if the *purpose* is not set to *reportStrongestCells* or *reportStrongestCSI-RSs* is set to *true*:
 - 4> initiate the measurement reporting procedure, as specified in 5.5.5, when it has determined the strongest cells on the associated frequency;
- 2> upon expiry of the periodical reporting timer for this *measId*:
 - 3> initiate the measurement reporting procedure, as specified in 5.5.5;
- 2> if the *purpose* is included and set to *reportCGI*:
 - 3> if the UE acquired the information needed to set all fields of *cgi-Info* for the requested cell; or
 - 3> if the UE detects that the requested NR cell is not transmitting *SIB1*:
 - 4> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;
 - 4> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;
 - 4> stop timer T321;
 - 4> initiate the measurement reporting procedure, as specified in 5.5.5;
- 2> upon expiry of the T321 for this *measId*:
 - 3> include a measurement reporting entry within the *VarMeasReportList* for this *measId*;

3> set the *numberOfReportsSent* defined within the *VarMeasReportList* for this *measId* to 0;

3> initiate the measurement reporting procedure, as specified in 5.5.5;

NOTE 2: The UE does not stop the periodical reporting with *triggerType* set to *event* or to *periodical* while the corresponding measurement is not performed due to the PCell RSRP (or PSCell RSRP, if the UE is in NE-DC) being equal to or better than *s-Measure* or due to the measurement gap not being setup.

NOTE 3: If the UE is configured with DRX, the UE may delay the measurement reporting for event triggered and periodical triggered measurements until the Active Time, which is defined in TS 36.321 [6].

5.5.4.2 Event A1 (Serving becomes better than threshold)

The UE shall:

- 1> consider the entering condition for this event to be satisfied when condition A1-1, as specified below, is fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition A1-2, as specified below, is fulfilled;
- 1> for this measurement, consider the primary or secondary cell that is configured on the frequency indicated in the associated *measObjectEUTRA* to be the serving cell;

Inequality A1-1 (Entering condition)

$$Ms - Hys > Thresh$$

Inequality A1-2 (Leaving condition)

$$Ms + Hys < Thresh$$

The variables in the formula are defined as follows:

Ms is the measurement result of the serving cell, not taking into account any offsets.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Thresh is the threshold parameter for this event (i.e. *a1-Threshold* as defined within *reportConfigEUTRA* for this event).

Ms is expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Hys is expressed in dB.

Thresh is expressed in the same unit as **Ms**.

5.5.4.3 Event A2 (Serving becomes worse than threshold)

The UE shall:

- 1> consider the entering condition for this event to be satisfied when condition A2-1, as specified below, is fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition A2-2, as specified below, is fulfilled;
- 1> for this measurement, consider the primary or secondary cell that is configured on the frequency indicated in the associated *measObjectEUTRA* to be the serving cell;

Inequality A2-1 (Entering condition)

$$Ms + Hys < Thresh$$

Inequality A2-2 (Leaving condition)

$$Ms - Hys > Thresh$$

The variables in the formula are defined as follows:

Ms is the measurement result of the serving cell, not taking into account any offsets.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Thresh is the threshold parameter for this event (i.e. *a2-Threshold* as defined within *reportConfigEUTRA* for this event).

Ms is expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Hys is expressed in dB.

Thresh is expressed in the same unit as ***Ms***.

5.5.4.4 Event A3 (Neighbour becomes offset better than PCell/ PSCell)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition A3-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition A3-2, as specified below, is fulfilled;

1> if *usePSCell* of the corresponding *reportConfig* is set to *true*:

2> use the PSCell for *Mp*, *Ofp* and *Ocp*;

1> else:

2> use the PCell for *Mp*, *Ofp* and *Ocp*;

NOTE 1: The cell(s) that triggers the event is on the frequency indicated in the associated *measObject* which may be different from the frequency used by the PCell/ PSCell.

Inequality A3-1 (Entering condition)

$$Mn + Ofn + Ocn - Hys > Mp + Ofp + Ocp + Off$$

Inequality A3-2 (Leaving condition)

$$Mn + Ofn + Ocn + Hys < Mp + Ofp + Ocp + Off$$

The variables in the formula are defined as follows:

Mn is the measurement result of the neighbouring cell, not taking into account any offsets.

Ofn is the frequency specific offset of the frequency of the neighbour cell (i.e. *offsetFreq* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell).

Ocn is the cell specific offset of the neighbour cell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.

Mp is the measurement result of the PCell/ PSCell, not taking into account any offsets.

Ofp is the frequency specific offset of the frequency of the PCell/ PSCell (i.e. *offsetFreq* as defined within *measObjectEUTRA* corresponding to the frequency of the PCell/ PSCell).

Ocp is the cell specific offset of the PCell/ PSCell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the PCell/ PSCell), and is set to zero if not configured for the PCell/ PSCell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Off is the offset parameter for this event (i.e. *a3-Offset* as defined within *reportConfigEUTRA* for this event).

Mn, ***Mp*** are expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Ofn, ***Ocn***, ***Ofp***, ***Ocp***, ***Hys***, ***Off*** are expressed in dB.

NOTE 2: The definition of Event A3 also applies to CondEvent A3.

5.5.4.5 Event A4 (Neighbour becomes better than threshold)

The UE shall:

- 1> consider the entering condition for this event to be satisfied when condition A4-1, as specified below, is fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition A4-2, as specified below, is fulfilled;

Inequality A4-1 (Entering condition)

$$Mn + Ofn + Ocn - Hys > Thresh$$

Inequality A4-2 (Leaving condition)

$$Mn + Ofn + Ocn + Hys < Thresh$$

The variables in the formula are defined as follows:

Mn is the measurement result of the neighbouring cell, not taking into account any offsets.

Ofn is the frequency specific offset of the frequency of the neighbour cell (i.e. *offsetFreq* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell).

Ocn is the cell specific offset of the neighbour cell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Thresh is the threshold parameter for this event (i.e. *a4-Threshold* as defined within *reportConfigEUTRA* for this event).

Mn is expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Ofn, Ocn, Hys are expressed in dB.

Thresh is expressed in the same unit as **Mn**.

NOTE : The definition of Event A4 also applies to CondEvent A4.

5.5.4.6 Event A5 (PCell/ PSCell becomes worse than threshold1 and neighbour becomes better than threshold2)

The UE shall:

- 1> consider the entering condition for this event to be satisfied when both condition A5-1 and condition A5-2, as specified below, are fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition A5-3 or condition A5-4, i.e. at least one of the two, as specified below, is fulfilled;
- 1> if *usePSCell* of the corresponding *reportConfig* is set to *true*:
 - 2> use the PSCell for *Mp*;

1> else:

2> use the PCell for *Mp*;

NOTE 1: The cell(s) that triggers the event is on the frequency indicated in the associated *measObject* which may be different from the frequency used by the PCell/ PSCell.

Inequality A5-1 (Entering condition 1)

$$Mp + Hys < Thresh$$

Inequality A5-2 (Entering condition 2)

$$Mn + Ofn + Ocn - Hys > Thresh2$$

Inequality A5-3 (Leaving condition 1)

$$Mp - Hys > Thresh1$$

Inequality A5-4 (Leaving condition 2)

$$Mn + Ofn + Ocn + Hys < Thresh2$$

The variables in the formula are defined as follows:

Mp is the measurement result of the PCell/ PSCell, not taking into account any offsets.

Mn is the measurement result of the neighbouring cell, not taking into account any offsets.

Ofn is the frequency specific offset of the frequency of the neighbour cell (i.e. *offsetFreq* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell).

Ocn is the cell specific offset of the neighbour cell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Thresh1 is the threshold parameter for this event (i.e. *a5-Threshold1* as defined within *reportConfigEUTRA* for this event).

Thresh2 is the threshold parameter for this event (i.e. *a5-Threshold2* as defined within *reportConfigEUTRA* for this event).

Mn, Mp are expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Ofn, Ocn, Hys are expressed in dB.

Thresh1 is expressed in the same unit as **Mp**.

Thresh2 is expressed in the same unit as **Mn**.

NOTE 2: The definition of Event A5 also applies to CondEvent A5.

5.5.4.6a Event A6 (Neighbour becomes offset better than SCell)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition A6-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition A6-2, as specified below, is fulfilled;

1> for this measurement, consider the (secondary) cell that is configured on the frequency indicated in the associated *measObjectEUTRA* to be the serving cell;

NOTE: The neighbour(s) is on the same frequency as the SCell i.e. both are on the frequency indicated in the associated *measObject*.

Inequality A6-1 (Entering condition)

$$Mn + Ocn - Hys > Ms + Ocs + Off$$

Inequality A6-2 (Leaving condition)

$$Mn + Ocn + Hys < Ms + Ocs + Off$$

The variables in the formula are defined as follows:

Mn is the measurement result of the neighbouring cell, not taking into account any offsets.

Ocn is the cell specific offset of the neighbour cell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the neighbour cell), and set to zero if not configured for the neighbour cell.

Ms is the measurement result of the serving cell, not taking into account any offsets.

Ocs is the cell specific offset of the serving cell (i.e. *cellIndividualOffset* as defined within *measObjectEUTRA* corresponding to the serving frequency), and is set to zero if not configured for the serving cell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Off is the offset parameter for this event (i.e. *a6-Offset* as defined within *reportConfigEUTRA* for this event).

Mn, Ms are expressed in dBm in case of RSRP, or in dB in case of RSRQ and RS-SINR.

Ocn, Ocs, Hys, Off are expressed in dB.

5.5.4.7 Event B1 (Inter RAT neighbour becomes better than threshold)

The UE shall:

- 1> for UTRA and CDMA2000, only trigger the event for cells included in the corresponding measurement object;
- 1> consider the entering condition for this event to be satisfied when condition B1-1, as specified below, is fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition B1-2, as specified below, is fulfilled;

Inequality B1-1 (Entering condition)

$$Mn + Ofn + Ocn - Hys > Thresh$$

Inequality B1-2 (Leaving condition)

$$Mn + Ofn + Ocn + Hys < Thresh$$

The variables in the formula are defined as follows:

Mn is the measurement result of the inter-RAT neighbour cell, not taking into account any offsets. For CDMA 2000 measurement result, *pilotStrength* is divided by -2.

Ofn is the frequency specific offset of the frequency of the inter-RAT neighbour cell (i.e. *offsetFreq* as defined within the *measObject* corresponding to the frequency of the neighbour inter-RAT cell).

Ocn is the cell specific offset of the inter-RAT NR neighbour cell (i.e. *cellIndividualOffset* as defined within the *measObjectNR* corresponding to the neighbour inter-RAT cell), and set to zero if not configured for the neighbour cell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigInterRAT* for this event).

Thresh is the threshold parameter for this event (i.e. *b1-Threshold* as defined within *reportConfigInterRAT* for this event). For CDMA2000, *b1-Threshold* is divided by -2.

Mn is expressed in dBm or in dB, depending on the measurement quantity of the inter-RAT neighbour cell.

Ofn, Ocn, Hys are expressed in dB.

Thresh is expressed in the same unit as **Mn**.

5.5.4.8 Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2)

The UE shall:

- 1> for UTRA and CDMA2000, only trigger the event for cells included in the corresponding measurement object;
- 1> consider the entering condition for this event to be satisfied when both condition B2-1 and condition B2-2, as specified below, are fulfilled;

1> consider the leaving condition for this event to be satisfied when condition B2-3 or condition B2-4, i.e. at least one of the two, as specified below, is fulfilled;

Inequality B2-1 (Entering condition 1)

$$Mp + Hys < Thresh1$$

Inequality B2-2 (Entering condition 2)

$$Mn + Ofn + Ocn - Hys > Thresh2$$

Inequality B2-3 (Leaving condition 1)

$$Mp - Hys > Thresh1$$

Inequality B2-4 (Leaving condition 2)

$$Mn + Ofn + Ocn + Hys < Thresh2$$

The variables in the formula are defined as follows:

Mp is the measurement result of the PCell, not taking into account any offsets.

Mn is the measurement result of the inter-RAT neighbour cell, not taking into account any offsets. For CDMA2000 measurement result, *pilotStrength* is divided by -2.

Ofn is the frequency specific offset of the frequency of the inter-RAT neighbour cell (i.e. *offsetFreq* as defined within the *measObject* corresponding to the frequency of the inter-RAT neighbour cell).

Ocn is the cell specific offset of the inter-RAT NR neighbour cell (i.e. *cellIndividualOffset* as defined within the *measObjectNR* corresponding to the neighbour inter-RAT cell), and set to zero if not configured for the neighbour cell.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigInterRAT* for this event).

Thresh1 is the threshold parameter for this event (i.e. *b2-Threshold1* as defined within *reportConfigInterRAT* for this event).

Thresh2 is the threshold parameter for this event (i.e. *b2-Threshold2* as defined within *reportConfigInterRAT* for this event). For CDMA2000, *b2-Threshold2* is divided by -2.

Mp is expressed in dBm in case of RSRP, or in dB in case of RSRQ.

Mn is expressed in dBm or dB, depending on the measurement quantity of the inter-RAT neighbour cell.

Ofn, Ocn, Hys are expressed in dB.

Thresh1 is expressed in the same unit as **Mp**.

Thresh2 is expressed in the same unit as **Mn**.

5.5.4.9 Event C1 (CSI-RS resource becomes better than threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition C1-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition C1-2, as specified below, is fulfilled;

Inequality C1-1 (Entering condition)

$$Mcr + Ocr - Hys > Thresh$$

Inequality C1-2 (Leaving condition)

$$Mcr + Ocr + Hys < Thresh$$

The variables in the formula are defined as follows:

Mcr is the measurement result of the CSI-RS resource, not taking into account any offsets.

Ocr is the CSI-RS specific offset (i.e. *csi-RS-IndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the CSI-RS resource), and set to zero if not configured for the CSI-RS resource.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Thresh is the threshold parameter for this event (i.e. *c1-Threshold* as defined within *reportConfigEUTRA* for this event).

Mcr, Thresh are expressed in dBm.

Ocr, Hys are expressed in dB.

5.5.4.10 Event C2 (CSI-RS resource becomes offset better than reference CSI-RS resource)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition C2-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition C2-2, as specified below, is fulfilled;

NOTE: The CSI-RS resource(s) that triggers the event is on the same frequency as the reference CSI-RS resource, i.e. both are on the frequency indicated in the associated *measObject*.

Inequality C2-1 (Entering condition)

$$Mcr + Ocr - Hys > Mref + Oref + Off$$

Inequality C2-2 (Leaving condition)

$$Mcr + Ocr + Hys < Mref + Oref + Off$$

The variables in the formula are defined as follows:

Mcr is the measurement result of the CSI-RS resource, not taking into account any offsets.

Ocr is the CSI-RS specific offset of the CSI-RS resource (i.e. *csi-RS-IndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the CSI-RS resource), and set to zero if not configured for the CSI-RS resource.

Mref is the measurement result of the reference CSI-RS resource (i.e. *c2-RefCSI-RS* as defined within *reportConfigEUTRA* for this event), not taking into account any offsets.

Oref is the CSI-RS specific offset of the reference CSI-RS resource (i.e. *csi-RS-IndividualOffset* as defined within *measObjectEUTRA* corresponding to the frequency of the reference CSI-RS resource), and is set to zero if not configured for the reference CSI-RS resource.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

Off is the offset parameter for this event (i.e. *c2-Offset* as defined within *reportConfigEUTRA* for this event).

Mcr, Mref are expressed in dBm.

Ocr, Oref, Hys, Off are expressed in dB.

5.5.4.11 Event W1 (WLAN becomes better than a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when *wlan-MobilitySet* within *VarWLAN-MobilityConfig* does not contain any entries and condition W1-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition W1-2, as specified below, is fulfilled;

Inequality W1-1 (Entering condition)

$$Mn - Hys > Thresh$$

Inequality W1-2 (Leaving condition)

$$Mn + Hys < Thresh$$

The variables in the formula are defined as follows:

Mn is the measurement result of WLAN(s) configured in the measurement object, not taking into account any offsets.

Hys is the hysteresis parameter for this event.

Thresh is the threshold parameter for this event (i.e. *wl-Threshold* as defined within *reportConfigInterRAT* for this event).

Mn is expressed in dBm.

Hys is expressed in dB.

Thresh is expressed in the same unit as **Mn**.

5.5.4.12 Event W2 (All WLAN inside WLAN mobility set becomes worse than threshold1 and a WLAN outside WLAN mobility set becomes better than threshold2)

The UE shall:

1> consider the entering condition for this event to be satisfied when both conditions W2-1 and W2-2 as specified below are fulfilled;

1> consider the leaving condition for this event to be satisfied when condition W2-3 or condition W2-4, i.e. at least one of the two, as specified below is fulfilled;

Inequality W2-1 (Entering condition 1)

$$Ms + Hys < Thresh1$$

Inequality W2-2 (Entering condition 2)

$$Mn - Hys > Thresh2$$

Inequality W2-3 (Leaving condition 1)

$$Ms - Hys > Thresh1$$

Inequality W2-4 (Leaving condition 2)

$$Mn + Hys < Thresh2$$

The variables in the formula are defined as follows:

Ms is the measurement result of WLAN(s) which matches all WLAN identifiers of at least one entry within *wlan-MobilitySet* in *VarWLAN-MobilityConfig*, not taking into account any offsets.

Mn is the measurement result of WLAN(s) configured in the measurement object which does not match all WLAN identifiers of any entry within *wlan-MobilitySet* in *VarWLAN-MobilityConfig*, not taking into account any offsets.

Hys is the hysteresis parameter for this event.

Thresh1 is the threshold parameter for this event (i.e. *w2-Threshold1* as defined within *reportConfigInterRAT* for this event).

Thresh2 is the threshold parameter for this event (i.e. *w2-Threshold2* as defined within *reportConfigInterRAT* for this event).

Mn, **Ms** are expressed in dBm.

Hys is expressed in dB.

Thresh1 is expressed in the same unit as **Ms**.

Thresh2 is expressed in the same unit as **Mn**.

5.5.4.13 Event W3 (All WLAN inside WLAN mobility set becomes worse than a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition W3-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition W3-2, as specified below, is fulfilled;

Inequality W3-1 (Entering condition)

$$Ms + Hys < Thresh$$

Inequality W3-2 (Leaving condition)

$$Ms - Hys > Thresh$$

The variables in the formula are defined as follows:

Ms is the measurement result of WLAN(s) which matches all WLAN identifiers of at least one entry within *wlan-MobilitySet* in *VarWLAN-MobilityConfig*, not taking into account any offsets.

Hys is the hysteresis parameter for this event.

Thresh is the threshold parameter for this event (i.e. *w3-Threshold* as defined within *reportConfigInterRAT* for this event).

Ms is expressed in dBm.

Hys is expressed in dB.

Thresh is expressed in the same unit as **Ms**.

5.5.4.14 Event V1 (The channel busy ratio is above a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition V1-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition V1-2, as specified below, is fulfilled;

Inequality V1-1 (Entering condition)

$$Ms - Hys > Thresh$$

Inequality V1-2 (Leaving condition)

$$Ms + Hys < Thresh$$

The variables in the formula are defined as follows:

Ms is the measurement result of channel busy ratio of the transmission resource pool, not taking into account any offsets.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

$Thresh$ is the threshold parameter for this event (i.e. *v1-Threshold* as defined within *ReportConfigEUTRA*).

Ms is expressed in decimal from 0 to 1 in steps of 0.01.

Hys is expressed in the same unit as **Ms** .

$Thresh$ is expressed in the same unit as **Ms** .

5.5.4.15 Event V2 (The channel busy ratio is below a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition V2-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition V2-2, as specified below, is fulfilled;

Inequality V2-1 (Entering condition)

$$Ms + Hys < Thresh$$

Inequality V2-2 (Leaving condition)

$$Ms - Hys > Thresh$$

The variables in the formula are defined as follows:

Ms is the measurement result of channel busy ratio of the transmission resource pool, not taking into account any offsets.

Hys is the hysteresis parameter for this event (i.e. *hysteresis* as defined within *reportConfigEUTRA* for this event).

$Thresh$ is the threshold parameter for this event (i.e. *v2-Threshold* as defined within *ReportConfigEUTRA*).

Ms is expressed in decimal from 0 to 1 in steps of 0.01.

Hys is expressed in the same unit as **Ms** .

$Thresh$ is expressed in the same unit as **Ms** .

5.5.4.16 Event H1 (The Aerial UE height is above a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition H1-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition H1-2, as specified below, is fulfilled;

Inequality H1-1 (Entering condition)

$$Ms - Hys > Thresh + Offset$$

Inequality H1-2 (Leaving condition)

$$Ms + Hys < Thresh + Offset$$

The variables in the formula are defined as follows:

Ms is the Aerial UE height, not taking into account any offsets.

Hys is the hysteresis parameter (i.e. *h1-Hysteresis* as defined within *ReportConfigEUTRA*) for this event.

Thresh is the reference threshold parameter for this event given in *MeasConfig*(i.e. *heightThreshRef* as defined within *MeasConfig*).

Offset is the offset value to *heightThreshRef* to obtain the absolute threshold for this event. (i.e. *h1-ThresholdOffset* as defined within *ReportConfigEUTRA*)

Ms is expressed in meters.

Thresh is expressed in the same unit as **Ms**.

5.5.4.17 Event H2 (The Aerial UE height is below a threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition H2-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition H2-2, as specified below, is fulfilled;

Inequality H2-1 (Entering condition)

$$Ms + Hys < Thresh + Offset$$

Inequality H2-2 (Leaving condition)

$$Ms - Hys > Thresh + Offset$$

The variables in the formula are defined as follows:

Ms is the Aerial UE height, not taking into account any offsets.

Hys is the hysteresis parameter (i.e. *h2-Hysteresis* as defined within *ReportConfigEUTRA*) for this event.

Thresh is the reference threshold parameter for this event given in *MeasConfig*(i.e. *heightThreshRef* as defined within *MeasConfig*).

Offset is the offset value to *heightThreshRef* to obtain the absolute threshold for this event. (i.e. *h2-ThresholdOffset* as defined within *ReportConfigEUTRA*)

Ms is expressed in meters.

Thresh is expressed in the same unit as **Ms**.

5.5.4.18 Void

5.5.4.19 Void

5.5.4.20 Event D1 (Distance between UE and referenceLocation1 is above threshold1 and distance between UE and referenceLocation2 is below threshold2)

The UE shall:

1> consider the entering condition for this event to be satisfied when both condition D1-1 and condition D1-2, as specified below, are fulfilled;

1> consider the leaving condition for this event to be satisfied when condition D1-3 or condition D1-4, i.e. at least one of the two, as specified below, is fulfilled;

Inequality D1-1 (Entering condition 1)

$$Ml1 - Hys > Thresh1$$

Inequality D1-2 (Entering condition 2)

$$Ml2 + Hys < Thresh2$$

Inequality D1-3 (Leaving condition 1)

$$Ml1 + Hys < Thresh1$$

Inequality D1-4 (Leaving condition 2)

$$Ml2 - Hys > Thresh2$$

The variables in the formula are defined as follows:

Ml1 is the distance between UE and a reference location for this event (i.e. *referenceLocation1* as defined within *reportConfigEUTRA* for this event), not taking into account any offsets.

Ml2 is the distance between UE and a reference location for this event (i.e. *referenceLocation2* as defined within *reportConfigEUTRA* for this event), not taking into account any offsets.

Hys is the hysteresis parameter for this event (i.e. *hysteresisLocation* as defined within *reportConfigEUTRA* for this event).

Thresh1 is the threshold for this event defined as a distance, configured with parameter *distanceThreshFromReference1*, from a reference location configured with parameter *referenceLocation1* within *reportConfigEUTRA* for this event.

Thresh2 is the threshold for this event defined as a distance, configured with parameter *distanceThreshFromReference2*, from a reference location configured with parameter *referenceLocation2* within *reportConfigEUTRA* for this event.

Ml1 is expressed in meters.

Ml2, Hys, Thresh1, Thresh2 are expressed in the same unit as **Ml1**.

NOTE: The definition of Event D1 also applies to CondEvent D1.

5.5.4.21 CondEvent T1 (Time measured at UE is within a duration from threshold)

The UE shall:

1> consider the entering condition for this event to be satisfied when condition T1-1, as specified below, is fulfilled;

1> consider the leaving condition for this event to be satisfied when condition T1-2, as specified below, is fulfilled;

Inequality T1-1 (Entering condition)

$$Mt > Thresh1$$

Inequality T1-2 (Leaving condition)

$$Mt > Thresh1 + Duration$$

The variables in the formula are defined as follows:

Mt is the time measured at UE.

Thresh1 is the threshold parameter for this event (i.e. *t1-Threshold* as defined within *reportConfigEUTRA* for this event).

Duration is the duration parameter for this event (i.e. *duration* as defined within *reportConfigEUTRA* for this event).

Mt is expressed in ms.

Thresh1, Duration are expressed in the same unit as **Mt**.

5.5.4.22 Event D2 (Distance between UE and serving cell moving reference location is above threshold1 and distance between UE and neighbour cell moving reference location is below threshold2)

The UE shall:

- 1> consider the entering condition for this event to be satisfied when both condition D2-1 and condition D2-2, as specified below, are fulfilled;
- 1> consider the leaving condition for this event to be satisfied when condition D2-3 or condition D2-4, i.e. at least one of the two, as specified below, is fulfilled;

Inequality D2-1 (Entering condition 1)

$$Ml1 - Hys > Thresh1$$

Inequality D2-2 (Entering condition 2)

$$Ml2 + Hys < Thresh2$$

Inequality D2-3 (Leaving condition 1)

$$Ml1 + Hys < Thresh1$$

Inequality D2-4 (Leaving condition 2)

$$Ml2 - Hys > Thresh2$$

The variables in the formula are defined as follows:

Ml1 is the distance between UE and a moving reference location of serving cell for this event, not taking into account any offsets. The moving reference location is determined based on *movingReferenceLocation*, serving cell ephemeris information, and the corresponding epoch time broadcast in *SystemInformationBlockType31*.

Ml2 is the distance between UE and a moving reference location of candidate target cell for this event, not taking into account any offsets. The moving reference location is determined based on *referenceLocation2* as defined within *reportConfigEUTRA* for this event, and the ephemeris information and epoch time of the cell indicated by *cellForWhichToTriggerD2* provided in the associated *measObjectEUTRA*.

Hys is the hysteresis parameter for this event (i.e. *hysteresisLocation* as defined within *reportConfigEUTRA* for this event).

Thresh1 is the threshold for this event defined as a distance, configured with parameter *distanceThreshFromReference1*, from a moving reference location determined based on *movingReferenceLocation*, serving cell ephemeris information, and the corresponding epoch time broadcast in *SystemInformationBlockType31*..

Thresh2 is the threshold for this event defined as a distance, configured with parameter *distanceThreshFromReference2*, from a moving reference location determined based on parameter *referenceLocation2* within *reportConfigEUTRA* for this event and the ephemeris information and epoch time of the cell indicated by *cellForWhichToTriggerD2* provided in the associated *measObjectEUTRA*.

Ml1 is expressed in meters.

Ml2, Hys, Thresh1, Thresh2 are expressed in the same unit as **Ml1**.

NOTE: The definition of Event D2 also applies to CondEvent D2.

5.5.5 Measurement reporting

5.5.5.1 General

Figure 5.5.5.1-1: Measurement reporting

The purpose of this procedure is to transfer measurement results from the UE to E-UTRAN. The UE shall initiate this procedure only after successful security activation.

For the *measId* for which the measurement reporting procedure was triggered, the UE shall set the *measResults* within the *MeasurementReport* message as follows:

- 1> set the *measId* to the measurement identity that triggered the measurement reporting;
- 1> set the *measResultPCell* to include the quantities of the PCell;
- 1> set the *measResultServFreqList* to include for each E-UTRA SCell that is configured, if any, within *measResultSCell* the quantities of the concerned SCell, if available according to performance requirements in TS 36.133 [16], except if *purpose* for the *reportConfig* associated with the *measId* that triggered the measurement reporting is set to *reportLocation*;
- 1> if the *reportConfig* associated with the *measId* that triggered the measurement reporting includes *reportAddNeighMeas*:
 - 2> for each E-UTRA serving frequency for which *measObjectId* is referenced in the *measIdList*, other than the frequency corresponding with the *measId* that triggered the measurement reporting:
 - 3> set the *measResultServFreqList* to include within *measResultBestNeighCell* the *physCellId* and the quantities of the best non-serving cell, based on RSRP, on the concerned serving frequency;
- 1> if the *triggerType* is set to *event*; and if the corresponding *measObject* concerns NR; and if *eventId* is set to *eventB1-NR* or *eventB2-NR*; or
- 1> if the *triggerType* is set to *event*; and if *eventId* is set to *eventA3* or *eventA4* or *eventA5*:
 - 2> if (NG)EN-DC is configured, and if *purpose* for the *reportConfig* or *reportConfigInterRAT* associated with the *measId* that triggered the measurement reporting is set to a value other than *reportLocation* or if *purpose* is not configured:
 - 3> set the *measResultServFreqListNR* to include for each NR serving frequency that the UE is configured to measure according to TS 38.331 [82], if any, the following:
 - 4> set *measResultSCell* to include the available results of the NR serving cell, as specified in 5.5.5.2;
 - 4> if the *reportConfig* associated with the *measId* that triggered the measurement reporting includes *reportAddNeighMeas* and if *eventId* is set to *eventA3* or *eventA4* or *eventA5*:
 - 5> set *measResultBestNeighCell* to include the available results, as specified in 5.5.5.2, of the non-serving cell with the highest sorting quantity determined as specified in 5.5.5.3;
 - 3> for each (serving or neighbouring) cell for which the UE reports results according to the previous, additionally include available beam results according to the following:
 - 4> if *maxReportRS-Index* is configured, set *measResultRS-IndexList* to include available results, as specified in 5.5.5.2, of up to *maxReportRS-Index* beams, ordered based on the quantity determined as specified in 5.5.5.3;

- 1> if there is at least one applicable neighbouring cell to report:
- 2> set the *measResultNeighCells* to include the best neighbouring cells up to *maxReportCells* in accordance with the following:
 - 3> if the *triggerType* is set to *event* and *eventId* is not set to *eventD1* or *eventD2*:
 - 4> include the cells included in the *cellsTriggeredList* as defined within the *VarMeasReportList* for this *measId*;
 - 3> else:
 - 4> include the applicable cells for which the new measurement results became available since the last periodical reporting or since the measurement was initiated or reset;

NOTE 1: The reliability of the report (i.e. the certainty it contains the strongest cells on the concerned frequency) depends on the measurement configuration i.e. the *reportInterval*. The related performance requirements are specified in TS 36.133 [16].

- 3> for each cell that is included in the *measResultNeighCells*, include the *physCellId*;
- 3> if the *triggerType* is set to *event*; or the *purpose* is set to *reportStrongestCells* or to *reportStrongestCellsForSON*:
 - 4> for each included cell, include the layer 3 filtered measured results in accordance with the *reportConfig* for this *measId*, ordered as follows:
 - 5> if the *measObject* associated with this *measId* concerns E-UTRA:
 - 6> set the *measResult* to include the quantity(ies) indicated in the *reportQuantity* within the concerned *reportConfig*;
 - 6> sort the included cells in order of decreasing *triggerQuantity*, i.e. the best cell is included first;
 - 5> if the *measObject* associated with this *measId* concerns NR:
 - 6> set the *measResultCell* to include the quantity(ies) indicated in the *reportQuantityCellNR* within the concerned *reportConfig*;
 - 6> if *maxReportRS-Index* and *reportQuantityRS-IndexNR* are configured, set *measResultRS-IndexList* to include the result of the best beam if *threshRS-Index* is included in the *VarMeasConfig* for the corresponding *measObject*, and the remaining beams whose quantity is above *threshRS-Index*, up to *maxReportRS-Index* beams in total:
 - 7> order beams based on the sorting quantity determined as specified in 5.5.5.3;
 - 7> for each included beam:
 - 8> include *ssbIndex*;
 - 8> if *reportRS-IndexResultsNR* is set to TRUE, for each quantity indicated, include the corresponding measurement result in *measResultSSB-Index* for each *ssb-Index*;
 - 6> sort the included cells in order of decreasing sorting quantity determined as specified in 5.5.5.3;
 - 5> if the *measObject* associated with this *measId* concerns UTRA FDD and if *ReportConfigInterRAT* includes the *reportQuantityUTRA-FDD*:
 - 6> set the *measResult* to include the quantities indicated by the *reportQuantityUTRA-FDD* in order of decreasing *measQuantityUTRA-FDD* within the *quantityConfig*, i.e. the best cell is included first;
 - 5> if the *measObject* associated with this *measId* concerns UTRA FDD and if *ReportConfigInterRAT* does not include the *reportQuantityUTRA-FDD*; or
 - 5> if the *measObject* associated with this *measId* concerns UTRA TDD, GERAN or CDMA2000:

- 6> set the *measResult* to the quantity as configured for the concerned RAT within the *quantityConfig* in order of either decreasing quantity for UTRA and GERAN or increasing quantity for CDMA2000 *pilotStrength*, i.e. the best cell is included first;
- 3> else if the *purpose* is set to *reportCGI* and the corresponding *measObject* concerns a RAT other than NR:
- 4> if the mandatory present fields of the *cgi-Info* for the cell indicated by the *cellForWhichToReportCGI* in the associated *measObject* have been obtained:
- 5> if the *includeMultiBandInfo* is configured:
- 6> include the *freqBandIndicator*;
 - 6> if the cell broadcasts the *multiBandInfoList*, include the *multiBandInfoList*;
 - 6> if the cell broadcasts the *freqBandIndicatorPriority*, include the *freqBandIndicatorPriority*;
- 5> if the cell broadcasts a CSG identity:
- 6> include the *csg-Identity*;
 - 6> include the *csg-MemberStatus* and set it to *member* if the cell is a CSG member cell;
- 5> if the *si-RequestForHO* is configured within the *reportConfig* associated with this *measId*:
- 6> include the *cgi-Info* containing all the fields other than the *plmn-IdentityList* that have been successfully acquired;
 - 6> include, within the *cgi-Info*, the field *plmn-IdentityList* in accordance with the following:
 - 7> if the cell is a CSG member cell, determine the subset of the PLMN identities, starting from the second entry of PLMN identities in the broadcast information, that meet the following conditions:
 - a) equal to the RPLMN or an EPLMN; and
 - b) the Permitted CSG list of the UE includes an entry comprising of the concerned PLMN identity and the CSG identity broadcast by the cell;
 - 7> if the subset of PLMN identities determined according to the previous includes at least one PLMN identity, include the *plmn-IdentityList* and set it to include this subset of the PLMN identities;
 - 7> if the cell is a CSG member cell, include the *primaryPLMN-Suitable* if the primary PLMN meets conditions a) and b) specified above;
 - 7> if the cell does not broadcast *csg-Identity* and the UE is capable of reporting the *plmn-IdentityList* from cells not broadcasting *csg-Identity*:
 - 8> include in the *plmn-IdentityList* the list of identities starting from the second entry of PLMN identities in the broadcast information;
- 5> else:
- 6> include the *cgi-Info* containing all the fields that have been successfully acquired and in accordance with the following:
 - 7> include in the *plmn-IdentityList* the list of identities starting from the second entry of PLMN Identities in the broadcast information;
- 4> if the *cellAccessRelatedInfoList-5GC* has been acquired:
- 5> include *cgi-Info-5GC*;

NOTE 1a: The UE may include the *cgi-Info-5GC* even when the N1 mode is disabled.

- 3> else if the *purpose* is set to *reportCGI* and the corresponding *measObject* concerns NR RAT:

4> if the Cell information of *cgi-Info* for the cell indicated by the *cellForWhichToReportCGI* in the associated *measObject* has been obtained:

5> include *plmn-IdentityInfoList* including *plmn-IdentityList*, *trackingAreaCode* (if available), *ran-AreaCode* (if available) and *cellIdentity* for each entry of the *plmn-IdentityInfoList*;

5> include *frequencyBandList* if broadcasted;

5> for each entry in *plmn-IdentityInfoList*, if the *gNB-ID-Length* is broadcasted:

6> include *gNB-ID-Length*;

4> else if MIB associated with the concerned *measObject* indicates that SIB1 is not broadcast:

5> include the *noSIB1* field;

1> for the cells included according to the previous (i.e. covering the PCell, the SCells, the best non-serving cells on serving frequencies as well as neighbouring EUTRA cells) include results according to the extended RSRQ if corresponding results are available according to the associated performance requirements defined in TS 36.133 [16];

1> if there is at least one applicable CSI-RS resource to report:

2> set the *measResultCSI-RS-List* to include the best CSI-RS resources up to *maxReportCells* in accordance with the following:

3> if the *triggerType* is set to *event*:

4> include the CSI-RS resources included in the *csi-RS-TriggeredList* as defined within the *VarMeasReportList* for this *measId*;

3> else:

4> include the applicable CSI-RS resources for which the new measurement results became available since the last periodical reporting or since the measurement was initiated or reset;

NOTE 2: The reliability of the report (i.e. the certainty it contains the strongest CSI-RS resources on the concerned frequency) depends on the measurement configuration i.e. the *reportInterval*. The related performance requirements are specified in TS 36.133 [16].

3> for each CSI-RS resource that is included in the *measResultCSI-RS-List*:

4> include the *measCSI-RS-Id*;

4> include the layer 3 filtered measured results in accordance with the *reportConfig* for this *measId*, ordered as follow:

5> set the *csi-RSRP-Result* to include the quantity indicated in the *reportQuantity* within the concerned *reportConfig* in order of decreasing *triggerQuantityCSI-RS*, i.e. the best CSI-RS resource is included first;

4> if *reportCRS-Meas* is set to *true* within the associated *reportConfig*, and the cell indicated by *physCellId* of this CSI-RS resource is not a serving cell:

5> set the *measResultNeighCells* to include the cell indicated by *physCellId* of this CSI-RS resource, and include the *physCellId*;

5> set the *rsrpResult* to include the RSRP of the concerned cell, if available according to performance requirements in TS 36.133 [16];

5> set the *rsrqResult* to include the RSRQ of the concerned cell, if available according to performance requirements in TS 36.133 [16];

1> if the *ue-RxTxTimeDiffPeriodical* is configured within the corresponding *reportConfig* for this *measId*:

2> set the *ue-RxTxTimeDiffResult* to the measurement result provided by lower layers;

- 2> set the *currentSFN*;
- 1> if the *measRSSI-ReportConfig* is configured within the corresponding *reportConfig* for this *measId*:
 - 2> set the *rssi-Result* to the average of sample value(s) provided by lower layers in the *reportInterval*;
 - 2> set the *channelOccupancy* to the rounded percentage of sample values which are beyond to the *channelOccupancyThreshold* within all the sample values in the *reportInterval*;
- 1> if the *measRSSI-ReportConfigNR* is configured within the corresponding *reportConfigInterRAT* for this *measId*:
 - 2> set the *rssi-ResultNR* to the average of sample value(s) provided by lower layers in the *reportInterval*;
 - 2> set the *channelOccupancyNR* to the rounded percentage of sample values which are beyond to the *channelOccupancyThresholdNR* within all the sample values in the *reportInterval*;
- 1> if uplink PDCP delay results are available:
 - 2> set the *ul-PDCP-DelayResultList* to include the uplink PDCP delay results available;
- 1> if uplink PDCP delay value results are available:
 - 2> set the *ul-PDCP-DelayValueResultList* to include the corresponding average uplink PDCP delay values;
- 1> if the *includeLocationInfo* is configured in the corresponding *reportConfig* for this *measId* or if *purpose* for the *reportConfig* associated with the *measId* that triggered the measurement reporting is set to *reportLocation*; and detailed location information that has not been reported is available, set the content of the *locationInfo* as follows:
 - 2> include the *locationCoordinates*;
 - 2> if available, include the *gnss-TOD-msec*, except if *purpose* for the *reportConfig* associated with the *measId* that triggered the measurement reporting is set to *reportLocation*;
 - 2> include the *verticalVelocityInfo*, if available;
- 1> if the *coarseLocationReq* is set to *true* in the corresponding *reportConfig* for this *measId*:
 - 2> if available, include the *coarseLocationInfo*;
- 1> if the *includeWLAN-Meas* is configured in the corresponding *reportConfig* for this *measId*, set the *measResults* as follows:
 - 2> if available, include the *logMeasResultListWLAN*, in order of decreasing RSSI for WLAN APs;
- 1> if the *includeBT-Meas* is configured in the corresponding *reportConfig* for this *measId*, set the *measResults* as follows:
 - 2> if available, include the *logMeasResultListBT*, in order of decreasing RSSI for Bluetooth beacons;
- 1> if the *includeUncomBarPreMeas* is configured in the corresponding *reportConfig* for this *measId* and if *includeUncomBarPreMeas* is set to *true*, set the *measResults* as follows:
 - 2> if available, include the *uncomBarPreMeasResult*;
- 1> if the *reportSSTD-Meas* is set to *true* or *pSCell* within the corresponding *reportConfig* for this *measId*:
 - 2> set the *measResultSSTD* to the measurement results provided by lower layers;
- 1> if the *reportSFTD-Meas* is set to *neighborCells* or *pSCell* within the corresponding *reportConfigInterRAT* for this *measId*, for each applicable cell for which results are available:
 - 2> set *sfn-OffsetResult* and *frameBoundaryOffsetResult* to the measurement results provided by lower layers;
 - 2> if the *ss-rsrp* in the *reportQuantityCellNR* is set to *TRUE* within the corresponding *reportConfigInterRAT* for this *measId*:
 - 3> include *rsrpResult* set to the RSRP of the concerned cell;

- 1> if there is at least one applicable transmission resource pool to report:
- 2> set the *measResultListCBR* to include the CBR measurement results in accordance with the following:
 - 3> if the *triggerType* is set to *event*:
 - 4> include the transmission resource pools included in the *poolsTriggeredList* as defined within the *VarMeasReportList* for this *measId*;
 - 3> else:
 - 4> include the applicable transmission resource pools for which the new measurement results became available since the last periodical reporting or since the measurement was initiated or reset;
 - 3> for each transmission resource pool to be reported:
 - 4> set the *poolIdentity* to the *poolReportId* of this transmission resource pool;
 - 4> if *adjacencyPSCCH-PSSCH* is set to *TRUE* for this transmission resource pool:
 - 5> set the *cbr-PSSCH* to the CBR measurement result on PSSCH and PSCCH of this transmission resource pool provided by lower layers;
 - 4> else:
 - 5> set the *cbr-PSSCH* to the CBR measurement result on PSSCH of this transmission resource pool provided by lower layers if available;
 - 5> set the *cbr-PSCCH* to the CBR measurement result on PSCCH of this transmission resource pool provided by lower layers if available;
 - 2> set the *measResultSensing* to include the sensing measurement results in accordance with the following:
 - 3> include the applicable transmission resource pools for which the new measurement results became available since the last periodical reporting or since the measurement was initiated or reset;
 - 3> for each transmission resource pool to be reported:
 - 4> set the *sensingResult* to the sensing measurement results provided by the lower layers;
 - 1> if the *triggerType* is set to *event*; and if *eventId* is set to *eventH1* or *eventH2*:
 - 2> set the *heightUE* to include the altitude of the UE;
 - 1> increment the *numberOfReportsSent* as defined within the *VarMeasReportList* for this *measId* by 1;
 - 1> stop the periodical reporting timer, if running;
 - 1> if the *numberOfReportsSent* as defined within the *VarMeasReportList* for this *measId* is less than the *reportAmount* as defined within the corresponding *reportConfig* for this *measId*:
 - 2> start the periodical reporting timer with the value of *reportInterval* as defined within the corresponding *reportConfig* for this *measId*;
 - 1> else:
 - 2> if the *triggerType* is set to *periodical*:
 - 3> remove the entry within the *VarMeasReportList* for this *measId*;
 - 3> remove this *measId* from the *measIdList* within *VarMeasConfig*;
 - 1> if the measured results are for CDMA2000 HRPD:
 - 2> set the *preRegistrationStatusHRPD* to the UE's CDMA2000 upper layer's HRPD *preRegistrationStatus*;
 - 1> if the measured results are for CDMA2000 1xRTT:

- 2> set the preRegistrationStatusHRPD to FALSE;
- 1> if the measured results are for WLAN:
 - 2> set the *measResultListWLAN* to include the quantities within the *quantityConfigWLAN* for up to *maxReportCells* WLAN(s), determined according to the following:
 - 3> include WLAN the UE is connected to, if any;
 - 3> if *reportAnyWLAN* is set to TRUE:
 - 4> consider WLAN with any WLAN identifiers to be applicable for measurement reporting;
 - 3> else:
 - 4> consider only WLANs which do not match all WLAN identifiers of any entry within *wlan-MobilitySet* in *VarWLAN-MobilityConfig* to be applicable for measurement reporting;
 - 3> include applicable WLAN in order of decreasing WLAN RSSI, i.e. the best WLAN is included first;
 - 2> for each included WLAN:
 - 3> set *wlan-Identifiers* to include all WLAN identifiers that can be acquired for the WLAN measured;
 - 3> set *connectedWLAN* to TRUE if the UE is connected to the WLAN measured;
 - 3> if *reportQuantityWLAN* exists within the *ReportConfigInterRAT* within the *VarMeasConfig* for this *measId*:
 - 4> if *bandRequestWLAN* is set to TRUE:
 - 5> set *bandWLAN* to include WLAN band of the WLAN measured;
 - 4> if *carrierInfoRequestWLAN* is set to TRUE:
 - 5> set *carrierInfoWLAN* to include WLAN carrier information of the WLAN measured if it can be acquired;
 - 4> if *availableAdmissionCapacityRequestWLAN* is set to TRUE:
 - 5> set the *measResult* to include *avaiableAdmissionCapacityWLAN* if it can be acquired;
 - 4> if *backhaulDL-BandwidthRequestWLAN* is set to TRUE:
 - 5> set the *measResult* to include *backhaulDL-BandwidthWLAN* if it can be acquired;
 - 4> if *backhaulUL-BandwidthRequestWLAN* is set to TRUE:
 - 5> set the *measResult* to include *backhaulUL-BandwidthWLAN* if it can be acquired;
 - 4> if *channelUtilizationRequestWLAN* is set to TRUE:
 - 5> set the *measResult* to include *channelUtilizationWLAN* if it can be acquired;
 - 4> if *stationCountRequestWLAN* is set to TRUE:
 - 5> set the *measResult* to include *stationCountWLAN* if it can be acquired;
 - 1> if the measurement configuration that triggered the measurement reporting procedure was configured by an *sl-ConfigDedicatedEUTRA* that was received within an NR RRCReconfiguration message:
 - 2> submit the *MeasurementReport* message via SRB1 embedded in NR RRC message *ULInformationTransferIRAT* as specified in TS 38.331 [82].
 - 1> else if the UE is configured with NE-DC:
 - 2> submit the *MeasurementReport* message via SRB1 embedded in NR RRC message *ULInformationTransferMRDC* as specified in TS 38.331 [82].

1> else:

2> submit the *MeasurementReport* message to lower layers for transmission, upon which the procedure ends;

5.5.5.2 Determination of available NR measurement results

When configured to report measurement results of the serving and the best neighbouring cells on NR serving frequencies, the UE shall consider NR measurement results to be available as follows:

1> only SSB based results are available and only if configured to measure these for the concerned serving frequency;

1> for the serving cell:

2> include cell quantities RSRP and RSRQ while SINR is included if the UE is configured to measure this quantity on an NR frequency, possibly different from the concerned serving frequency, but only if configured by NR *measConfig*:

2> include beam results and beam quantities if the UE is configured to measure these on an NR frequency, possibly different from the concerned serving frequency, but only if configured by NR *measConfig*;

1> for a neighbouring cell:

2> include cell quantities, beam results and beam quantities if the UE is configured to measure these on an NR frequency, possibly different from the concerned serving frequency, but only if configured by NR *measConfig*.

1> filter available results according to the applicable field in NR *quantityConfig*:

5.5.5.3 Selection of NR sorting quality

When configured to report the best cells or beams, the UE shall determine the quantity that is used to order and select as follows:

1> for cells on the frequency associated with the *measId* that triggered the measurement reporting, if the *reportTrigger* is set to *event*, consider the quantity used in *bN-ThresholdYNR* to be the sorting quantity;

1> for other cases, determine the sorting quantity as follows:

2> consider the following quantities as candidate sorting quantities:

3> for cells on the frequency associated with the *measId* that triggered the measurement reporting (for a *triggerType* set to *periodical*):

4> the quantities defined by *reportQuantityCellNR*, when used for sorting cells;

4> the quantities defined by *reportQuantityRS-IndexNR*, when used for sorting beams;

3> for cells, serving or non-serving (i.e. within *reportAddNeighMeas*), on NR serving frequencies other than the one associated with the *measId* triggering reporting:

4> the available quantities of available NR measurement results as specified in 5.5.5.2;

2> if there is a single candidate sorting quantity;

3> consider the concerned quantity to be the sorting quantity;

2> else:

3> if RSRP is one of the candidate sorting quantities;

4> consider RSRP to be the sorting quantity;

3> else:

4> consider RSRQ to be the sorting quantity;

5.5.6 Measurement related actions

5.5.6.1 Actions upon handover and re-establishment

E-UTRAN applies the handover procedure as follows:

- when performing the handover procedure, as specified in 5.3.5.4, ensure that a *measObjectId* corresponding to each handover target serving frequency is configured as a result of the procedures described in this clause and in 5.3.5.4;
- when changing the band while the physical frequency remains unchanged, E-UTRAN releases the *measObject* corresponding to the source frequency and adds a *measObject* corresponding to the target frequency (i.e. it does not reconfigure the *measObject*);

E-UTRAN applies the re-establishment procedure as follows:

- when performing the connection re-establishment procedure, as specified in 5.3.7, ensure that a *measObjectId* corresponding each target serving frequency is configured as a result of the procedure described in this clause and the subsequent connection reconfiguration procedure immediately following the re-establishment procedure;
- in the first reconfiguration following the re-establishment when changing the band while the physical frequency remains unchanged, E-UTRAN releases the *measObject* corresponding to the source frequency and adds a *measObject* corresponding to the target frequency (i.e. it does not reconfigure the *measObject*);

The UE shall:

- 1> for each *measId* included in the *measIdList* within *VarMeasConfig*:
- 2> if the *triggerType* is set to *periodical*:
 - 3> remove this *measId* from the *measIdList* within *VarMeasConfig*
- 1> if the procedure was triggered due to a handover or successful re-establishment and the procedure involves a change of primary frequency, update the *measId* values in the *measIdList* within *VarMeasConfig* as follows:
 - 2> if a *measObjectId* value corresponding to the target primary frequency exists in the *measObjectList* within *VarMeasConfig*:
 - 3> for each *measId* value in the *measIdList*:
 - 4> if the *measId* value is linked to the *measObjectId* value corresponding to the source primary frequency:
 - 5> link this *measId* value to the *measObjectId* value corresponding to the target primary frequency;
 - 4> else if the *measId* value is linked to the *measObjectId* value corresponding to the target primary frequency:
 - 5> link this *measId* value to the *measObjectId* value corresponding to the source primary frequency;
 - 2> else:
 - 3> remove all *measId* values that are linked to the *measObjectId* value corresponding to the source primary frequency;
 - 1> remove all measurement reporting entries within *VarMeasReportList*;
 - 1> stop the periodical reporting timer or timer T321, whichever one is running, as well as associated information (e.g. *timeToTrigger*) for all *measId*;
 - 1> release the measurement gaps (configured by E-UTRA RRC), if activated;

NOTE 1: If the UE requires measurement gaps to perform inter-frequency or inter-RAT measurements, the UE resumes the inter-frequency and inter-RAT measurements after the E-UTRAN has setup the measurement gaps.

NOTE 2: In this procedure, the UE may or may not release the *measGapSharingConfig*.

5.5.6.2 Speed dependant scaling of measurement related parameters

The UE shall adjust the value of the following parameter configured by the E-UTRAN depending on the UE speed: *timeToTrigger*. The UE shall apply 3 different levels, which are selected as follows:

The UE shall:

- 1> perform mobility state detection using the mobility state detection as specified in TS 36.304 [4] with the following modifications:
 - 2> counting handovers instead of cell reselections;
 - 2> applying the parameter applicable for RRC_CONNECTED as included in *speedStatePars* within *VarMeasConfig*;
- 1> if high mobility state is detected:
 - 2> use the *timeToTrigger* value multiplied by *sf-High* within *VarMeasConfig*;
- 1> else if medium mobility state is detected:
 - 2> use the *timeToTrigger* value multiplied by *sf-Medium* within *VarMeasConfig*;
- 1> else:
 - 2> no scaling is applied;

5.5.7 Inter-frequency RSTD measurement indication

5.5.7.1 General

Figure 5.5.7.1-1: Inter-frequency RSTD measurement indication

The purpose of this procedure is to indicate to the network that the UE is going to start/stop OTDOA inter-frequency RSTD measurements which require measurement gaps as specified in TS 36.133 [16], clause 8.1.2.6. The procedure is also used to indicate to the network that the UE is going to start/stop OTDOA intra-frequency RSTD measurements which require measurement gaps. This procedure is also used to indicate to the network the measurement gap that the category M1 or M2 UE prefers to perform RSTD measurements with dense PRS configuration, as specified in TS 36.133 [16], Table 8.1.2.1-3.

NOTE: It is a network decision to configure the measurement gap.

5.5.7.2 Initiation

The UE shall:

- 1> if and only if upper layers indicate to start performing inter-frequency RSTD measurements and the UE requires measurement gaps for these measurements while measurement gaps are either not configured or not sufficient:
 - 2> initiate the procedure to indicate start;

NOTE 1: The UE verifies the measurement gap situation only upon receiving the indication from upper layers. If at this point in time sufficient gaps are available, the UE does not initiate the procedure. Unless it receives a new indication from upper layers, the UE is only allowed to further repeat the procedure in the same PCell once per frequency if the provided measurement gaps are insufficient.

1> if and only if upper layers indicate to stop performing inter-frequency RSTD measurements:

2> initiate the procedure to indicate stop;

NOTE 2: The UE may initiate the procedure to indicate stop even if it did not previously initiate the procedure to indicate start.

5.5.7.3 Actions related to transmission of *InterFreqRSTDMeasurementIndication* message

The UE shall set the contents of *InterFreqRSTDMeasurementIndication* message as follows:

1> if the procedure is initiated to indicate start or stop of inter-frequency RSTD measurements:

2> set the *rstd-InterFreqIndication* as follows:

3> if the procedure is initiated to indicate start of inter-frequency RSTD measurements:

4> set the *rstd-InterFreqInfoList* according to the information received from upper layers;

4> for category M1 or M2 UE, if the procedure is initiated to indicate the measurement gap that the UE prefers to perform RSTD measurements with dense PRS configuration:

5> set the *measPRS-Offset-r15* according to the UE preference;

3> else if the procedure is initiated to indicate stop of inter-frequency RSTD measurements:

4> set the *rstd-InterFreqIndication* to the value *stop*;

1> else:

2> set the *rstd-InterFreqIndication* as follows:

3> if the procedure is initiated to indicate start of intra-frequency RSTD measurements:

4> set the *carrierFreq* in the *rstd-InterFreqInfoList* to the carrier frequency of the serving cell;

4> for category M1 or M2 UE, if the procedure is initiated to indicate the measurement gap that the UE prefers to perform RSTD measurements with dense PRS configuration:

5> set the *measPRS-Offset-r15* according to the UE preference;

3> else if the procedure is initiated to indicate stop of intra-frequency RSTD measurements:

4> set the *rstd-InterFreqIndication* to the value *stop*;

1> submit the *InterFreqRSTDMeasurementIndication* message to lower layers for transmission, upon which the procedure ends;

5.5.8 Measurements in NB-IoT

Upon transition to RRC_CONNECTED mode, the UE shall:

1> if *neighCellMeasCriteria* is present in *SystemInformationBlockType3-NB*:

2> set *NRSRP_{Ref}* to the latest result of the serving cell measurement as used for cell selection/reselection evaluation;

2> if the relaxed monitoring criterion defined in TS 36.304 [4] was not fulfilled:

3> start T326 with the value *t-MeasureDeltaP*;

While in RRC_CONNECTED mode, after performing a measurement, the UE shall:

- 1> in the following use the NRSRP measurement for the measured carrier and *nrs-PowerOffsetNonAnchor* corresponding to the measured carrier;
- 1> if *neighCellMeasCriteria* is present in *SystemInformationBlockType3-NB*:
 - 2> if $(\text{NRSRP}_{\text{Ref}} - (\text{NRSRP} - \text{nrs-PowerOffsetNonAnchor})) > s\text{-MeasureDeltaP}$:
 - 3> set $\text{NRSRP}_{\text{Ref}} = (\text{NRSRP} - \text{nrs-PowerOffsetNonAnchor})$;
 - 3> start or restart T326 with the value *t-MeasureDeltaP*;
 - 1> if *neighCellMeasCriteria* is not present in *SystemInformationBlockType3-NB*; or
 - 1> if T326 is running:
 - 2> if $(\text{NRSRP} - \text{nrs-PowerOffsetNonAnchor}) < s\text{-MeasureIntra}$, perform intra-frequency measurements as defined in TS 36.133 [16];
 - 2> if $(\text{NRSRP} - \text{nrs-PowerOffsetNonAnchor}) < s\text{-MeasureInter}$, perform inter-frequency measurements as defined in TS 36.133 [16];

While in RRC_CONNECTED mode, the UE shall:

- 1> if *t-Service* is present in *SystemInformationBlockType3-NB*:

- 2> perform intra-frequency measurements or inter-frequency measurements before *t-Service*;

NOTE: The exact time to start measurements is left up to UE implementation and *t-ServiceStartNeigh* may be used to decide when to start measurements.

- 1> if *referenceLocation* and *distanceThresh* are present in *SystemInformationBlockType3I-NB*:

- 2> perform intra-frequency measurements or inter-frequency measurements when the distance between UE and serving cell reference location is above *distanceThresh*.

5.5.9 GNSS measurement triggering and reporting

For BL UEs or UEs in CE or NB-IoT UEs that are connected to NTN, GNSS measurement can be triggered aperiodically by the GNSS Measurement Command MAC CE (see TS 36.321 [6]), or triggered by the UE autonomously if enabled by the network, or triggered by the UE using available idle periods.

The UE shall:

- 1> if an indication to perform GNSS measurement is received from lower layers:

- 2> perform GNSS measurement using the measurement gap with a gap length indicated by lower layers, as specified in TS 36.213 [23];

- 2> stop timer T390, if running;

- 1> if *gnss-AutonomousEnabled* is configured:

- 2> perform GNSS measurement using an autonomous gap starting from T390 expiry if *ul-TransmissionExtensionEnabled* is configured, otherwise starting from GNSS validity duration expiry, with a gap length indicated by lower layers or equal to the latest reported time duration required for the UE to acquire a GNSS position if not indicated by lower layers;

NOTE: UE can also autonomously start GNSS measurements during available idle periods in RRC_CONNECTED to keep GNSS valid, and the exact time of starting GNSS measurements during available idle periods is left to UE implementation.

- 1> upon starting GNSS measurement:

- 2> stop timer T318, if running;

- 1> upon indication that GNSS becomes valid:
- 2> instruct lower layers to report the remaining GNSS measurement validity duration (see TS 36.321 [6]).
- 2> start or restart timer T318, if timer T317 expires during GNSS measurement, or if timer T317 expires before GNSS measurement and timer T318 is stopped upon GNSS measurement;
- 1> upon indication that GNSS measurement has failed:
- 2> if GNSS position is out-of-date; and
- 2> if *ul-TransmissionExtensionEnabled* is not configured or T390 has expired:
 - 3> perform the actions upon leaving RRC_CONNECTED as specified in 5.3.12, with release cause 'other'.

5.6 Other

5.6.0 General

For NB-IoT, only a subset of the procedures described in this clause apply.

Table 5.6.0-1 specifies the procedures that are applicable to NB-IoT. All other procedures are not applicable to NB-IoT; this is not further stated in the corresponding procedures.

Table 5.6.0-1: "Other" Procedures applicable to a NB-IoT UE

Clause	Procedures
5.6.1	DL information transfer
5.6.2	UL information transfer
5.6.3	UE Capability transfer
5.6.5	UE information (see NOTE)
5.6.23	PUR Configuration Request
5.6.24	Neighbour Relation Reporting for SON ANR in NB-IoT

NOTE: Not applicable for a UE that only supports the Control Plane CIoT EPS optimisation (see TS 24.301 [35]).

5.6.1 DL information transfer

5.6.1.1 General

Figure 5.6.1.1-1: DL information transfer

The purpose of this procedure is to transfer NAS, (tunneled) non-3GPP dedicated information or time reference information from E-UTRAN to a UE in RRC_CONNECTED, or to transfer F1-C related information from IAB-donor-CU to IAB-DU via IAB-MT in RRC_CONNECTED.

5.6.1.2 Initiation

E-UTRAN initiates the DL information transfer procedure whenever there is a need to transfer NAS, non-3GPP dedicated information, time reference information or F1-C related information. E-UTRAN initiates the DL information transfer procedure by sending the *DLInformationTransfer* message.

5.6.1.3 Reception of the *DLInformationTransfer* by the UE

Upon receiving *DLInformationTransfer* message, the UE shall:

- 1> if the UE is a NB-IoT UE; or
- 1> if the *dedicatedInfoType* is present and set to *dedicatedInfoNAS*:

 - 2> forward the *dedicatedInfoNAS* to the NAS upper layers.

- 1> if the *dedicatedInfoType* is present and set to *dedicatedInfoCDMA2000-1XRTT* or to *dedicatedInfoCDMA2000-HRPD*:

 - 2> forward the *dedicatedInfoCDMA2000* to the CDMA2000 upper layers;

- 1> if *timeReferenceInfo* is included:
 - 2> calculate the time reference based on the included *time*, *timeInfoType* and *referenceSFN* in *timeReferenceInfo*;
 - 2> calculate the inaccuracy of the time reference based on the *uncertainty* and other implementation-related inaccuracies, if *uncertainty* is included in *timeReferenceInfo*;
 - 2> inform upper layers of the time reference and, if *uncertainty* is included in *timeReferenceInfo*, of the inaccuracy of the time reference.

Upon receiving *DLInformationTransfer* message, the IAB-MT shall:

- 1> if *dedicatedInfoF1c* is included:
 - 2> forward *dedicatedInfoF1c* to the IAB-DU.

5.6.2 UL information transfer

5.6.2.1 General

Figure 5.6.2.1-1: UL information transfer

The purpose of this procedure is to transfer NAS or (tunneled) non-3GPP dedicated information from the UE to E-UTRAN, or to transfer F1-C related information from IAB-DU to IAB-donor-CU via IAB-MT in RRC_CONNECTED.

5.6.2.2 Initiation

A UE in RRC_CONNECTED initiates the UL information transfer procedure whenever there is a need to transfer NAS, non-3GPP dedicated information, except at RRC connection establishment or resume in which case the NAS information is piggybacked to the *RRCConnectionSetupComplete* or *RRCConnectionResumeComplete* message correspondingly. In addition, an IAB-MT in RRC_CONNECTED may initiate the UL information transfer procedure whenever there is a need to transfer F1-C related information. The UE initiates the UL information transfer procedure

by sending the *ULInformationTransfer* message. When CDMA2000 information has to be transferred, the UE shall initiate the procedure only if SRB2 is established. When F1-C related information has to be transferred, the IAB-MT shall initiate the procedure only if SRB2 is established.

5.6.2.3 Actions related to transmission of *ULInformationTransfer* message

The UE shall set the contents of the *ULInformationTransfer* message as follows:

- 1> if there is a need to transfer NAS information:
- 2> if the UE is a NB-IoT UE:
 - 3> set the *dedicatedInfoNAS* to include the information received from upper layers;
- 2> else:
 - 3> set the *dedicatedInfoType* to include the *dedicatedInfoNAS*;
- 1> if there is a need to transfer CDMA2000 1XRTT information:
 - 2> set the *dedicatedInfoType* to include the *dedicatedInfoCDMA2000-1XRTT*;
- 1> if there is a need to transfer CDMA2000 HRPD information:
 - 2> set the *dedicatedInfoType* to include the *dedicatedInfoCDMA2000-HRPD*;
- 1> upon RRC connection establishment, if UE supports the Control Plane CIoT EPS/5GS optimisation and UE does not need UL gaps during continuous uplink transmission:
 - 2> configure lower layers to stop using UL gaps during continuous uplink transmission in FDD for *ULInformationTransfer* message and subsequent uplink transmission in RRC_CONNECTED except for UL transmissions as specified in TS 36.211 [21];
- 1> if there is a need to transfer F1-C related information (applies only to IAB-MT):
 - 2> include the *dedicatedInfoF1c*;
- 1> submit the *ULInformationTransfer* message to lower layers for transmission, upon which the procedure ends;

5.6.2.4 Failure to deliver *ULInformationTransfer* message

The UE shall:

- 1> if the UE is a NB-IoT UE, AS security is not started and radio link failure occurs before the successful delivery of *ULInformationTransfer* messages has been confirmed by lower layers; or
- 1> if mobility (i.e. handover, RRC connection re-establishment) occurs before the successful delivery of *ULInformationTransfer* messages has been confirmed by lower layers:
 - 2> inform upper layers about the possible failure to deliver the information contained in the concerned *ULInformationTransfer* messages, unless the messages include *dedicatedInfoF1c* and no *dedicatedInfoType* is included;

5.6.2a UL information transfer for MR-DC

5.6.2a.1 General

Figure 5.6.2a.1-1: UL information transfer MR-DC

The purpose of this procedure is to transfer from the UE to E-UTRAN MR-DC dedicated information e.g. the NR RRC *MeasurementReport*, the NR RRC *UEAssistanceInformation*, the NR RRC *IABOtherInformation*, NR RRC *FailureInformation* or an NR RRC *ReconfigurationComplete* (transmitted upon intra-SN CPC without MN involvement execution if NR RRC *Reconfiguration* with *conditionalReconfiguration* for CPC was received via SRB1 and the UE is operating in EN-DC) messages.

5.6.2a.2 Initiation

A UE in RRC_CONNECTED initiates the UL information transfer procedure whenever there is a need to transfer MR DC dedicated information as specified in TS 38.331 [82]. I.e. the procedure is not used during an RRC connection reconfiguration involving NR connection reconfiguration, in which case the MR DC information is piggybacked to the *RRCConnectionReconfigurationComplete* message, except in the case the UE executes an intra-SN Conditional PSCell Change without MN involvement.

5.6.2a.3 Actions related to transmission of *ULInformationTransferMRDC* message

The UE shall set the contents of the *ULInformationTransferMRDC* message as follows:

- 1> if there is a need to transfer MR DC dedicated information:
- 2> set the *ul-DCCH-MessageNR* to include the MR DC dedicated information to be transferred;
- 1> submit the *ULInformationTransferMRDC* message to lower layers for transmission, upon which the procedure ends;

5.6.2a.4 Void

5.6.3 UE capability transfer

5.6.3.1 General

Figure 5.6.3.1-1: UE capability transfer

The purpose of this procedure is to transfer UE radio access capability information from the UE to E-UTRAN.

If the UE is NTN capable, the UE reports its E-UTRAN radio access capabilities for the network type (TN or NTN) to which it is connected.

If the UE has changed its E-UTRAN radio access capabilities, the UE shall request higher layers to initiate the necessary NAS procedures (see TS 23.401 [41]) that would result in the update of UE radio access capabilities using a new RRC connection.

NOTE: Change of the UE's GERAN UE radio capabilities in RRC_IDLE is supported by use of Tracking Area Update.

5.6.3.2 Initiation

E-UTRAN initiates the procedure to a UE in RRC_CONNECTED when it needs (additional) UE radio access capability information. Except if the UE is using Control plane CIoT EPS optimisation, E-UTRAN should retrieve UE capabilities only after AS security activation and E-UTRAN does not forward capabilities that were retrieved before AS security activation to the CN.

5.6.3.3 Reception of the *UECapabilityEnquiry* by the UE

The UE shall:

- 1> for NB-IoT, set the contents of *UECapabilityInformation* message as follows:
 - 2> include the UE Radio Access Capability Parameters within the *ue-Capability*;
 - 2> include *ue-RadioPagingInfo*;
 - 2> submit the *UECapabilityInformation* message to lower layers for transmission, upon which the procedure ends;
- 1> else, set the contents of *UECapabilityInformation* message as follows:
 - 2> if the *ue-CapabilityRequest* includes *eutra*:
 - 3> include the *UE-EUTRA-Capability* within a *ue-CapabilityRAT-Container* and with the *rat-Type* set to *eutra*;
 - 3> if the UE supports FDD and TDD:
 - 4> set all fields of *UECapabilityInformation*, except field *fdd-Add-UE-EUTRA-Capabilities* and *tdd-Add-UE-EUTRA-Capabilities* (including their sub-fields), to include the values applicable for both FDD and TDD (i.e. functionality supported by both modes);
 - 4> if (some of) the UE capability fields have a different value for FDD and TDD:
 - 5> if for FDD, the UE supports additional functionality compared to what is indicated by the previous fields of *UECapabilityInformation*:
 - 6> include field *fdd-Add-UE-EUTRA-Capabilities* and set it to include fields reflecting the additional functionality applicable for FDD;
 - 5> if for TDD, the UE supports additional functionality compared to what is indicated by the previous fields of *UECapabilityInformation*:
 - 6> include field *tdd-Add-UE-EUTRA-Capabilities* and set it to include fields reflecting the additional functionality applicable for TDD;

NOTE 1: The UE includes fields of *XDD-Add-UE-EUTRA-Capabilities* in accordance with the following:

- The field is included only if one or more of its sub-fields (or bits in the feature group indicators string) has a value that is different compared to the value signalled elsewhere within *UE-EUTRA-Capability*; (this value signalled elsewhere is also referred to as the *Common value*, that is supported for both XDD modes)

- For the fields that are included in *XDD-Add-UE-EUTRA-Capabilities*, the UE sets:
 - the sub-fields (or bits in the feature group indicators string) that are not allowed to be different to the same value as the *Common value*;
 - the sub-fields (or bits in the feature group indicators string) that are allowed to be different to a value indicating at least the same functionality as indicated by the *Common value*;

3> else (UE supports single xDD mode):

- 4> set all fields of *UECapabilityInformation*, except field *fdd-Add-UE-EUTRA-Capabilities* and *tdd-Add-UE-EUTRA-Capabilities* (including their sub-fields), to include the values applicable for the xDD mode supported by the UE;

3> compile a list of band combinations, candidate for inclusion in the *UECapabilityInformation* message, comprising of band combinations supported by the UE according to the following priority order (i.e. listed in order of decreasing priority):

- 4> include all non-CA bands, regardless of whether UE supports carrier aggregation, only:

- if the UE includes *ue-Category-v1020* (i.e. indicating category 6 to 8); or
- if for at least one of the non-CA bands, the UE supports more MIMO layers with TM9 and TM10 than implied by the UE category; or
- if the UE supports TM10 with one or more CSI processes; or
- if the UE supports 1024QAM in DL;

- 4> if the *UECapabilityEnquiry* message includes *requestedFrequencyBands* and UE supports *requestedFrequencyBands*:

5> include all 2DL+1UL CA band combinations, only consisting of bands included in *requestedFrequencyBands*;

5> include all other CA band combinations, only consisting of bands included in *requestedFrequencyBands*, and prioritized in the order of *requestedFrequencyBands*, (i.e. first include remaining band combinations containing the first-listed band, then include remaining band combinations containing the second-listed band, and so on);

- 4> else (no requested frequency bands):

5> include all 2DL+1UL CA band combinations;

5> include all other CA band combinations;

- 4> if UE supports *maximumCCsRetrieval* and if the *UECapabilityEnquiry* message includes the *requestedMaxCCsDL* and the *requestedMaxCCsUL* (i.e. both UL and DL maximums are given):

5> remove from the list of candidates the band combinations for which the number of CCs in DL exceeds the value indicated in the *requestedMaxCCsDL* or for which the number of CCs in UL exceeds the value indicated in the *requestedMaxCCsUL*;

5> indicate in *requestedCCsUL* the same value as received in *requestedMaxCCsUL*;

5> indicate in *requestedCCsDL* the same value as received in *requestedMaxCCsDL*;

- 4> else if UE supports *maximumCCsRetrieval* and if the *UECapabilityEnquiry* message includes the *requestedMaxCCsDL* (i.e. only DL maximum limit is given):

5> remove from the list of candidates the band combinations for which the number of CCs in DL exceeds the value indicated in the *requestedMaxCCsDL*;

5> indicate value in *requestedCCsDL* the same value as received in *requestedMaxCCsDL*;

- 4> else if UE supports *maximumCCsRetrieval* and if the *UECapabilityEnquiry* message includes the *requestedMaxCCsUL* (i.e. only UL maximum limit is given):

- 5> remove from the list of candidates the band combinations for which the number of CCs in UL exceeds the value indicated in the *requestedMaxCCsUL*;
- 5> indicate in *requestedCCsUL* the same value as received in *requestedMaxCCsUL*;
- 4> if the UE supports *reducedIntNonContComb* and the *UECapabilityEnquiry* message includes *requestReducedIntNonContComb*:
 - 5> set *reducedIntNonContCombRequested* to true;
 - 5> remove from the list of candidates the intra-band non-contiguous CA band combinations which support is implied by another intra-band non-contiguous CA band combination included in the list of candidates as specified in TS 36.306 [5], clause 4.3.5.21:
- 4> if the UE supports *requestReducedFormat* and UE supports *skipFallbackCombinations* and *UECapabilityEnquiry* message includes *requestSkipFallbackComb*:
 - 5> set *skipFallbackCombRequested* to true;
 - 5> for each band combination included in the list of candidates (including 2DL+1UL CA band combinations), starting with the ones with the lowest number of DL and UL carriers, that concerns a fallback band combination of another band combination included in the list of candidates as specified in TS 36.306 [5]:
 - 6> remove the band combination from the list of candidates;
 - 6> include *differentFallbackSupported* in the band combination included in the list of candidates whose fallback concerns the removed band combination, if its capabilities differ from the removed band combination;
- 4> if the UE supports *requestReducedFormat* and *diffFallbackCombReport*, and *UECapabilityEnquiry* message includes *requestDiffFallbackCombList*:
 - 5> if the UE does not support *skipFallbackCombinations* or *UECapabilityEnquiry* message does not include *requestSkipFallbackComb*:
 - 6> remove all band combination from the list of candidates;
 - 5> for each CA band combination indicated in *requestDiffFallbackCombList*:
 - 6> include the CA band combination, if not already in the list of candidates;
 - 6> include the fallback combinations for which the supported UE capabilities are different from the capability of the CA band combination;
 - 5> include CA band combinations indicated in *requestDiffFallbackCombList* into *requestedDiffFallbackCombList*;
 - 3> if the *UECapabilityEnquiry* message includes *requestReducedFormat* and UE supports *requestReducedFormat*:
 - 4> include in *supportedBandCombinationReduced* as many as possible of the band combinations included in the list of candidates, including the non-CA combinations, determined according to the rules and priority order defined above;
 - 3> else:
 - 4> if the *UECapabilityEnquiry* message includes *requestedFrequencyBands* and UE supports *requestedFrequencyBands*:
 - 5> include in *supportedBandCombination* as many as possible of the band combinations included in the list of candidates, including the non-CA combinations and up to 5DL+5UL CA band combinations, determined according to the rules and priority order defined above;
 - 5> include in *supportedBandCombinationAdd* as many as possible of the remaining band combinations included in the list of candidates, (i.e. the candidates not included in

supportedBandCombination), up to 5DL+5UL CA band combinations, determined according to the rules and priority order defined above;

4> else:

- 5> include in *supportedBandCombination* as many as possible of the band combinations included in the list of candidates, including the non-CA combinations and up to 5DL+5UL CA band combinations, determined according to the rules defined above;
- 5> if it is not possible to include in *supportedBandCombination* all the band combinations to be included according to the above, selection of the subset of band combinations to be included is left up to UE implementation;

3> indicate in *requestedBands* the same bands and in the same order as included in *requestedFrequencyBands*, if received;

3> if the UE is a category 0, M1 or M2 UE, or supports any UE capability information in *ue-RadioPagingInfo*, according to TS 36.306 [5]:

4> include *ue-RadioPagingInfo* and set the fields according to TS 36.306 [5];

3> if the UE supports (NG)EN-DC or NE-DC and if *requestedFreqBandsNR-MRDC* is included in the request:

4> include into *featureSetsEUTRA* the feature sets that are applicable for the received *requestedFreqBandsNR-MRDC* and *requestedCapabilityCommon* as specified in TS 38.331 [82], clause 5.6.1.4.

NOTE 2: The network must include the *requestedFreqBandsNR-MRDC* in order to obtain feature sets for E-UTRA and MR-DC.

NOTE 3: Even if the network requests (only) capabilities for *eutra*, it may include NR band numbers in the *requestedFreqBandsNR-MRDC* in order to ensure that the UE includes all necessary feature sets (i.e. E-UTRA and NR) needed for subsequently requested *eutra-nr* capabilities.

3> if the *UECapabilityEnquiry* message includes *requestSTTI-SPT-Capability* and if the UE supports short TTI and/or SPT (i.e., *stti-SPT-Supported*):

4> for each band combination the UE included in a field of the *UECapabilityInformation* message in accordance with the previous:

5> if the UE supports short TTI, include the short TTI capabilities for each of the band combinations using the *stti-SPT-BandParameters*;

5> if the UE supports SPT, include the SPT capabilities for each of the band combinations using the *stti-SPT-BandParameters*;

NOTE 4: The UE may have to add/repeat the band combinations to the list of band combinations included earlier, to include short TTI capabilities and/or SPT capabilities.

3> if the *UECapabilityEnquiry* message includes *sidelinkRequest*:

4> for a sidelink band combination the UE included in *v2x-SupportedBandCombinationListEUTRA-NR*:

5> if the UE supports partial sensing for a band of the sidelink band combination, include the partial sensing capabilities for the band using the *v2x-BandParametersEUTRA-NR-v1710*;

4> set *sidelinkRequested* to true;

2> if the *ue-CapabilityRequest* includes *geran-cs* and if the UE supports GERAN CS domain:

3> include the UE radio access capabilities for GERAN CS within a *ue-CapabilityRAT-Container* and with the *rat-Type* set to *geran-cs*;

2> if the *ue-CapabilityRequest* includes *geran-ps* and if the UE supports GERAN PS domain:

- 3> include the UE radio access capabilities for GERAN PS within a *ue-CapabilityRAT-Container* and with the *rat-Type* set to *geran-ps*;
- 2> if the *ue-CapabilityRequest* includes *utra* and if the UE supports UTRA:
 - 3> include the UE radio access capabilities for UTRA within a *ue-CapabilityRAT-Container* and with the *rat-Type* set to *utra*;
- 2> if the *ue-CapabilityRequest* includes *cdma2000-1XRTT* and if the UE supports CDMA2000 1xRTT:
 - 3> include the UE radio access capabilities for CDMA2000 within a *ue-CapabilityRAT-Container* and with the *rat-Type* set to *cdma2000-1XRTT*;
- 2> if the *ue-CapabilityRequest* includes *nr* and if the UE supports NR:
 - 3> include the UE radio access capabilities for NR within a *ue-CapabilityRAT-Container*, with the *rat-Type* set to *nr*;
 - 3> include band combinations and feature sets as specified in TS 38.331 [82], clause 5.6.1.4, considering the included *requestedFreqBandsNR-MRDC*, *requestedCapabilityNR*, the *eutra-nr-only* flag and *requestedCapabilityCommon* (if present);
- 2> if the *ue-CapabilityRequest* includes *eutra-nr* and if the UE supports (NG)EN-DC or NE-DC:
 - 3> include the UE radio access capabilities for EUTRA-NR within a *ue-CapabilityRAT-Container*, with the *rat-Type* set to *eutra-nr*;
 - 3> include band combinations as specified in TS 38.331 [82], clause 5.6.1.4, considering the included *requestedFreqBandsNR-MRDC*, *requestedCapabilityNR* (if present) and *requestedCapabilityCommon* (if included);
- 1> if the RRC message segmentation is enabled based on the field *rrc-SegAllowed* received, and the encoded RRC message is larger than the maximum supported size of a PDCP SDU specified in TS 36.323 [8]:
 - 2> initiate the UL message segment transfer procedure as specified in clause 5.6.22;
- 1> else:
 - 2> submit the *UECapabilityInformation* message to lower layers for transmission, upon which the procedure ends;

5.6.4 CSFB to 1x Parameter transfer

5.6.4.1 General

Figure 5.6.4.1-1: CSFB to 1x Parameter transfer

The purpose of this procedure is to transfer the CDMA2000 1xRTT parameters required to register the UE in the CDMA2000 1xRTT network for CSFB support.

5.6.4.2 Initiation

A UE in RRC_CONNECTED initiates the CSFB to 1x parameter transfer procedure upon request from the CDMA2000 upper layers. The UE initiates the CSFB to 1x parameter transfer procedure by sending the *CSFBParametersRequestCDMA2000* message.

5.6.4.3 Actions related to transmission of *CSFBParametersRequestCDMA2000* message

The UE shall:

- 1> submit the *CSFBParametersRequestCDMA2000* message to lower layers for transmission using the current configuration;

5.6.4.4 Reception of the *CSFBParametersResponseCDMA2000* message

Upon reception of the *CSFBParametersResponseCDMA2000* message, the UE shall:

- 1> forward the *rand* and the *mobilityParameters* to the CDMA2000 1xRTT upper layers;

5.6.5 UE Information

5.6.5.1 General

Figure 5.6.5.1-1: UE information procedure

The UE information procedure is used by E-UTRAN to request the UE to report information.

5.6.5.2 Initiation

E-UTRAN initiates the procedure by sending the *UEInformationRequest* message. E-UTRAN should initiate this procedure only after successful security activation.

5.6.5.3 Reception of the *UEInformationRequest* message

Upon receiving the *UEInformationRequest* message, the UE shall, only after successful security activation:

- 1> if *rach-ReportReq* is set to *true*, set the contents of the *rach-Report* in the *UEInformationResponse* message as follows:
 - 2> set the *numberOfPreamblesSent* to indicate the number of preambles sent by MAC for the last successfully completed random access procedure;
 - 2> if contention resolution was not successful as specified in TS 36.321 [6] for at least one of the transmitted preambles for the last successfully completed random access procedure:
 - 3> set the *contentionDetected* to *true*;
 - 2> else:

- 3> set the *contentionDetected* to *false*;
- 2> if the UE is a BL UE or UE in CE:
 - 3> set the *initialCEL* to indicate the initial CE level used for the last successfully completed random access procedure;
- 2> if the UE is a NB-IoT UE:
 - 3> set the *initialNRSRP-Level* to indicate the NRSRP level of the NPRACH resource selected for the first preamble transmission for the last successfully completed random access procedure;
- 2> if the UE is a BL UE, UE in CE or NB-IoT UE:
 - 3> if the last successfully completed random access procedure was initiated with EDT PRACH resource and succeeded after receiving EDT fallback indication from lower layers:
 - 4> set the *edt-Fallback* to *true*;
 - 3> else:
 - 4> set the *edt-Fallback* to *false*;
- 1> if *rlf-ReportReq* is set to *true* and the UE has radio link failure information or handover failure information available in *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT) and if the RPLMN is included in *plmn-IdentityList* stored in *VarRLF-Report*:
 - 2> for NB-IoT, if the global cell identity of the selected cell is the same as the *reestablishmentCellId* in the *VarRLF-Report-NB*:
 - 3> remove the *reestablishmentCellId* from the *VarRLF-Report-NB*;
 - 2> set *timeSinceFailure* in *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT) to the time that elapsed since the last radio link or handover failure in E-UTRA;
 - 2> set the *rlf-Report* in the *UEInformationResponse* message to the value of *rlf-Report* in *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT);
 - 2> discard the *rlf-Report* from *VarRLF-Report* (*VarRLF-Report-NB* in NB-IoT) upon successful delivery of the *UEInformationResponse* message confirmed by lower layers;
- 1> except for NB-IoT, if *connEstFailReportReq* is set to *true* and the UE has connection establishment failure information in *VarConnEstFailReport* and if the RPLMN is equal to *plmn-Identity* stored in *VarConnEstFailReport*:
 - 2> set *timeSinceFailure* in *VarConnEstFailReport* to the time that elapsed since the last connection establishment failure in E-UTRA;
 - 2> set the *connEstFailReport* in the *UEInformationResponse* message to the value of *connEstFailReport* in *VarConnEstFailReport*;
 - 2> discard the *connEstFailReport* from *VarConnEstFailReport* upon successful delivery of the *UEInformationResponse* message confirmed by lower layers;
- 1> except for NB-IoT, if the *logMeasReportReq* is present and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 2> if *VarLogMeasReport* includes one or more logged measurement entries, set the contents of the *logMeasReport* in the *UEInformationResponse* message as follows:
 - 3> include the *absoluteTimeStamp* and set it to the value of *absoluteTimeInfo* in the *VarLogMeasReport*;
 - 3> include the *traceReference* and set it to the value of *traceReference* in the *VarLogMeasReport*;
 - 3> include the *traceRecordingSessionRef* and set it to the value of *traceRecordingSessionRef* in the *VarLogMeasReport*;

- 3> include the *tce-Id* and set it to the value of *tce-Id* in the *VarLogMeasReport*;
- 3> include the *logMeasInfoList* and set it to include one or more entries from the *VarLogMeasReport* starting from the entries logged first, and for each entry of the *logMeasInfoList* that is included, include all information stored in the corresponding *logMeasInfoList* entry in *VarLogMeasReport*;
- 3> if the *VarLogMeasReport* includes one or more additional logged measurement entries that are not included in the *logMeasInfoList* within the *UEInformationResponse* message:
 - 4> include the *logMeasAvailable*;
 - 4> if *logMeasResultListBT* is included in one or more of the additional logged measurement entries in *VarLogMeasReport* that are not included in the *logMeasInfoList* within the *UEInformationResponse* message:
 - 5> include the *logMeasAvailableBT*;
 - 4> if *logMeasResultListWLAN* is included in one or more of the additional logged measurement entries in *VarLogMeasReport* that are not included in the *logMeasInfoList* within the *UEInformationResponse* message:
 - 5> include the *logMeasAvailableWLAN*;
- 1> except for NB-IoT, if *mobilityHistoryReportReq* is set to *true*:
 - 2> include the *mobilityHistoryReport* and set it to include entries from *VarMobilityHistoryReport*;
 - 2> include in the *mobilityHistoryReport* an entry for the current cell, possibly after removing the oldest entry if required, and set its fields as follows:
 - 3> set *visitedCellId* to the global cell identity or the physical cell identity and carrier frequency of the current cell;
 - 3> set field *timeSpent* to the time spent in the current cell;
- 1> except for NB-IoT, if the *idleModeMeasurementReq* is included in the *UEInformationRequest* and the UE has stored *VarMeasIdleReport* that contains measurement information concerning cells other than the PCell:
 - 2> set the *measResultListIdle-r15* in the *UEInformationResponse* message to the value of *measReportIdle-r15* in the *VarMeasIdleReport*;
 - 2> set the *measResultListExtIdle* in the *UEInformationResponse* message to the value of *measReportIdle-r16* in the *VarMeasIdleReport*, if available;
 - 2> set the *measResultListIdleNR* in the *UEInformationResponse* message to the value of *measReportIdleNR* in the *VarMeasIdleReport*, if available;
 - 2> discard the *VarMeasIdleReport* upon successful delivery of the *UEInformationResponse* message confirmed by lower layers;
- 1> except for NB-IoT, if *flightPathInfoReq* field is present and the UE has flight path information available:
 - 2> include the *flightPathInfoReport* and set it to include the list of waypoints along the flight path;
 - 2> if the *includeTimeStamp* is set to TRUE:
 - 3> set the field *timeStamp* to the time when UE intends to arrive to each waypoint if this information is available at the UE;
- 1> for NB-IoT, if *anr-ReportReq* is set to *true* and the UE has *measResultList* available in *VarANR-MeasReport-NB*:
 - 2> set the *anr-MeasReport* in the *UEInformationResponse* message as follows:
 - 3> if the global cell identity of the PCell is different from *servCellIdentity* in the *VarANR-MeasReport-NB*;
 - 4> include the *servCellIdentity* and set it to the value of *servCellIdentity* in the *VarANR-MeasReport-NB*;

- 3> set *measResultServCell* to the value of *measResultServCell* in the *VarANR-MeasReport-NB*;
- 3> set *relativeTimeStamp* to the value of *relativeTimeStamp* in the *VarANR-MeasReport-NB*;
- 3> set *measResultList* to the value of *measResultList* in the *VarANR-MeasReport-NB*;
- 2> discard the *VarANR-MeasReport-NB* upon successful delivery of the *UEInformationResponse* message confirmed by lower layers;
- 1> except for NB-IoT, if the *coarseLocationReq* is set to true:
 - 2> if available, include the *coarseLocationInfo*;
- 1> if the *logMeasReport* is included in the *UEInformationResponse*:
 - 2> submit the *UEInformationResponse* message to lower layers for transmission via SRB2;
 - 2> discard the logged measurement entries included in the *logMeasInfoList* from *VarLogMeasReport* upon successful delivery of the *UEInformationResponse* message confirmed by lower layers;
- 1> else:
 - 2> submit the *UEInformationResponse* message to lower layers for transmission via SRB1;
- 1> except for NB-IoT, if *rach-ReportReqNR* is set to *true*, and if the UE has NR RACH report information available in *VarRA-Report* of TS 38.331 [82] that is stored and the RPLMN is included in *plmn-IdentityList* stored in *VarRA-Report* of TS 38.331 [82], set the content of *rach-ReportNR* in the *UEInformationResponse* message as below:
 - 2> for each *RA-Report* of *ra-ReportList* in *VarRA-Report* of TS 38.331 [82]:
 - 3> include it as part of *rach-ReportListNR*;
 - 3> if the *cellIdListNR* is not set or the *cellId* of *RA-Report* has not been included in *cellIdListNR*:
 - 4> add a new entry in *cellIdListNR* and set the *cellIdNR* to the global cell identity including the tracking area code, if available, otherwise to the physical cell identity and carrier frequency, as indicated in the *cellId* of *RA-Report*;
 - 2> discard the *RA-Report* that was included in *rach-ReportListNR* from *ra-ReportList* in *VarRA-Report* of TS 38.331[82] upon successful delivery of the *UEInformationResponse* message as confirmed by lower layers.

5.6.6 Logged Measurement Configuration

5.6.6.1 General

Figure 5.6.6.1-1: Logged measurement configuration

The purpose of this procedure is to configure the UE to perform logging of measurement results while in RRC_IDLE and to perform logging of measurement results for MBSFN in both RRC_IDLE and RRC_CONNECTED. The procedure applies to logged measurements capable UEs that are in RRC_CONNECTED.

NOTE: E-UTRAN may retrieve stored logged measurement information by means of the UE information procedure.

5.6.6.2 Initiation

E-UTRAN initiates the logged measurement configuration procedure to UE in RRC_CONNECTED by sending the *LoggedMeasurementConfiguration* message.

5.6.6.3 Reception of the *LoggedMeasurementConfiguration* by the UE

Upon receiving the *LoggedMeasurementConfiguration* message the UE shall:

- 1> discard the logged measurement configuration as well as the logged measurement information as specified in 5.6.7;
- 1> store the received *loggingDuration*, *loggingInterval* and *areaConfiguration*, if included, in *VarLogMeasConfig*;
- 1> if the *LoggedMeasurementConfiguration* message includes *plmn-IdentityList*:

 - 2> set *plmn-IdentityList* in *VarLogMeasReport* to include the RPLMN as well as the PLMNs included in *plmn-IdentityList*;

- 1> else:
 - 2> set *plmn-IdentityList* in *VarLogMeasReport* to include the RPLMN;
- 1> store the received *absoluteTimeInfo*, *traceReference*, *traceRecordingSessionRef* and *tce-Id* in *VarLogMeasReport*;
- 1> store the received *targetMBSFN-AreaList*, if included, in *VarLogMeasConfig*;
- 1> store the received *bt-NameList*, if included, in *VarLogMeasConfig*;
- 1> store the received *wlan-NameList*, if included, in *VarLogMeasConfig*;
- 1> store the received *loggedEventTriggerConfig*, if included, in *VarLogMeasConfig*;
- 1> store the received *measUncomBarPre*, if included, in *VarLogMeasConfig*;
- 1> start timer T330 with the timer value set to the *loggingDuration*;
- 1> store the received *sigLoggedMeasType*, if included, in *VarLogMeasReport*;

5.6.6.4 T330 expiry

Upon expiry of T330 the UE shall:

- 1> release *VarLogMeasConfig*;

The UE is allowed to discard stored logged measurements, i.e. to release *VarLogMeasReport*, 48 hours after T330 expiry.

5.6.7 Release of Logged Measurement Configuration

5.6.7.1 General

The purpose of this procedure is to release the logged measurement configuration as well as the logged measurement information.

5.6.7.2 Initiation

The UE shall initiate the procedure upon receiving a logged measurement configuration in another RAT. The UE shall also initiate the procedure upon power off or detach.

The UE shall:

- 1> stop timer T330, if running;
- 1> if stored, discard the logged measurement configuration as well as the logged measurement information, i.e. release the UE variables *VarLogMeasConfig* and *VarLogMeasReport*;

5.6.8 Measurements logging

5.6.8.1 General

This procedure specifies the logging of available measurements by a UE in RRC_IDLE that has a logged measurement configuration and the logging of available measurements by a UE in both RRC_IDLE and RRC_CONNECTED if *targetMBSFN-AreaList* is included in *VarLogMeasConfig*.

When UE is configured to perform logging of measurements, measurements are performed with CRS.

5.6.8.2 Initiation

While T330 is running, the UE shall:

- 1> if measurement logging is suspended:
 - 2> if during the last logging interval the IDC problems detected by the UE is resolved, resume measurement logging;
- 1> if not suspended, perform the logging in accordance with the following:
 - 2> if *targetMBSFN-AreaList* is included in *VarLogMeasConfig*:
 - 3> if the UE is camping normally on an E-UTRA cell or is connected to E-UTRA; and
 - 3> if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*; and
 - 3> if the PCell (in RRC_CONNECTED) or cell where the UE is camping (in RRC_IDLE) is part of the area indicated by *areaConfiguration* if configured in *VarLogMeasConfig*:
 - 4> for MBSFN areas, indicated in *targetMBSFN-AreaList*, from which the UE is receiving MBMS service:
 - 5> perform MBSFN measurements in accordance with the performance requirements as specified in TS 36.133 [16];

NOTE 1: When configured to perform MBSFN measurement logging by *targetMBSFN-AreaList*, the UE is not required to receive additional MBSFN subframes, i.e. logging is based on the subframes corresponding to the MBMS services the UE is receiving.

- 5> perform logging at regular time intervals as defined by the *loggingInterval* in *VarLogMeasConfig*, but only for those intervals for which MBSFN measurement results are available as specified in TS 36.133 [16];

2> else:

- 3> if the *loggedEventTriggerConfig* is configured in *VarLogMeasConfig*, and *eventType* is set to *outOfCoverage*:
 - 4> perform the logging at regular time intervals as defined by the *loggingInterval* in *VarLogMeasConfig* only when the UE is in *any cell selection* state;

- 4> upon transition from *any cell selection* state to *camped normally* state in E-UTRA:
 - 5> if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*; and
 - 5> if *areaConfiguration* is not included in *VarLogMeasConfig* or if the current camping cell is part of the area indicated by *areaConfiguration* in *VarLogMeasConfig*:
 - 6> perform the logging;
- 3> else if the *loggedEventTriggerConfig* is configured in *VarLogMeasConfig* and *eventType* is set to *eventL1*:
 - 4> if the UE is in *camped normally* state on an E-UTRA cell and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport*:
 - 5> if *areaConfiguration* is not included in *VarLogMeasConfig*; or
 - 5> if the serving cell is part of the area indicated by *areaConfiguration* in *VarLogMeasConfig*:
 - 6> perform the logging at regular time intervals as defined by the *loggingInterval* in *VarLogMeasConfig* only when the conditions indicated by the *eventL1* are met;
 - 3> else if the UE is in *any cell selection* state (as specified in TS 36.304 [4]):
 - 4> perform the logging at regular time intervals, as defined by the *loggingInterval* in *VarLogMeasConfig*;
 - 3> else if the UE is camping normally on an E-UTRA cell and if the RPLMN is included in *plmn-IdentityList* stored in *VarLogMeasReport* and, if the cell is part of the area indicated by *areaConfiguration* if configured in *VarLogMeasConfig*:
 - 4> perform the logging at regular time intervals, as defined by the *loggingInterval* in *VarLogMeasConfig*;
- 2> when adding a logged measurement entry in *VarLogMeasReport*, include the fields in accordance with the following:
 - 3> if the UE detected IDC problems during the last logging interval:
 - 4> if *measResultServCell* in *VarLogMeasReport* is not empty:
 - 5> include *inDeviceCoexDetected*;
 - 5> suspend measurement logging from the next logging interval;
 - 4> else:
 - 5> suspend measurement logging;
 - NOTE 1A: The UE may detect the start of IDC problems as early as Phase 1 as described in clause 23.4 of TS 36.300 [9].
 - 3> set the *relativeTimeStamp* to indicate the elapsed time since the moment at which the logged measurement configuration was received;
 - 3> if detailed location information became available during the last logging interval, set the content of the *locationInfo* as follows:
 - 4> include the *locationCoordinates*;
 - 3> if *wlan-NameList* is included in *VarLogMeasConfig*:
 - 4> if detailed WLAN measurements are available:
 - 5> include *logMeasResultListWLAN*, in order of decreasing RSSI for WLAN APs;
 - 3> if *bt-NameList* is included in *VarLogMeasConfig*:
 - 4> if detailed Bluetooth measurements are available:

- 5> include *logMeasResultListBT*, in order of decreasing RSSI for Bluetooth beacons;
- 3> if *measUncomBarPre* is included in *VarLogMeasConfig*:
 - 4> if available, include the *uncomBarPreMeasResult*;
- 3> if *targetMBSFN-AreaList* is included in *VarLogMeasConfig*:
 - 4> for each MBSFN area, for which the mandatory measurements result fields became available during the last logging interval:
 - 5> set the *rsrpResultMBSFN*, *rsrqResultMBSFN* to include measurement results that became available during the last logging interval;
 - 5> include the fields *signallingBLER-Result* or *dataBLER-MCH-ResultList* if the concerned BLER results are available,
 - 5> set the *mbsfn-AreaId* and *carrierFreq* to indicate the MBSFN area in which the UE is receiving MBSFN transmission;
 - 4> if in RRC_CONNECTED:
 - 5> set the *servCellIdentity* to indicate global cell identity of the PCell;
 - 5> set the *measResultServCell* to include the layer 3 filtered measured results of the PCell;
 - 5> if available, set the *measResultNeighCells* to include the layer 3 filtered measured results of SCell(s) and neighbouring cell(s) measurements that became available during the last logging interval, in order of decreasing RSRP, for at most the following number of cells: 6 intra-frequency and 3 inter-frequency cells per frequency and according to the following:
 - 6> for each cell included, include the optional fields that are available;
 - 5> if available, optionally set the *measResultNeighCells* to include the layer 3 filtered measured results of neighbouring cell(s) measurements that became available during the last logging interval, in order of decreasing RSCP(UTRA)/RSSI(GERAN)/PilotStrength(cdma2000), for at most the following number of cells: 3 inter-RAT cells per frequency/set of frequencies (GERAN), and according to the following:
 - 6> for each cell included, include the optional fields that are available;
 - 4> if in RRC_IDLE:
 - 5> set the *servCellIdentity* to indicate global cell identity of the serving cell;
 - 5> set the *measResultServCell* to include the quantities of the serving cell;
 - 5> if available, set the *measResultNeighCells*, in order of decreasing ranking-criterion as used for cell re-selection, to include neighbouring cell measurements that became available during the last logging interval for at most the following number of neighbouring cells: 6 intra-frequency and 3 inter-frequency neighbours per frequency and according to the following:
 - 6> for each neighbour cell included, include the optional fields that are available;
 - 5> if available, optionally set the *measResultNeighCells*, in order of decreasing ranking-criterion as used for cell re-selection, to include neighbouring cell measurements that became available during the last logging interval, for at most the following number of cells: 3 inter-RAT cells per frequency/set of frequencies (GERAN), and according to the following:
 - 6> for each cell included, include the optional fields that are available;
 - 4> for the cells included according to the previous (i.e. covering previous and current serving cells as well as neighbouring EUTRA cells) include results according to the extended RSRQ if corresponding results are available according to the associated performance requirements defined in TS 36.133 [16];

- 4> for the cells included according to the previous (i.e. covering previous and current serving cells as well as neighbouring EUTRA cells) include RSRQ type if the result was based on measurements using a wider band or using all OFDM symbols;

NOTE 2: The UE includes the latest results in accordance with the performance requirements as specified in TS 36.133 [16]. E.g. RSRP and RSRQ results are available only if the UE has a sufficient number of results/ receives a sufficient number of subframes during the logging interval.

3> else:

- 4> if the UE is in *any cell selection* state (as specified in TS 36.304 [4]):

5> set *anyCellSelectionDetected* to indicate the detection of no suitable or no acceptable cell found;

5> if the *loggedEventTriggerConfig* is not configured in the *VarLogMeasConfig*;

6> set the *servCellIdentity* to indicate global cell identity of the last logged cell that the UE was camping on;

6> set the *measResultServCell* to include the quantities of the last logged cell the UE was camping on;

5> else if the RPLMN at the time of entering the *any cell selection* state is included in *plmn-IdentityList* stored in *VarLogMeasReport*; and

5> if *areaConfiguration* is not included in *VarLogMeasConfig* or if the last suitable cell that the UE was camping on is part of the area indicated by *areaConfiguration* in *VarLogMeasConfig*:

6> set the *servCellIdentity* to indicate global cell identity of the last suitable cell that the UE was camping on;

6> set the *measResultServingCell* to include the quantities of the last suitable cell the UE was camping on;

5> else:

6> set the fields within the *servCellIdentity* and *measResultServingCell* to all zeros to indicate unavailability of the *servCellIdentity* and *measResultServCell*.

4> else:

5> set the *servCellIdentity* to indicate global cell identity of the cell the UE is camping on;

5> set the *measResultServCell* to include the quantities of the cell the UE is camping on;

4> if available, set the *measResultNeighCells*, in order of decreasing ranking-criterion as used for cell re-selection, to include neighbouring cell measurements that became available during the last logging interval for at most the following number of neighbouring cells: 6 intra-frequency and 3 inter-frequency neighbours per frequency as well as 3 inter-RAT neighbours, per frequency/ set of frequencies (GERAN) per RAT and according to the following:

5> for each neighbour cell included, include the optional fields that are available;

4> for the cells included according to the previous (i.e. covering previous and current serving cells as well as neighbouring EUTRA cells) include results according to the extended RSRQ if corresponding results are available according to the associated performance requirements defined in TS 36.133 [16];

4> for the cells included according to the previous (i.e. covering previous and current serving cells as well as neighbouring EUTRA cells) include RSRQ type if the result was based on measurements using a wider band or using all OFDM symbols;

NOTE 3: The UE includes the latest results of the available measurements as used for cell reselection evaluation in RRC_IDLE or as used for evaluation of reporting criteria or for measurement reporting according to 5.5.3 in RRC_CONNECTED, which are performed in accordance with the performance requirements as specified in TS 36.133 [16].

- 2> when the memory reserved for the logged measurement information becomes full, stop timer T330 and perform the same actions as performed upon expiry of T330, as specified in 5.6.6.4;

5.6.9 In-device coexistence indication

5.6.9.1 General

Figure 5.6.9.1-1: In-device coexistence indication

The purpose of this procedure is to inform E-UTRAN about (a change of) the In-Device Coexistence (IDC) problems experienced by the UE in RRC_CONNECTED, as described in TS 36.300 [9], and to provide the E-UTRAN with information in order to resolve them.

5.6.9.2 Initiation

A UE capable of providing IDC indications may initiate the procedure when it is configured to provide IDC indications and upon change of IDC problem information.

Upon initiating the procedure, the UE shall:

- 1> if configured to provide IDC indications:
- 2> if the UE did not transmit an *InDeviceCoexIndication* message since it was configured to provide IDC indications:
 - 3> if on one or more frequencies for which a *measObjectEUTRA* is configured, the UE is experiencing IDC problems that it cannot solve by itself; or
 - 3> if configured to provide IDC indications for UL CA; and if on one or more supported UL CA combination comprising of carrier frequencies for which a measurement object is configured, the UE is experiencing IDC problems that it cannot solve by itself; or
 - 3> if configured to provide IDC indications for MR-DC, and if on one or more supported MR-DC combination comprising of at least one E-UTRA carrier frequency for which a measurement object is configured and at least one NR carrier frequency included in *candidateServingFreqListNR*, the UE is experiencing IDC problems that it cannot solve by itself;
 - 4> initiate transmission of the *InDeviceCoexIndication* message in accordance with 5.6.9.3;
- 2> else:
 - 3> if the set of frequencies, for which a *measObjectEUTRA* is configured and on which the UE is experiencing IDC problems that it cannot solve by itself, is different from the set indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if for one or more of the frequencies in the previously reported set of frequencies, the *interferenceDirection* is different from the value indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if the TDM assistance information is different from the assistance information included in the last transmitted *InDeviceCoexIndication* message; or

- 3> if configured to provide IDC indications for UL CA; and if the *victimSystemType* is different from the value indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if configured to provide IDC indications for UL CA; and if the set of supported UL CA combinations on which the UE is experiencing IDC problems that it cannot solve by itself and that the UE includes in *affectedCarrierFreqCombList* according to 5.6.9.3, is different from the set indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if configured to provide IDC indications for MR-DC, and if the *victimSystemType* is different from the value indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if configured to provide IDC indications for MR-DC, for one or more of the frequencies in the previously reported set of frequencies, if *interferenceDirectionMRDC* is different from the value indicated in the last transmitted *InDeviceCoexIndication* message; or
 - 3> if configured to provide IDC indications for MR-DC, and if the set of supported MR-DC combinations on which the UE is experiencing IDC problems that it cannot solve by itself and that the UE includes in *affectedCarrierFreqCombInfoListMRDC* according to 5.6.9.3, is different from the set indicated in the last transmitted *InDeviceCoexIndication* message:
- 4> initiate transmission of the *InDeviceCoexIndication* message in accordance with 5.6.9.3;

NOTE 1: The term "IDC problems" refers to interference issues applicable across several subframes/slots where not necessarily all the subframes/slots are affected.

NOTE 2: For the frequencies on which a serving cell or serving cells is configured that is activated, IDC problems consist of interference issues that the UE cannot solve by itself, during either active data exchange or upcoming data activity which is expected in up to a few hundred milliseconds.
 For frequencies on which a SCell or SCells is configured that is deactivated, reporting IDC problems indicates an anticipation that the activation of the SCell or SCells would result in interference issues that the UE would not be able to solve by itself.
 For a non-serving frequency, reporting IDC problems indicates an anticipation that if the non-serving frequency or frequencies became a serving frequency or serving frequencies then this would result in interference issues that the UE would not be able to solve by itself.

5.6.9.3 Actions related to transmission of *InDeviceCoexIndication* message

The UE shall set the contents of the *InDeviceCoexIndication* message as follows:

- 1> if there is at least one E-UTRA carrier frequency, for which a measurement object is configured, that is affected by IDC problems:
 - 2> include the field *affectedCarrierFreqList* with an entry for each affected E-UTRA carrier frequency for which a measurement object is configured;
 - 2> for each E-UTRA carrier frequency included in the field *affectedCarrierFreqList*, include *interferenceDirection* and set it accordingly;
 - 2> include Time Domain Multiplexing (TDM) based assistance information, unless *idc-HardwareSharingIndication* is configured and the UE has no Time Doman Multiplexing based assistance information that could be used to resolve the IDC problems;
 - 3> if the UE has DRX related assistance information that could be used to resolve the IDC problems:
 - 4> include *drx-CycleLength*, *drx-Offset* and *drx-ActiveTime*;
 - 3> else (the UE has desired subframe reservation patterns related assistance information that could be used to resolve the IDC problems):
 - 4> include *idc-SubframePatternList*;
 - 3> use the MCG as timing reference if TDM based assistance information regarding the SCG is included;
- 1> if the UE is configured to provide UL CA information and there is a supported UL CA combination comprising of carrier frequencies for which a measurement object is configured, that is affected by IDC problems:

- 2> include *victimSystemType* in *ul-CA-AssistanceInfo*;
- 2> if the UE sets *victimSystemType* to *wlan* or *Bluetooth*:
 - 3> include *affectedCarrierFreqCombList* in *ul-CA-AssistanceInfo* with an entry for each supported UL CA combination comprising of carrier frequencies for which a measurement object is configured, that is affected by IDC problems;
- 2> else:
 - 3> optionally include *affectedCarrierFreqCombList* in *ul-CA-AssistanceInfo* with an entry for each supported UL CA combination comprising of carrier frequencies for which a measurement object is configured, that is affected by IDC problems;
- 1> if *idc-HardwareSharingIndication* is configured, and there is at least one E-UTRA carrier frequency, for which a measurement object is configured, the UE is experiencing hardware sharing problems that it cannot solve by itself:
 - 2> include the *hardwareSharingProblem* and set it accordingly;
- 1> if the UE is configured to provide IDC indications for MR-DC and there is a supported MR-DC band combination comprising of at least one E-UTRA carrier frequency for which a measurement object is configured and at least one NR carrier frequency included in *candidateServingFreqListNR*, that is affected by IDC problems; and
- 1> if the IDC problem does not only concern the E-UTRA band combination as the UE already included in *affectedCarrierFreqCombList*:
 - 2> for each entry of *affectedCarrierFreqCombInfoListMRDC* in *mrdc-AssistanceInfo*;
 - 3> include *victimSystemType*;
 - 3> include *interferenceDirectionMRDC*;
 - 3> if the UE sets *victimSystemType* to *wlan* or *Bluetooth*:
 - 4> include a set of at least one NR carrier frequency included in *candidateServingFreqListNR* and optionally one or more E-UTRA carrier frequency for which a measurement object is configured, that is affected by IDC problems;
 - 3> else:
 - 4> optionally include a set of at least one NR carrier frequency included in *candidateServingFreqListNR* and optionally one or more E-UTRA carrier frequency for which a measurement object is configured, that is affected by IDC problems;

NOTE 1: When sending an *InDeviceCoexIndication* message to inform E-UTRAN the IDC problems, the UE includes all assistance information (rather than providing e.g. the changed part(s) of the assistance information).

NOTE 2: Upon not anymore experiencing a particular IDC problem that the UE previously reported, the UE provides an IDC indication with the modified contents of the *InDeviceCoexIndication* message (e.g. by an empty message).

The UE shall submit the *InDeviceCoexIndication* message to lower layers for transmission.

5.6.10 UE Assistance Information

5.6.10.1 General

Figure 5.6.10.1-1: UE Assistance Information

The purpose of this procedure is to inform E-UTRAN of the UE's power saving preference and SPS assistance information, maximum PDSCH/PUSCH bandwidth configuration preference, overheating assistance information, or the UE's delay budget report carrying desired increment/decrement in the Uu air interface delay or connected mode DRX cycle length and for BL UEs or UEs in CE of the RLM event ("early-out-of-sync" or "early-in-sync") and RLM information or the UE preference for the NR SCG deactivation or that the UE with a deactivated NR SCG has uplink data to send on a DRB for which there is no MCG RLC bearer. Upon configuring the UE to provide power preference indications E-UTRAN may consider that the UE does not prefer a configuration primarily optimised for power saving until the UE explicitly indicates otherwise.

5.6.10.2 Initiation

A UE capable of providing power preference indications in RRC_CONNECTED may initiate the procedure in several cases including upon being configured to provide power preference indications and upon change of power preference.

A UE capable of providing SPS assistance information in RRC_CONNECTED may initiate the procedure in several cases including upon being configured to provide SPS assistance information and upon change of SPS assistance information.

A UE capable of providing delay budget report in RRC_CONNECTED may initiate the procedure in several cases, including upon being configured to provide delay budget report and upon change of delay budget preference.

A UE capable of CE mode and providing maximum PDSCH/PUSCH bandwidth preference in RRC_CONNECTED may initiate the procedure upon being configured to provide maximum PDSCH/PUSCH bandwidth preference and/or upon change of maximum PDSCH/PUSCH bandwidth preference.

A UE capable of providing overheating assistance information in RRC_CONNECTED may initiate the procedure if it was configured to do so, upon detecting internal overheating, or upon detecting that it is no longer experiencing an overheating condition.

A UE supporting NR SCG deactivation may initiate the procedure in several cases including upon being configured to provide its preference for NR SCG deactivation and upon change of its preference for NR SCG deactivation.

A UE in EN-DC that has uplink data to transmit for a DRB for which there is no MCG RLC bearer while the SCG is deactivated shall initiate the procedure.

Upon initiating the procedure, the UE shall:

- 1> if configured to provide power preference indications:
- 2> if the UE did not transmit a *UEAssistanceInformation* message with *powerPrefIndication* since it was configured to provide power preference indications; or
- 2> if the current power preference is different from the one indicated in the last transmission of the *UEAssistanceInformation* message and timer T340 is not running;

- 3> start or restart timer T340 with the timer value set to the *powerPrefIndicationTimer*, if the UE does not prefer a configuration primarily optimised for power saving;
- 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if configured to provide maximum PDSCH/PUSCH bandwidth preference:
 - 2> if the UE did not transmit a *UEAssistanceInformation* message with *bw-Preference* since it was configured to provide maximum PDSCH/PUSCH bandwidth preference; or
 - 2> if the current maximum PDSCH/PUSCH bandwidth preference is different from the one indicated in the last transmission of the *UEAssistanceInformation* message and timer T341 is not running;
 - 3> start timer T341 with the timer value set to the *bw-PreferenceIndicationTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if configured to provide SPS assistance information:
 - 2> if the UE did not transmit a *UEAssistanceInformation* message with *sps-AssistanceInformation* since it was configured to provide SPS assistance information; or
 - 2> if the current SPS assistance information is different from the one indicated in the last transmission of the *UEAssistanceInformation* message;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if configured to report RLM events:
 - 2> if "early-out-of-sync" event has been detected (T314 has expired) and T343 is not running:
 - 3> start timer T343 with the timer value set to the *rlmReportTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
 - 2> if "early-in-sync" event has been detected (T315 has expired) and T344 is not running:
 - 3> start timer T344 with the timer value set to the *rlmReportTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if configured to provide delay budget report:
 - 2> if the UE did not transmit a *UEAssistanceInformation* message with *delayBudgetReport* since it was configured to provide delay budget report; or
 - 2> if the current delay budget is different from the one indicated in the last transmission of the *UEAssistanceInformation* message and timer T342 is not running;
 - 3> start or restart timer T342 with the timer value set to the *delayBudgetReportingProhibitTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if configured to provide overheating assistance information:
 - 2> if the overheating condition has been detected and T345 is not running; or
 - 2> if the current overheating assistance information is different from the one indicated in the last transmission of the *UEAssistanceInformation* message and timer T345 is not running;
 - 3> start timer T345 with the timer value set to the *overheatingIndicationProhibitTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;

NOTE: In case overheating assistance for NR SCG is released while the regular overheating assistance remains configured, a UE that included SCG overheating parameters in the last reported overheating assistance considers overheating assistance information to be different regardless whether or not its preferences for the regular overheating assistance changed.

- 1> if configured to provide its preference for NR SCG deactivation;
- 2> if the UE did not transmit a *UEAssistanceInformation* message with *scg-DeactivationPreference* since it was configured to provide its preference for NR SCG deactivation and the UE prefers the NR SCG to be deactivated; or
- 2> if the UE preference for NR SCG deactivation is different from the one indicated in the last transmission of the *UEAssistanceInformation* message and timer T346 is not running:
 - 3> start or restart timer T346 with the timer value set to the *scg-DeactivationPreferenceProhibitTimer*;
 - 3> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3;
- 1> if the UE is configured with a deactivated NR SCG and there are uplink data to send on a DRB for which *rlc-Config* is not configured in *drb-ToAddModList*; and
- 1> if the UE previously did not have any uplink data to send for any SCG RLC entity:
 - 2> initiate transmission of the *UEAssistanceInformation* message in accordance with 5.6.10.3.

5.6.10.3 Actions related to transmission of *UEAssistanceInformation* message

The UE shall set the contents of the *UEAssistanceInformation* message for power preference indications:

- 1> if configured to provide power preference indication and if the UE prefers a configuration primarily optimised for power saving:
 - 2> set *powerPrefIndication* to *lowPowerConsumption*;
- 1> else if configured to provide power preference indication:
 - 2> set *powerPrefIndication* to *normal*;

The UE shall set the contents of the *UEAssistanceInformation* message for SPS assistance information:

- 1> if configured to provide SPS assistance information:
 - 2> if there is any traffic for V2X sidelink communication which needs to report SPS assistance information:
 - 3> include *trafficPatternInfoListSL* in the *UEAssistanceInformation* message;
 - 2> if there is any traffic for uplink communication which needs to report SPS assistance information:
 - 3> include *trafficPatternInfoListUL* in the *UEAssistanceInformation* message;

The UE shall set the contents of the *UEAssistanceInformation* message for bandwidth preference indications:

- 1> set *bw-Preference* to its preferred configuration;

The UE shall set the contents of the *UEAssistanceInformation* message for delay budget report:

- 1> if configured to provide delay budget report:
 - 2> if the UE prefers an adjustment in the connected mode DRX cycle length:
 - 3> set *delayBudgetReport* to *type1* according to a desired value;
 - 2> else if the UE prefers coverage enhancement configuration change:
 - 3> set *delayBudgetReport* to *type2* according to a desired value;

The UE shall set the contents of the *UEAssistanceInformation* message for the RLM report:

- 1> if configured to provide RLM report:
 - 2> if T314 has expired:
 - 3> set *rlm-event* to *earlyOutOfSync*;

- 2> if T315 has expired:
 - 3> set *rlm-event* to *earlyInSync*;
 - 3> if configured to report *rlmReportRep-MPDCCH*:
 - 4> set *excessRep-MPDCCH* to the value indicated by lower layers;

The UE shall set the contents of the *UEAssistanceInformation* message for overheating assistance indication:

- 1> if configured to provide overheating assistance indication:
 - 2> if the UE experiences internal overheating:
 - 3> if the UE prefers to temporarily reduce its DL category and UL category:
 - 4> include *reducedUE-Category* in the *OverheatingAssistance* IE;
 - 4> set *reducedUE-CategoryDL* to the number to which the UE prefers to temporarily reduce its DL category;
 - 4> set *reducedUE-CategoryUL* to the number to which the UE prefers to temporarily reduce its UL category;
 - 3> if the UE prefers to temporarily reduce the number of maximum secondary component carriers:
 - 4> include *reducedMaxCCs* in the *OverheatingAssistance* IE;
 - 4> set *reducedCCsDL* to the number of maximum SCells the UE prefers to be temporarily configured in downlink;
 - 4> set *reducedCCsUL* to the number of maximum SCells the UE prefers to be temporarily configured in uplink;
 - 3> if configured to provide overheating assistance indication for NR SCG:
 - 4> include *overheatingAssistanceForSCG* in the *OverheatingAssistance* IE;
 - 4> if configured with serving cells operating on FR2-2 for NR SCG
 - 5> include *overheatingAssistanceForSCG-FR2-2* in the *OverheatingAssistance* IE;
 - 4> set *overheatingAssistanceForSCG* and if applicable, *overheatingAssistanceForSCG-FR2-2*, in accordance with clause 5.7.4.3a as specified in TS 38.331 [82];
 - 2> else (if the UE no longer experiences an overheating condition):
 - 3> if the UE had a preference for the *OverheatingAssistance*:
 - 4> do not include *reducedUE-Category*, *reducedMaxCCs* in *OverheatingAssistance* IE;
 - 3> if the UE had a preference for the *overheatingAssistanceForSCG*:
 - 4> do not include *overheatingAssistance-v1610* in the *UEAssistanceInformation-v1610* IE; or
 - 4> do not include *UEAssistanceInformation-v1610* IE in the *UEAssistanceInformation-v1530* IE; or
 - 4> do not include *UEAssistanceInformation-v1530* IEs in *UEAssistanceInformation-v1450* IEs;
 - 4> if configured with serving cells operating on FR2-2 for NR SCG
 - 5> do not include *OverheatingAssistance-v1710* in the *UEAssistanceInformation-v1710* IE;

NOTE 0: It is up to UE implementation to whether include an empty *OverheatingAssistance* IE or not, for the case where UE only had a preference for the *overheatingAssistanceForSCG*.

The UE shall set the contents of the *UEAssistanceInformation* message for NR SCG deactivation:

- 1> if configured to provide its preference for NR SCG deactivation;
- 2> if the UE prefers NR SCG to be deactivated
 - 3> include the *scg-DeactivationPreference* and set it to *scgDeactivationPreferred*:
- 2> else:
 - 3> include the *scg-DeactivationPreference* and set it to *noPreference*:

The UE shall:

- 1> if the UE is configured with a deactivated NR SCG and there are uplink data to send on a DRB for which *rlc-Config* is not configured in *drb-ToAddModList*: and
- 1> if the UE previously did not have any uplink data to send for any SCG RLC entity:
 - 2> include *uplinkData* in the *UEAssistanceInformation* message;
- 1> if the procedure was triggered to provide SPS assistance information and the related configuration was provided by an *RRCConnectionReconfiguration* message that was received embedded within an NR *RRCReconfiguration* message:
 - 2> submit the *UEAssistanceInformation* message via SRB1 embedded in NR RRC message *ULInformationTransferIRAT* as specified in TS 38.331 [82];
- 1> else:
 - 2> submit the *UEAssistanceInformation* message to lower layers for transmission.

NOTE 1: It is up to UE implementation when and how to trigger SPS assistance information.

NOTE 2: It is up to UE implementation to set the content of *trafficPatternInfoListSL* and *trafficPatternInfoListUL*.

NOTE 3: Traffic patterns for different Destination Layer 2 IDs are provided in different entries in *trafficPatternInfoListSL*.

NOTE 4: Although not recommended, UE may start or restart the following timers whenever it sends the *UEAssistanceInformation* message (i.e. even if the message was not triggered for the concerned feature): T340, T341, T342, T343, T344 and T345.

5.6.11 Mobility history information

5.6.11.1 General

This procedure specifies how the mobility history information is stored by the UE, covering RRC_CONNECTED and RRC_IDLE.

5.6.11.2 Initiation

If the UE supports storage of mobility history information, the UE shall:

- 1> Upon change of cell, consisting of PCell in RRC_CONNECTED or serving cell in RRC_IDLE, to another E-UTRA or inter-RAT cell or when entering out of service:
 - 2> include an entry in variable *VarMobilityHistoryReport* possibly after removing the oldest entry, if necessary, according to following:
 - 3> if the global cell identity of the previous PCell/ serving cell is available:
 - 4> include the global cell identity of that cell in the field *visitedCellId* of the entry;
 - 3> else:

- 4> include the physical cell identity and carrier frequency of that cell in the field *visitedCellId* of the entry;
- 3> set the field *timeSpent* of the entry as the time spent in the previous PCell/ serving cell;
- 1> upon entering E-UTRA (in RRC_CONNECTED or RRC_IDLE) while previously out of service and/ or using another RAT:
 - 2> include an entry in variable *VarMobilityHistoryReport* possibly after removing the oldest entry, if necessary, according to following:
 - 3> set the field *timeSpent* of the entry as the time spent outside E-UTRA;

5.6.12 RAN-assisted WLAN interworking

5.6.12.1 General

The purpose of this procedure is to facilitate access network selection and traffic steering between E-UTRAN and WLAN.

If required by upper layers (see TS 24.312 [66], the UE shall provide an up-to-date set of the applicable parameters provided by *wlan-OffloadConfigCommon* or *wlan-OffloadConfigDedicated* to upper layers, and inform upper layers when no parameters are configured. The parameter set from either *wlan-OffloadConfigCommon* or *wlan-OffloadConfigDedicated* is selected as specified in clauses 5.2.2.24, 5.3.12, 5.6.12.2 and 5.6.12.4.

5.6.12.2 Dedicated WLAN offload configuration

The UE shall:

- 1> if the received *wlan-OffloadInfo* is set to *release*:
- 2> release *wlan-OffloadConfigDedicated* and *t350*;
- 2> if the *wlan-OffloadConfigCommon* corresponding to the RPLMN is broadcast by the cell:
 - 3> apply the *wlan-OffloadConfigCommon* corresponding to the RPLMN included in *SystemInformationBlockType17*;
- 1> else:
 - 2> apply the received *wlan-OffloadConfigDedicated*:

5.6.12.3 WLAN offload RAN evaluation

The UE shall:

- 1> if the UE is configured with either *wlan-OffloadConfigCommon* or *wlan-OffloadConfigDedicated*; and
- 1> if the UE is in RRC_IDLE or none of *rclwi-Configuration*, *lwa-Configuration* and *lwip-Configuration* is configured:
 - 2> provide measurement results required for the evaluation of the network selection and traffic steering rules as defined in TS 24.312 [66] to upper layers;
 - 2> evaluate the network selection and traffic steering rules as defined in TS 36.304 [4] using WLAN identifiers as indicated in other clauses (either provided in *steerToWLAN* included in *rclwi-Configuration* or in *wlan-Id-List* included in *SystemInformationBlockType17*);

5.6.12.4 T350 expiry or stop

The UE shall:

- 1> if T350 expires or is stopped:

- 2> release the *wlan-OffloadConfigDedicated* and *t350*;
- 2> release *rclwi-Configuration* if configured;
- 2> if the *wlan-OffloadConfigCommon* corresponding to the RPLMN is broadcast by the cell:
 - 3> apply the *wlan-OffloadConfigCommon* and the *wlan-Id-List* corresponding to the RPLMN included in *SystemInformationBlockType17*;

5.6.12.5 Cell selection/ re-selection while T350 is running

The UE shall:

- 1> if, while T350 is running, the UE selects/ reselects a cell which is not the PCell when the *wlan-OffloadDedicated* was configured:
 - 2> stop timer T350;
 - 2> perform the actions as specified in 5.6.12.4;

5.6.13 SCG failure information

5.6.13.1 General

Figure 5.6.13.1-1: SCG failure information

The purpose of this procedure is to inform E-UTRAN about an SCG failure the UE has experienced i.e. SCG radio link failure, SCG change failure.

5.6.13.2 Initiation

A UE initiates the procedure to report SCG failures when neither MCG nor SCG transmission is suspended and when one of the following conditions is met:

- 1> upon detecting radio link failure for the SCG, in accordance with 5.3.11; or
- 1> upon SCG change failure, in accordance with 5.3.5.7a; or
- 1> upon stopping uplink transmission towards the PSCell due to exceeding the maximum uplink transmission timing difference when *powerControlMode* is configured to 1, in accordance with clause 7.17.2 of TS 36.133 [29].

In case of DC, upon initiating the procedure, the UE shall:

- 1> suspend all SCG DRBs and suspend SCG transmission for split DRBs;
- 1> reset SCG-MAC;
- 1> stop T307;
- 1> if the UE is configured with NE-DC:

2> initiate transmission of the *SCGFailureInformationEUTRA* message via the NR MCG as specified in TS 38.331 [82], clause 5.7.3a;

1> else:

2> initiate transmission of the *SCGFailureInformation* message in accordance with 5.6.13.3;

5.6.13.3 Actions related to transmission of *SCGFailureInformation* message

The UE shall set the contents of the *SCGFailureInformation* message as follows:

1> if the UE initiates transmission of the *SCGFailureInformation* message to provide SCG radio link failure information:

2> include *failureType* and set it to the trigger for detecting SCG radio link failure;

1> else if the UE initiates transmission of the *SCGFailureInformation* message to provide SCG change failure information:

2> include *failureType* and set it to scg-ChangeFailure;

1> else if the UE initiates transmission of the *SCGFailureInformation* message due to exceeding maximum uplink transmission timing difference:

2> include *failureType* and set it to *maxUL-TimingDiff*;

1> set the *measResultServFreqList* to include for each E-UTRA SCG cell that is configured, if any, within *measResultSCell* the quantities of the concerned SCell, if available according to performance requirements in TS 36.133 [16];

1> for each E-UTRA SCG serving frequency included in *measResultServFreqList*, include within *measResultBestNeighCell* the *physCellId* and the quantities of the best non-serving cell, based on RSRP, on the concerned serving frequency;

1> set the *measResultNeighCells* to include the best measured cells on non-serving E-UTRA frequencies, ordered such that the best cell is listed first, and based on measurements collected up to the moment the UE detected the failure, and set its fields as follows;

2> if the UE was configured to perform measurements for one or more non-serving EUTRA frequencies and measurement results are available, include the *measResultListEUTRA*;

2> for each neighbour cell included, include the optional fields that are available;

NOTE 1: The measured quantities are filtered by the L3 filter as configured in the mobility measurement configuration. The measurements are based on the time domain measurement resource restriction, if configured. Exclude-listed cells are not required to be reported.

The UE shall submit the *SCGFailureInformation* message to lower layers for transmission.

5.6.13.4 Failure type determination in NE-DC

The UE shall:

1> if SCG failure is due to T313 expiry:

2> consider the *failureType* to be *t313-Expiry*;

1> else if SCG failure is due to indication from SCG MAC that a random access problem was detected:

2> consider the *failureType* to be *randomAccessProblem*;

1> else if SCG failure is due to indication from SCG RLC that the maximum number of retransmissions was reached:

2> consider the *failureType* to be *rlc-MaxNumRetx*;

1> else if SCG failure is due to SCG change failure:

2> consider the *failureType* to be *scg-ChangeFailure*;

5.6.13.5 Setting the contents of *MeasResultSCG-FailureMRDC*

The UE shall:

1> set the contents of the *MeasResultSCG-FailureMRDC* as follows:

2> for each *measObjectEUTRA* for which a *measId* is configured and for which measurement results are available;

3> include an entry in *measResultsFreqListEUTRA*;

3> if a serving cell is associated with the *MeasObjectEUTRA*:

4> set *measResultServingCell* to include the available quantities of the concerned cell and in accordance with the performance requirements in TS 36.133 [16];

3> set the *measResultNeighCellList* to include the best measured cells, ordered such that the best cell is listed first, and based on measurements collected up to the moment the UE detected the failure, and set its fields as follows;

4> ordering the cells with sorting as follows:

5> using RSRP if RSRP measurement results are available, otherwise using RSRQ if RSRQ measurement results are available, otherwise using SINR;

4> for each neighbour cell included:

5> include the optional fields for which measurement results are available;

2> if detailed location information is available, set the content of the *locationInfo* as follows;

3> include the *locationCoordinates*;

3> include the *horizontalVelocity*, if available;

2> if available, set the *logMeasResultListWLAN* to include the WLAN measurement results, in order of decreasing RSSI for WLAN APs;

2> if available, set the *logMeasResultListBT* to include the Bluetooth measurement results, in order of decreasing RSSI for Bluetooth beacons;

NOTE: The measured quantities are filtered by the L3 filter as configured in the mobility measurement configuration. The measurements are based on the time domain measurement resource restriction, if configured. Exclude-listed cells are not required to be reported.

5.6.13a NR SCG failure information

5.6.13a.1 General

Figure 5.6.13a.1-1: NR SCG failure information

The purpose of this procedure is to inform E-UTRAN about an SCG failure the UE has experienced (e.g. SCG radio link failure, failure to successfully complete an SCG reconfiguration with sync), as specified in TS 38.331 [82], clause 5.7.3.2.

5.6.13a.2 Initiation

A UE initiates the procedure to report NR SCG failures when neither E-UTRA MCG nor NR SCG transmission is not suspended and in accordance with TS 38.331 [82], clause 5.7.3.2. Actions the UE shall perform upon initiating the procedure, other than related to the transmission of the *SCGFailureInformationNR* message are specified in TS 38.331 [82], clause 5.7.3.2.

5.6.13a.3 Actions related to transmission of *SCGFailureInformationNR* message

The UE shall set the contents of the *SCGFailureInformationNR* message as follows:

- 1> include *failureType* within *failureReportSCG-NR* and set it to indicate the SCG failure in accordance with TS 38.331 [82], clause 5.7.3.3;

NOTE 1: This may involve including both *failureType-r15* and *failureType-v1610*, see TS 38.331 [82], clause 5.7.3.3.

- 1> include and set *measResultSCG* in accordance with TS 38.331 [82], clause 5.7.3.4:

- 1> for each NR frequency the UE is configured to measure by *measConfig* for which measurement results are available:

- 2> set the *measResultFreqListNR* to include the best measured cells, ordered such that the best cell is listed first using RSRP to order if RSRP measurement results are available for cells on this frequency, otherwise using RSRQ to order if RSRQ measurement results are available for cells on this frequency, otherwise using SINR to order, and based on measurements collected up to the moment the UE detected the failure, and for each cell that is included, include the optional fields that are available;

NOTE 2: Field *measResultSCG* is used to report available results for NR frequencies the UE is configured to measure by NR RRC signalling.

- 1> if detailed location information is available, set the content of the *locationInfo* as follows:

- 2> include the *locationCoordinates*;

- 2> include the *horizontalVelocity*, if available;

- 1> if available, set the *logMeasResultListWLAN* to include the WLAN measurement results, in order of decreasing RSSI for WLAN APs;

- 1> if available, set the *logMeasResultListBT* to include the Bluetooth measurement results, in order of decreasing RSSI for Bluetooth beacons;

The UE shall submit the *SCGFailureInformationNR* message to lower layers for transmission.

5.6.14 LTE-WLAN Aggregation

5.6.14.1 Introduction

E-UTRAN can configure the UE to connect to a WLAN and configure bearers for LWA (referred to as LWA DRBs). The UE uses the WLAN parameters received from E-UTRAN in performing WLAN measurements. The UE also performs WLAN connection management as described in 5.6.15 while LWA is configured.

5.6.14.2 Reception of LWA configuration

Upon reception of LWA configuration, the UE shall:

- 1> if the received *lwa-Configuration* is set to *release*:
- 2> release the LWA configuration as described in 5.6.14.3;
- 1> else:
 - 2> if the received *lwa-Config* includes *lwa-WT-Counter*:
 - 3> determine the S-KWT key based on the K_{eNB} key and received *lwa-WT-Counter* value, as specified in TS 33.401 [32];
 - 3> forward the S-KWT key to upper layers to be used as a PMK or PSK for WLAN authentication;
 - 2> if the received *lwa-Config* includes *lwa-MobilityConfig*:
 - 3> if the received *lwa-MobilityConfig* includes *wlan-ToReleaseList*:
 - 4> for each *WLAN-Identifiers* included in *wlan-ToReleaseList*:
 - 5> remove the *WLAN-Identifiers* if already part of the current *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;
 - 3> if the received *lwa-MobilityConfig* includes *wlan-ToAddList*:
 - 4> for each *WLAN-Identifiers* included in *wlan-ToAddList*:
 - 5> add the *WLAN-Identifiers* to the current *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;
 - 3> if the received *lwa-MobilityConfig* includes *associationTimer*:
 - 4> start or restart timer T351 with the timer value set to the *associationTimer*;
 - 3> if the received *lwa-MobilityConfig* includes *successReportRequested*:
 - 4> set *successReportRequested* in *VarWLAN-MobilityConfig* to the value of *successReportRequested*;
 - 3> if the received *lwa-MobilityConfig* includes *wlan-SuspendConfig*:
 - 4> set the field(s) in *wlan-SuspendConfig* within *VarWLAN-MobilityConfig* to the value(s) of field(s) included in *wlan-SuspendConfig*;
 - 2> start WLAN Status Monitoring as described in 5.6.15.4;

5.6.14.3 Release of LWA configuration

To release the LWA configuration, the UE shall:

- 1> for each LWA DRB that is part of the current UE configuration:

- 2> disable data handling for this DRB at the LWAAP entity;
- 2> perform PDCP data recovery as specified in TS 36.323 [8];
- 1> delete any existing values in *VarWLAN-MobilityConfig* and *VarWLAN-Status*;
- 1> stop timer T351, if running;
- 1> stop WLAN status monitoring and WLAN connection attempts for LWA;
- 1> indicate the release of LWA configuration, if configured, to upper layers;

5.6.15 WLAN connection management

5.6.15.1 Introduction

WLAN connection management procedures in this clause are triggered as specified in other clauses where the UE is using a WLAN connection for LWA, RCLWI or LWIP.

The UE stores the current WLAN mobility set, which is a set of one or more WLAN identifier(s) (e.g. BSSID, SSID, HESSID) in *wlan-MobilitySet* in *VarWLAN-MobilityConfig*. This WLAN mobility set can be configured and updated by the eNB. A WLAN is considered to be inside the WLAN mobility set if its identifiers match all WLAN identifiers of at least one entry in *wlan-MobilitySet* and outside the WLAN mobility set otherwise. When the UE receives a new or updated WLAN mobility set, it initiates connection to a WLAN inside the WLAN mobility set, if not already connected to such a WLAN, and starts WLAN status monitoring as described in 5.6.15.4. The UE can perform WLAN mobility within the WLAN mobility set (connect or reconnect to a WLAN inside the WLAN mobility set) without any signalling to E-UTRAN.

The UE reports the WLAN connection status information to E-UTRAN as described in 5.6.15.2. The information in this report is based on the monitoring of WLAN connection as described in 5.6.15.4.

5.6.15.2 WLAN connection status reporting

5.6.15.2.1 General

Figure 5.6.15.2.1-1: WLAN connection status reporting

The purpose of this procedure is to inform E-UTRAN about the status of WLAN connection for LWA, RCLWI, or LWIP.

5.6.15.2.2 Initiation

The UE in RRC_CONNECTED initiates the WLAN status reporting procedure when:

- 1> it connects successfully to a WLAN inside WLAN mobility set while T351 is running after a WLAN mobility set change; or
- 1> after a *lwa-WT-Counter* update or after a *lwip-Counter* update (if success report is requested by the eNB); or
- 1> its connection or connection attempts to all WLAN(s) inside WLAN mobility set fails in accordance with WLAN Status Monitoring described in 5.6.15.4; or
- 1> T351 expires; or

- 1> its WLAN connection to all WLAN(s) inside WLAN mobility set becomes temporarily unavailable; or
- 1> its WLAN connection to a WLAN inside the WLAN mobility set is successfully established after its previous WLAN Connection Status Report indicating WLAN temporary suspension;

Upon initiating the procedure, the UE shall:

- 1> initiate transmission of the *WLANConnectionStatusReport* message in accordance with 5.6.15.2.3;

5.6.15.2.3 Actions related to transmission of *WLANConnectionStatusReport* message

The UE shall set the contents of the *WLANConnectionStatusReport* message as follows:

- 1> set *wlan-status* to *status* in *VarWLAN-Status*;
- 1> submit the *WLANConnectionStatusReport* message to lower layers for transmission, upon which the procedure ends;

5.6.15.3 T351 Expiry (WLAN connection attempt timeout)

Upon T351 expiry, the UE shall:

- 1> set the *status* in *VarWLAN-Status* to *failureTimeout*;
- 1> perform WLAN connection status reporting procedure in 5.6.15.2;
- 1> stop WLAN status monitoring and WLAN connection attempts;

5.6.15.4 WLAN status monitoring

To perform WLAN status monitoring, the UE shall:

- 1> if UE is not configured with *rclwi-Configuration* and WLAN connection to a WLAN inside the WLAN mobility set is successfully established or maintained after a WLAN mobility set configuration update, after a *lwa-WT-Counter* update or after a *lwip-Counter* update:
 - 2> set the *status* in *VarWLAN-Status* to *successfulAssociation*;
 - 2> stop timer T351, if running;
 - 2> if *successReportRequested* in *VarWLAN-MobilityConfig* is set to *TRUE*:
 - 3> perform WLAN Connection Status Reporting procedure in 5.6.15.2;
- 1> if WLAN connection or connection attempts to all WLAN(s) inside WLAN mobility set fails:
 - 2> if the failure is due to WLAN radio link issues:
 - 3> set the *status* in *VarWLAN-Status* to *failureWlanRadioLink*;
 - 2> else if the failure is due to UE internal problems related to WLAN:
 - 3> set the *status* in *VarWLAN-Status* to *failureWlanUnavailable*;

NOTE 1: The UE internal problems related to WLAN include connection to another WLAN based on user preferences or turning off WLAN connection or connection rejection from WLAN or other WLAN problems.

- 3> remove all WLAN related measurement reporting entries within *VarMeasReportList*;
- 2> stop timer T351, if running;
- 2> perform WLAN Connection Status Reporting procedure in 5.6.15.2;
- 2> if the UE is configured with *rclwi-Configuration*:

- 3> release *rclwi-Configuration* and inform upper layers of a move-traffic-from-WLAN indication (see TS 24.302 [74]);
- 2> stop WLAN Status Monitoring and WLAN connection attempts;
- 1> if *wlan-SuspendResumeAllowed* in *wlan-SuspendConfig* within *VarWLAN-MobilityConfig* is set to *TRUE*:
 - 2> if WLAN connection to all WLAN(s) inside WLAN mobility set becomes temporarily unavailable:
 - 3> set the *status* in *VarWLAN-Status* to *suspended*;
 - 3> if *wlan-SuspendTriggersStatusReport* in *wlan-SuspendConfig* within *VarWLAN-MobilityConfig* is set to *TRUE*:
 - 4> trigger PDCP Status Report as specified in TS 36.323 [8];
 - 3> perform WLAN Connection Status Reporting procedure in 5.6.15.2;
 - 2> if the *status* in *VarWLAN-Status* in the last WLAN Connection Status Report by this UE was *suspended* and WLAN connection to a WLAN inside the WLAN mobility set is successfully established:
 - 3> set the *status* in *VarWLAN-Status* to *resumed*;
 - 3> perform WLAN Connection Status Reporting procedure in 5.6.15.2;

5.6.16 RAN controlled LTE-WLAN interworking

5.6.16.1 General

The purpose of this procedure is to perform RAN-controlled LTE-WLAN interworking (RCLWI) i.e. control access network selection and traffic steering between E-UTRAN and WLAN.

5.6.16.2 WLAN traffic steering command

The UE shall:

- 1> if the received *rclwi-Configuration* is set to *setup*:
 - 2> if the *command* is set to *steerToWLAN*:
 - 3> inform the upper layers of a move-traffic-to-WLAN indication along with the WLAN identifier lists in *steerToWLAN* (see TS 24.302 [74]);
 - 3> store *steerToWLAN* in *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;
 - 3> perform the WLAN status monitoring procedure as specified in 5.6.15.4 using *steerToWLAN* as the WLAN mobility set;
 - 2> else:
 - 3> inform the upper layers of a move-traffic-from-WLAN indication (see TS 24.302 [74]);
 - 3> clear *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;
 - 3> stop performing the WLAN status monitoring procedure as specified in 5.6.15.4;
 - 3> delete any existing values in *VarWLAN-Status*;
- 1> else (the *rclwi-Configuration* is released):
 - 2> clear *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;
 - 2> stop performing the WLAN status monitoring procedure as specified in 5.6.15.4;
 - 2> delete any existing values in *VarWLAN-Status*;

2> inform the upper layers of release of the *rclwi-Configuration*.

5.6.17 LTE-WLAN aggregation with IPsec tunnel

5.6.17.1 General

The WLAN resources that are used over the LWIP tunnel as described in TS 36.300 [9] established as part of LWIP procedures are referred to as 'LWIP resources'. The purpose of this clause is to specify procedures to indicate to higher layers to initiate the establishment/ release of the LWIP tunnel over WLAN and to indicate which DRB(s) shall use the LWIP resources.

5.6.17.2 LWIP reconfiguration

The UE shall:

1> if the received *lwip-Configuration* is set to *release*:

2> release the LWIP configuration, if configured, as described in 5.6.17.3;

1> else:

2> if *lwip-MobilityConfig* is included:

3> if the received *lwip-MobilityConfig* includes *wlan-ToReleaseList*:

4> for each *WLAN-Identifiers* included in *wlan-ToReleaseList*:

5> remove the *WLAN-Identifiers* if already part of the current *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;

3> if the received *lwip-MobilityConfig* includes *wlan-ToAddList*:

4> for each *WLAN-Identifiers* included in *wlan-ToAddList*:

5> add the *WLAN-Identifiers* to the current *wlan-MobilitySet* in *VarWLAN-MobilityConfig*;

3> if the received *lwip-MobilityConfig* includes *associationTimer*:

4> start timer T351 with the timer value set according to the value of *associationTimer*;

3> if the received *lwip-MobilityConfig* includes *successReportRequested*:

4> set *successReportRequested* in *VarWLAN-MobilityConfig* to the value of *successReportRequested*;

2> if *tunnelConfigLWIP* is included:

3> indicate to higher layers to configure the LWIP tunnel according to the received *tunnelConfigLWIP*, as specified in TS 33.401 [32];

3> if *lwip-Counter* is included:

4> determine the LWIP-PSK based on the K_{eNB} key and received *lwip-Counter* value, as specified in TS 33.401 [32];

4> forward the LWIP-PSK to upper layers for LWIP tunnel establishment;

2> start WLAN Status Monitoring as described in 5.6.15.4;

5.6.17.3 LWIP release

The UE shall:

1> delete any existing values in *VarWLAN-MobilityConfig* and *VarWLAN-Status*;

1> stop timer T351, if running;

- 1> release the *lwip-Configuration*;
- 1> indicate to higher layers to stop all DRBs from using the LWIP resources;
- 1> indicate to higher layers to release the LWIP tunnel, as specified in TS 33.401 [32];
- 1> stop WLAN status monitoring and WLAN connection attempts for LWIP;

5.6.18 Void

5.6.19 Application layer measurement reporting

5.6.19.1 General

Figure 5.6.19.1-1: Application layer measurement reporting

The purpose of this procedure is to inform E-UTRAN about application layer measurement report.

5.6.19.2 Initiation

A UE capable of application layer measurement reporting in RRC_CONNECTED may initiate the procedure when configured with application layer measurement, i.e. when *measConfigAppLayer* has been configured by E-UTRAN.

Upon initiating the procedure, the UE shall:

- 1> if configured with application layer measurement, and SRB4 is configured, and the UE has received application layer measurement report information from upper layers:
- 2> set the *measReportAppLayerContainer* in the *MeasReportAppLayer* message to the value of the application layer measurement report information;
- 2> set the *serviceType* in the *MeasReportAppLayer* message to the type of the application layer measurement report information;
- 2> submit the *MeasReportAppLayer* message to lower layers for transmission via SRB4.

5.6.20 Idle/Inactive Measurements

5.6.20.1 General

This procedure specifies the measurements to be performed and stored by a UE in RRC_IDLE or RRC_INACTIVE when it has an idle/inactive measurement configuration.

5.6.20.1a Measurement configuration

The purpose of this procedure is to update the idle/inactive measurement configuration.

The UE initiates this procedure while T331 is running and one of the following conditions is met:

- 1> upon selecting a cell when entering RRC_IDLE or RRC-INACTIVE from RRC_CONNECTED; or
- 1> upon update of system information (*SIB5*, or *SIB24*), e.g. due to intra-RAT cell (re)selection;

While in RRC_IDLE or RRC_INACTIVE and T331 is running, the UE shall:

- 1> if *VarMeasIdleConfig* includes neither a *measIdleCarrierListEUTRA* nor a *measIdleCarrierListNR* received from the *RRCConnectionRelease* message:
 - 2> if the UE is capable of idle/inactive measurements for E-UTRA:
 - 3> if the *SIB5* includes the *measIdleConfigSIB*:
 - 4> store or replace the *measIdleCarrierListEUTRA* of *measIdleConfigSIB* of *SIB5* within *VarMeasIdleConfig*;
 - 3> else:
 - 4> remove the *measIdleCarrierListEUTRA* in *VarMeasIdleConfig*, if stored;
 - 2> if the UE is capable of idle/inactive measurements for NR:
 - 3> if the *SIB5* includes the *measIdleConfigSIB-NR*:
 - 4> store or replace the *measIdleCarrierListNR* of *measIdleConfigSIB-NR* of *SIB5* within *VarMeasIdleConfig*;
 - 3> else:
 - 4> remove the *measIdleCarrierListNR* in *VarMeasIdleConfig*, if stored;
 - 1> for each entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig* that does not contain an *ssb-MeasConfig* received from the *RRCConnectionRelease* message:
 - 2> if there is an entry in *measIdleCarrierListNR* in *measIdleConfigSIB-NR* of *SIB5* that has the same carrier frequency and subcarrier spacing as the entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig* and that contains *ssb-MeasConfig*:
 - 3> delete the *ssb-MeasConfig* of the corresponding entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig*;
 - 3> store the SSB measurement configuration from *SIB5* into *maxRS-IndexCellQual*, *threshRS-Index*, *measTimingConfig*, *ssb-ToMeasure*, *deriveSSB-IndexFromCell*, and *ss-RSSI-Measurement* within *ssb-MeasConfig* of the corresponding entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig*;
 - 2> else if there is an entry in *carrierFreqListNR* of *SIB24* with the same carrier frequency and subcarrier spacing as the entry in *measIdleCarrierListNR* within *VarMeasIdleConfig*:
 - 3> delete the *ssb-MeasConfig* of the corresponding entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig*;
 - 3> store the SSB measurement configuration from *SIB24* into *maxRS-IndexCellQual*, *threshRS-Index*, *measTimingConfig*, *ssb-ToMeasure*, *deriveSSB-IndexFromCell*, and *ss-RSSI-Measurement* within *ssb-MeasConfig* of the corresponding entry in *measIdleCarrierListNR* within *VarMeasIdleConfig*;
 - 2> else:
 - 3> remove the *ssb-MeasConfig* of the corresponding entry in the *measIdleCarrierListNR* within *VarMeasIdleConfig*, if stored;

5.6.20.2 Performing measurements

When performing measurements on NR carriers according to this clause, the UE shall derive the cell quality as specified in 5.5.3.3 and consider the beam quality to be the value of the measurement results of the concerned beam, where each result is averaged as described in TS 38.215 [89].

While in RRC_IDLE or RRC_INACTIVE, and T331 is running, the UE shall:

- 1> perform the measurements in accordance with the following:
- 2> if the SIB2 contains *idleModeMeasurements*, for each entry in *measIdleCarrierListEUTRA* within *VarMeasIdleConfig*:
- 3> if UE supports carrier aggregation between serving carrier and the carrier frequency and bandwidth indicated by *carrierFreq* and *allowedMeasBandwidth* within the corresponding entry;
- 4> perform measurements in the carrier frequency and bandwidth indicated by *carrierFreq* and *allowedMeasBandwidth* within the corresponding entry;

NOTE 1: How the UE performs the idle/inactive measurements is up to UE implementation as long as the requirements in TS 36.133 [16] are met for measurement reporting.

- 4> if the *reportQuantities* is set to *rsrq*:
 - 5> consider RSRQ as the sorting quantity;
- 4> else:
 - 5> consider RSRP as the sorting quantity;
- 4> if the *measCellList* is included:
 - 5> consider cells identified by each entry within the *measCellList* to be applicable for idle /inactive measurement reporting;
- 4> else:
 - 5> consider up to *maxCellMeasIdle* strongest identified cells, according to the sorting quantity, to be applicable for idle/inactive measurement reporting;
- 4> for all cells applicable for idle/inactive measurement reporting and for the serving cell, derive measurement results for the measurement quantities indicated by *reportQuantities*;
- 4> store the derived measurement result as indicated by *reportQuantities* for the serving cell within *measResultServingCell* in the *measReportIdle* in *VarMeasIdleReport*;
- 4> store the derived measurement results as indicated by *reportQuantities* for cells applicable for idle/inactive measurement reporting within *measResultNeighCells* in the *measReportIdle* in *VarMeasIdleReport* in decreasing order of the sorting quantity, i.e. the best cell is included first, as follows:
 - 5> if *qualityThreshold* is configured:
 - 6> include the measurement results from the cells applicable for idle/inactive measurement reporting whose RSRP/RSRQ measurement results are above the value(s) provided in *qualityThreshold*;
 - 5> else:
 - 6> include the measurement results from all cells applicable for idle/inactive measurement reporting;
- 2> if the SIB2 contains *idleModeMeasurementsNR* and *VarMeasIdleConfig* includes the *measIdleCarrierListNR*:
 - 3> for each entry in *measIdleCarrierListNR* within *VarMeasIdleConfig* that contains *ssb-MeasConfig*:
 - 4> if UE supports (NG)EN-DC between serving carrier and the carrier frequency and subcarrier spacing indicated by *carrierFreqNR* and *subCarrierSpacingSSB* within the corresponding entry:
 - 5> perform measurements in the carrier frequency and subcarrier spacing indicated by *carrierFreqNR* and *subCarrierSpacingSSB* within the corresponding entry;

- 5> if the *reportQuantitiesNR* is set to *rsrq*:
- 6> consider RSRQ as the cell sorting quantity;
- 5> else:
- 6> consider RSRP as the cell sorting quantity;
- 5> if the *measCellListNR* is included:
- 6> consider cells identified by each entry within the *measCellListNR* to be applicable for idle/inactive measurement reporting;
- 5> else:
- 6> consider up to *maxCellMeasIdle* strongest identified cells, according to the sorting quantity, to be applicable for idle/inactive measurement reporting;
- 5> for all cells applicable for idle/inactive measurement reporting, derive the cell measurement results for the measurement quantities indicated by *reportQuantitiesNR*;
- 5> store the derived measurement results as indicated by *reportQuantitiesNR* within the *measReportIdleNR* in *VarMeasIdleReport* in decreasing order of the cell sorting quantity, i.e. the best cell is included first, as follows:
- 6> if *qualityThresholdNR* is configured:
- 7> include the measurement results from the cells applicable for idle/inactive measurement reporting whose RSRP/RSRQ measurement results are above the value(s) provided in *qualityThresholdNR*;
- 6> else:
- 7> include the measurement results from all cells applicable for idle/inactive measurement reporting;
- 5> if *beamMeasConfigIdle* is included in the associated entry in *measIdleCarrierListNR* and if UE supports *nr-IdleInactiveBeamMeasFR1* or *nr-IdleInactiveBeamMeasFR2* for the FR of the carrier frequency indicated by *carrierFreqNR* within the associated entry, for each cell in the measurement results:
- 6> derive beam measurements based on SS/PBCH block for each measurement quantity indicated in *reportQuantityRS-IndexNR*, as described in TS 38.215 [89];
- 6> if the *reportQuantityRS-IndexNR* is set to *rsrq*:
- 7> consider RSRQ as the beam sorting quantity;
- 6> else:
- 7> consider RSRP as the beam sorting quantity;
- 6> set *resultRS-IndexList* to include up to *maxReportRS-Index* SS/PBCH block indexes in order of decreasing sorting quantity as follows:
- 7> include the index associated to the best beam for the sorting quantity and if *threshRS-Index* is included, the remaining beams whose sorting quantity is above *threshRS-Index*;
- 6> if the *reportRS-IndexResultsNR* is set to true:
- 7> include the beam measurement results as indicated by *reportQuantityRS-IndexNR*;
- 3> if, as the result of the procedure in this clause, the UE performs measurements in one or more carrier frequency indicated by *measIdleCarrierListNR*:
- 4> store the cell measurement results for RSRP and RSRQ for the serving cell within *measResultServingCell* in the *measReportIdle* in *VarMeasIdleReport*;

NOTE 2: The UE is not required to perform idle/inactive measurements on a given carrier if the SSB configuration of that carrier provided via dedicated signaling is different from the SSB configuration broadcasted in the serving cell, if any.

NOTE 3: How the UE prioritizes which frequencies to measure or report (in case it is configured with more frequencies than it can measure or report) is left to UE implementation.

5.6.20.3 T331 expiry or stop

The UE shall:

- 1> if T331 expires or is stopped:
- 2> release the *VarMeasIdleConfig*;

NOTE: It is up to UE implementation whether to continue idle/inactive measurements according to SIB5 and SIB24 configuration or according to NR SIB11 and NR SIB4 configuration as specified in TS 38.331 [82] upon inter-RAT cell reselection to NR, after T331 has expired or stopped.

5.6.20.4 Cell re-selection or selection while T331 is running

The UE shall:

- 1> if intra-RAT cell selection or reselection occurs while T331 is running:
 - 2> if *validityAreaList* is configured in *VarMeasIdleConfig*:
 - 3> if the serving cell frequency does not match with the *carrierFreq* of any entry in the *validityAreaList*; or
 - 3> if the serving frequency matches with the *carrierFreq* of an entry in the *validityAreaList*, the *validityCellList* is included in that entry, and the physical cell identity of the serving cell does not match with any entry in *validityCellList*:
 - 4> stop timer T331;
 - 4> perform the actions as specified in 5.6.20.3, upon which the procedure ends;
 - 2> else if *validityArea* is configured in *VarMeasIdleConfig* and UE reselects to a serving cell whose physical cell identity does not match any entry in *validityArea* for the corresponding carrier frequency:
 - 3> stop timer T331;
 - 3> perform the actions as specified in 5.6.20.3, upon which the procedure ends;
- 1> if inter-RAT cell selection or reselection occurs while timer T331 is running:
 - 2> stop timer T331;
 - 2> perform the actions as specified in 5.6.20.3;

5.6.21 Failure information

5.6.21.1 General

5.6.21.2 Initiation

A UE initiates the procedure to report failures when one of the following conditions is met:

- 1> upon detecting RLC failure, in accordance with 5.3.11;
- 1> upon detecting a DAPS HO failure, in accordance with 5.3.5.6.

Upon initiating the procedure, the UE shall:

- 1> initiate transmission of the *FailureInformation* message in accordance with 5.6.21.3;

5.6.21.3 Actions related to transmission of *FailureInformation* message

When initiating the procedure according to 5.6.21.2, the UE shall:

- 1> set the contents of the *FailureInformation* message as follows:
 - 2> if the procedure is initiated to report RLC failure:
 - 3> set *logicalChannelIdentity* to the logical channel identity of the RLC entity;
 - 3> set *cellGroupIndication* to the cell group where the RLC entity is located;
 - 3> set *failureType* to the type of failure that has been detected;
 - 2> if the procedure is initiated to report a DAPS HO failure:
 - 3> set *failureType* to *dapsHO-failure*;
- 1> submit the *FailureInformation* message to lower layers for transmission.

5.6.22 UL message segment transfer

5.6.22.1 General

Figure 5.6.22.1-1: UL message segment transfer

The purpose of this procedure is to transfer segments of UL DCCH messages from UE to E-UTRAN in RRC_CONNECTED.

NOTE: The segmentation of UL DCCH message is only applicable to *UECapabilityInformation* in this release.

5.6.22.2 Initiation

A UE capable of UL RRC message segmentation in RRC_CONNECTED will initiate the procedure when the following conditions are met:

- 1> if the RRC message segmentation is enabled based on the field *rrc-SegAllowed* received, and
- 1> if the encoded RRC message is larger than the maximum supported size of a PDCP SDU specified in TS 36.323 [8];

Upon initiating the procedure, the UE shall:

- 1> initiate transmission of the *ULDedicatedMessageSegment* message as specified in 5.6.22.3;

5.6.22.3 Actions related to transmission of *ULDedicatedMessageSegment* message

The UE shall segment the encoded RRC PDU based on the maximum supported size of a PDCP SDU specified in TS 36.323 [8]. UE shall minimize the number of segments and set the contents of the *ULDedicatedMessageSegment* messages as follows:

- 1> For each new UL DCCH message, set the *segmentNumber* to 0 for the first message segment and increment the *segmentNumber* for each subsequent RRC message segment;
- 1> set *rrc-MessageSegmentContainer* to include the segment of the UL DCCH message corresponding to the *segmentNumber*;
- 1> if the segment included in the *rrc-MessageSegmentContainer* is the last segment of the UL DCCH message:
 - 2> set the *rrc-MessageSegmentType* to *lastSegment*;
- 1> else:
 - 2> set the *rrc-MessageSegmentType* to *notLastSegment*;
- 1> submit all the *ULDedicatedMessageSegment* messages generated for the segmented RRC message to lower layers for transmission in ascending order based on the *segmentNumber*, upon which the procedure ends.

5.6.23 PUR Configuration Request

5.6.23.1 General

Figure 5.6.23.1-1: PUR Configuration Request

The purpose of this procedure is to indicate to the E-UTRAN that the UE is interested to be configured with PUR and provide PUR related information to E-UTRAN, or that the UE is no longer interested to be configured with PUR.

The procedure is applicable only for BL UEs, UEs in CE or NB-IoT UEs.

5.6.23.2 Initiation

A UE in RRC_CONNECTED may initiate the procedure when all of the following conditions are fulfilled:

- 1> if the UE is connected to EPC:
 - 2> for CP transmission using PUR, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *cp-PUR-EPC*; or
 - 2> for UP transmission using PUR, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *up-PUR-EPC*;
- 1> else if the UE is connected to 5GC:
 - 2> for CP transmission using PUR, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *cp-PUR-5GC*; or
 - 2> for UP transmission using PUR, *SystemInformationBlockType2* (*SystemInformationBlockType2-NB* in NB-IoT) includes *up-PUR-5GC*;
- 1> the size of the resulting MAC PDU including the total UL data size of the traffic is smaller than or equal to the maximum supported TBS based on the UE category.

NOTE 1: It is up to UE implementation how the UE determines whether the size of UL data is suitable for transmission using PUR.

Upon initiating the procedure, the UE shall:

- 1> initiate transmission of the *PURConfigurationRequest* message in accordance with 5.6.23.3;

5.6.23.3 Actions related to transmission of *PURConfigurationRequest* message

When initiating the procedure according to 5.6.23.2, the UE shall set the contents of the *PURConfigurationRequest* message as follows:

- 1> if the UE is interested to be configured with PUR, include *pur-SetupRequest* and set the contents of *pur-SetupRequest* as follows:
 - 2> set *requestedNumOccasions* to the requested number of PUR occasions requested;

- 2> set *requestedPeriodicityAndOffset* according to the requested periodicity between consecutive PUR occasions and the requested time offset with respect to current time until the first PUR occasion;
- 2> set *requestedTBS* to the requested TBS for the PUR occasion(s);
- 2> if RRC response message is preferred by the UE for acknowledging the reception of a transmission using PUR, include *rrc-ACK*;
- 1> if the UE is no longer interested to be configured with PUR:
 - 2> include *pur-ReleaseRequest*;

The UE shall submit the *PURConfigurationRequest* message to lower layers for transmission.

5.6.24 Neighbour Relation Reporting for SON ANR in NB-IoT

5.6.24.0 General

This procedure specifies the neighbour measurements and CGI reading performed when the UE is in RRC_IDLE when it has an ANR measurement configuration and the storage of the associated information by a UE in RRC_IDLE and RRC_CONNECTED.

NOTE: E-UTRAN may retrieve the stored ANR measurements information by means of the UE information procedure.

5.6.24.1 Initiation

While the UE is in RRC_IDLE, the UE shall:

- 1> store the measurement results for the serving cell in *measResultServCell* in *VarANR-MeasReport-NB*;
- 1> while the serving cell global cell identity is the same as stored in *servCellIdentity* in *VarANR-MeasReport-NB*:
 - 2> perform the measurements once in accordance with the following:
 - 3> for each carrier frequency indicated by an entry in *anr-CarrierList*, if present, within *VarANR-MeasConfig-NB*:
 - 4> add a new entry in *measResultList* in *VarANR-MeasReport-NB*;
 - 4> set the *carrierFreq* to the carrier frequency;
 - 4> perform measurements on the corresponding carrier frequency and determines the strongest cell, if any, on the carrier frequency;

NOTE: How the UE performs ANR measurement in RRC_IDLE is up to UE implementation as long as the measurement requirements (see TS 36.133 [16], clause 4.6) are met. While performing an ANR measurement, the UE performs inter-frequency measurements on the configured frequency regardless of the measurement rules for cell re-selection and the relaxed monitoring measurement rules as specified in TS 36.304 [4].

- 4> if the strongest cell is not identified by an entry within the *excludedCellList*, if present, for the corresponding entry in *anr-CarrierList*:

- 5> set the *physCellId* to the physical cell identity of the cell;
- 5> set the *measResultLastServCell* to the last measurement results of the PCell;
- 5> set the *measResult* to the measurement results of the cell;
- 5> if the NRSRP measurement result is above the value provided in *anr-qualityThreshold*:
 - 6> set the *cgi-Info* with the information obtained from the *systemInformationBlockType1-NB* of the cell;

2> set the *relativeTimeStamp* to the elapsed time since the measurements configuration was received;

1> release the *VarANR-MeasConfig-NB*.

The UE may discard the ANR measurements information, i.e. release the UE variables *VarANR-MeasConfig-NB* and *VarANR-MeasReport-NB*, 96 hours after the configuration was received, upon power off or upon detach and upon entering another RAT.

5.6.25 DL message segment transfer

5.6.25.1 General

Figure 5.6.25.1-1: DL message segment transfer

The purpose of this procedure is to transfer segments of DL DCCH messages from E-UTRAN to the UE.

NOTE: The segmentation of DL DCCH message is only applicable to *RRCConnectionReconfiguration* and *RRCConnectionResume* messages in this release.

5.6.25.2 Initiation

E-UTRAN initiates the DL Dedicated Message Segment transfer procedure whenever the encoded RRC message PDU exceeds the maximum PDCP SDU size. E-UTRAN initiates the DL Dedicated Message Segment transfer procedure by sending the *DL Dedicated Message Segment* message.

5.6.25.3 Reception of *DL Dedicated Message Segment* by the UE

Upon receiving *DL Dedicated Message Segment* message, the UE shall:

1> store the segment;

1> if all segments of the message have been received:

2> assemble the message from the received segments and process the message according to 5.3.5 for the *RRCConnectionReconfiguration* message or 5.3.3.4a for the *RRCConnectionResume* message;

2> discard all segments.

5.6.26 MCG failure information

5.6.26.1 General

Figure 5.6.26.1-1: MCG failure information

The purpose of this procedure is to inform the network about an MCG failure the UE has experienced i.e. MCG radio link failure. A UE in RRC_CONNECTED, for which AS security has been activated with SRB2 and at least one DRB setup, may initiate the fast MCG link recovery procedure in order to continue the RRC connection without re-establishment.

5.6.26.2 Initiation

A UE configured with split SRB1 or SRB3 initiates the procedure to report MCG failures when neither MCG nor SCG transmission is suspended, the SCG is not deactivated, $t316$ is configured, and when the following condition is met:

- 1> upon detecting radio link failure of the MCG, in accordance with 5.3.11, while T316 is not running.

Upon initiating the procedure, the UE shall:

- 1> stop timer T310, if running;
- 1> stop timer T312, if running;
- 1> suspend MCG transmission for all SRBs and DRBs, except SRB0;
- 1> reset MCG MAC;
- 1> stop conditional reconfiguration evaluation for CHO, if configured;
- 1> stop conditional reconfiguration evaluation for CPC, if configured;
- 1> initiate transmission of the *MCGFailureInformation* message in accordance with 5.6.26.4.

NOTE: The handling of any outstanding UL RRC messages during the initiation of the fast MCG link recovery is left to UE implementation.

5.6.26.3 Failure type determination

The UE shall set the MCG failure type as follows:

- 1> if the UE initiates transmission of the *MCGFailureInformation* message due to T310 expiry:
 - 2> set the *failureType* as *t310-Expiry*;
- 1> else if the UE initiates transmission of the *MCGFailureInformation* message due to T312 expiry:
 - 2> set the *failureType* as *t312-Expiry*;
- 1> else if the UE initiates transmission of the *MCGFailureInformation* message to provide random access problem indication from MCG MAC:
 - 2> set the *failureType* as *randomAccessProblem*;

- 1> else if the UE initiates transmission of the *MCGFailureInformation* message to provide indication from MCG RLC that the maximum number of retransmissions has been reached:
- 2> set the *failureType* as *rlc-MaxNumRetx*.

5.6.26.4 Actions related to transmission of *MCGFailureInformation* message

The UE shall set the contents of the *MCGFailureInformation* message as follows:

- 1> include and set *failureType* in accordance with 5.6.26.3;
- 1> for each *measObjectEUTRA* for which a *measId* is configured and for which measurement results are available:
 - 2> include an entry in *measResultsFreqListEUTRA*;
 - 2> if a serving cell is associated with the *MeasObjectEUTRA*:
 - 3> set *measResultServingCell* to include the available quantities of the concerned cell and in accordance with the performance requirements in TS 36.133 [16];
 - 2> set the *measResultNeighCellList* to include the best measured cells, ordered such that the best cell is listed first, and based on measurements collected up to the moment the UE detected the failure, and set its fields as follows:
 - 3> ordering the cells with sorting as follows:
 - 4> using RSRP if RSRP measurement results are available, otherwise using RSRQ if RSRQ measurement results are available, otherwise using SINR;
 - 3> for each neighbour cell included:
 - 4> include the optional fields for which measurement results are available;

NOTE 1: The measured quantities are filtered by the L3 filter as configured in the mobility measurement configuration. The measurements are based on the time domain measurement resource restriction, if configured. Exclude-listed cells are not required to be reported.

- 1> for each NR frequency the UE is configured to measure by *measConfig* for which measurement results are available:
 - 2> set the *measResultFreqListNR* to include the best measured cells, ordered such that the best cell is listed first using RSRP to order the cells if RSRP measurement results are available for cells on this frequency, otherwise using RSRQ to order the cells if RSRQ measurement results are available for cells on this frequency, otherwise using SINR to order the cells, based on measurements collected up to the moment the UE detected the failure, and for each cell that is included, include the optional fields that are available;
- 1> for each UTRA frequency the UE is configured to measure by *measConfig* for which measurement results are available:
 - 2> set the *measResultFreqListUTRA* to include the best measured cells, ordered such that the best cell is listed first using RSCP to order the cells if RSCP measurement results are available for cells on this frequency, otherwise using EcN0 to order the cells, based on measurements collected up to the moment the UE detected the failure, and for each cell that is included, include the optional fields that are available;
- 1> for each GERAN frequency the UE is configured to measure by *measConfig* for which measurement results are available:
 - 2> set the *measResultFreqListGERAN* to include the best measured cells based on measurements collected up to the moment the UE detected the failure, and for each cell that is included, include the optional fields that are available;
- 1> if the UE is in (NG)EN-DC:
 - 2> include and set *measResultSCG* in accordance with TS 38.331 [82], clause 5.7.3.4;

NOTE 2: Field *measResultSCG* is used to report available results for NR frequencies the UE is configured to measure by NR RRC signalling.

1> if SRB1 is configured as split SRB and *pdcP-Duplication* is not configured in accordance with TS 38.331 [82, 6.3.2]:

2> if the *primaryPath* for the PDCP entity of SRB1 refers to the MCG:

3> set the *primaryPath* to refer to the SCG.

The UE shall:

1> start timer T316;

1> if SRB1 is configured as split SRB:

2> submit the *MCGFailureInformation* message to lower layers for transmission via SRB1, upon which the procedure ends;

1> else (i.e. SRB3 is configured):

2> submit the *MCGFailureInformation* message to lower layers for transmission, embedded in NR RRC message *ULInformationTransferMRDC* via SRB3 as specified in TS 38.331 [82], clause 5.7.2a.3.

5.6.26.5 T316 expiry

The UE shall:

1> if T316 expires:

2> initiate the connection re-establishment procedure as specified in 5.3.7.

5.6.27 Void

5.6.28 UL transfer of IRAT information

5.6.28.1 General

Figure 5.6.28.1-1: UL transfer of IRAT information

The purpose of this procedure is to transfer from the UE to E-UTRAN dedicated information terminated by E-UTRAN but specified by another RAT e.g. the NR RRC *MeasurementReport* message, the NR RRC *SidelinkUEInformationNR* message or the NR RRC *UEAssistanceInformation* message. The specific information transferred in this message is set in accordance with:

- the procedure specified in 5.7.4 of TS 38.331 [82] for NR *UEAssistanceInformation* message;
- the procedure specified in 5.8.3 of TS 38.331 [82] for NR *SidelinkUEInformationNR* message;
- the procedure specified in 5.5.5 of TS 38.331 [82] for NR *MeasurementReport* Message.

5.6.28.2 Initiation

A UE in RRC_CONNECTED initiates the UL information transfer procedure whenever there is a need to transfer dedicated IRAT information as specified in TS 38.331 [82].

5.6.28.3 Actions related to transmission of *ULInformationTransferIRAT* message

The UE shall set the contents of the *ULInformationTransferIRAT* message as follows:

- 1> if there is a need to transfer dedicated NR information:
 - 2> set the *ul-DCCH-MessageNR* to include the IRAT dedicated information to be transferred;
- 1> submit the *ULInformationTransferIRAT* message to lower layers for transmission, upon which the procedure ends.

5.7 Generic error handling

5.7.1 General

The generic error handling defined in the subsequent clauses applies unless explicitly specified otherwise e.g. within the procedure specific error handling.

The UE shall consider a value as not comprehended when it is set:

- to an extended value that is not defined in the version of the transfer syntax supported by the UE.
- to a spare or reserved value unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved value.

The UE shall consider a field as not comprehended when it is defined:

- as spare or reserved unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/ reserved field.

5.7.2 ASN.1 violation or encoding error

The UE shall:

- 1> when receiving an RRC message on the BCCH, BR-BCCH, PCCH, CCCH, MCCH, SC-MCCH or SBCCH for which the abstract syntax is invalid, as specified in ITU-T X.680 (07/2002) [13]:
 - 2> ignore the message;

NOTE: This clause applies in case one or more fields is set to a value, other than a spare, reserved or extended value, not defined in this version of the transfer syntax. E.g. in the case the UE receives value 12 for a field defined as INTEGER (1..11). In cases like this, it may not be possible to reliably detect which field is in the error hence the error handling is at the message level.

5.7.3 Field set to a not comprehended value

The UE shall, when receiving an RRC message on any logical channel:

- 1> if the message includes a field that has a value that the UE does not comprehend:
 - 2> if a default value is defined for this field:
 - 3> treat the message while using the default value defined for this field;
 - 2> else if the concerned field is optional:

- 3> treat the message as if the field were absent and in accordance with the need code for absence of the concerned field;
- 2> else:

3> treat the message as if the field were absent and in accordance with clause 5.7.4;

5.7.4 Mandatory field missing

The UE shall:

- 1> if the message includes a field that is mandatory to include in the message (e.g. because conditions for mandatory presence are fulfilled) and that field is absent or treated as absent:
- 2> if the RRC message was received on DCCH or CCCH:
 - 3> ignore the message;
 - 2> else:
 - 3> if the field concerns a (sub-field of) an entry of a list (i.e. a SEQUENCE OF):
 - 4> treat the list as if the entry including the missing or not comprehended field was not present;
 - 3> else if the field concerns a sub-field of another field, referred to as the 'parent' field i.e. the field that is one nesting level up compared to the erroneous field:
 - 4> consider the 'parent' field to be set to a not comprehended value;
 - 4> apply the generic error handling to the subsequent 'parent' field(s), until reaching the top nesting level i.e. the message level;
 - 3> else (field at message level):
 - 4> ignore the message;

NOTE 1: The error handling defined in these clauses implies that the UE ignores a message with the message type or version set to a not comprehended value.

NOTE 2: The nested error handling for messages received on logical channels other than DCCH and CCCH applies for errors in extensions also, even for errors that can be regarded as invalid E-UTRAN operation e.g. E-UTRAN not observing conditional presence.

The following ASN.1 further clarifies the levels applicable in case of nested error handling for errors in extension fields.

```
-- /example/ ASN1START

-- Example with extension addition group

ItemInfoList ::= SEQUENCE (SIZE (1..max)) OF ItemInfo

ItemInfo ::= SEQUENCE {
  itemIdentity           INTEGER (1..max),
  field1                 Field1,
  field2                 Field2           OPTIONAL,           -- Need ON
  ...
  [[ field3-r9            Field3-r9        OPTIONAL,           -- Cond Cond1
    field4-r9            Field4-r9        OPTIONAL,           -- Need ON
  ]]
}

-- Example with traditional non-critical extension (empty sequence)

BroadcastInfoBlock1 ::= SEQUENCE {
  itemIdentity           INTEGER (1..max),
  field1                 Field1,
  field2                 Field2           OPTIONAL,           -- Need ON
  nonCriticalExtension   BroadcastInfoBlock1-v940-IEs   OPTIONAL
}
```

```

BroadcastInfoBlock1-v940-IES ::= SEQUENCE {
    field3-r9                               Field3-r9
    field4-r9                               Field4-r9
    nonCriticalExtension                   SEQUENCE {}
}                                         OPTIONAL,
                                         OPTIONAL,
                                         OPTIONAL
                                         -- Cond Cond1
                                         -- Need ON
                                         -- Need OP
-- ASN1STOP

```

The UE shall, apply the following principles regarding the levels applicable in case of nested error handling:

- an extension addition group is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, a error regarding the conditionality of *field3* would result in the entire itemInfo entry to be ignored (rather than just the extension addition group containing *field3* and *field4*)
- a traditional *nonCriticalExtension* is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, a error regarding the conditionality of *field3* would result in the entire *BroadcastInfoBlock1* to be ignored (rather than just the non critical extension containing *field3* and *field4*).

5.7.5 Not comprehended field

The UE shall, when receiving an RRC message on any logical channel:

- 1> if the message includes a field that the UE does not comprehend:
- 2> treat the rest of the message as if the field was absent;

NOTE: This clause does not apply to the case of an extension to the value range of a field. Such cases are addressed instead by the requirements in clause 5.7.3.

5.8 MBMS

5.8.1 Introduction

5.8.1.1 General

In general the control information relevant only for UEs supporting MBMS is separated as much as possible from unicast control information. Most of the MBMS control information is provided on a logical channel specific for MBMS common control information: the MCCH. E-UTRA employs one MCCH logical channel per MBSFN area. In case the network configures multiple MBSFN areas, the UE acquires the MBMS control information from the MCCHs that are configured to identify if services it is interested to receive are ongoing. The action applicable when the UE is unable to simultaneously receive MBMS and unicast services is up to UE implementation. In this release of the specification, an MBMS capable UE is only required to support reception of a single MBMS service at a time, and reception of more than one MBMS service (also possibly on more than one MBSFN area) in parallel is left for UE implementation. The MCCH carries the *MBSFNAreaConfiguration* message, which indicates the MBMS sessions that are ongoing as well as the (corresponding) radio resource configuration. The MCCH may also carry the *MBMSCountingRequest* message, when E-UTRAN wishes to count the number of UEs in RRC_CONNECTED that are receiving or interested to receive one or more specific MBMS services.

A limited amount of MBMS control information is provided on the BCCH. This primarily concerns the information needed to acquire the MCCH(s). This information is carried by means of a single MBMS specific *SystemInformationBlock*: *SystemInformationBlockType13*. An MBSFN area is identified solely by the *mbsfn-AreaId* in *SystemInformationBlockType13*. At mobility, the UE considers that the MBSFN area is continuous when the source cell and the target cell broadcast the same value in the *mbsfn-AreaId*.

5.8.1.2 Scheduling

The MCCH information is transmitted periodically, using a configurable repetition period. Scheduling information is not provided for MCCH i.e. both the time domain scheduling as well as the lower layer configuration are semi-statically configured, as defined within *SystemInformationBlockType13*.

For MBMS user data, which is carried by the MTCH logical channel, E-UTRAN periodically provides MCH scheduling information (MSI) at lower layers (MAC). This MCH information only concerns the time domain scheduling i.e. the frequency domain scheduling and the lower layer configuration are semi-statically configured. The periodicity of the MSI is configurable and defined by the MCH scheduling period.

5.8.1.3 MCCH information validity and notification of changes

Change of MCCH information only occurs at specific radio frames, i.e. the concept of a modification period is used. Within a modification period, the same MCCH information may be transmitted a number of times, as defined by its scheduling (which is based on a repetition period). The modification period boundaries are defined by SFN values for which $SFN \bmod m = 0$, where m is the number of radio frames comprising the modification period. The modification period is configured by means of *SystemInformationBlockType13*.

When the network changes (some of) the MCCH information, it notifies the UEs about the change during a first modification period. In the next modification period, the network transmits the updated MCCH information. These general principles are illustrated in figure 5.8.1.3-1, in which different colours indicate different MCCH information. Upon receiving a change notification, a UE interested to receive MBMS services acquires the new MCCH information immediately from the start of the next modification period. The UE applies the previously acquired MCCH information until the UE acquires the new MCCH information.

Figure 5.8.1.3-1: Change of MCCH Information

Indication of an MBMS specific RNTI, the M-RNTI (see TS 36.321 [6]), on PDCCH is used to inform UEs in RRC_IDLE and UEs in RRC_CONNECTED about an MCCH information change. When receiving an MCCH information change notification, the UE knows that the MCCH information will change at the next modification period boundary. The notification on PDCCH indicates which of the MCCHs will change, which is done by means of an 8-bit bitmap. Within this bitmap, the bit at the position indicated by the field *notificationIndicator* is used to indicate changes for that MBSFN area: if the bit is set to "1", the corresponding MCCH will change. No further details are provided e.g. regarding which MCCH information will change. The MCCH information change notification is used to inform the UE about a change of MCCH information upon session start or about the start of MBMS counting.

The MCCH information change notifications on PDCCH are transmitted periodically and are carried on MBSFN subframes only except on MBMS-dedicated cell or FeMBMS/Unicast-mixed cell where the MCCH information change is provided on non-MBSFN subframes. These MCCH information change notification occasions are common for all MCCHs that are configured, and configurable by parameters included in *SystemInformationBlockType13*: a repetition coefficient, a radio frame offset and a subframe index. These common notification occasions are based on the MCCH with the shortest modification period.

NOTE 1: E-UTRAN may modify the MBMS configuration information provided on MCCH at the same time as updating the MBMS configuration information carried on BCCH i.e. at a coinciding BCCH and MCCH modification period. Upon detecting that a new MCCH is configured on BCCH, a UE interested to receive one or more MBMS services should acquire the MCCH, unless it knows that the services it is interested in are not provided by the corresponding MBSFN area.

A UE that is receiving an MBMS service via MRB shall acquire the MCCH information from the start of each modification period. A UE interested to receive MBMS from a carrier on which *dl-Bandwidth* included in *MasterInformationBlock* is set to *n6* shall acquire the MCCH information at least once every MCCH modification period. A UE that is not receiving an MBMS service via MRB, as well as UEs that are receiving an MBMS service via MRB but potentially interested to receive other services not started yet in another MBSFN area from a carrier on which *dl-Bandwidth* included in *MasterInformationBlock* is other than *n6*, shall verify that the stored MCCH information remains valid by attempting to find the MCCH information change notification at least *notificationRepetitionCoeff* times during the modification period of the applicable MCCH(s), if no MCCH information change notification is received.

NOTE 2: In case the UE is aware which MCCH(s) E-UTRAN uses for the service(s) it is interested to receive, the UE may only need to monitor change notifications for a subset of the MCCHs that are configured, referred to as the 'applicable MCCH(s)' in the above.

5.8.2 MCCH information acquisition

5.8.2.1 General

Figure 5.8.2.1-1: MCCH information acquisition

The UE applies the MCCH information acquisition procedure to acquire the MBMS control information that is broadcasted by the E-UTRAN. The procedure applies to MBMS capable UEs that are in RRC_IDLE or in RRC_CONNECTED.

5.8.2.2 Initiation

A UE interested to receive MBMS services shall apply the MCCH information acquisition procedure upon entering the corresponding MBSFN area (e.g. upon power on, following UE mobility) and upon receiving a notification that the MCCH information has changed. A UE that is receiving an MBMS service shall apply the MCCH information acquisition procedure to acquire the MCCH, that corresponds with the service that is being received, at the start of each modification period.

Unless explicitly stated otherwise in the procedural specification, the MCCH information acquisition procedure overwrites any stored MCCH information, i.e. delta configuration is not applicable for MCCH information and the UE discontinues using a field if it is absent in MCCH information unless explicitly specified otherwise.

5.8.2.3 MCCH information acquisition by the UE

An MBMS capable UE shall:

- 1> if the procedure is triggered by an MCCH information change notification;
- 2> start acquiring the *MBSFNAreaConfiguration* message and the *MBMSCountingRequest* message if present, from the beginning of the modification period following the one in which the change notification was received;

NOTE 1: The UE continues using the previously received MCCH information until the new MCCH information has been acquired.

- 1> if the UE enters an MBSFN area:

- 2> acquire the *MBSFNAreaConfiguration* message and the *MBMSCountingRequest* message if present, at the next repetition period;

- 1> if the UE is receiving an MBMS service:

- 2> start acquiring the *MBSFNAreaConfiguration* message and the *MBMSCountingRequest* message if present, that both concern the MBSFN area of the service that is being received, from the beginning of each modification period;

5.8.2.4 Actions upon reception of the *MBSFNAreaConfiguration* message

No UE requirements related to the contents of this *MBSFNAreaConfiguration* apply other than those specified elsewhere e.g. within procedures using the concerned system information, the corresponding field descriptions.

5.8.2.5 Actions upon reception of the *MBMSCountingRequest* message

Upon receiving *MBMSCountingRequest* message, the UE shall perform the MBMS Counting procedure as specified in 5.8.4.

5.8.3 MBMS PTM radio bearer configuration

5.8.3.1 General

The MBMS PTM radio bearer configuration procedure is used by the UE to configure RLC, MAC and the physical layer upon starting and/or stopping to receive an MRB. The procedure applies to UEs interested to receive one or more MBMS services.

NOTE: In case the UE is unable to receive an MBMS service due to capability limitations, upper layers may take appropriate action e.g. terminate a lower priority unicast service.

5.8.3.2 Initiation

The UE applies the MRB establishment procedure to start receiving a session of a service it has an interest in. The procedure may be initiated e.g. upon start of the MBMS session, upon (re-)entry of the corresponding MBSFN service area, upon becoming interested in the MBMS service, upon removal of UE capability limitations inhibiting reception of the concerned service.

The UE applies the MRB release procedure to stop receiving a session. The procedure may be initiated e.g. upon stop of the MBMS session, upon leaving the corresponding MBSFN service area, upon losing interest in the MBMS service, when capability limitations start inhibiting reception of the concerned service.

5.8.3.3 MRB establishment

Upon MRB establishment, the UE shall:

- 1> establish an RLC entity in accordance with the configuration specified in 9.1.1.4;
- 1> configure an MTCH logical channel in accordance with the received *logicalChannelIdentity*, applicable for the MRB, as included in the *MBSFNAreaConfiguration* message;
- 1> configure the physical layer in accordance with the *pmch-Config*, applicable for the MRB, as included in the *MBSFNAreaConfiguration* message;
- 1> inform upper layers about the establishment of the MRB by indicating the corresponding *tmgi* and *sessionId*;

5.8.3.4 MRB release

Upon MRB release, the UE shall:

- 1> release the RLC entity as well as the related MAC and physical layer configuration;
- 1> inform upper layers about the release of the MRB by indicating the corresponding *tmgi* and *sessionId*;

5.8.4 MBMS Counting Procedure

5.8.4.1 General

Figure 5.8.4.1-1: MBMS Counting procedure

The MBMS Counting procedure is used by the E-UTRAN to count the number of RRC_CONNECTED mode UEs which are receiving via an MRB or interested to receive via an MRB the specified MBMS services.

The UE determines interest in an MBMS service, that is identified by the TMGI, by interaction with upper layers.

5.8.4.2 Initiation

E-UTRAN initiates the procedure by sending an *MBMSCountingRequest* message.

5.8.4.3 Reception of the *MBMSCountingRequest* message by the UE

Upon receiving the *MBMSCountingRequest* message, the UE in RRC_CONNECTED mode shall:

- 1> if the *SystemInformationBlockType1*, that provided the scheduling information for the *SystemInformationBlockType13* that included the configuration of the MCCH via which the *MBMSCountingRequest* message was received, contained the identity of the Registered PLMN; and
- 1> if the UE is receiving via an MRB or interested to receive via an MRB at least one of the services in the received *countingRequestList*:

 - 2> if more than one entry is included in the *mbsfn-AreaInfoList* received in the *SystemInformationBlockType13* that included the configuration of the MCCH via which the *MBMSCountingRequest* message was received:
 - 3> include the *mbsfn-AreaIndex* in the *MBMSCountingResponse* message and set it to the index of the entry in the *mbsfn-AreaInfoList* within the received *SystemInformationBlockType13* that corresponds with the MBSFN area used to transfer the received *MBMSCountingRequest* message;
 - 2> for each MBMS service included in the received *countingRequestList*:
 - 3> if the UE is receiving via an MRB or interested to receive via an MRB this MBMS service:
 - 4> include an entry in the *countingResponseList* within the *MBMSCountingResponse* message with *countingResponseService* set it to the index of the entry in the *countingRequestList* within the received *MBMSCountingRequest* that corresponds with the MBMS service the UE is receiving or interested to receive;
 - 2> submit the *MBMSCountingResponse* message to lower layers for transmission upon which the procedure ends;

NOTE 1: UEs that are receiving an MBMS User Service, as specified in TS 23.246 [56], by means of a Unicast Bearer Service, as specified in TS 26.346 [57], (i.e. via a DRB), but are interested to receive the concerned MBMS User Service, as specified in TS 23.246 [56], via an MBMS Bearer Service (i.e. via an MRB), respond to the counting request.

NOTE 2: If ciphering is used at upper layers, the UE does not respond to the counting request if it can not decipher the MBMS service for which counting is performed (see TS 22.146 [62], clause 5.3).

NOTE 3: The UE treats the *MBMSCountingRequest* messages received in each modification period independently. In the unlikely case E-UTRAN would repeat an *MBMSCountingRequest* (i.e. including the same services) in a subsequent modification period, the UE responds again. The UE provides at most one *MBMSCountingResponse* message to multiple transmission attempts of an *MBMSCountingRequest* messages in a given modification period.

5.8.5 MBMS interest indication

5.8.5.1 General

Figure 5.8.5.1-1: MBMS interest indication

The purpose of this procedure is to inform E-UTRAN that the UE is receiving or is interested to receive MBMS service(s) via an MRB or SC-MRB, and if so, to inform E-UTRAN about the priority of MBMS versus unicast reception or MBMS service(s) reception in receive only mode.

5.8.5.2 Initiation

An MBMS or SC-PTM capable UE in RRC_CONNECTED may initiate the procedure in several cases including upon successful connection establishment, upon entering or leaving the service area, upon session start or stop, upon change of interest, upon change of priority between MBMS reception and unicast reception, upon change to a PCell broadcasting *SystemInformationBlockType15*, upon starting and stopping of MBMS service(s) in receive only mode, upon change of receive only mode frequency, bandwidth or subcarrier spacing of MBMS service(s) in receive only mode.

Upon initiating the procedure, the UE shall:

- 1> if *SystemInformationBlockType15* is broadcast by the PCell; or
- 1> if *mbms-ROM-ServiceIndication* is received in *SystemInformationBlockType2* from PCell:
 - 2> ensure having a valid version of *SystemInformationBlockType15* for the PCell, if present;
 - 2> if the UE did not transmit an *MBMSInterestIndication* message since last entering RRC_CONNECTED state; or
 - 2> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell neither broadcasting *SystemInformationBlockType15* nor including *mbms-ROM-ServiceIndication* in *SystemInformationBlockType2*:
 - 3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:
 - 4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;
 - 2> else:
 - 3> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, has changed since the last transmission of the *MBMSInterestIndication* message; or

3> if at least one of the subcarrier spacing or bandwidth parameter of receive only mode MBMS frequency of interest, determined in accordance with 5.8.5.3, has changed since the last transmission of the *MBMSInterestIndication* message; or

3> if the prioritisation of reception of all indicated MBMS frequencies compared to reception of any of the established unicast bearers has changed since the last transmission of the *MBMSInterestIndication* message;

4> initiate transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4;

NOTE: The UE may send an *MBMSInterestIndication* even when it is able to receive the MBMS services it is interested in i.e. to avoid that the network allocates a configuration inhibiting MBMS reception.

3> else if *SystemInformationBlockType20* is broadcast by the PCell:

4> if since the last time the UE transmitted an *MBMSInterestIndication* message, the UE connected to a PCell not broadcasting *SystemInformationBlockType20*; or

4> if the set of MBMS services of interest determined in accordance with 5.8.5.3a is different from *mbms-Services* included in the last transmission of the *MBMSInterestIndication* message;

5> initiate the transmission of the *MBMSInterestIndication* message in accordance with 5.8.5.4.

5.8.5.3 Determine MBMS frequencies of interest

The UE shall:

1> consider a frequency to be part of the MBMS frequencies of interest if the following conditions are met:

2> at least one MBMS session the UE is receiving or interested to receive via an MRB or SC-MRB is ongoing or about to start; and

NOTE 1: The UE may determine whether the session is ongoing from the start and stop time indicated in the User Service Description (USD), see TS 36.300 [9] or TS 26.346 [57].

2> for at least one of these MBMS sessions either *SystemInformationBlockType15* acquired from the PCell includes for the concerned frequency one or more MBMS SAIs as indicated in the USD for this session or this session is in receive only mode; and

NOTE 2: The UE considers a frequency to be part of the MBMS frequencies of interest even though E-UTRAN may (temporarily) not employ an MRB or SC-MRB for the concerned session. I.e. the UE does not verify if the session is indicated on (SC-)MCCH

NOTE 3: The UE considers the frequencies of interest independently of any synchronization state, e.g. TS 36.300 [9], Annex J.1.

2> the UE is capable of simultaneously receiving MRBs and/or is capable of simultaneously receiving SC-MRBs on the set of MBMS frequencies of interest, regardless of whether a serving cell is configured on each of these frequencies or not; and

2> the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the set of MBMS frequencies of interest;

NOTE 4: Indicating a frequency implies that the UE supports *SystemInformationBlockType13* or *SystemInformationBlockType20* acquisition for the concerned frequency i.e. the indication should be independent of whether a serving cell is configured on that frequency.

NOTE 5: When evaluating which frequencies it can receive simultaneously, the UE does not take into account the serving frequencies that are currently configured i.e. it only considers MBMS frequencies it is interested to receive.

NOTE 6: The set of MBMS frequencies of interest includes at most one frequency for a given physical frequency. The UE only considers a physical frequency to be part of the MBMS frequencies of interest if it supports at least one of the bands indicated for this physical frequency in *SystemInformationBlockType1* (for serving frequency) or *SystemInformationBlockType15* (for neighbouring frequencies). In this case, E-UTRAN may assume the UE supports MBMS reception on any of the bands supported by the UE (i.e. according to *supportedBandCombination*).

5.8.5.3a Determine MBMS services of interest

The UE shall:

- 1> consider a MBMS service to be part of the MBMS services of interest if the following conditions are met:
 - 2> the UE is SC-PTM capable; and
 - 2> the UE is receiving or interested to receive this service via an SC-MRB; and
 - 2> one session of this service is ongoing or about to start; and
 - 2> one or more MBMS SAIs in the USD for this service is included in *SystemInformationBlockType15* acquired from the PCell for a frequency belonging to the set of MBMS frequencies of interest, determined according to 5.8.5.3.

5.8.5.4 Actions related to transmission of *MBMSInterestIndication* message

The UE shall set the contents of the *MBMSInterestIndication* message as follows:

- 1> if the set of MBMS frequencies of interest, determined in accordance with 5.8.5.3, is not empty:
 - 2> include *mbms-FreqList* and set it to include the MBMS frequencies of interest sorted by decreasing order of interest, using the EARFCN corresponding with *freqBandIndicator* included in *SystemInformationBlockType1* (for serving frequency), if applicable, and the EARFCN(s) as included in *SystemInformationBlockType15* (for neighbouring frequencies);

NOTE 1: The EARFCN included in *mbms-FreqList* is merely used to indicate a physical frequency the UE is interested to receive i.e. the UE may not support the band corresponding to the included EARFCN (but it does support at least one of the bands indicated in system information for the concerned physical frequency).

- 2> include *mbms-Priority* if the UE prioritises reception of all indicated MBMS frequencies above reception of any of the unicast bearers;
- 2> if *SystemInformationBlockType20* is broadcast by the PCell:
 - 3> include *mbms-Services* and set it to indicate the set of MBMS services of interest determined in accordance with 5.8.5.3a;

NOTE 2: If the UE prioritises MBMS reception and unicast data cannot be supported because of congestion on the MBMS carrier(s), E-UTRAN may initiate release of unicast bearers. It is up to E-UTRAN implementation whether all bearers or only GBR bearers are released. E-UTRAN does not initiate re-establishment of the released unicast bearers upon alleviation of the congestion.

- 1> if the UE is receiving MBMS service(s) in receive only mode:
 - 2> if the *supportedBandCombination* the UE included in *UE-EUTRA-Capability* contains at least one band combination including the *mbms-ROM-Freq*:
 - 3> include *mbms-ROM-Freq*, *mbms-ROM-SubcarrierSpacing* and *mbms-Bandwidth*;

NOTE 3: The EARFCN included in *mbms-ROM-Freq* is used to indicate a physical frequency the UE is interested to receive MBMS service(s) in receive only mode and is determined based on UE implementation.

The UE shall submit the *MBMSInterestIndication* message to lower layers for transmission.

5.8a SC-PTM

5.8a.1 Introduction

5.8a.1.1 General

SC-PTM control information is provided on a specific logical channel: the SC-MCCH. The SC-MCCH carries the *SCPTMConfiguration* message which indicates the MBMS sessions that are ongoing as well as the (corresponding) information on when each session may be scheduled, i.e. scheduling period, scheduling window and start offset. The *SCPTMConfiguration* message also provides information about the neighbour cells transmitting the MBMS sessions which are ongoing on the current cell. In this release of the specification, an SC-PTM capable UE is only required to support reception of a single MBMS service at a time, and reception of more than one MBMS service in parallel is left for UE implementation.

A limited amount of SC-PTM control information is provided on the BCCH or BR-BCCH. This primarily concerns the information needed to acquire the SC-MCCH.

NOTE: For BL UEs and UEs in CE, SC-MCCH transmission uses a 1.4 MHz channel bandwidth and a maximum TBS of 936 bits, see TS 36.213 [23]. For NB-IoT UEs, the maximum TBS for SC-MCCH transmission is 680 bits, see TS 36.213 [23].

5.8a.1.2 SC-MCCH scheduling

The SC-MCCH information (i.e. information transmitted in messages sent over SC-MCCH) is transmitted periodically, using a configurable repetition period. SC-MCCH transmissions (and the associated radio resources and MCS) are indicated on PDCCH.

5.8a.1.3 SC-MCCH information validity and notification of changes

Change of SC-MCCH information only occurs at specific radio frames, i.e. the concept of a modification period is used. Within a modification period, the same SC-MCCH information may be transmitted a number of times, as defined by its scheduling (which is based on a repetition period). The modification period boundaries are defined by SFN values for which SFN mod $m=0$, where m is the number of radio frames comprising the modification period. The modification period is configured by means of *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT). If H-SFN is provided in *SystemInformationBlockType1-BR*, modification period boundaries for BL UEs or UEs in CE are defined by SFN values for which $(H\text{-SFN} * 1024 + SFN) \text{ mod } m=0$. The modification period boundaries for NB-IoT UEs are defined by SFN values for which $(H\text{-SFN} * 1024 + SFN) \text{ mod } m=0$.

When the network changes (some of) the SC-MCCH information, it notifies the UEs, other than BL UEs, UEs in CE or NB-IoT UEs, about the change in the first subframe which can be used for SC-MCCH transmission in a repetition period. LSB bit in 8-bit bitmap when set to '1' indicates the change in SC-MCCH. Upon receiving a change notification, a UE interested to receive MBMS services transmitted using SC-PTM acquires the new SC-MCCH information starting from the same subframe. The UE applies the previously acquired SC-MCCH information until the UE acquires the new SC-MCCH information.

When the network changes (some of) the SC-MCCH information for start of new MBMS service(s) transmitted using SC-PTM, it notifies BL UEs, UEs in CE or NB-IoT UEs about the change in every PDCCH which schedules the first SC-MCCH in a repetition period in the current modification period. The notification is transmitted with 1 bit. The bit, when set to '1', indicates the start of new MBMS service(s), see TS 36.212 [22], clauses 5.3.3.1.14 and 6.4.3.3. Upon receiving a change notification, a BL UE, UE in CE or NB-IoT UE interested to receive MBMS services transmitted using SC-PTM acquires the new SC-MCCH information scheduled by the PDCCH. The BL UE, UE in CE or NB-IoT UE applies the previously acquired SC-MCCH information until the BL UE, UE in CE or NB-IoT UE acquires the new SC-MCCH information.

When the network changes SC-MTCH specific information e.g. start of new MBMS service(s) transmitted using SC-PTM or change of ongoing MBMS service(s) transmitted using SC-PTM, it notifies the BL UEs, UEs in CE or NB-IoT UEs in the PDCCH which schedules the SC-MTCH in the current modification period. The notification is transmitted with a 2 bit bitmap. The LSB in the 2-bit bitmap, when set to '1', indicates the change of the on-going MBMS service and the MSB in the 2-bit bitmap, when set to '1', indicates the start of new MBMS service(s), see TS 36.212 [22], clauses 5.3.3.1.12, 5.3.3.1.13 and 6.4.3.2. In the case the network changes an on-going SC-MTCH transmission in the next modification period, it notifies the BL UEs, UEs in CE or NB-IoT UEs in the PDCCH which schedules this SC-

MTCH in the current modification period. In the case the network starts new MBMS service(s) transmitted using SC-PTM, the network notifies the UEs which have on-going SC-MTCH in the PDCCH scheduling each of the SC-MTCH. Upon receiving such notification, a BL UE, UE in CE or NB-IoT UE acquires the new SC-MCCH information at the start of the next modification period. The BL UE, UE in CE or NB-IoT UE applies the previously acquired SC-MCCH information until the BL UE, UE in CE or NB-IoT UE acquires the new SC-MCCH information.

5.8a.1.4 Procedures

The SC-PTM capable UE receiving or interested to receive MBMS service(s) via SC-MRB applies SC-PTM procedures described in 5.8a and, except for NB-IoT UE, the MBMS interest indication procedure as specified in 5.8.5.

5.8a.2 SC-MCCH information acquisition

5.8a.2.1 General

Figure 5.8a.2.1-1: SC-MCCH information acquisition

The UE applies the SC-MCCH information acquisition procedure to acquire the SC-PTM control information that is broadcast by the E-UTRAN. The procedure applies to SC-PTM capable UEs that are in RRC_IDLE except for BL UEs, UEs in CE and NB-IoT UEs, performing EDT procedure. This procedure also applies to SC-PTM capable UEs that are in RRC_CONNECTED except for BL UEs, UEs in CE or NB-IoT UEs.

5.8a.2.2 Initiation

A UE interested to receive MBMS services via SC-MRB shall apply the SC-MCCH information acquisition procedure upon entering the cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT) (e.g. upon power on, following UE mobility) and upon receiving a notification that the SC-MCCH information has changed. A UE, except for BL UE, UE in CE or NB-IoT UE, that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure to acquire the SC-MCCH information that corresponds with the service that is being received, at the start of each modification period. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB shall apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed. The BL UE, UE in CE or NB-IoT UE that is receiving an MBMS service via SC-MRB may apply the SC-MCCH information acquisition procedure upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service.

Unless explicitly stated otherwise in the procedural specification, the SC-MCCH information acquisition procedure overwrites any stored SC-MCCH information, i.e. delta configuration is not applicable for SC-MCCH information and the UE discontinues using a field if it is absent in SC-MCCH information unless explicitly specified otherwise.

5.8a.2.3 SC-MCCH information acquisition by the UE

A SC-PTM capable UE shall:

- 1> if the procedure is triggered by an SC-MCCH information change notification and the UE has no ongoing MBMS service;
- 2> except for a BL UE, UE in CE or NB-IoT UE, start acquiring the *SCPTMConfiguration* message from the subframe in which the change notification was received;

2> for a BL UE, UE in CE or NB-IoT UE, acquire the *SCPTMConfiguration* message scheduled by the PDCCH in which the change notification was received;

NOTE 1: The UE continues using the previously received SC-MCCH information until the new SC-MCCH information has been acquired.

1> if the UE enters a cell broadcasting *SystemInformationBlockType20* (*SystemInformationBlockType20-NB* in NB-IoT):

2> acquire the *SCPTMConfiguration* message at the next repetition period;

1> if the UE is receiving an MBMS service via an SC-MRB:

2> except for BL UE, UE in CE or NB-IoT UE, start acquiring the *SCPTMConfiguration* message from the beginning of each modification period;

2> a BL UE, UE in CE or NB-IoT UE shall start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information that corresponds with the service that is being received is about to be changed;

2> a BL UE, UE in CE or NB-IoT UE may start acquiring the *SCPTMConfiguration* message at the start of the next modification period upon receiving a notification that the SC-MCCH information is about to be changed due to start of a new service;

5.8a.2.4 Actions upon reception of the *SCPTMConfiguration* message

No UE requirements related to the contents of this *SCPTMConfiguration* apply other than those specified elsewhere e.g. within procedures using the concerned system information, the corresponding field descriptions.

5.8a.3 SC-PTM radio bearer configuration

5.8a.3.1 General

The SC-PTM radio bearer configuration procedure is used by the UE to configure RLC, MAC and the physical layer upon starting and/or stopping to receive an SC-MRB transmitted on SC-MTCH. The procedure applies to SC-PTM capable UEs that are in RRC_IDLE and to SC-PTM capable UEs that are not BL UEs, UEs in CE or NB-IoT UEs in RRC_CONNECTED, and are interested to receive one or more MBMS services via SC-MRB.

NOTE: In case the UE is unable to receive an MBMS service via an SC-MRB due to capability limitations, upper layers may take appropriate action e.g. terminate a lower priority unicast service.

5.8a.3.2 Initiation

The UE applies the SC-MRB establishment procedure to start receiving a session of a MBMS service it has an interest in. The procedure may be initiated e.g. upon start of the MBMS session, upon entering a cell providing via SC-MRB a MBMS service in which the UE has interest, upon becoming interested in the MBMS service, upon removal of UE capability limitations inhibiting reception of the concerned service.

The UE applies the SC-MRB release procedure to stop receiving a session. The procedure may be initiated e.g. upon stop of the MBMS session, upon leaving the cell where a SC-MRB is established, upon losing interest in the MBMS service, when capability limitations start inhibiting reception of the concerned service.

5.8a.3.3 SC-MRB establishment

Upon SC-MRB establishment, the UE shall:

1> establish an RLC entity in accordance with the configuration specified in 9.1.1.7;

1> configure a SC-MTCH logical channel applicable for the SC-MRB and instruct MAC to receive DL-SCH on the cell where the *SCPTMConfiguration* message was received for the MBMS service for which the SC-MRB is established and using *g-RNTI* and *sc-mtch-SchedulingInfo* (if included) in this message for this MBMS service;

1> configure the physical layer in accordance with the *sc-mtch-InfoList*, applicable for the SC-MRB, as included in the *SCPTMConfiguration* message;

1> inform upper layers about the establishment of the SC-MRB by indicating the corresponding *tmgi* and *sessionId*;

5.8a.3.4 SC-MRB release

Upon SC-MRB release, the UE shall:

1> release the RLC entity as well as the related MAC and physical layer configuration;

1> inform upper layers about the release of the SC-MRB by indicating the corresponding *tmgi* and *sessionId*;

5.9 RN procedures

5.9.1 RN reconfiguration

5.9.1.1 General

Figure 5.9.1.1-1: RN reconfiguration

The purpose of this procedure is to configure/reconfigure the RN subframe configuration and/or to update the system information relevant for the RN in RRC_CONNECTED.

5.9.1.2 Initiation

E-UTRAN may initiate the RN reconfiguration procedure to an RN in RRC_CONNECTED when AS security has been activated.

5.9.1.3 Reception of the *RNReconfiguration* by the RN

The RN shall:

1> if the *rn-SystemInfo* is included:

2> if the *systemInformationBlockType1* is included:

3> act upon the received *SystemInformationBlockType1* as specified in 5.2.2.7;

2> if the *SystemInformationBlockType2* is included:

3> act upon the received *SystemInformationBlockType2* as specified in 5.2.2.9;

1> if the *rn-SubframeConfig* is included:

2> reconfigure lower layers in accordance with the received *subframeConfigPatternFDD* or *subframeConfigPatternTDD*;

2> if the *rpdch-Config* is included:

- 3> reconfigure lower layers in accordance with the received *rpdcch-Config*;
- 1> submit the *RNReconfigurationComplete* message to lower layers for transmission, upon which the procedure ends;

5.10 Sidelink

5.10.1 Introduction

The sidelink communication and associated synchronisation resource configuration applies for the frequency at which it was received/ acquired. Moreover, for a UE configured with one or more SCells, the sidelink communication and associated synchronisation resource configuration provided by dedicated signalling applies for the PCell/ the primary frequency. The sidelink discovery and associated synchronisation resource configuration applies for the frequency at which it was received/ acquired or the indicated frequency in the configuration. For a UE configured with one or more SCells, the sidelink discovery and associated synchronisation resource configuration provided by dedicated signalling applies for the PCell/ the primary frequency / any other indicated frequency.

NOTE 1: Upper layers configure the UE to receive or transmit sidelink communication on a specific frequency, to monitor or transmit non-PS related sidelink discovery announcements on one or more frequencies or to monitor or transmit PS related sidelink discovery announcements on a specific frequency, but only if the UE is authorised to perform these particular ProSe related sidelink activities.

NOTE 2: It is up to UE implementation which actions to take (e.g. termination of unicast services, detach) when it is unable to perform the desired sidelink activities, e.g. due to UE capability limitations.

Sidelink communication consists of one-to-many and one-to-one sidelink communication. One-to-many sidelink communication consists of relay related and non-relay related one-to-many sidelink communication. One-to-one sidelink communication consists of relay related and non-relay related one-to-one sidelink communication. In relay related one-to-one sidelink communication the communicating parties consist of one sidelink relay UE and one sidelink remote UE.

Sidelink discovery consists of public safety related (PS related) and non-PS related sidelink discovery. PS related sidelink discovery consists of relay related and non-relay related PS related sidelink discovery. Upper layers indicate to RRC whether a particular sidelink announcement is PS related or non-PS related.

Upper layers indicate to RRC whether a particular sidelink procedure is V2X related or not.

The specification covers the use of UE to network sidelink relays by specifying the additional requirements that apply for a sidelink relay UE and a sidelink remote UE, i.e. for such UEs the regular sidelink UE requirements equally apply unless explicitly stated otherwise.

NOTE 3: In case the configurations for V2X sidelink communication are acquired from NR, the configurations for V2X sidelink communication in *SystemInformationBlockType21*, *SystemInformationBlockType26*, *SL-V2X-ConfigDedicated* within *RRCConnectionReconfiguration* used in this clause can be provided by *SIB13*, *SIB14*, *sl-ConfigDedicatedEUTRA* within *RRCReconfiguration* as specified in TS 38.331 [82], respectively.

5.10.1a Conditions for sidelink communication operation

The UE shall perform sidelink communication operation only if the conditions defined in this clause are met:

- 1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for sidelink communication operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for sidelink communication operation as defined in TS 36.304 [4], clause 11.4; or
- 1> if the UE is camped on a serving cell (RRC_IDLE) on which it fulfils the conditions to support sidelink communication in limited service state as specified in TS 23.303 [68], clause 4.5.6; and if either the serving cell is on the frequency used for sidelink communication operation or the UE is out of coverage on the frequency used for sidelink communication operation as defined in TS 36.304 [4], clause 11.4; or
- 1> if the UE has no serving cell (RRC_IDLE);

5.10.1b Conditions for PS related sidelink discovery operation

The UE shall perform PS related sidelink discovery operation only if the conditions defined in this clause are met:

- 1> if the UE's serving cell is suitable (RRC_IDLE or RRC_CONNECTED); and if either the selected cell on the frequency used for PS related sidelink discovery operation belongs to the registered or other PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for PS related sidelink discovery operation as defined in TS 36.304 [4], clause 11.4; or
- 1> if the UE is camped on a serving cell (RRC_IDLE) on which it fulfils the conditions to support sidelink discovery in limited service state as specified in TS 23.303 [68], clause 4.5.6; and if either the serving cell is on the frequency used for PS related sidelink discovery operation or the UE is out of coverage on the frequency used for PS related sidelink discovery operation as defined in TS 36.304 [4], clause 11.4; or
- 1> if the UE has no serving cell (RRC_IDLE);

5.10.1c Conditions for non-PS related sidelink discovery operation

The UE shall perform non-PS related sidelink discovery operation only if the conditions defined in this clause are met:

- 1> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable; and if the selected cell on the frequency used for non-PS related sidelink discovery operation belongs to the registered or other PLMN as specified in TS 24.334 [69].

5.10.1d Conditions for V2X sidelink communication operation

The UE shall perform V2X sidelink communication operation only if the conditions defined in this clause are met:

- 1> if the UE's serving cell is suitable; and if either the selected cell on the frequency used for V2X sidelink communication operation belongs to the registered or equivalent PLMN as specified in TS 24.334 [69] or the UE is out of coverage on the frequency used for V2X sidelink communication operation as defined in TS 36.304 [4], clause 11.4 and TS 38.304 [92], clause 8.1; or
- 1> if the UE's serving cell fulfils the conditions to support V2X sidelink communication in limited service state as specified in TS 23.285 [78], clause 4.4.8; and if either the serving cell is on the frequency used for V2X sidelink communication operation or the UE is out of coverage on the frequency used for V2X sidelink communication operation as defined in TS 36.304 [4], clause 11.4 and TS 38.304 [92], clause 8.1; or
- 1> if the UE has no serving cell (RRC_IDLE);

5.10.2 Sidelink UE information

5.10.2.1 General

Figure 5.10.2-1: Sidelink UE information

The purpose of this procedure is to inform E-UTRAN that the UE is interested or no longer interested to receive sidelink communication or discovery, to receive V2X sidelink communication, as well as to request assignment or release of transmission resources for sidelink communication or discovery announcements or V2X sidelink communication or sidelink discovery gaps, to report parameters related to sidelink discovery from system information

of inter-frequency/PLMN cells and to report the synchronization reference used by the UE for V2X sidelink communication.

5.10.2.2 Initiation

A UE capable of sidelink communication or V2X sidelink communication or sidelink discovery that is in RRC_CONNECTED may initiate the procedure to indicate it is (interested in) receiving sidelink communication or V2X sidelink communication or sidelink discovery in several cases including upon successful connection establishment, upon change of interest, upon change to a PCell broadcasting *SystemInformationBlockType18* or *SystemInformationBlockType19* or *SystemInformationBlockType21* including *sl-V2X-ConfigCommon*. A UE capable of sidelink communication or V2X sidelink communication or sidelink discovery may initiate the procedure to request assignment of dedicated resources for the concerned sidelink communication transmission or discovery announcements or V2X sidelink communication transmission or to request sidelink discovery gaps for sidelink discovery transmission or sidelink discovery reception and a UE capable of inter-frequency/PLMN sidelink discovery parameter reporting may initiate the procedure to report parameters related to sidelink discovery from system information of inter-frequency/PLMN cells.

NOTE 1: A UE in RRC_IDLE that is configured to transmit sidelink communication / V2X sidelink communication / sidelink discovery announcements, while *SystemInformationBlockType18*/ *SystemInformationBlockType19*/ *SystemInformationBlockType21* including *sl-V2X-ConfigCommon* or *SystemInformationBlockType26* does not include the resources for transmission (in normal conditions), initiates connection establishment in accordance with 5.3.3.1a.

Upon initiating the procedure, the UE shall:

- 1> if *SystemInformationBlockType18* is broadcast by the PCell;
- 2> ensure having a valid version of *SystemInformationBlockType18* for the PCell;
- 2> if configured by upper layers to receive sidelink communication:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*; or

NOTE 2: After handover/ re-establishment from a source PCell not broadcasting *SystemInformationBlockType18* the UE repeats the same interest information that it provided previously as such a source PCell may not forward the interest information.

- 3> if the last transmission of the *SidelinkUEInformation* message did not include *commRxInterestedFreq*; or if the frequency configured by upper layers to receive sidelink communication on has changed since the last transmission of the *SidelinkUEInformation* message;
- 4> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink communication reception frequency of interest in accordance with 5.10.2.3;

- 2> else:
 - 3> if the last transmission of the *SidelinkUEInformation* message included *commRxInterestedFreq*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it is no longer interested in sidelink communication reception in accordance with 5.10.2.3;
- 2> if configured by upper layers to transmit non-relay related one-to-many sidelink communication:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*; or

- 3> if the last transmission of the *SidelinkUEInformation* message did not include *commTxResourceReq*; or if the information carried by the *commTxResourceReq* has changed since the last transmission of the *SidelinkUEInformation* message;
- 4> initiate transmission of the *SidelinkUEInformation* message to indicate the non-relay related one-to-many sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;
- 2> else:
 - 3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReq*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires non-relay related one-to-many sidelink communication transmission resources in accordance with 5.10.2.3;
 - 2> if configured by upper layer to transmit relay related one-to-many sidelink communication:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*, connected to a PCell not broadcasting *SystemInformationBlockType19* or broadcasting *SystemInformationBlockType19* not including *discConfigRelay*; or
 - 3> if the last transmission of *SidelinkUEInformation* message did not include *commTxResourceReqRelay*; or if the information carried by the *commTxResourceReqRelay* has changed since the last transmission of the *SidelinkUEInformation* message:
 - 4> if the UE is acting as sidelink relay UE:
 - 5> initiate transmission of the *SidelinkUEInformation* message to indicate the relay related one-to-many sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;
 - 2> else:
 - 3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReqRelay*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires relay related one-to-many sidelink communication transmission resources in accordance with 5.10.2.3;
 - 2> if configured by upper layers to transmit non-relay related one-to-one sidelink communication:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18* or connected to a PCell broadcasting *SystemInformationBlockType18* not including *commTxResourceUC-ReqAllowed*; or
 - 3> if the last transmission of the *SidelinkUEInformation* message did not include *commTxResourceReqUC*; or if the information carried by the *commTxResourceReqUC* has changed since the last transmission of the *SidelinkUEInformation* message:
 - 4> if *commTxResourceUC-ReqAllowed* is included in *SystemInformationBlockType18*:
 - 5> initiate transmission of the *SidelinkUEInformation* message to indicate the non-relay related one-to-one sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;
 - 2> else:
 - 3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReqUC*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires non-relay related one-to-one sidelink communication transmission resources in accordance with 5.10.2.3;
 - 2> if configured by upper layers to transmit relay related one-to-one sidelink communication:

- 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType18*, connected to a PCell not broadcasting *SystemInformationBlockType19* or broadcasting *SystemInformationBlockType19* not including *discConfigRelay*; or
 - 3> if the last transmission of the *SidelinkUEInformation* message did not include *commTxResourceReqRelayUC*; or if the information carried by the *commTxResourceReqRelayUC* has changed since the last transmission of the *SidelinkUEInformation* message;
 - 4> if the UE is acting as sidelink relay UE; or
 - 4> if the UE has a selected sidelink relay UE; and if *SystemInformationBlockType19* is broadcast by the PCell and includes *discConfigRelay*; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met;
 - 5> initiate transmission of the *SidelinkUEInformation* message to indicate the relay related one-to-one sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;
- 2> else:
- 3> if the last transmission of the *SidelinkUEInformation* message included *commTxResourceReqRelayUC*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires relay related one-to-one sidelink communication transmission resources in accordance with 5.10.2.3;
- 1> if *SystemInformationBlockType19* is broadcast by the PCell:
- 2> ensure having a valid version of *SystemInformationBlockType19* for the PCell;
 - 2> if configured by upper layers to receive sidelink discovery announcements on a serving frequency or on one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19* of the PCell:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19*; or
 - 3> if the last transmission of the *SidelinkUEInformation* message did not include *discRxInterest*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it is interested in sidelink discovery reception in accordance with 5.10.2.3; - 2> else:
 - 3> if the last transmission of the *SidelinkUEInformation* message included *discRxInterest*:
 - 4> initiate transmission of the *SidelinkUEInformation* message to indicate it is no longer interested in sidelink discovery reception in accordance with 5.10.2.3;
 - 2> if the UE is configured by upper layers to transmit non-PS related sidelink discovery announcements on the primary frequency or on one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19* of the PCell, with *discTxResourcesInterFreq* included within *discResourcesNonPS* and not set to *noTxOnCarrier*:
 - 3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or
 - 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19* or connected to a PCell broadcasting *SystemInformationBlockType19* not including *discTxResourcesInterFreq* within *discResourcesNonPS* or *discTxResourcesInterFreq* did not include all frequencies for which the UE will request resources; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *discTxResourceReq*; or if the non-PS related sidelink discovery announcement resources required by the UE have changed (i.e. resulting in a change of *discTxResourceReq*) since the last transmission of the *SidelinkUEInformation* message;

4> initiate transmission of the *SidelinkUEInformation* message to indicate the non-PS related sidelink discovery announcement resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discTxResourceReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires non-PS related sidelink discovery announcement resources in accordance with 5.10.2.3;

2> if configured by upper layers to transmit PS related sidelink discovery announcements on the primary frequency or, in case of non-relay PS related sidelink discovery announcements, on a frequency included in *discInterFreqList*, if included in *SystemInformationBlockType19*, with *discTxResourcesInterFreq* included within *discResourcesPS* and not set to *noTxOnCarrier*:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19*, connected to a PCell broadcasting *SystemInformationBlockType19* not including *discConfigPS*, or in case of non-relay PS related transmission: (connected to a PCell broadcasting *SystemInformationBlockType19* not including *discTxResourcesInterFreq* within *discResourcesPS* or for which *discTxResourcesInterFreq* did not include all frequencies for which the UE will request resources), or in case of relay related PS sidelink discovery announcements: (connected to a PCell broadcasting *SystemInformationBlockType19* not including *discConfigRelay*) sidelink; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *discTxResourceReqPS*; or if the PS related sidelink discovery announcement resources required by the UE have changed (i.e. resulting in a change of *discTxResourceReqPS*) since the last transmission of the *SidelinkUEInformation* message:

4> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements; or

4> if the UE is acting as sidelink relay UE; and if *SystemInformationBlockType19* includes *discConfigRelay*; and if the sidelink relay UE threshold conditions as specified in 5.10.10.4 are met; or

4> if the UE is selecting a sidelink relay UE / has a selected sidelink relay UE; and if *SystemInformationBlockType19* includes *discConfigRelay*; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met:

5> initiate transmission of the *SidelinkUEInformation* message to indicate the PS related sidelink discovery announcement resources required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discTxResourceReqPS*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires PS related sidelink discovery announcement resources in accordance with 5.10.2.3;

2> if configured by upper layers to monitor or transmit sidelink discovery announcements; and if the UE requires sidelink discovery gaps, to perform such actions:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType19* or connected to a PCell broadcasting *SystemInformationBlockType19* not including *gapRequestsAllowedCommon* while at the same time the UE was not configured with *gapRequestsAllowedDedicated*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include the gaps required to monitor or transmit the sidelink discovery announcements (i.e. UE requiring gaps to monitor discovery announcements while *discRxGapReq* was not included or UE requiring gaps to transmit discovery announcements while *discTxGapReq* was not included); or if the sidelink discovery gaps required by the UE have changed (i.e. resulting in a change of *discRxGapReq* or *discTxGapReq*) since the last transmission of the *SidelinkUEInformation* message;

4> if the UE is configured with *gapRequestsAllowedDedicated* set to *true*; or

4> if the UE is not configured with *gapRequestsAllowedDedicated* and *gapRequestsAllowedCommon* is included in *SystemInformationBlockType19*:

5> initiate transmission of the *SidelinkUEInformation* message to indicate the sidelink discovery gaps required by the UE in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *discTxGapReq* or *discRxGapReq*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires sidelink discovery gaps in accordance with 5.10.2.3;

2> if the UE acquired the relevant parameters from the system information of one or more cells on a carrier included in the *discSysInfoToReportConfig* and T370 is running:

3> if the UE has configured lower layers to transmit or monitor the sidelink discovery announcements on those cells:

4> initiate transmission of the *SidelinkUEInformation* message to report the acquired system information parameters and stop T370;

1> if *SystemInformationBlockType21* including *sl-V2X-ConfigCommon* is broadcast by the PCell:

2> ensure having a valid version of *SystemInformationBlockType21* and *SystemInformationBlockType26*, if broadcast, for the PCell;

2> if configured by upper layers to receive V2X sidelink communication on a primary frequency or on one or more frequencies included in *v2x-InterFreqInfoList*, if included in *SystemInformationBlockType21* or *SystemInformationBlockType26* of the PCell:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType21* including *sl-V2X-ConfigCommon*; or

3> if the last transmission of the *SidelinkUEInformation* message did not include *v2x-CommRxInterestedFreqList*; or if the frequency(ies) configured by upper layers to receive V2X sidelink communication on has changed since the last transmission of the *SidelinkUEInformation* message:

4> initiate transmission of the *SidelinkUEInformation* message to indicate the V2X sidelink communication reception frequency(ies) of interest in accordance with 5.10.2.3;

2> else:

3> if the last transmission of the *SidelinkUEInformation* message included *v2x-CommRxInterestedFreqList*:

4> initiate transmission of the *SidelinkUEInformation* message to indicate it is no longer interested in V2X sidelink communication reception in accordance with 5.10.2.3;

2> if configured by upper layers to transmit V2X sidelink communication on a primary frequency or on one or more frequencies included in *v2x-InterFreqInfoList*, if included in *SystemInformationBlockType21* or *SystemInformationBlockType26* of the PCell:

3> if the UE did not transmit a *SidelinkUEInformation* message since last entering RRC_CONNECTED state; or

- 3> if since the last time the UE transmitted a *SidelinkUEInformation* message the UE connected to a PCell not broadcasting *SystemInformationBlockType21* including *sl-V2X-ConfigCommon*; or
- 3> if the last transmission of the *SidelinkUEInformation* message did not include *v2x-CommTxResourceReq*; or if the information carried by the *v2x-CommTxResourceReq* has changed since the last transmission of the *SidelinkUEInformation* message;
- 4> initiate transmission of the *SidelinkUEInformation* message to indicate the V2X sidelink communication transmission resources required by the UE in accordance with 5.10.2.3;

2> else:

- 3> if the last transmission of the *SidelinkUEInformation* message included *v2x-CommTxResourceReq*:
- 4> initiate transmission of the *SidelinkUEInformation* message to indicate it no longer requires V2X sidelink communication transmission resources in accordance with 5.10.2.3;

5.10.2.3 Actions related to transmission of *SidelinkUEInformation* message

The UE shall set the contents of the *SidelinkUEInformation* message as follows:

- 1> if the UE initiates the procedure to indicate it is (no more) interested to receive sidelink communication or discovery or receive V2X sidelink communication or to request (configuration/ release) of sidelink communication or V2X sidelink communication or sidelink discovery transmission resources (i.e. UE includes all concerned information, irrespective of what triggered the procedure):
- 2> if *SystemInformationBlockType18* is broadcast by the PCell:
 - 3> if configured by upper layers to receive sidelink communication:
 - 4> include *commRxInterestedFreq* and set it to the sidelink communication frequency;
 - 3> if configured by upper layers to transmit non-relay related one-to-many sidelink communication:
 - 4> include *commTxResourceReq* and set its fields as follows:
 - 5> set *carrierFreq* to indicate the sidelink communication frequency i.e. the same value as indicated in *commRxInterestedFreq* if included;
 - 5> set *destinationInfoList* to include the non-relay related one-to-many sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;
 - 3> if configured by upper layers to transmit non-relay related one-to-one sidelink communication; and
 - 3> if *commTxResourceUC-ReqAllowed* is included in *SystemInformationBlockType18*:
 - 4> include *commTxResourceReqUC* and set its fields as follows:
 - 5> set *carrierFreq* to indicate the one-to-one sidelink communication frequency i.e. the same value as indicated in *commRxInterestedFreq* if included;
 - 5> set *destinationInfoList* to include the non-relay related one-to-one sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;
 - 3> if configured by upper layers to transmit relay related one-to-one sidelink communication; and
 - 3> if *SystemInformationBlockType19* is broadcast by the PCell including *discConfigRelay*; and
 - 3> if the UE is acting as sidelink relay UE; or if the UE has a selected sidelink relay UE; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met:
 - 4> include *commTxResourceReqRelayUC* and set its fields as follows:
 - 5> set *destinationInfoList* to include the one-to-one sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;

- 4> include *ue-Type* and set it to *relayUE* if the UE is acting as sidelink relay UE and to *remoteUE* otherwise;
- 3> if configured by upper layers to transmit relay related one-to-many sidelink communication; and
- 3> if *SystemInformationBlockType19* is broadcast by the PCell including *discConfigRelay*; and
- 3> if the UE is acting as sidelink relay UE:
 - 4> include *commTxResourceReqRelay* and set its fields as follows:
 - 5> set *destinationInfoList* to include the one-to-many sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;
 - 4> include *ue-Type* and set it to *relayUE*;
- 2> if *SystemInformationBlockType19* is broadcast by the PCell:
 - 3> if configured by upper layers to receive sidelink discovery announcements on a serving frequency or one or more frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19*:
 - 4> include *discRxInterest*;
 - 3> if the UE is configured by upper layers to transmit non-PS related sidelink discovery announcements:
 - 4> for each frequency on which the UE is configured to transmit non-PS related sidelink discovery announcements that concerns the primary frequency or that is included in *discInterFreqList* with *discTxResourcesInterFreq* included within *discResourcesNonPS* and not set to *noTxOnCarrier*:
 - 5> for the first frequency, include *discTxResourceReq* and set it to indicate the number of discovery messages for sidelink discovery announcement(s) for which it requests E-UTRAN to assign dedicated resources as well as the concerned frequency, if different from the primary;
 - 5> for any additional frequency, include *discTxResourceReqAddFreq* and set it to indicate the number of discovery messages for sidelink discovery announcement(s) for which it requests E-UTRAN to assign dedicated resources as well as the concerned frequency;
 - 3> if configured by upper layers to transmit PS related sidelink discovery announcements; and
 - 3> if the frequency on which the UE is configured to transmit PS related sidelink discovery announcements either concerns the primary frequency or, in case of non-relay PS related sidelink discovery announcements, is included in *discInterFreqList* with *discTxResources InterFreq* included within *discResourcesPS* and not set to *noTxOnCarrier*:
 - 4> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements and *SystemInformationBlockType19* includes *discConfigPS*; or
 - 4> if the UE is acting as sidelink relay UE; and if *SystemInformationBlockType19* includes *discConfigRelay*; and if the sidelink relay UE threshold conditions as specified in 5.10.10.4 are met; or
 - 4> if the UE is selecting a sidelink relay UE / has a selected sidelink relay UE; and if *SystemInformationBlockType19* includes *discConfigRelay*; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met:
 - 5> include *discTxResourceReqPS* and set it to indicate the number of discovery messages for PS related sidelink discovery announcement(s) for which it requests E-UTRAN to assign dedicated resources as well as the concerned frequency, if different from the primary;
 - 2> if *SystemInformationBlockType21* is broadcast by the PCell and *SystemInformationBlockType21* includes *sl-V2X-ConfigCommon*:
 - 3> if configured by upper layers to receive V2X sidelink communication:
 - 4> include *v2x-CommRxInterestedFreqList* and set it to the frequency(ies) for V2X sidelink communication reception;
 - 3> if configured by upper layers to transmit V2X sidelink communication:

- 4> if configured by upper layers to transmit P2X related V2X sidelink communication:
 - 5> include *p2x-CommTxType* set to *true*;
- 4> include *v2x-CommTxResourceReq* and set its fields as follows for each frequency on which the UE is configured for V2X sidelink communication transmission:
 - 5> set *carrierFreqCommTx* to indicate the frequency for V2X sidelink communication transmission;
 - 5> set *v2x-TypeTxSync* to the current synchronization reference type used on the associated *carrierFreqCommTx* for V2X sidelink communication transmission;
 - 5> set *v2x-DestinationInfoList* to include the V2X sidelink communication transmission destination(s) for which it requests E-UTRAN to assign dedicated resources;
- 1> else if the UE initiates the procedure to request sidelink discovery transmission and/ or reception gaps:
 - 2> if the UE is configured with *gapRequestsAllowedDedicated* set to *true*; or
 - 2> if the UE is not configured with *gapRequestsAllowedDedicated* and *gapRequestsAllowedCommon* is included in *SystemInformationBlockType19*:
 - 3> if the UE requires sidelink discovery gaps to monitor the sidelink discovery announcements the UE is configured to monitor by upper layers:
 - 4> include *discRxGapReq* and set it to indicate, for each frequency that either concerns the primary frequency or is included in *discInterFreqList* on which the UE is configured to monitor sidelink discovery announcements and for which it requires sidelink discovery gaps to do so, the gap pattern(s) as well as the concerned frequency, if different from the primary;
 - 3> if the UE requires sidelink discovery gaps to transmit the sidelink discovery announcements the UE is configured to transmit by upper layers:
 - 4> include *discTxGapReq* and set it to indicate, for each frequency that either concerns the primary or is included in *discInterFreqList* on which the UE is configured to transmit sidelink discovery announcements and for which it requires sidelink discovery gaps to do so, the gap pattern(s) as well as the concerned frequency, if different from the primary;
- 1> else if the UE initiates the procedure to report the system information parameters related to sidelink discovery of carriers other than the primary:
 - 2> include *discSysInfoReportFreqList* and set it to report the system information parameter acquired from the cells on those carriers;

The UE shall:

- 1> if the UE initiates the sidelink UE information procedure while connected to an NR PCell:
 - 2> submit the *SidelinkUEInformation* message via SRB1 embedded in NR RRC message *ULInformationTransferIRAT* as specified in TS 38.331 [82];
- 1> else:
 - 2> submit the *SidelinkUEInformation* message to lower layers for transmission.

5.10.3 Sidelink communication monitoring

A UE capable of sidelink communication that is configured by upper layers to receive sidelink communication shall:

- 1> if the conditions for sidelink communication operation as defined in 5.10.1a are met:
- 2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4], clause 11.4:
- 3> if the cell chosen for sidelink communication reception broadcasts *SystemInformationBlockType18* including *commRxPool*:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated by *commRxPool*;

NOTE 1: If *commRxPool* includes one or more entries including *rxParametersNCell*, the UE may only monitor such entries if the associated PSS/SSS or SLSSIDs is detected. When monitoring such pool(s), the UE applies the timing of the concerned PSS/SSS or SLSS.

2> else (i.e. out of coverage on the sidelink carrier):

3> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources that were preconfigured (i.e. *preconfigComm* in *SL-Preconfiguration* defined in 9.3);

NOTE 2: The UE may monitor in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UE's own timing.

5.10.4 Sidelink communication transmission

A UE capable of sidelink communication that is configured by upper layers to transmit non-relay related sidelink communication and has related data to be transmitted or a UE capable of relay related sidelink communication that is configured by upper layers to transmit relay related sidelink communications and satisfies the conditions for relay related sidelink communication specified in this clause shall:

- 1> if the conditions for sidelink communication operation as defined in 5.10.1a are met:
- 2> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4], clause 11.4:
 - 3> if the UE is in RRC_CONNECTED and uses the PCell for sidelink communication:
 - 4> if the UE is configured, by the current PCell/ the PCell in which physical layer problems or radio link failure was detected, with *commTxResources* set to *scheduled*:
 - 5> if T310 or T311 is running; and if the PCell at which the UE detected physical layer problems or radio link failure broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional*; or
 - 5> if T301 is running and the cell on which the UE initiated connection re-establishment broadcasts *SystemInformationBlockType18* including *commTxPoolExceptional*:
 - 6> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolExceptional*;
 - 5> else:
 - 6> configure lower layers to request E-UTRAN to assign transmission resources for sidelink communication;
 - 4> else if the UE is configured with *commTxPoolNormalDedicated* or *commTxPoolNormalDedicatedExt*:
 - 5> if *priorityList* is included for the entries of *commTxPoolNormalDedicated* or *commTxPoolNormalDedicatedExt*:
 - 6> configure lower layers to transmit the sidelink control information and the corresponding data using the one or more pools of resources indicated by *commTxPoolNormalDedicated* or *commTxPoolNormalDedicatedExt* i.e. indicate all entries of this field to lower layers;
 - 5> else:
 - 6> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolNormalDedicated*;
 - 3> else (i.e. sidelink communication in RRC_IDLE or on cell other than PCell in RRC_CONNECTED):
 - 4> if the cell chosen for sidelink communication transmission broadcasts *SystemInformationBlockType18*:
 - 5> if *SystemInformationBlockType18* includes *commTxPoolNormalCommon*:
 - 6> if *priorityList* is included for the entries of *commTxPoolNormalCommon* or *commTxPoolNormalCommonExt*:
 - 7> configure lower layers to transmit the sidelink control information and the corresponding data using the one or more pools of resources indicated by *commTxPoolNormalCommon* and/or *commTxPoolNormalCommonExt* i.e. indicate all entries of these fields to lower layers;
 - 6> else:
 - 7> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolNormalCommon*;

- 5> else if *SystemInformationBlockType18* includes *commTxPoolExceptional*:
- 6> from the moment the UE initiates connection establishment until receiving an *RRCConnectionReconfiguration* including *sl-CommConfig* or until receiving an *RRCConnectionRelease* or an *RRCConnectionReject*;
- 7> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources indicated by the first entry in *commTxPoolExceptional*;
- 2> else (i.e. out of coverage on sidelink carrier):
- 3> if *priorityList* is included for the entries of *preconfigComm* in *SL-Preconfiguration* defined in 9.3:
- 4> configure lower layers to transmit the sidelink control information and the corresponding data using the one or more pools of resources indicated *preconfigComm* i.e. indicate all entries of this field to lower layers and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;
- 3> else:
- 4> configure lower layers to transmit the sidelink control information and the corresponding data using the pool of resources that were preconfigured i.e. indicated by the first entry in *preconfigComm* in *SL-Preconfiguration* defined in 9.3 and in accordance with the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;
- The conditions for relay related sidelink communication are as follows:
- 1> if the transmission concerns sidelink relay communication; and the UE is capable of sidelink relay or sidelink remote operation;
- 2> if the UE is in RRC_IDLE; and if the UE has a selected sidelink relay UE: configure lower layers to transmit the sidelink control information and the corresponding data using the resources, as specified previously in this clause, only if the following condition is met:
- 3> if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met; and if the UE configured lower layers with a pool of resources included in *SystemInformationBlockType18* (i.e. *commTxPoolNormalCommon*, *commTxPoolNormalCommonExt* or *commTxPoolExceptional*); and *commTxAllowRelayCommon* is included in *SystemInformationBlockType18*;
- 2> if the UE is in RRC_CONNECTED: configure lower layers to transmit the sidelink control information and the corresponding data using the resources, as specified previously in this clause, only if the following condition is met:
- 3> if the UE configured lower layers with resources provided by dedicated signalling (i.e. *commTxResources*); and the UE is configured with *commTxAllowRelayDedicated* set to *true*;

5.10.5 Sidelink discovery monitoring

A UE capable of non-PS related sidelink discovery that is configured by upper layers to monitor non-PS related sidelink discovery announcements shall:

- 1> for each frequency the UE is configured to monitor non-PS related sidelink discovery announcements on, prioritising the frequencies included in *discInterFreqList*, if included in *SystemInformationBlockType19*:
- 2> if the PCell or the cell the UE is camping on indicates the pool of resources to monitor sidelink discovery announcements on by *discRxResourcesInterFreq* in *discResourcesNonPS* within *discInterFreqList* in *SystemInformationBlockType19*:
- 3> configure lower layers to monitor sidelink discovery announcements using the pool of resources indicated by *discRxResourcesInterFreq* in *discResourcesNonPS* within *SystemInformationBlockType19*;
- 2> else if the cell used for sidelink discovery monitoring broadcasts *SystemInformationBlockType19*:

- 3> configure lower layers to monitor sidelink discovery announcements using the pool of resources indicated by *discRxPool* in *SystemInformationBlockType19*;
- 2> if the UE is configured with *discRxGapConfig* and requires sidelink discovery gaps to monitor sidelink discovery announcements on the concerned frequency;
 - 3> configure lower layers to monitor the concerned frequency using the sidelink discovery gaps indicated by *discRxGapConfig*;
- 2> else:
 - 3> configure lower layers to monitor the concerned frequency without affecting normal operation;

A UE capable of PS related sidelink discovery that is configured by upper layers to monitor PS related sidelink discovery announcements shall:

- 1> if out of coverage on the frequency, as defined in TS 36.304 [4], clause 11.4:
- 2> configure lower layers to monitor sidelink discovery announcements using the pool of resources that were preconfigured (i.e. indicated by *discRxPoolList* within *preconfigDisc* in *SL-Preconfiguration* defined in 9.3);
- 1> else if configured by upper layers to monitor non-relay PS related discovery announcements; and if the PCell or the cell the UE is camping on indicates a pool of resources to monitor sidelink discovery announcements on by *discRxResourcesInterFreq* in *discResourcesPS* within *discInterFreqList* in *SystemInformationBlockType19*:
 - 2> configure lower layers to monitor sidelink discovery announcements using the pool of resources indicated by *discRxResourcesInterFreq* in *discResourcesPS* in *SystemInformationBlockType19*;
- 1> else if configured by upper layers to monitor PS related sidelink discovery announcements; and if the cell used for sidelink discovery monitoring broadcasts *SystemInformationBlockType19*:
 - 2> configure lower layers to monitor sidelink discovery announcements using the pool of resources indicated by *discRxPoolPS* in *SystemInformationBlockType19*;
- 1> if the UE is configured with *discRxGapConfig* and requires sidelink discovery gaps to monitor sidelink discovery announcements on the concerned frequency;
 - 2> configure lower layers to monitor the concerned frequency using the sidelink discovery gaps indicated by *discRxGapConfig*;
- 1> else:
 - 2> configure lower layers to monitor the concerned frequency without affecting normal operation;

NOTE 1: The requirement not to affect normal UE operation also applies for the acquisition of sidelink discovery related system and synchronisation information from inter-frequency cells.

NOTE 2: The UE is not required to monitor all pools simultaneously.

NOTE 3: It is up to UE implementation to decide whether a cell is sufficiently good to be used to monitor sidelink discovery announcements.

NOTE 4: If *discRxPool*, *discRxPoolPS* or *discRxResourcesInterFreq* includes one or more entries including *rxParameters*, the UE may only monitor such entries if the associated SLSSIDs are detected. When monitoring such pool(s) the UE applies the timing of the corresponding SLSS.

5.10.6 Sidelink discovery announcement

A UE capable of non-PS related sidelink discovery that is configured by upper layers to transmit non-PS related sidelink discovery announcements shall, for each frequency the UE is configured to transmit such announcements on:

NOTE: In case the configured resources are insufficient it is up to UE implementation to decide which sidelink discovery announcements to transmit.

- 1> if the frequency used to transmit sidelink discovery announcements concerns the serving frequency (RRC_IDLE) or primary frequency (RRC_CONNECTED):

2> if the UE's serving cell (RRC_IDLE) or PCell (RRC_CONNECTED) is suitable as defined in TS 36.304 [4]:

3> if the UE is in RRC_CONNECTED (i.e. PCell is used for sidelink discovery announcement):

4> if the UE is configured with *discTxResources* set to *scheduled*:

5> configure lower layers to transmit the sidelink discovery announcement using the assigned resources indicated by *scheduled* in *discTxResources*;

4> else if the UE is configured with *discTxPoolDedicated* (i.e. *discTxResources* set to *ue-Selected*):

5> select an entry of the list of resource pool entries in *discTxPoolDedicated* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;

3> else if T300 is not running (i.e. UE in RRC_IDLE, announcing via serving cell):

4> if *SystemInformationBlockType19* of the serving cell includes *discTxPoolCommon*:

5> select an entry of the list of resource pool entries in *discTxPoolCommon* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;

1> else if, for the frequency used to transmit sidelink discovery announcements on, the UE is configured with dedicated resources (i.e. with *discTxResources-r12*, if *discTxCarrierFreq* is included in *discTxInterFreqInfo*, or with *discTxResources* within *discTxInfoInterFreqListAdd* in *discTxInterFreqInfo*); and the conditions for non-PS related sidelink discovery operation as defined in 5.10.1c are met:

2> if the UE is configured with *discTxResources* set to *scheduled*:

3> configure lower layers to transmit the sidelink discovery announcement using the assigned resources indicated by *scheduled* in *discTxResources*;

2> else if the UE is configured with *discTxResources* set to *ue-Selected*:

3> select an entry of the list of resource pool entries in *ue-Selected* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;

1> else if the frequency used to transmit sidelink discovery announcements on is included in *discInterFreqList* within *SystemInformationBlockType19* of the serving cell/ PCell, and *discTxResourcesInterFreq* within *discResourcesNonPS* in the corresponding entry of *discInterFreqList* is set to *discTxPoolCommon* (i.e. serving cell/ PCell broadcasts pool of resources) and the conditions for non-PS related sidelink discovery operation as defined in 5.10.1c are met; or

1> else if *discTxPoolCommon* is included in *SystemInformationBlockType19* acquired from cell selected on the sidelink discovery announcement frequency; and the conditions for non-PS related sidelink discovery operation as defined in 5.10.1c are met:

2> select an entry of the list of resource pool entries in *discTxPoolCommon* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;

1> if the UE is configured with *discTxGapConfig* and requires sidelink discovery gaps to transmit sidelink discovery announcements on the concerned frequency;

2> configure lower layers to transmit on the concerned frequency using the sidelink discovery gaps indicated by *discTxGapConfig*,

1> else:

2> configure lower layers to transmit on the concerned frequency without affecting normal operation;

A UE capable of PS related sidelink discovery that is configured by upper layers to transmit PS related sidelink discovery announcements shall:

1> if out of coverage on the frequency used to transmit PS related sidelink discovery announcements as defined in TS 36.304 [4], clause 11.4, and the conditions for PS-related sidelink discovery operation as defined in 5.10.1b are met:

2> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements; or

- 2> if the UE is selecting a sidelink relay UE/ has a selected sidelink relay UE:
 - 3> configure lower layers to transmit sidelink discovery announcements using the pool of resources that were preconfigured and in accordance with the following;
 - 4> randomly select, using a uniform distribution, an entry of *preconfigDisc* in *SL-Preconfiguration* defined in 9.3;
 - 4> using the timing of the selected SyncRef UE, or if the UE does not have a selected SyncRef UE, based on the UEs own timing;
- 1> else if the frequency used to transmit sidelink discovery announcements concerns the serving frequency (RRC_IDLE) or primary frequency (RRC_CONNECTED) and the conditions for PS related sidelink discovery operation as defined in 5.10.1b are met:
 - 2> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements; or
 - 2> if the UE is acting as sidelink relay UE; and if the UE is in RRC_IDLE; and if the sidelink relay UE threshold conditions as specified in 5.10.10.4 are met; or
 - 2> if the UE is acting as sidelink relay UE; and if the UE is in RRC_CONNECTED; or
 - 2> if the UE is selecting a sidelink relay UE / has a selected sidelink relay UE; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met:
 - 3> if the UE is configured with *discTxPoolPS-Dedicated*; or
 - 3> if the UE is in RRC_IDLE; and if *discTxPoolPS-Common* is included in *SystemInformationBlockType19*:
 - 4> select an entry of the list of resource pool entries and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;
 - 3> else if the UE is configured with *discTxResourcesPS* set to *scheduled*:
 - 4> configure lower layers to transmit the sidelink discovery announcement using the assigned resources indicated by *scheduled* in *discTxResourcesPS*;
 - 1> else if, for the frequency used to transmit sidelink discovery announcements on, the UE is configured with dedicated resources (i.e. with *discTxResourcesPS* in *discTxInterFreqInfo* within *sl-DiscConfig*); and the conditions for PS related sidelink discovery operation as defined in 5.10.1b are met:
 - 2> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements:
 - 3> if the UE is configured with *discTxResourcesPS* set to *scheduled*:
 - 4> configure lower layers to transmit the sidelink discovery announcement using the assigned resources indicated by *scheduled* in *discTxResourcesPS*;
 - 3> else if the UE is configured with *discTxResourcesPS* set to *ue-Selected*:
 - 4> select an entry of the list of resource pool entries in *ue-Selected* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;
 - 1> else if the frequency used to transmit sidelink discovery announcements on is included in *discInterFreqList* within *SystemInformationBlockType19* of the serving cell/ PCCell, while *discTxResourcesInterFreq* within *discResourcesPS* in the corresponding entry of *discInterFreqList* is set to *discTxPoolCommon* (i.e. serving cell/ PCCell broadcasts pool of resources) and the conditions for PS related sidelink discovery operation as defined in 5.10.1b are met:
 - 2> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements:
 - 3> select an entry of the list of resource pool entries in *discTxPoolCommon* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;
 - 1> else if *discTxPoolPS-Common* is included in *SystemInformationBlockType19* acquired from cell selected on the sidelink discovery announcement frequency; and the conditions for PS related sidelink discovery operation as defined in 5.10.1b are met:

- 2> if configured by upper layers to transmit non-relay PS related sidelink discovery announcements:
- 3> select an entry of the list of resource pool entries in *discTxPoolPS-Common* and configure lower layers to use it to transmit the sidelink discovery announcements as specified in 5.10.6a;
- 1> if the UE is configured with *discTxGapConfig* and requires gaps to transmit sidelink discovery announcements on the concerned frequency;
- 2> configure lower layers to transmit on the concerned frequency using the gaps indicated by *discTxGapConfig*,
- 1> else:
 - 2> configure lower layers to transmit on the concerned frequency without affecting normal operation;

5.10.6a Sidelink discovery announcement pool selection

A UE that is configured with a list of resource pool entries for sidelink discovery announcement transmission (i.e. by *SL-DiscTxPoolList*) shall:

- 1> if *poolSelection* is set to *rsrpBased*:
- 2> select a pool from the list of pools the UE is configured with for which the RSRP measurement of the reference cell selected as defined in 5.10.6b, after applying the layer 3 filter defined by *quantityConfig* as specified in 5.5.3.2, is in-between *threshLow* and *threshHigh*;
- 1> else:
 - 2> randomly select, using a uniform distribution, a pool from the list of pools the UE is configured with;
- 1> configure lower layers to transmit the sidelink discovery announcement using the selected pool of resources;

NOTE 1: When performing resource pool selection based on RSRP, the UE uses the latest results of the available measurements used for cell reselection evaluation in RRC_IDLE/ for measurement report triggering evaluation in RRC_CONNECTED, which are performed in accordance with the performance requirements specified in TS 36.133 [16].

5.10.6b Sidelink discovery announcement reference carrier selection

A UE capable of sidelink discovery that is configured by upper layers to transmit sidelink discovery announcements shall:

- 1> for each frequency the UE is transmitting sidelink discovery announcements on, select a cell to be used as reference for synchronisation and DL measurements in accordance with the following:
 - 2> if the frequency concerns the primary frequency:
 - 3> use the PCell as reference;
 - 2> else if the frequency concerns a secondary frequency:
 - 3> use the concerned SCell as reference;
 - 2> else if the UE is configured with *discTxRefCarrierDedicated* for the frequency:
 - 3> use the cell indicated by this field as reference;
 - 2> else if the UE is configured with *refCarrierCommon* for the frequency:
 - 3> use the serving cell (RRC_IDLE)/ PCell (RRC_CONNECTED) as reference;
 - 2> else:
 - 3> use the DL frequency paired with the one used to transmit sidelink discovery announcements on as reference;

5.10.7 Sidelink synchronisation information transmission

5.10.7.1 General

Figure 5.10.7.1-1: Synchronisation information transmission for sidelink communication or V2X sidelink communication, in (partial) coverage

Figure 5.10.7.1-2: Synchronisation information transmission for sidelink communication or V2X sidelink communication / sidelink discovery, out of coverage

Figure 5.10.7.1-3: Synchronisation information transmission for sidelink discovery, in (partial) coverage

The purpose of this procedure is to provide synchronisation information to a UE. For sidelink discovery, the synchronisation information concerns a Sidelink Synchronisation Signal (SLSS) and, in case of PS related discovery, also timing information and some additional configuration parameters (i.e. the *MasterInformationBlock-SL* message), while for sidelink communication or V2X sidelink communication it concerns an SLSS and the *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message. A UE transmits synchronisation information either when E-UTRAN configures it to do so by dedicated signalling (i.e. network based), or when not configured by dedicated signalling (i.e. UE based) and E-UTRAN broadcasts (in coverage) or pre-configures a threshold (out of coverage).

The synchronisation information transmitted by the UE may be derived from information/ signals received from E-UTRAN (in coverage) or received from a UE acting as synchronisation reference for the transmitting UE or received from GNSS. In the remainder, the UE acting as synchronisation reference is referred to as SyncRef UE.

5.10.7.2 Initiation

A UE capable of SLSS transmission shall, when transmitting sidelink discovery announcements in accordance with 5.10.6 and when the following conditions are met:

- 1> if in coverage on the frequency used for sidelink discovery, as defined in TS 36.304 [4], clause 11.4;
 - 2> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*; or
 - 2> if *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType19*; and the RSRP measurement of the reference cell, selected as defined in 5.10.6b, is below the value of *syncTxThreshIC*:
 - 3> if the sidelink discovery announcements are not PS related; or if *syncTxPeriodic* is not included:
 - 4> transmit SLSS on the frequency used for sidelink discovery in accordance with 5.10.7.3 and TS 36.211 [21]; - 3> else:
 - 4> transmit SLSS on the frequency used for sidelink discovery in accordance with 5.10.7.3 and TS 36.211 [21];
 - 4> transmit the *MasterInformationBlock-SL* message on the frequency used for sidelink discovery, in the same subframe as SLSS, and in accordance with 5.10.7.4;
- 1> else (i.e. out of coverage, PS):
- 2> if *syncTxThreshOoC* is included in the preconfigured sidelink parameters (i.e. *SL-Preconfiguration* defined in 9.3); and the UE has not selected SyncRef UE or the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*:
 - 3> transmit SLSS on the frequency used for sidelink discovery in accordance with 5.10.7.3 and TS 36.211 [21];
 - 3> transmit the *MasterInformationBlock-SL* message on the frequency used for sidelink discovery, in the same subframe as SLSS, and in accordance with 5.10.7.4;

A UE capable of sidelink communication that is configured by upper layers to transmit sidelink communication shall, irrespective of whether or not it has data to transmit:

- 1> if the conditions for sidelink communication operation as defined in 5.10.1a are met:
- 2> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*:
- 3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];
- 3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

A UE shall, when transmitting sidelink communication in accordance with 5.10.4 and when the following conditions are met:

- 1> if in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4], clause 11.4;
- 2> if the UE is in RRC_CONNECTED; and *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType18*; and the RSRP measurement of the cell chosen for sidelink communication transmission is below the value of *syncTxThreshIC*; or
- 2> if the UE is in RRC_IDLE; and *syncTxThreshIC* is included in *SystemInformationBlockType18*; and the RSRP measurement of the cell chosen for sidelink communication transmission is below the value of *syncTxThreshIC*:
- 3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];
- 3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

1> else (i.e. out of coverage):

2> if *syncTxThreshOoC* is included in the preconfigured sidelink parameters (i.e. *SL-Preconfiguration* defined in 9.3); and the UE has no selected SyncRef UE or the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*:

3> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];

3> transmit the *MasterInformationBlock-SL* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

A UE capable of V2X sidelink communication and SLSS/PSBCH transmission shall, when transmitting non-P2X related V2X sidelink communication in accordance with 5.10.13, and if the conditions for V2X sidelink communication operation as defined in 5.10.1d are met and when the following conditions are met:

1> if in coverage on the frequency used for V2X sidelink communication, as defined in TS 36.304 [4], clause 11.4; and has selected GNSS or the cell as synchronization reference as defined in 5.10.13.3; or

1> if out of coverage on the frequency used for V2X sidelink communication, as defined in TS 36.304 [4], clause 11.4, and the frequency used to transmit V2X sidelink communication is included in *v2x-InterFreqInfoList* in *RRCConectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/ PCell; and has selected GNSS or the cell as synchronization reference as defined in 5.10.13.3:

2> if *syncFreqList* is not included in *RRCConectionReconfiguration* nor in *SystemInformationBlockType26*; or

2> if *syncFreqList* is included in *RRCConectionReconfiguration* or in *SystemInformationBlockType26*; and if none of the frequency(ies) selected as specified in TS 36.321 [6] is included in the *syncFreqList* or the concerned frequency is selected as the synchronisation carrier frequency in accordance with 5.10.8a; or

2> if *syncFreqList* and *slss-TxMultiFreq* are included in *RRCConectionReconfiguration* or in *SystemInformationBlockType26*; and if the UE has selected a frequency other than the concerned frequency as the synchronisation carrier frequency; and if *slss-TxDisabled* corresponding to the concerned frequency is not configured in *RRCConectionReconfiguration*; and if the concerned frequency has been selected for V2X sidelink communication transmission as specified in TS 36.321 [6] and is included in *syncFreqList*; and if UE is capable of SLSS/PSBCH transmission on the concerned frequency:

3> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*; or

3> if *networkControlledSyncTx* is not configured; and for the concerned frequency *syncTxThreshIC* is configured; and the RSRP measurement of the reference cell, selected as defined in 5.10.13.3, for V2X sidelink communication transmission is below the value of *syncTxThreshIC*:

4> transmit SLSS on the frequency used for V2X sidelink communication in accordance with 5.10.7.3 and TS 36.211 [21];

4> transmit the *MasterInformationBlock-SL-V2X* message on the frequency used for V2X sidelink communication, in the same subframe as SLSS, and in accordance with 5.10.7.4;

1> else:

2> for the frequency used for V2X sidelink communication, if *syncOffsetIndicators* is included in *SL-V2X-Preconfiguration*:

3> If *syncFreqList* is not included in *SL-V2X-Preconfiguration*; or

3> if *syncFreqList* is included in *SL-V2X-Preconfiguration*, and if none of the frequency(ies) selected as specified in TS 36.321 [6] is included in the *syncFreqList* or the concerned frequency is selected as the synchronisation carrier frequency in accordance with 5.10.8a; or

3> if *syncFreqList* and *slss-TxMultiFreq* are included in *SL-V2X-Preconfiguration*, and if the UE has selected a frequency other than the concerned frequency as the synchronisation carrier frequency; and if *slss-TxDisabled* corresponding to the concerned frequency is not configured in *SL-V2X-Preconfiguration*; and if the concerned frequency has been selected for V2X sidelink communication transmission as specified in TS 36.321 [6] and included in *syncFreqList*; and if the UE is capable of SLSS/PSBCH transmission on the frequency:

- 4> if *syncTxThreshOoC* is included in *SL-V2X-Preconfiguration*; and the UE is not directly synchronized to GNSS, and the UE has no selected SyncRef UE or the S-RSRP measurement result of the selected SyncRef UE is below the value of *syncTxThreshOoC*; or
- 4> if the UE selects GNSS as the synchronization reference source:
 - 5> transmit SLSS in accordance with 5.10.7.3 and TS 36.211 [21];
 - 5> transmit the *MasterInformationBlock-SL-V2X* message, in the same subframe as SLSS, and in accordance with 5.10.7.4;

NOTE 1: In the case of limited transmission capabilities on multiple carrier frequencies, when the UE is configured with *syncFreqList*, whether to transmit SLSS/PSBCH on a frequency, which is selected for V2X sidelink communication transmission as specified in TS 36.321 [6] and is other than the synchronisation carrier frequency, is up to UE implementation.

5.10.7.3 Transmission of SLSS

The UE shall select the SLSSID and the subframe in which to transmit SLSS as follows:

- 1> if triggered by sidelink discovery announcement and in coverage on the frequency used for sidelink discovery, as defined in TS 36.304 [4], clause 11.4:
 - 2> select the SLSSID included in the entry of *discSyncConfig* included in the received *SystemInformationBlockType19*, that includes *txParameters*;
 - 2> use *syncOffsetIndicator* corresponding to the selected SLSSID;
 - 2> for each pool used for the transmission of discovery announcements (each corresponding to the selected SLSSID):
 - 3> if a subframe indicated by *syncOffsetIndicator* corresponds to the first subframe of the discovery transmission pool;
 - 4> if *discTxGapConfig* is configured and includes the concerned subframe; or the subframe is not used for regular uplink transmission:
 - 5> select the concerned subframe;
 - 3> else:
 - 4> if *discTxGapConfig* is configured and includes the concerned subframe; or the subframe is not used for regular uplink transmission:
 - 5> select the subframe indicated by *syncOffsetIndicator* that precedes and which, in time domain, is nearest to the first subframe of the discovery transmission pool;
 - 3> if the sidelink discovery announcements concern PS; and if *syncTxPeriodic* is included:
 - 4> additionally select each subframe that periodically occurs 40 subframes after the selected subframe;
 - 1> if triggered by sidelink communication and in coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4], clause 11.4:
 - 2> select the SLSSID included in the entry of *commSyncConfig* that is included in the received *SystemInformationBlockType18* and includes *txParameters*;
 - 2> use *syncOffsetIndicator* corresponding to the selected SLSSID;
 - 2> if in RRC_CONNECTED; and if *networkControlledSyncTx* is configured and set to *on*:
 - 3> select the subframe(s) indicated by *syncOffsetIndicator*;
 - 2> else (when transmitting communication):

- 3> select the subframe(s) indicated by *syncOffsetIndicator* within the SC period in which the UE intends to transmit sidelink control information or data;
- 1> if triggered by V2X sidelink communication and in coverage on the frequency used for V2X sidelink communication, as defined in TS 36.304 [4], clause 11.4; or
- 1> if triggered by V2X sidelink communication, and out of coverage on the frequency used for V2X sidelink communication, and the concerned frequency is included in *v2x-InterFreqInfoList* in *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* of the serving cell/ PCell;
- 2> if the UE has selected GNSS as synchronization reference in accordance with 5.10.8.2:
 - 3> select SLSSID 0;
 - 3> use *syncOffsetIndicator* included in the entry of *v2x-SyncConfig* corresponding to the concerned frequency in *v2x-InterFreqInfoList* or within *SystemInformationBlockType21*, that includes *txParameters* and *gnss-Sync*;
 - 3> select the subframe(s) indicated by *syncOffsetIndicator*;
- 2> if the UE has selected a cell as synchronization reference in accordance with 5.10.8.2:
 - 3> select the SLSSID included in the entry of *v2x-SyncConfig* configured for the concerned frequency in *v2x-InterFreqInfoList* or within *SystemInformationBlockType21*, that includes *txParameters* and does not include *gnss-Sync*;
 - 3> use *syncOffsetIndicator* corresponding to the selected SLSSID;
 - 3> select the subframe(s) indicated by *syncOffsetIndicator*;
- 1> else if triggered by V2X sidelink communication and the UE has GNSS as the synchronization reference:
 - 2> select SLSSID 0;
 - 2> if *syncOffsetIndicator3* is configured for the frequency used for V2X sidelink communication in *SL-V2X-Preconfiguration*:
 - 3> select the subframe(s) indicated by *syncOffsetIndicator3*;
 - 2> else:
 - 3> select the subframe(s) indicated by *syncOffsetIndicator1*;
 - 1> else:
 - 2> select the synchronisation reference UE (i.e. SyncRef UE) as defined in 5.10.8;
 - 2> if the UE has a selected SyncRef UE and *inCoverage* in the *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message received from this UE is set to *TRUE*; or
 - 2> if the UE has a selected SyncRef UE and *inCoverage* in the *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message received from this UE is set to *FALSE* while the SLSS from this UE is part of the set defined for out of coverage, see TS 36.211 [21];
 - 3> select the same SLSSID as the SLSSID of the selected SyncRef UE;
 - 3> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* or *v2x-CommPreconfigSync* in *SL-V2X-Preconfiguration* defined in 9.3) corresponding to the concerned frequency, such that the subframe timing is different from the SLSS of the selected SyncRef UE;
 - 2> else if the UE has a selected SyncRef UE and the SLSS from this UE was transmitted on the subframe indicated by *syncOffsetIndicator3* that is included in the *syncOffsetIndicators* in *SL-V2X-Preconfiguration*, and is corresponding to the frequency used for V2X sidelink communication:

- 3> select SLSSID 169;
- 3> select the subframe(s) indicated by *syncOffsetIndicator2*;
- 2> else if the UE has a selected SyncRef UE:
 - 3> select the SLSSID from the set defined for out of coverage having an index that is 168 more than the index of the SLSSID of the selected SyncRef UE, see TS 36.211 [21];
 - 3> select the subframe in which to transmit the SLSS according to *syncOffsetIndicator1* or *syncOffsetIndicator2* included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* or *v2x-CommPreconfigSync* in *SL-V2X-Preconfiguration* defined in 9.3), such that the subframe timing is different from the SLSS of the selected SyncRef UE;
- 2> else (i.e. no SyncRef UE selected):
 - 3> if the UE has not randomly selected an SLSSID:
 - 4> if triggered by V2X sidelink communication, randomly select, using a uniform distribution, an SLSSID from the set of sequences defined for out of coverage except SLSSID 168 and 169, see TS 36.211 [21];
 - 4> else, randomly select, using a uniform distribution, an SLSSID from the set of sequences defined for out of coverage, see TS 36.211 [21];
 - 4> select the subframe in which to transmit the SLSS according to the *syncOffsetIndicator1* or *syncOffsetIndicator2* (arbitrary selection between these) included in the preconfigured sidelink parameters (i.e. *preconfigSync* in *SL-Preconfiguration* or *v2x-CommPreconfigSync* in *SL-V2X-Preconfiguration* defined in 9.3);

5.10.7.4 Transmission of *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message

The UE shall set the contents of the *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message as follows:

- 1> if in coverage on the frequency used for the sidelink operation that triggered this procedure as defined in TS 36.304 [4], clause 11.4:
 - 2> set *inCoverage* to *TRUE*;
 - 2> set *sl-Bandwidth* to the value of *ul-Bandwidth* as included in the received *SystemInformationBlockType2* of the cell chosen for the concerned sidelink operation;
 - 2> if *tdd-Config* is included in the received *SystemInformationBlockType1*:
 - 3> set *subframeAssignmentSL* to the value representing the same meaning as of *subframeAssignment* that is included in *tdd-Config* in the received *SystemInformationBlockType1*;
 - 2> else:
 - 3> set *subframeAssignmentSL* to *none*;
 - 2> if triggered by sidelink communication; and if *syncInfoReserved* is included in an entry of *commSyncConfig* from the received *SystemInformationBlockType18*:
 - 3> set *reserved* to the value of *syncInfoReserved* in the received *SystemInformationBlockType18*;
 - 2> if triggered by sidelink discovery; and if *syncInfoReserved* is included in an entry of *discSyncConfig* from the received *SystemInformationBlockType19*:
 - 3> set *reserved* to the value of *syncInfoReserved* in the received *SystemInformationBlockType19*;
 - 2> if triggered by V2X sidelink communication; and if *syncInfoReserved* is included in an entry of *v2x-SyncConfig* from the received *SystemInformationBlockType21* or *SystemInformationBlockType26*:

3> set *reserved* to the value of *syncInfoReserved* in the received *SystemInformationBlockType21* or *SystemInformationBlockType26*;

2> else:

3> set all bits in *reserved* to 0;

1> else if out of coverage on the frequency used for V2X sidelink communication as defined in TS 36.304 [4], clause 11.4; and the concerned frequency is included in *v2x-InterFreqInfoList* in *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/ PCell:

2> set *inCoverage* to TRUE;

2> set *sl-Bandwidth* to the value of the corresponding field included in *v2x-InterFreqInfoList*;

2> set *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the preconfigured sidelink parameters (i.e. *v2x-CommPreconfigGeneral* in *SL-V2X-Preconfiguration* defined in 9.3);

1> else if out of coverage on the frequency used for V2X sidelink communication as defined in TS 36.304 [4], clause 11.4; and the UE selects GNSS timing as the synchronization reference source and *syncOffsetIndicator3* is not included in *SL-V2X-Preconfiguration*:

2> set *inCoverage* to TRUE;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the preconfigured sidelink parameters (i.e. *v2x-CommPreconfigGeneral* in *SL-V2X-Preconfiguration* defined in 9.3);

1> else if the UE has a selected SyncRef UE (as defined in 5.10.8) and if the SyncRef UE is selected on the concern frequency:

2> set *inCoverage* to FALSE;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the received *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X*;

1> else:

2> set *inCoverage* to FALSE;

2> set *sl-Bandwidth*, *subframeAssignmentSL* and *reserved* to the value of the corresponding field included in the preconfigured sidelink parameters (i.e. *preconfigGeneral* in *SL-Preconfiguration* or *v2x-CommPreconfigGeneral* in *SL-V2X-Preconfiguration* defined in 9.3);

1> set *directFrameNumber* and *directSubframeNumber* according to the subframe used to transmit the SLSS, as specified in 5.10.7.3;

1> submit the *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message to lower layers for transmission upon which the procedure ends;

5.10.7.5 Void

5.10.8 Sidelink synchronisation reference

5.10.8.1 General

The purpose of this procedure is to select a synchronisation reference and used a.o. when transmitting sidelink communication, V2X sidelink communication, sidelink discovery or synchronisation information.

5.10.8.2 Selection and reselection of synchronisation reference

The UE shall:

- 1> if triggered by V2X sidelink communication, and in coverage on the frequency for V2X sidelink communication; or
- 1> if triggered by V2X sidelink communication, and out of coverage on the frequency for V2X sidelink communication, and the frequency used to transmit V2X sidelink communication is included in *v2x-InterFreqInfoList* in *RRCConectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/ PCell:
- 2> if *syncFreqList* is not included in *RRCConectionReconfiguration* nor in *SystemInformationBlockType26*; or
- 2> if *syncFreqList* is included in *RRCConectionReconfiguration* or in *SystemInformationBlockType26*, and none of the frequency(ies) selected as specified in TS 36.321 [6] is included in the *syncFreqList*; or
- 2> if *syncFreqList* is included in *RRCConectionReconfiguration* or in *SystemInformationBlockType26*, and no synchronisation carrier frequency is selected as specified in 5.10.8a:
 - 3> if *typeTxSync* is configured for the concerned frequency and set to *enb*:
 - 4> select a cell as the synchronization reference source as defined in 5.10.13.3;
 - 3> else if *typeTxSync* for the concerned frequency is not configured or is set to *gnss*, and GNSS is reliable in accordance with TS 36.101 [42] and TS 36.133 [16]:
 - 4> select GNSS as the synchronization reference source;
 - 3> else (i.e., there is no GNSS which is reliable in accordance with TS 36.101 [42] and TS 36.133 [16]):
 - 4> search SLSSID=0 on the concerned frequency to detect candidate SLSS, in accordance with TS 36.133 [16];
 - 4> when evaluating the detected SLSS, apply layer 3 filtering as specified in 5.5.3.2 using the preconfigured *filterCoefficient* as defined in 9.3, before using the S-RSRP measurement results;
 - 4> if the S-RSRP of the SyncRef UE identified by the detected SLSS exceeds the minimum requirement defined in TS 36.133 [16]:
 - 5> select the SyncRef UE;
 - 4> else (i.e., no SLSSID=0 detected):
 - 5> select a cell as the synchronization reference source as defined in 5.10.13.3;
 - 2> if *syncFreqList* is included in *RRCConectionReconfiguration* or in *SystemInformationBlockType26*, and the UE has selected a synchronisation carrier frequency as specified in 5.10.8a:
 - 3> consider the synchronisation reference source (i.e. eNB, GNSS or SyncRef UE) that is selected on the synchronisation carrier frequency as the synchronization reference;
 - 1> else, if triggered by V2X sidelink communication, and out of coverage on the frequency for V2X sidelink communication, and for the frequency used for V2X sidelink communication, if *syncPriority* in *SL-V2X-Preconfiguration* is set to *gnss* and GNSS is reliable in accordance with TS 36.101 [42] and TS 36.133 [16]:
 - 2> select GNSS as the synchronization reference source;
 - 1> else, for the frequency used for sidelink communication, V2X sidelink communication or sidelink discovery, if out of coverage on that frequency as defined in TS 36.304 [4], clause 11.4:
 - 2> if triggered by sidelink communication or sidelink discovery; or
 - 2> if triggered by V2X sidelink communication, and *syncFreqList* is not included in *SL-V2X-Preconfiguration*; or
 - 2> if triggered by V2X sidelink communication, and *syncFreqList* is included in *SL-V2X-Preconfiguration*, and none of the frequency(ies) selected as specified in TS 36.321 [6] is included in the *syncFreqList*; or
 - 2> if triggered by V2X sidelink communication, and *syncFreqList* is included in *SL-V2X-Preconfiguration*, and no synchronisation carrier frequency is selected as specified in 5.10.8a:

- 3> perform a full search (i.e. covering all subframes and all possible SLSSIDs) to detect candidate SLSS, in accordance with TS 36.133 [16]
- 3> when evaluating the one or more detected SLSSIDs, apply layer 3 filtering as specified in 5.5.3.2 using the preconfigured *filterCoefficient* as defined in 9.3, before using the S-RSRP measurement results;
- 3> if the UE has selected a SyncRef UE:
 - 4> if the S-RSRP of the strongest candidate SyncRef UE exceeds the minimum requirement TS 36.133 [16] by *syncRefMinHyst* and the strongest candidate SyncRef UE belongs to the same priority group as the current SyncRef UE and the S-RSRP of the strongest candidate SyncRef UE exceeds the S-RSRP of the current SyncRef UE by *syncRefDiffHyst*; or
 - 4> if the S-RSRP of the candidate SyncRef UE exceeds the minimum requirement TS 36.133 [16] by *syncRefMinHyst* and the candidate SyncRef UE belongs to a higher priority group than the current SyncRef UE; or
 - 4> if GNSS becomes reliable in accordance with TS 36.101 [42] and TS 36.133 [16], and GNSS belongs to a higher priority group than the current SyncRef UE; or
 - 4> if the S-RSRP of the current SyncRef UE is less than the minimum requirement defined in TS 36.133 [16]:
 - 5> consider no SyncRef UE to be selected;
- 3> if the UE has selected GNSS as the synchronization reference for V2X sidelink communication:
 - 4> if the S-RSRP of the candidate SyncRef UE exceeds the minimum requirement defined in TS 36.133 [16] by *syncRefMinHyst* and the candidate SyncRef UE belongs to a higher priority group than GNSS; or
 - 4> if GNSS becomes not reliable in accordance with TS 36.101 [42] and TS 36.133 [16]:
 - 5> consider GNSS not to be selected;
- 3> if the UE has not selected a SyncRef UE and has not selected GNSS as synchronization reference source:
 - 4> if not concerning V2X sidelink communication, and if the UE detects one or more SLSSIDs for which the S-RSRP exceeds the minimum requirement defined in TS 36.133 [16] by *syncRefMinHyst* and for which the UE received the corresponding *MasterInformationBlock-SL* message (candidate SyncRef UEs), select a SyncRef UE according to the following priority group order:
 - 5> UEs of which *inCoverage*, included in the *MasterInformationBlock-SL* message received from this UE, is set to *TRUE*, starting with the UE with the highest S-RSRP result (priority group 1);
 - 5> UEs of which SLSSID is part of the set defined for in coverage, starting with the UE with the highest S-RSRP result (priority group 2);
 - 5> Other UEs, starting with the UE with the highest S-RSRP result (priority group 3);
 - 4> for V2X sidelink communication, if the UE detects one or more SLSSIDs for which the S-RSRP exceeds the minimum requirement defined in TS 36.133 [16] by *syncRefMinHyst* and for which the UE received the corresponding *MasterInformationBlock-SL-V2X* message (candidate SyncRef UEs), or if the UE detects GNSS that is reliable in accordance with TS 36.101 [42] and TS 36.133 [16], select a synchronization reference according to the following priority group order:
 - 5> if *syncPriority* corresponding to the concerned frequency in *SL-V2X-Preconfiguration* is set to *enb*:
 - 6> UEs of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, starting with the UE with the highest S-RSRP result (priority group 1);
 - 6> UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 2);

- 6> GNSS that is reliable in accordance with TS 36.101 [42] and TS 36.133 [16] (priority group 3);
- 6> UEs of which SLSSID is 0, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, or of which SLSSID is 0 and SLSS is transmitted on subframes indicated by *syncOffsetIndicator3*, starting with the UE with the highest S-RSRP result (priority group 4);
- 6> UEs of which SLSSID is 0 and is not transmitted on subframes indicated by *syncOffsetIndicator3*, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 5);
- 6> UEs of which SLSSID is 169, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 5);
- 6> Other UEs, starting with the UE with the highest S-RSRP result (priority group 6);
- 5> if *syncPriority* corresponding to the concerned frequency in *SL-V2X-Preconfiguration* is set to *gnss*:
 - 6> GNSS that is reliable in accordance with TS 36.101 [42] and TS 36.133 [16] (priority group 1);
 - 6> UEs of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, starting with the UE with the highest S-RSRP result (priority group 2);
 - 6> UEs of which SLSSID is 0, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, or of which SLSSID is 0 and SLSS is transmitted on subframes indicated by *syncOffsetIndicator3*, starting with the UE with the highest S-RSRP result (priority group 2);
 - 6> UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 3);
 - 6> UEs of which SLSSID is 0 and is not transmitted on subframes indicated by *syncOffsetIndicator3*, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 3);
 - 6> UEs of which SLSSID is 169, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE*, starting with the UE with the highest S-RSRP result (priority group 3);
 - 6> Other UEs, starting with the UE with the highest S-RSRP result (priority group 4);
- 2> if triggered by V2X sidelink communication, and *syncFreqList* is included in *SL-V2X-Preconfiguration*, and the UE has selected a synchronisation carrier frequency as specified in 5.10.8a;
- 3> consider the synchronization reference source (i.e. eNB, GNSS or SyncRef UE) that selected on the synchronisation carrier frequency as the synchronization reference;

5.10.8a Selection and reselection of synchronisation carrier frequency

For the frequency(ies) which are in coverage for the UE as defined in TS 36.304 [4], clause 11.4 and which have been selected for V2X sidelink communication as specified in TS 36.321 [6], and/or for the frequency(ies) which are out of coverage for the UE and included in *v2x-InterFreqInfoList* within *RRCCConnectionReconfiguration* or *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/ PCell and which have been selected for V2X sidelink communication as specified in TS 36.321 [6], the UE capable of V2X sidelink communication and synchronisation carrier frequency selection shall:

- 1> if *syncFreqList* is included in *RRCCConnectionReconfiguration* or in *SystemInformationBlockType26*, and includes at least one of the concerned frequency(ies):

- 2> if no synchronisation carrier frequency is selected:
 - 3> if *typeTxSync* is configured for the concerned frequency(ies) and set to *enb*; or
 - 3> if *typeTxSync* for the concerned frequency(ies) is not configured or is set to *gnss*, and GNSS is reliable in accordance with TS 36.101 [42] and TS 36.133 [16];
 - 4> select one frequency from the concerned frequency(ies) which are included in *syncFreqList* as the synchronisation carrier frequency.
 - 3> else (i.e., there is no GNSS which is reliable in accordance with TS 36.101 [42] and TS 36.133 [16]);
 - 4> select the synchronisation reference source(s) on the concerned frequency(ies) which are included in *syncFreqList* according to 5.10.8.2;
 - 4> if SyncRef UE(s) with SLSSID=0 is detected on at least one frequency from the concerned frequency(ies);
 - 5> select one frequency from the concerned frequency(ies) with the SyncRef UE(s) with SLSSID=0 detected as the synchronisation carrier frequency;
 - 4> else (i.e., no SLSSID=0 detected and UE selects a cell as the synchronisation reference source);
 - 5> select one frequency from the concerned frequencies which are included in *syncFreqList* as the synchronisation carrier frequency;
 - 2> else (i.e. the synchronisation carrier frequency is selected):
 - 3> if the UE selects GNSS as the synchronisation reference source, and GNSS is unreliable in accordance with TS 36.101 [42] and TS 36.133 [16]; or
 - 3> if the UE selects a cell as the synchronisation reference source, and the cell cannot fulfil the S criterion in accordance with TS 36.304 [4]; or
 - 3> if the UE selects a SyncRef UE and the S-RSRP of the current SyncRef UE is less than the minimum requirement defined in TS 36.133 [16]; or
 - 3> if the synchronisation carrier frequency is not selected for V2X sidelink communication as specified in TS 36.321 [6];
 - 4> consider no synchronisation carrier frequency is selected;

For the frequency(ies) which are out of coverage for the UE and not included in *v2x-InterFreqInfoList* within *RRCConnectionReconfiguration* nor *SystemInformationBlockType21* nor *SystemInformationBlockType26* of the serving cell/ PCell and which have been selected for V2X sidelink carrier communication as specified in TS 36.321 [6], the UE capable of V2X sidelink communication and selection of synchronisation carrier frequency selection shall:

- 1> if *syncFreqList* is included in *SL-V2X-Preconfiguration*, and at least one of the concerned frequency(ies) is included in *syncFreqList*:
- 2> if no synchronisation carrier frequency is selected:
 - 3> if *syncPriority* in *SL-V2X-Preconfiguration* is set to *gnss* and GNSS is reliable in accordance with TS 36.101 [42] and TS 36.133 [16];
 - 4> select one frequency from the concerned frequency(ies) which are included in *syncFreqList* as the synchronisation carrier frequency.
 - 3> else:
 - 4> select the synchronisation reference source(s) on the concerned frequency(ies) which are included in *SyncFreqList* according to 5.10.8.2;
 - 4> select the frequency with the highest synchronisation reference source priority as the synchronisation carrier frequency, according to the following priority group order:

- 5> if *syncPriority* corresponding to the concerned frequency(ies) in *SL-V2X-Preconfiguration* is set to *enb*:
- 6> the frequency(ies) with SyncRef UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE* (priority group 1);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 2);
 - 6> the frequency(ies) using GNSS as synchronisation reference source (priority group 3);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 0, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, or of which SLSSID is 0 and SLSS is transmitted on subframes indicated by *syncOffsetIndicator3* (priority group 4);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 0 and is not transmitted on subframes indicated by *syncOffsetIndicator3*, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 5);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 169, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 5);
 - 6> the frequency(ies) with other SyncRef UE (priority group 6);
- 5> if *syncPriority* corresponding to the concerned frequency(ies) in *SL-V2X-Preconfiguration* is set to *gnss*:
- 6> the frequency(ies) with SyncRef UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE* (priority group 1);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 0, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *TRUE*, or of which SLSSID is 0 and SLSS is transmitted on subframes indicated by *syncOffsetIndicator3* (priority group 1);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is part of the set defined for in coverage, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 2);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 0 and is not transmitted on subframes indicated by *syncOffsetIndicator3*, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 2);
 - 6> the frequency(ies) with SyncRef UE of which SLSSID is 169, and *inCoverage*, included in the *MasterInformationBlock-SL-V2X* message received from this UE, is set to *FALSE* (priority group 2);
 - 6> the frequency(ies) with other SyncRef UE (priority group 3);
- 2> else (i.e. the synchronisation carrier frequency is selected):
- 3> if the UE selects GNSS as the synchronisation reference source, and GNSS is unreliable in accordance with TS 36.101 [42] and TS 36.133 [16]; or
 - 3> if the UE selects a SyncRef UE and the S-RSRP of the current SyncRef UE is less than the minimum requirement defined in TS 36.133 [16]; or
 - 3> if the synchronisation carrier frequency is not selected for V2X sidelink communication as specified in TS 36.321 [6];
 - 4> consider no synchronisation carrier frequency is selected;

NOTE 1: If more than one selected carrier frequencies satisfy the condition as the synchronisation carrier frequency for V2X sidelink communication, how to select one synchronisation carrier frequency is up to UE implementation.

NOTE 2: All concerned carrier frequency(ies) have the same *typeTxSync* and *syncPriority* configured.

5.10.9 Sidelink common control information

5.10.9.1 General

The sidelink common control information is carried by a single message, the *MasterInformationBlock-SL* (MIB-SL) message for sidelink discovery and sidelink communication or the *MasterInformationBlock-SL-V2X* (MIB-SL-V2X) message for V2X sidelink communication. The MIB-SL or MIB-SL-V2X includes timing information as well as some configuration parameters and is transmitted via SL-BCH.

The MIB-SL for sidelink discovery and sidelink communication uses a fixed schedule with a periodicity of 40 ms without repetitions. In particular, the MIB-SL is scheduled in subframes indicated by *syncOffsetIndicator-r12* i.e. for which $(10*DFN + \text{subframe number}) \bmod 40 = \text{syncOffsetIndicator-r12}$.

The MIB-SL-V2X for V2X sidelink communication uses a fixed schedule with a periodicity of 160 ms without repetitions. In particular, the MIB-SL-V2X is scheduled in subframes indicated by *SL-OffsetIndicatorSync* i.e. for which $(10*DFN + \text{subframe number}) \bmod 160 = \text{SL-OffsetIndicatorSync}$.

The sidelink common control information may change at any transmission i.e. neither a modification period nor a change notification mechanism is used.

A UE configured to receive or transmit sidelink communication or PS related sidelink discovery shall:

- 1> if the UE has a selected SyncRef UE, as specified in 5.10.8.2;
- 2> ensure having a valid version of the *MasterInformationBlock-SL* message of that SyncRefUE;

A UE configured to receive or transmit V2X sidelink communication shall:

- 1> if the UE has a selected SyncRef UE, as specified in 5.10.8.2;
- 2> ensure having a valid version of the *MasterInformationBlock-SL-V2X* message of that SyncRefUE;

5.10.9.2 Actions related to reception of *MasterInformationBlock-SL*/ *MasterInformationBlock-SL-V2X* message

Upon receiving *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X*, the UE shall:

- 1> apply the values of *sl-Bandwidth*, *subframeAssignmentSL*, *directFrameNumber* and *directSubframeNumber* included in the received *MasterInformationBlock-SL* or *MasterInformationBlock-SL-V2X* message;

5.10.10 Sidelink relay UE operation

5.10.10.1 General

This procedure is used by a UE supporting sidelink relay UE operation and involves evaluation of the AS-layer conditions that need to be met in order for upper layers to configure a sidelink relay UE to receive/ transmit relay related PS sidelink discovery/ relay related sidelink communication. The AS-layer conditions merely comprise of being configured with radio resources that can be used for transmission.

A UE that fulfils the criteria specified in 5.10.10.2 and 5.10.10.3 and that is configured by higher layers accordingly is acting as a sidelink relay UE.

5.10.10.2 AS-conditions for relay related sidelink communication transmission by sidelink relay UE

A UE capable of sidelink relay UE operation shall inform upper layers that it is configured with radio resources that can be used for relay related sidelink communication transmission if the following conditions are met:

- 1> if in RRC_CONNECTED; and if the UE is configured with *commTxResources*; and the UE is configured with *commTxAllowRelayDedicated* set to *true*;

5.10.10.3 AS-conditions for relay PS related sidelink discovery transmission by sidelink relay UE

A UE capable of sidelink relay UE operation shall inform upper layers that it is configured with radio resources that can be used for relay PS related sidelink discovery transmission if the following conditions are met:

- 1> if in RRC_IDLE; and if the UE's serving cell is suitable as defined in TS 36.304 [4]; and if *SystemInformationBlockType19* includes *discConfigPS* including *discTxPoolPS-Common* and *discConfigRelay*; and if the sidelink relay UE threshold conditions as specified in 5.10.10.4 are met;
- 1> else if in RRC_CONNECTED; and if *discTxResourcesPS* is configured;

5.10.10.4 Sidelink relay UE threshold conditions

A UE capable of sidelink relay UE operation shall:

- 1> if the threshold conditions specified in this clause were not met:
- 2> if neither *threshHigh* nor *threshLow* is included in *relayUE-Config* within *SystemInformationBlockType19*:
 - 3> consider the threshold conditions to be met (entry);
- 2> else if *threshHigh* is not included in *relayUE-Config* within *SystemInformationBlockType19*; or the RSRP measurement of the PCell, or the cell on which the UE camps, is below *threshHigh* by *hystMax* (also included within *relayUE-Config*); and
- 2> if *threshLow* is not included in *relayUE-Config* within *SystemInformationBlockType19*; or the RSRP measurement of the PCell, or the cell on which the UE camps, is above *threshLow* by *hystMin* (also included within *relayUE-Config*):
 - 3> consider the threshold conditions to be met (entry);
- 1> else:
 - 2> if *threshHigh* is included in *relayUE-Config* within *SystemInformationBlockType19*; and the RSRP measurement of the PCell, or the cell on which the UE camps, is above *threshHigh* (also included within *relayUE-Config*); or
 - 2> if *threshLow* is included in *relayUE-Config* within *SystemInformationBlockType19*; and the RSRP measurement of the PCell, or the cell on which the UE camps, is below *threshLow* (also included within *relayUE-Config*);
 - 3> consider the threshold conditions not to be met (leave);

5.10.11 Sidelink remote UE operation

5.10.11.1 General

This procedure is used by a UE supporting sidelink remote UE operation and involves evaluation of the AS-layer conditions that need to be met in order for upper layers to configure a sidelink remote UE to receive/ transmit relay related sidelink PS discovery/ relay related sidelink communication. The AS-layer conditions merely comprise of being configured with radio resources that can be used for transmission, as well as whether or not having a selected sidelink relay UE.

5.10.11.2 AS-conditions for relay related sidelink communication transmission by sidelink remote UE

A UE capable of sidelink remote UE operation shall inform upper layers whether it is configured with radio resources that can be used for relay related sidelink communication transmission if the following conditions are met:

- 1> if the UE is out of coverage; and is preconfigured with *SL-Preconfiguration* including *discTxPoolList* and *preconfigRelay*;
- 1> else if in RRC_IDLE; and if the UE's serving cell is suitable as defined in TS 36.304 [4]; and if *SystemInformationBlockType18* includes *commTxPoolNormalCommon* and *commTxAllowRelayCommon*; and if *SystemInformationBlockType19* includes *discConfigRelay*; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met;
- 1> else if in RRC_CONNECTED; and if the UE is configured with *commTxResources*; and the UE is configured with *commTxAllowRelayDedicated* set to *true*;

5.10.11.3 AS-conditions for relay PS related sidelink discovery transmission by sidelink remote UE

A UE capable of sidelink remote UE operation shall inform upper layers whether it is configured with radio resources that can be used for relay PS related sidelink discovery transmission if the following conditions are met:

- 1> if the UE is out of coverage; and is preconfigured with *SL-Preconfiguration* including *discTxPoolList* and *preconfigRelay*;
- 1> else if in RRC_IDLE; and if the UE's serving cell is suitable as defined in TS 36.304 [4]; and if *SystemInformationBlockType19* includes *discConfigPS* including *discTxPoolPS-Common* and *discConfigRelay*; and if the sidelink remote UE threshold conditions as specified in 5.10.11.5 are met;
- 1> else if in RRC_CONNECTED; and if *discTxResourcesPS* is configured;

5.10.11.4 Selection and reselection of sidelink relay UE

A UE capable of sidelink remote UE operation that is configured by upper layers to search for a sidelink relay UE shall:

- 1> if out of coverage on the frequency used for sidelink communication, as defined in TS 36.304 [4], clause 11.4; or
- 1> if the serving frequency is used for sidelink communication and the RSRP measurement of the cell on which the UE camps (RRC_IDLE)/ the PCell (RRC_CONNECTED) is below *threshHigh* within *remoteUE-Config* :

 - 2> search for candidate sidelink relay UEs, in accordance with TS 36.133 [16]
 - 2> when evaluating the one or more detected sidelink relay UEs, apply layer 3 filtering as specified in 5.5.3.2 across measurements that concern the same ProSe Relay UE ID and using the *filterCoefficient* in *SystemInformationBlockType19* (in coverage) or the preconfigured *filterCoefficient* as defined in 9.3(out of coverage), before using the SD-RSRP measurement results;

NOTE 1: The details of the interaction with upper layers are up to UE implementation.

- 2> if the UE does not have a selected sidelink relay UE:
 - 3> select a candidate sidelink relay UE which SD-RSRP exceeds *q-RxLevMin* included in either *reselectionInfoIC* (in coverage) or *reselectionInfoOoC* (out of coverage) by *minHyst*;
- 2> else if SD-RSRP of the currently selected sidelink relay UE is below *q-RxLevMin* included in either *reselectionInfoIC* (in coverage) or *reselectionInfoOoC* (out of coverage); or if upper layers indicate not to use the currently selected sidelink relay: (i.e. sidelink relay UE reselection):
 - 3> select a candidate sidelink relay UE which SD-RSRP exceeds *q-RxLevMin* included in either *reselectionInfoIC* (in coverage) or *reselectionInfoOoC* (out of coverage) by *minHyst*;
- 2> else if the UE did not detect any candidate sidelink relay UE which SD-RSRP exceeds *q-RxLevMin* included in either *reselectionInfoIC* (in coverage) or *reselectionInfoOoC* (out of coverage) by *minHyst*:

3> consider no sidelink relay UE to be selected;

NOTE 2: The UE may perform sidelink relay UE reselection in a manner resulting in selection of the sidelink relay UE, amongst all candidate sidelink relay UEs meeting higher layer criteria, that has the best radio link quality. Further details, including interaction with upper layers, are up to UE implementation.

5.10.11.5 Sidelink remote UE threshold conditions

A UE capable of sidelink remote UE operation shall:

- 1> if the threshold conditions specified in this clause were not met:
 - 2> if *threshHigh* is not included in *remoteUE-Config* within *SystemInformationBlockType19*; or
 - 2> if *threshHigh* is included in *remoteUE-Config* within *SystemInformationBlockType19*; and the RSRP measurement of the PCell, or the cell on which the UE camps, is below *threshHigh* by *hystMax* (also included within *remoteUE-Config*):
 - 3> consider the threshold conditions to be met (entry);
- 1> else:
 - 2> if *threshHigh* is included in *remoteUE-Config* within *SystemInformationBlockType19*; and the RSRP measurement of the PCell, or the cell on which the UE camps, is above *threshHigh* (also included within *remoteUE-Config*):
 - 3> consider the threshold conditions not to be met (leave);

5.10.12 V2X sidelink communication monitoring

A UE capable of V2X sidelink communication that is configured by upper layers to receive V2X sidelink communication shall:

- 1> if the conditions for sidelink operation as defined in 5.10.1d are met:
 - 2> if in coverage on the frequency used for V2X sidelink communication, as defined in TS 36.304 [4], clause 11.4, or TS 38.304 [92], clause 8.1:
 - 3> if the frequency used to receive V2X sidelink communication is included in *v2x-InterFreqInfoList* within *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/Pcell, and *v2x-CommRxPool* is included in *SL-V2X-InterFreqUE-Config* within *v2x-UE-ConfigList* in the entry of *v2x-InterFreqInfoList* for the concerned frequency:
 - 4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated in *v2x-CommRxPool*;
 - 3> else:
 - 4> if the cell chosen for V2X sidelink communication reception broadcasts *SystemInformationBlockType21* including *v2x-CommRxPool* in *sl-V2X-ConfigCommon* or,
 - 4> if the UE is configured with *v2x-CommRxPool* included in *mobilityControlInfoV2X* in *RRCConnectionReconfiguration*:
 - 5> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated in *v2x-CommRxPool*;
 - 2> else (i.e. out of coverage on the frequency used for V2X sidelink communication, as defined in TS 36.304 [4], clause 11.4 and TS 38.304 [92], clause 8.1):
 - 3> if the frequency used to receive V2X sidelink communication is included in *v2x-InterFreqInfoList* within *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell/PCell, and *v2x-CommRxPool* is included in *SL-V2X-*

InterFreqUE-Config within *v2x-UE-ConfigList* in the entry of *v2x-InterFreqInfoList* for the concerned frequency:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources indicated in *v2x-CommRxPool*;

3> else:

4> configure lower layers to monitor sidelink control information and the corresponding data using the pool of resources that were preconfigured (i.e. *v2x-CommRxPoolList* in *SL-V2X-Preconfiguration* defined in 9.3);

5.10.13 V2X sidelink communication transmission

5.10.13.1 Transmission of V2X sidelink communication

A UE capable of V2X sidelink communication that is configured by upper layers to transmit V2X sidelink communication and has related data to be transmitted shall:

1> if the conditions for sidelink operation as defined in 5.10.1d are met:

2> if in coverage on the frequency used for V2X sidelink communication as defined in TS 36.304 [4], clause 11.4, or TS 38.304 [92], clause 8.1; or

2> if the frequency used to transmit V2X sidelink communication is included in *v2x-InterFreqInfoList* in *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* within *SystemInformationBlockType21* or *SystemInformationBlockType26*:

3> if the UE is in RRC_CONNECTED and uses the PCell or the frequency included in *v2x-InterFreqInfoList* in *RRCConnectionReconfiguration* for V2X sidelink communication:

4> if the UE is configured, by the current PCell with *commTxResources* set to *scheduled*:

5> if T310 or T311 is running; and if the PCell at which the UE detected physical layer problems or radio link failure broadcasts *SystemInformationBlockType21* including *v2x-CommTxPoolExceptional* in *sl-V2X-ConfigCommon*, or *v2x-CommTxPoolExceptional* is included in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType21* or *SystemInformationBlockType26* or *RRCConnectionReconfiguration*; or

5> if T301 is running and the cell on which the UE initiated connection re-establishment broadcasts *SystemInformationBlockType21* including *v2x-CommTxPoolExceptional* in *sl-V2X-ConfigCommon*, or *v2x-CommTxPoolExceptional* is included in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType21* or *SystemInformationBlockType26*; or

5> if T304 is running and the UE is configured with *v2x-CommTxPoolExceptional* included in *mobilityControlInfoV2X* in *RRCConnectionReconfiguration* or in *v2x-InterFreqInfoList* for the concerned frequency in *RRCConnectionReconfiguration*:

6> configure lower layers to transmit the sidelink control information and the corresponding data based on random selection using the pool of resources indicated by *v2x-CommTxPoolExceptional* as defined in TS 36.321 [6];

5> else:

6> configure lower layers to request E-UTRAN to assign transmission resources for V2X sidelink communication;

4> else if the UE is configured with *v2x-CommTxPoolNormalDedicated* or *v2x-CommTxPoolNormal* or *v2x-CommTxPoolNormal* in the entry of *v2x-InterFreqInfoList* for the concerned frequency in *sl-V2X-ConfigDedicated* in *RRCConnectionReconfiguration*:

5> if the UE is configured to transmit non-P2X related V2X sidelink communication and a result of sensing on the resources configured in *v2x-CommTxPoolNormalDedicated* or *v2x-*

- CommTxPoolNormal* in the entry of *v2x-InterFreqInfoList* for the concerned frequency in *RRConnectionReconfiguration* is not available in accordance with TS 36.213 [23]; or
- 5> if the UE is configured to transmit P2X related V2X sidelink communication and selects to use partial sensing according to 5.10.13.1a, and a result of partial sensing on the resources configured in *v2x-CommTxPoolNormalDedicated* or *p2x-CommTxPoolNormal* in the entry of *v2x-InterFreqInfoList* for the concerned frequency in *RRConnectionReconfiguration* is not available in accordance with TS 36.213 [23];
 - 6> if *v2x-CommTxPoolExceptional* is included in *mobilityControlInfoV2X* in *RRConnectionReconfiguration* (i.e., handover case); or
 - 6> if *v2x-CommTxPoolExceptional* is included in the entry of *v2x-InterFreqInfoList* for the concerned frequency in *RRConnectionReconfiguration*; or
 - 6> if the PCell broadcasts *SystemInformationBlockType21* including *v2x-CommTxPoolExceptional* in *sl-V2X-ConfigCommon* or *v2x-CommTxPoolExceptional* in *v2x-InterFreqInfoList* for the concerned frequency or broadcasts *SystemInformationBlockType26* including *v2x-CommTxPoolExceptional* in *v2x-InterFreqInfoList* for the concerned frequency:
 - 7> configure lower layers to transmit the sidelink control information and the corresponding data based on random selection using the pool of resources indicated by *v2x-CommTxPoolExceptional* as defined in TS 36.321 [6];
- 5> else if the UE is configured to transmit P2X related V2X sidelink communication:
- 6> select a resource pool according to 5.10.13.2;
 - 6> perform P2X related V2X sidelink communication according to 5.10.13.1a;
- 5> else if the UE is configured to transmit non-P2X related V2X sidelink communication:
- 6> configure lower layers to transmit the sidelink control information and the corresponding data based on sensing (as defined in TS 36.321 [6] and TS 36.213 [23]) using one of the resource pools indicated by *v2x-commTxPoolNormalDedicated* or *v2x-CommTxPoolNormal* in the entry of *v2x-InterFreqInfoList* for the concerned frequency, which is selected according to 5.10.13.2;
- 3> else:
- 4> if the cell chosen for V2X sidelink communication transmission broadcasts *SystemInformationBlockType21* or *SystemInformationBlockType26*:
 - 5> if the UE is configured to transmit non-P2X related V2X sidelink communication, and if *SystemInformationBlockType21* includes *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, or *SystemInformationBlockType26* includes *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, and if a result of sensing on the resources configured in *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency is available in accordance with TS 36.213 [23]:
 - 6> configure lower layers to transmit the sidelink control information and the corresponding data based on sensing (as defined in TS 36.321 [6] and TS 36.213 [23]) using one of the resource pools indicated by *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, which is selected according to 5.10.13.2;
 - 5> else if the UE is configured to transmit P2X related V2X sidelink communication, and if *SystemInformationBlockType21* includes *p2x-CommTxPoolNormalCommon* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, or *SystemInformationBlockType26* includes *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, and if the UE selects to use random selection according to 5.10.13.1a, or selects to use partial sensing according to 5.10.13.1a and a result of partial sensing on the resources configured in *p2x-CommTxPoolNormalCommon* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency is available in accordance with TS 36.213 [23]:

- 6> select a resource pool from *p2x-CommTxPoolNormalCommon* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency according to 5.10.13.2, but ignoring *zoneConfig* in *SystemInformationBlockType21* or *SystemInformationBlockType26*;
- 6> perform P2X related V2X sidelink communication according to 5.10.13.1a;
- 5> else if *SystemInformationBlockType21* includes *v2x-CommTxPoolExceptional* in *sl-V2X-ConfigCommon* or *v2x-CommTxPoolExceptional* in *v2x-InterFreqInfoList* for the concerned frequency, or *SystemInformationBlockType26* includes *v2x-CommTxPoolExceptional* in *v2x-InterFreqInfoList* for the concerned frequency:
 - 6> from the moment the UE initiates connection establishment until receiving an *RRCConnectionReconfiguration* including *sl-V2X-ConfigDedicated*, or until receiving an *RRCConnectionRelease* or an *RRCConnectionReject*; or
 - 6> if the UE is in RRC_IDLE and a result of sensing on the resources configured in *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType21* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType26* is not available in accordance with TS 36.213 [23]; or
 - 6> if the UE is in RRC_IDLE and UE selects to use partial sensing according to 5.10.13.1a and a result of partial sensing on the resources configured in *p2x-CommTxPoolNormalCommon* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType21* or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency in *SystemInformationBlockType26* is not available in accordance with TS 36.213 [23]:
- 7> configure lower layers to transmit the sidelink control information and the corresponding data based on random selection (as defined in TS 36.321 [6]) using the pool of resources indicated in *v2x-CommTxPoolExceptional*;

2> else:

- 3> configure lower layers to transmit the sidelink control information and the corresponding data based on sensing (as defined in TS 36.321 [6] and TS 36.213 [23]) using one of the resource pools indicated by *v2x-CommTxPoolList* in *SL-V2X-Preconfiguration* in case of non-P2X related V2X sidelink communication, which is selected according to 5.10.13.2, or using one of the resource pools indicated by *p2x-CommTxPoolList* in *SL-V2X-Preconfiguration* in case of P2X related V2X sidelink communication, which is selected according to 5.10.13.2, and in accordance with the timing of the selected reference as defined in 5.10.8;

The UE capable of non-P2X related V2X sidelink communication that is configured by upper layers to transmit V2X sidelink communication shall perform sensing on all pools of resources which may be used for transmission of the sidelink control information and the corresponding data. The pools of resources are indicated by *SL-V2X-Preconfiguration*, *v2x-CommTxPoolNormalCommon*, *v2x-CommTxPoolNormalDedicated* in *sl-V2X-ConfigDedicated*, or *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* for the concerned frequency, as configured above.

5.10.13.1a Transmission of P2X related V2X sidelink communication

A UE configured to transmit P2X related V2X sidelink communication shall:

- 1> if *partialSensing* is included and *randomSelection* is not included in *resourceSelectionConfigP2X* of the pool selected; or
- 1> if both *partialSensing* and *randomSelection* are included in *resourceSelectionConfigP2X* of the pool selected, and the UE selects to use partial sensing:
 - 2> configure lower layers to transmit the sidelink control information and the corresponding data based on partial sensing (as defined in TS 36.321 [6] and TS 36.213 [23]) using the selected resource pool, if the UE supports partial sensing;
- 1> if *partialSensing* is not included and *randomSelection* is included in *resourceSelectionConfigP2X* of the pool selected.

- 2> configure lower layers to transmit the sidelink control information and the corresponding data based on random selection (as defined in TS 36.321 [6] and TS 36.213 [23]) using the selected resource pool;
- 1> if both *partialSensing* and *randomSelection* is included in *resourceSelectionConfigP2X* of the pool selected, and the UE selects to use random selection:
 - 2> configure lower layers to transmit the sidelink control information and the corresponding data based on random selection using the selected resource pool and indicates to lower layers that transmissions of multiple MAC PDUs are allowed (as defined in TS 36.321 [6] and TS 36.213 [23]).

NOTE: If both *partialSensing* and *randomSelection* is included in *resourceSelectionConfigP2X* of the pool selected, the selection between partial sensing and random selection is left to UE implementation.

5.10.13.2 V2X sidelink communication transmission pool selection

For a frequency used for V2X sidelink communication, if *zoneConfig* is not ignored as specified in 5.10.13.1, the UE configured by upper layers for V2X sidelink communication shall only use the pool which corresponds to geographical coordinates of the UE, if *zoneConfig* is included in *SystemInformationBlockType21* or *SystemInformationBlockType26* of the serving cell (RRC_IDLE)/ PCell (RRC_CONNECTED) or in *RRCCofigurationReconfiguration* for the concerned frequency, and the UE is configured to use resource pools provided by RRC signalling for the concerned frequency; or if *zoneConfig* is included in *SL-V2X-Preconfiguration* for the concerned frequency, and the UE is configured to use resource pools in *SL-V2X-Preconfiguration* for the frequency, according to 5.10.13.1. The UE shall only use the pool which is associated with the synchronization reference source selected in accordance with 5.10.8.2.

- 1> if the UE is configured to transmit on *p2x-CommTxPoolNormalCommon* or on *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* in *SystemInformationBlockType21* or on *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* in *SystemInformationBlockType26* according to 5.10.13.1; or
- 1> if the UE is configured to transmit on *p2x-CommTxPoolList-r14* in *SL-V2X-Preconfiguration* according to 5.10.13.1; or
- 1> if *zoneConfig* is not included in *SystemInformationBlockType21* and the UE is configured to transmit on *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormalDedicated*; or
- 1> if *zoneConfig* is included in *SystemInformationBlockType21* and the UE is configured to transmit on *v2x-CommTxPoolNormalDedicated* for P2X related V2X sidelink communication and *zoneID* is not included in *v2x-CommTxPoolNormalDedicated*; or
- 1> if *zoneConfig* is not included in the entry of *v2x-InterFreqInfoList* for the concerned frequency and the UE is configured to transmit on *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* in *RRCCofigurationReconfiguration*; or
- 1> if *zoneConfig* is included in the entry of *v2x-InterFreqInfoList* for the concerned frequency and the UE is configured to transmit on *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* in *RRCCofigurationReconfiguration* and *zoneID* is not included in *p2x-CommTxPoolNormal*; or
- 1> if *zoneConfig* is not included in *SL-V2X-Preconfiguration* for the concerned frequency and the UE is configured to transmit on *v2x-CommTxPoolList* in *SL-V2X-Preconfiguration* for the concerned frequency:
- 2> select a pool associated with the synchronization reference source selected in accordance with 5.10.8.2;

NOTE 0: If multiple pools are associated with the selected synchronization reference source, it is up to UE implementation which resource pool is selected for V2X sidelink communication transmission.

- 1> if *zoneConfig* is included in *SystemInformationBlockType21* and the UE is configured to transmit on *v2x-CommTxPoolNormalCommon* or *v2x-CommTxPoolNormalDedicated* for non-P2X related V2X sidelink communication; or
- 1> if *zoneConfig* is included in *SystemInformationBlockType21* and the UE is configured to transmit on *v2x-CommTxPoolNormalDedicated* for P2X related V2X sidelink communication and *zoneID* is included in *v2x-CommTxPoolNormalDedicated*; or
- 1> if *zoneConfig* is included in the entry of *v2x-InterFreqInfoList* for the concerned frequency and if the UE is configured to transmit on *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* or is configured to transmit on *p2x-*

CommTxPoolNormal in *v2x-InterFreqInfoList* in *RRConnectionReconfiguration* and *zoneID* is included in *p2x-CommTxPoolNormal*; or

1> if *zoneConfig* is included in *SL-V2X-Preconfiguration* for the concerned frequency and the UE is configured to transmit on *v2x-CommTxPoolList* in *SL-V2X-Preconfiguration* for the concerned frequency;

2> select the pool configured with *zoneID* equal to the zone identity determined below and associated with the synchronization reference source selected in accordance with 5.10.8.2;

The UE shall determine an identity of the zone (i.e. Zone_id) in which it is located using the following formulae, if *zoneConfig* is included in *SystemInformationBlockType21* or *SystemInformationBlockType26* or in *SL-V2X-Preconfiguration*:

$$x_1 = \text{FLOOR}(x / L) \bmod Nx;$$

$$y_1 = \text{FLOOR}(y / W) \bmod Ny;$$

$$\text{Zone_id} = y_1 * Nx + x_1.$$

The parameters in the formulae are defined as follows:

L is the value of *zoneLength* included in *zoneConfig* in *SystemInformationBlockType21* or *SystemInformationBlockType26* or in *SL-V2X-Preconfiguration*;

W is the value of *zoneWidth* included in *zoneConfig* in *SystemInformationBlockType21* or *SystemInformationBlockType26* or in *SL-V2X-Preconfiguration*;

Nx is the value of *zoneIdLongiMod* included in *zoneConfig* in *SystemInformationBlockType21* or *SystemInformationBlockType26* or in *SL-V2X-Preconfiguration*;

Ny is the value of *zoneIdLatiMod* included in *zoneConfig* in *SystemInformationBlockType21* or *SystemInformationBlockType26* or in *SL-V2X-Preconfiguration*;

x is the geodesic distance in longitude between UE's current location and geographical coordinates (0, 0) according to WGS84 model [80] and it is expressed in meters;

y is the geodesic distance in latitude between UE's current location and geographical coordinates (0, 0) according to WGS84 model [80] and it is expressed in meters.

The UE shall select a pool of resources which includes a *zoneID* equals to the Zone_id calculated according to above mentioned formulae and indicated by *v2x-CommTxPoolNormalDedicated*, *v2x-CommTxPoolNormalCommon*, *v2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* or *p2x-CommTxPoolNormal* in *v2x-InterFreqInfoList* in *RRConnectionReconfiguration*, or *v2x-CommTxPoolList* according to 5.10.13.1.

NOTE 1: The UE uses its latest geographical coordinates to perform resource pool selection.

NOTE 2: If geographical coordinates are not available and zone specific TX resource pools are configured for the concerned frequency, it is up to UE implementation which resource pool is selected for V2X sidelink communication transmission.

5.10.13.3 V2X sidelink communication transmission reference cell selection

A UE capable of V2X sidelink communication that is configured by upper layers to transmit V2X sidelink communication shall:

1> for each frequency used to transmit V2X sidelink communication, select a cell to be used as reference for synchronisation and DL measurements in accordance with the following:

2> if the frequency concerns the primary frequency:

3> use the PCell (RRC_CONNECTED) or the serving cell (RRC_IDLE) as reference;

2> else if the frequency concerns a secondary frequency:

3> use the concerned SCell as reference;

2> else if the UE is in coverage of the concerned frequency:

3> use the DL frequency paired with the one used to transmit V2X sidelink communication as reference;

2> else (i.e., out of coverage on the concerned frequency):

3> use the PCell (RRC_CONNECTED) or the serving cell (RRC_IDLE) as reference, if needed;

5.10.14 DFN derivation from GNSS

When the UE selects GNSS as the synchronization reference source, the DFN used for V2X sidelink communication is derived from the current UTC time, by the following formulae:

$$DFN = \text{FLOOR}(0.1 * (T_{current} - T_{ref} - offsetDFN)) \bmod 1024$$

$$\text{SubframeNumber} = \text{FLOOR}(T_{current} - T_{ref} - offsetDFN) \bmod 10$$

Where:

Tcurrent is the current UTC time that obtained from GNSS. This value is expressed in milliseconds;

Tref is the reference UTC time 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Thursday, December 31, 1899 and Friday, January 1, 1900). This value is expressed in milliseconds;

OffsetDFN is the value *offsetDFN* if configured, otherwise it is zero. This value is expressed in milliseconds.

NOTE: In case of leap second change event, how V2X UE obtains the scheduled time of leap second change to adjust *Tcurrent* correspondingly is left to UE implementation. How V2X UE handles the sudden discontinuity of DFN is left to UE implementation.

5.10.15 Void

5.10.16 Sidelink synchronisation information transmission for NR sidelink communication

Figure 5.10.16-1: Synchronisation information transmission for NR sidelink communication, in (partial) coverage

Figure 5.10.16-2: Synchronisation information transmission for NR sidelink communication, out of coverage

The purpose of this procedure is to provide synchronisation information to a UE.

The initiation and the procedure for the transmission of sidelink SSB follow the procedure specified for NR sidelink communication in clause 5.8.5 of TS 38.331 [82].

NOTE: When applying the procedure in this clause, *SystemInformationBlockType28* in Figure 5.10.16-1 corresponds to *SIB12* specified in TS 38.331 [82].

6 Protocol data units, formats and parameters (tabular & ASN.1)

6.1 General

The contents of each RRC message is specified in clause 6.2 using ASN.1 to specify the message syntax and using tables when needed to provide further detailed information about the fields specified in the message syntax. The syntax of the information elements that are defined as stand-alone abstract types is further specified in a similar manner in clause 6.3.

The need for fields to be present in a message or an abstract type, i.e., the ASN.1 fields that are specified as OPTIONAL in the abstract notation (ASN.1), is specified by means of comment text tags attached to the OPTIONAL statement in the abstract syntax. All comment text tags are available for use in the downlink direction only. The meaning of each tag is specified in table 6.1-1.

Table 6.1-1: Meaning of abbreviations used to specify the need for fields to be present

Abbreviation	Meaning
Cond <i>conditionTag</i> (Used in downlink only)	<i>Conditionally present</i> A field for which the need is specified by means of conditions. For each <i>conditionTag</i> , the need is specified in a tabular form following the ASN.1 segment. In case, according to the conditions, a field is not present, the UE takes no action and where applicable shall continue to use the existing value (and/ or the associated functionality) unless explicitly stated otherwise (e.g. in the conditional presence table or in the description of the field itself).
Need OP (Used in downlink only)	<i>Optionally present</i> A field that is optional to signal. For downlink messages, the UE is not required to take any special action on absence of the field beyond what is specified in the procedural text or the field description table following the ASN.1 segment. The UE behaviour on absence should be captured either in the procedural text or in the field description.
Need ON (Used in downlink only)	<i>Optionally present, No action</i> A field that is optional to signal. If the message is received by the UE, and in case the field is absent, the UE takes no action and where applicable shall continue to use the existing value (and/ or the associated functionality).

Abbreviation	Meaning
Need OR (Used in downlink only)	<i>Optionally present, Release</i> A field that is optional to signal. If the message is received by the UE, and in case the field is absent, the UE shall discontinue/ stop using/ delete any existing value (and/ or the associated functionality).

Any field with Need ON in system information shall be interpreted as Need OR.

Need codes may not be specified for a parent extension field/ extension group, used in downlink, which includes one or more child extension fields. Upon absence of such a parent extension field/ extension group, the UE shall:

- For each individual child extension field, including extensions that are mandatory to include in the optional group, act in accordance with the need code that is defined for the extension;
- Apply this behaviour not only for child extension fields included directly within the optional parent extension field/ extension group, but also for extension fields defined at further nesting levels as long as for none of the fields in-between the concerned extension field and the parent extension field a need code is specified;

NOTE 1: The above applies for groups of non critical extensions using double brackets (referred to as extension groups), as well as non-critical extensions at the end of a message or at the end of a structure contained in a BIT STRING or OCTET STRING (referred to as parent extension fields).

Need codes, conditions and ASN.1 defaults specified for a particular (child) field only apply in case the (parent) field including the particular field is present. This rule does not apply for optional parent extension fields/ extension groups without need codes,

NOTE 2: The previous rule implies that E-UTRAN has to include such a parent extension field to release a child field that is either:

- Optional with need OR, or
- Conditional while the UE releases the child field when absent.

The handling of need codes as specified in the previous is illustrated by means of an example, as shown in the following ASN.1.

```
-- /example/ ASN1START

RRCMessage-r8-IEs ::= SEQUENCE {
    field1
    field2
    nonCriticalExtension
} OPTIONAL, -- Need ON
OPTIONAL

RRCMessage-v8a0-IEs ::= SEQUENCE {
    field3
    nonCriticalExtension
} OPTIONAL, -- Need ON
OPTIONAL

RRCMessage-v940-IEs ::= SEQUENCE {
    field4
    nonCriticalExtension
} OPTIONAL, -- Need OR
OPTIONAL

InformationElement1 ::= SEQUENCE {
    field11
    field12
    ...
    [[ field13
        field14
    ]]
} OPTIONAL, -- Need ON
OPTIONAL, -- Need OR
OPTIONAL, -- Need OR
OPTIONAL, -- Need ON

InformationElement2 ::= SEQUENCE {
    field21
    ...
} OPTIONAL, -- Need OR

-- ASN1STOP
```

The handling of need codes as specified in the previous implies that:

- if *field2* in *RRCMessage-r8-IEs* is absent, the UE does not modify *field21*;
- if *field2* in *RRCMessage-r8-IEs* is present but does not include *field21*, the UE releases *field21*;
- if the extension group containing *field13* is absent, the UE releases *field13* and does not modify *field14*;
- if *nonCriticalExtension* defined by IE *RRCMessage-v8a0-IEs* is absent, the UE does not modify *field3* and releases *field4*;

In the ASN.1 of this specification, the first bit of a bit string refers to the leftmost bit, unless stated otherwise.

6.2 RRC messages

NOTE: The messages included in this clause reflect the current status of the discussions. Additional messages may be included at a later stage.

6.2.1 General message structure

– *EUTRA-RRC-Definitions*

This ASN.1 segment is the start of the E-UTRA RRC PDU definitions.

```
-- ASN1START
EUTRA-RRC-Definitions DEFINITIONS AUTOMATIC TAGS ::=

BEGIN

-- ASN1STOP
```

– *BCCH-BCH-Message*

The *BCCH-BCH-Message* class is the set of RRC messages that may be sent from the E-UTRAN to the UE via BCH on the BCCH logical channel.

```
-- ASN1START
BCCH-BCH-Message ::= SEQUENCE {
    message           BCCH-BCH-MessageType
}

BCCH-BCH-MessageType ::= MasterInformationBlock

-- ASN1STOP
```

– *BCCH-BCH-Message-MBMS*

The *BCCH-BCH-Message-MBMS* class is the set of RRC messages that may be sent from the E-UTRAN to the UE via BCH on the BCCH logical channel in an MBMS-dedicated cell.

```
-- ASN1START
BCCH-BCH-Message-MBMS ::= SEQUENCE {

6.2.2 Message definitions

– *CounterCheck*

The *CounterCheck* message is used by the E-UTRAN to indicate the current COUNT MSB values associated to each DRB and to request the UE to compare these to its COUNT MSB values and to report the comparison results to E-UTRAN.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

CounterCheck message

```
-- ASN1START

CounterCheck ::= SEQUENCE {
    rrc-TransactionIdentifier           RRC-TransactionIdentifier,
    criticalExtensions                 CHOICE {

    countMSB-Uplink                 INTEGER(0..33554431),
    countMSB-Downlink               INTEGER(0..33554431)
}

-- ASN1STOP
```

CounterCheck field descriptions	
count-MSB-Downlink	If configured with E-UTRA PDCP, it indicates the value of 25 MSBs from downlink COUNT associated to this DRB. If configured with NR PDCP, it indicates the value of 25 MSBs from RX_NEXT – 1 (specified in TS 38.323 [83]) associated to this DRB.
count-MSB-Uplink	If configured with E-UTRA PDCP, it indicates the value of 25 MSBs from uplink COUNT associated to this DRB. If configured with NR PDCP, it indicates the value of 25 MSBs from TX_NEXT – 1 (specified in TS 38.323 [83]) associated to this DRB.
drb-CountMSB-InfoList	Indicates the MSBs of the COUNT values of the DRBs.

— *CounterCheckResponse*

The *CounterCheckResponse* message is used by the UE to respond to a *CounterCheck* message.

Signalling radio bearer: SRB1

```

<i>CounterCheckResponse</i> field descriptions	
<i>count-Downlink</i>	If configured with E-UTRA PDCP, it indicates the value of downlink COUNT associated to this DRB. If configured with NR PDCP, it indicates the value of RX_NEXT – 1 (specified in TS 38.323 [83]) associated to this DRB.
<i>count-Uplink</i>	If configured with E-UTRA PDCP, it indicates the value of uplink COUNT associated to this DRB. If configured with NR PDCP, it indicates the value of TX_NEXT – 1 (specified in TS 38.323 [83]) associated to this DRB.
<i>drb-CountInfoList</i>	Indicates the COUNT values of the DRBs.

– ***CSFBParametersRequestCDMA2000***

The *CSFBParametersRequestCDMA2000* message is used by the UE to obtain the CDMA2000 1xRTT Parameters from the network. The UE needs these parameters to generate the CDMA2000 1xRTT Registration message used to register with the CDMA2000 1xRTT Network which is required to support CSFB to CDMA2000 1xRTT.

Signalling radio bearer: SRB1

    lateNonCriticalExtension     OCTET STRING           OPTIONAL,
    nonCriticalExtension         SEQUENCE {}           OPTIONAL
}

-- ASN1STOP

```

DLDedicatedMessageSegment field descriptions

segmentNumber

Identifies the sequence number of a segment within the encoded DL DCCH message. The network transmits the segments with continuously increasing *segmentNumber* order so that the UE's RRC layer may expect to obtain them from lower layers in the correct order. Hence, the UE is not required to perform segment re-ordering on RRC level.

rrc-MessageSegmentContainer

Includes a segment of the encoded DL DCCH message. The size of the included segment in this container should be small enough so the resulting encoded RRC message PDU is less than or equal to the PDCP SDU size limit.

rrc-MessageSegmentType

Indicates whether the included DL DCCH message segment is the last segment of the message or not.

- *DlInformationTransfer*

The *DlInformationTransfer* message is used for the downlink transfer of NAS, non-3GPP dedicated information, IAB-DU specific F1-C related information, or time reference information.

NOTE: The UE may use the time reference information provided in the *timeReferenceInfo* IE for numerous purposes, possibly involving upper layers e.g. to synchronise the UE clock.

Signalling radio bearer: SRB2 or SRB1. If only *timeReferenceInfo* is included in the message, SRB1 is used. Otherwise, SRB1 is used only if SRB2 not established yet, and if SRB2 is suspended, E-UTRAN does not send this message until SRB2 is resumed. If only *dedicatedInfoF1c* is included, SRB2 is used.

}

-- ASN1STOP
```

FailureInformation field descriptions

cellGroupIndication

This field indicates the cell group (MCG, SCG) of the RLC entity for which the PDCP duplication failure occurred.

failureType

This field indicates the type of failure reported. Value *duplication* indicates that a radio link failure for one of the RLC entities configured with PDCP duplication has been detected. Value *dapsHO-failure* indicates that timer T304 expired during a DAPS HO.

logicalChannelIdentity, logicalChannelIdentityExt

This field indicates the logical channel identity of the RLC entity for which the PDCP duplication failure occurred.

NOTE: The UE may apply the *FailureInformation-r16* message to report a failure defined in REL-15, but only if it is configured with a feature incorporating a failure that can only be reported by the *FailureInformation-r16* message.

HandoverFromEUTRAPreparationRequest (CDMA2000)

The *HandoverFromEUTRAPreparationRequest* message is used to trigger the handover preparation procedure with a CDMA2000 RAT. This message is also used to trigger a tunneled preparation procedure with a CDMA2000 1xRTT RAT to obtain traffic channel resources for the enhanced CS fallback to CDMA2000 1xRTT, which may also involve a

concurrent preparation for handover to CDMA2000 HRPD. Also, this message is used to trigger the dual Rx/Tx redirection procedure with a CDMA2000 1xRTT RAT.

Signalling radio bearer: SRB1

-- ASN1STOP
```

HandoverFromEUTRAPreparationRequest field descriptions

concurrPrepCDMA2000-HRPD

Value TRUE indicates that upper layers should initiate concurrent preparation for handover to CDMA2000 HRPD in addition to preparation for enhanced CS fallback to CDMA2000 1xRTT.

dualRxTxRedirectIndicator

Value TRUE indicates that the second radio of the dual Rx/Tx UE is being redirected to CDMA2000 1xRTT, as specified in TS 23.272 [51].

redirectCarrierCDMA2000-1XRTT

Used to indicate the CDMA2000 1xRTT carrier frequency where the UE is being redirected to.

Conditional presence	Explanation
<i>cdma2000-1XRTT</i>	The field is optionally present, need ON, if the <i>cdma2000-Type</i> = <i>type1XRTT</i> ; otherwise it is not present.
<i>cdma2000-Type</i>	The field is mandatory present if the <i>cdma2000-Type</i> = <i>type1XRTT</i> ; otherwise it is not present.
<i>dualRxTxRedirect</i>	The field is optionally present, need ON, if <i>dualRxTxRedirectIndicator</i> is present; otherwise it is not present.

InDeviceCoexIndication

The *InDeviceCoexIndication* message is used to inform E-UTRAN about IDC problems which can not be solved by the UE itself, as well as to provide information that may assist E-UTRAN when resolving these problems.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

```

<i>InDeviceCoexIndication</i> field descriptions	
AffectedCarrierFreq	If <i>carrierFreq-v1310</i> is included, <i>carrierFreq-r11</i> is ignored by eNB.
affectedCarrierFreqCombList	Indicates a list of E-UTRA carrier frequencies that are affected by IDC problems due to Inter-Modulation Distortion and harmonics from E-UTRA when configured with UL CA. <i>affectedCarrierFreqCombList-r13</i> is used when more than 5 serving cells are configured or affected combinations contain <i>MeasObjectId</i> larger than 32. If <i>affectedCarrierFreqCombList-r13</i> is included, <i>affectedCarrierFreqCombList-r11</i> shall not be included.
affectedCarrierFreqCombMRDC	Indicates a set of at least one NR carrier frequency and optionally one or more E-UTRA carrier frequency that is affected by IDC problems due to Inter-Modulation Distortion and harmonics when configured with MR-DC.
affectedCarrierFreqList	List of E-UTRA carrier frequencies affected by IDC problems. If E-UTRAN includes <i>affectedCarrierFreqList-v1310</i> it includes the same number of entries, and listed in the same order, as in <i>affectedCarrierFreqList-r11</i> .
drx-ActiveTime	Indicates the desired active time that the E-UTRAN is recommended to configure. Value in number of subframes. Value sf20 corresponds to 20 subframes, sf30 corresponds to 30 subframes and so on.
drx-CycleLength	Indicates the desired DRX cycle length that the E-UTRAN is recommended to configure. Value in number of subframes. Value sf40 corresponds to 40 subframes, sf64 corresponds to 64 subframes and so on.
drx-Offset	Indicates the desired DRX starting offset that the E-UTRAN is recommended to configure. The UE shall set the value of drx-Offset smaller than the value of <i>drx-CycleLength</i> . The starting frame and subframe satisfy the relation: [(SFN * 10) + subframe number] modulo (<i>drx-CycleLength</i>) = <i>drx-Offset</i> .
hardwareSharingProblem	Indicates whether the UE has hardware sharing problems that the UE cannot solve by itself. The field is present (i.e. value <i>true</i>), if the UE has such hardware sharing problems. Otherwise the field is absent.
idc-SubframePatternList	A list of one or more subframe patterns indicating which HARQ process E-UTRAN is requested to abstain from using. Value 0 indicates that E-UTRAN is requested to abstain from using the subframe. For FDD, the radio frame in which the pattern starts (i.e. the radio frame in which the first/leftmost bit of the <i>subframePatternFDD</i> corresponds to subframe #0) occurs when SFN mod 2 = 0. For TDD, the first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod x = 0, where x is the size of the bit string divided by 10. The UE shall indicate a subframe pattern that follows HARQ time line, as specified in TS 36.213 [23], i.e., if a subframe is set to 1 in the subframe pattern, also the corresponding subframes carrying the potential UL grant, as specified in TS 36.213 [23], clause 8.0, the UL HARQ retransmission, as specified in TS 36.213 [23], clause 8.0, and the DL/UL HARQ feedback, as specified in TS 36.213 [23], clauses 7.3, 8.3 and 9.1.2, shall be set to 1.
interferenceDirection	Indicates the direction of IDC interference. Value <i>eutra</i> indicates that only E-UTRA is victim of IDC interference, value <i>other</i> indicates that only another radio is victim of IDC interference and value <i>both</i> indicates that both E-UTRA and another radio are victims of IDC interference. The other radio refers to either the ISM radio or GNSS (see TR 36.816 [63]).
interferenceDirectionMRDC	Indicates the direction of IDC interference. Value <i>eutra-nr</i> indicates E-UTRA and NR is victim, value <i>nr</i> indicates NR, value <i>other</i> indicates other radio system and so on. The other radio refers to either the ISM radio or GNSS (see TR 36.816 [63]).
victimSystemType	Indicate the list of victim system types to which IDC interference is caused from E-UTRA when configured with UL CA or from E-UTRA and NR when configured with MR-DC. <i>gps</i> , <i>glonass</i> , <i>bds</i> , <i>galileo</i> , and <i>navic</i> indicate the type of GNSS. Value <i>wlan</i> indicates WLAN and value <i>bluetooth</i> indicates Bluetooth.

– *InterFreqRSTDMeasurementIndication*

The *InterFreqRSTDMeasurementIndication* message is used to indicate that the UE is going to either start or stop OTDOA inter-frequency RSTD measurement which requires measurement gaps as specified in TS 36.133 [16], clause 8.1.2.6. The *InterFreqRSTDMeasurementIndication* message is also used to indicate to the network that the UE is going to start/stop OTDOA intra-frequency RSTD measurements which require measurement gaps. The *InterFreqRSTDMeasurementIndication* message is also used to indicate to the network the measurement gap that the category M1 or M2 UE prefers to perform RSTD measurements with dense PRS configuration, as specified in TS 36.133 [16], Table 8.1.2.1-3.

    ]
}

-- ASN1STOP
```

<i>InterFreqRSTDMeasurementIndication</i> field descriptions	
<i>carrierFreq</i>	The EARFCN value of the carrier received from upper layers for which the UE needs to perform the inter-frequency RSTD measurements. If the UE includes <i>carrierFreq-v1090</i> , it shall set <i>carrierFreq-r10</i> to <i>maxEARFCN</i> . In case the UE starts intra-frequency RSTD measurements the <i>carrierFreq</i> indicates the carrier frequency of the serving cell.
<i>measPRS-Offset</i>	Indicates the requested gap offset for performing inter-frequency or intra-frequency RSTD measurements. It is the smallest subframe offset from the beginning of subframe 0 of SFN=0 of the serving cell of the requested gap for measuring PRS positioning occasions in the carrier frequency <i>carrierFreq</i> for which the UE needs to perform the inter-frequency or intra-frequency RSTD measurements. The PRS positioning occasion information is received from upper layers. The value of <i>measPRS-Offset-r10</i> is obtained by mapping the starting subframe of the PRS positioning occasion in the measured cell onto the corresponding subframe in the serving cell and is calculated as the serving cell's number of subframes from SFN=0 mod 40. If <i>measPRS-Offset-r15</i> is included, the field further indicates the requested gap pattern that the category M1 or M2 UE prefers to perform RSTD measurements with dense PRS configuration, as specified in TS 36.133 [16], Table 8.1.2.1-3, where value <i>rstd0</i> corresponds to Gap Pattern Id <i>rstd0</i> , value <i>rstd1</i> corresponds to Gap Pattern Id <i>rstd1</i> and so on. The value of <i>measPRS-Offset-r15</i> is obtained by mapping the starting subframe of the PRS positioning occasion in the measured cell onto the corresponding subframe in the serving cell and is calculated as the serving cell's number of subframes from SFN=0 mod MGRP corresponding to the requested Gap pattern Id. If <i>measPRS-Offset-r15</i> is included, <i>measPRS-Offset-r10</i> is ignored. The UE shall take into account any additional time required by the UE to start PRS measurements on the other carrier when it does this mapping for determining the <i>measPRS-Offset</i> . NOTE: Figure 6.2.2-1 illustrates the <i>measPRS-Offset</i> field.
<i>rstd-InterFreqIndication</i>	Indicates the inter-frequency or intra-frequency RSTD measurement action, i.e. the UE is going to start or stop inter-frequency or intra-frequency RSTD measurement.

Figure 6.2.2-1 (informative): Exemplary calculation of *measPRS-Offset* field.

– *LoggedMeasurementConfiguration*

The *LoggedMeasurementConfiguration* message is used by E-UTRAN to configure the UE to perform logging of measurement results while in RRC_IDLE or to perform logging of measurement results for MBSFN while in both RRC_IDLE and RRC_CONNECTED. It is used to transfer the logged measurement configuration for network performance optimisation, see TS 37.320 [60].

LoggedMeasurementConfiguration field descriptions

absoluteTimeInfo

Indicates the absolute time in the current cell.

areaConfiguration

Used to restrict the area in which the UE performs measurement logging to cells broadcasting either one of the included cell identities or one of the included tracking area codes/ identities.

eventType

The value *outOfCoverage* indicates the UE to perform logging of measurements when the UE enters *any cell selection* state, and the value *eventL1* indicates the UE to perform logging of measurements when the triggering condition (similar as event A2 as specified in 5.5.4.3) as configured in the event is met for the camping cell in *camped normally* state.

measUncomBarPre

If configured, the UE attempts to perform the uncompensated Barometric pressure measurement in RRC_IDLE as defined in TS 37.355 [109].

plmn-IdentityList

Indicates a set of PLMNs defining when the UE performs measurement logging as well as the associated status indication and information retrieval i.e. the UE performs these actions when the RPLMN is part of this set of PLMNs.

sigLoggedMeasType

If included, the field indicates a signalling based logged measurement configuration (See TS 37.320 [60]).

targetMBSFN-AreaList

Used to indicate logging of MBSFN measurements and further restrict the area and frequencies for which the UE performs measurement logging for MBSFN. If both MBSFN area id and carrier frequency are present, a specific MBSFN area is indicated. If only carrier frequency is present, all MBSFN areas on that carrier frequency are indicated. If there is no entry in the list, any MBSFN area is indicated.

tce-Id

Parameter Trace Collection Entity Id: See TS 32.422 [58].

traceRecordingSessionRef

Parameter Trace Recording Session Reference: See TS 32.422 [58]

MasterInformationBlock

The *MasterInformationBlock* includes the system information transmitted on BCH.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: BCCH

Direction: E-UTRAN to UE

MasterInformationBlock

```

-- ASN1START

MasterInformationBlock ::= SEQUENCE {
    dl-Bandwidth          ENUMERATED {
        n6, n15, n25, n50, n75, n100},
        phich-Config          PHICH-Config,
        systemFrameNumber     BIT STRING (SIZE (8)),
        schedulingInfoSIB1-BR-r13   INTEGER (0..31),
        systemInfoUnchanged-BR-r15  BOOLEAN,
        partEARFCN-r17         CHOICE {
            spare              BIT STRING (SIZE (2)),

        },
        spare                BIT STRING (SIZE (1))
}

-- ASN1STOP

```

<i>MasterInformationBlock</i> field descriptions	
<i>dl-Bandwidth</i>	Parameter: transmission bandwidth configuration, N_{RB} in downlink, see TS 36.101 [42], table 5.6-1 and TS 36.102 [113], table 5.3A-1. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.
<i>earfcn-LSB</i>	Indicates the 2 least significant bits of the EARFCN for NTN bands where 100 kHz raster is used, see TS 36.102 [113].
<i>phich-Config</i>	Specifies the PHICH configuration. If the UE is a BL UE or UE in CE, it shall ignore this field.
<i>schedulingInfoSIB1-BR</i>	Indicates the index to the tables that define <i>SystemInformationBlockType1-BR</i> scheduling information. The tables are specified in TS 36.213 [23], Table 7.1.6-1 and Table 7.1.7.2.7-1. Value 0 means that <i>SystemInformationBlockType1-BR</i> is not scheduled.
<i>systemFrameNumber</i>	Defines the 8 most significant bits of the SFN. As indicated in TS 36.211 [21], 6.6.1, the 2 least significant bits of the SFN are acquired implicitly in the P-BCH decoding, i.e. timing of 40ms P-BCH TTI indicates 2 least significant bits (within 40ms P-BCH TTI, the first radio frame: 00, the second radio frame: 01, the third radio frame: 10, the last radio frame: 11). One value applies for all serving cells of a Cell Group (i.e. MCG or SCG). The associated functionality is common (i.e. not performed independently for each cell).
<i>systemInfoUnchanged-BR</i>	Value TRUE indicates that no change has occurred in the SIB1-BR and SI messages at least over the SI validity time. NOTE: Value of <i>systemInfoUnchanged-BR</i> is also carried in RSS (if transmitted), see TS 36.211 [21].

— *MasterInformationBlock-MBMS*

The *MasterInformationBlock-MBMS* includes the system information transmitted on BCH.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: BCCH

Direction: E-UTRAN to UE

MasterInformationBlock-MBMS

```
-- ASN1START

MasterInformationBlock-MBMS-r14 ::= SEQUENCE {
    dl-Bandwidth-MBMS-r14
    systemFrameNumber-r14
    additionalNonMBSFNSubframes-r14
    semiStaticCFI-MBMS-r16
    spare
}
-- ASN1STOP
```

<i>MasterInformationBlock-MBMS</i> field descriptions	
<i>additionalNonMBSFNSubframes</i>	Configures additional non-MBSFN subframes where <i>SystemInformationBlockType1-MBMS</i> and <i>SystemInformation-MBMS</i> may be transmitted. Value 0, 1, 2, 3 mean zero, one, two, three additional non-MBSFN subframes are configured after each subframe which has PBCH.
<i>dl-Bandwidth-MBMS</i>	Parameter: transmission bandwidth configuration, N_{RB} in downlink, see TS 36.101 [42], table 5.6-1. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.
<i>semiStaticCFI-MBMS</i>	Indicates semi-static value of CFI as specified in TS 36.213 [23], clause 9.1.3. If value 0 is indicated, CFI is obtained from PCFICH, otherwise the UE may assume the CFI in CAS is given by this field.
<i>systemFrameNumber</i>	Defines the 6 most significant bits of the SFN of the MBMS-dedicated cell. As indicated in TS 36.211 [21], clause 6.6.1, the 4 least significant bits of the SFN are acquired implicitly in the P-BCH decoding, i.e. timing of 160ms P-BCH TTI indicates 4 least significant bits (within 40ms P-BCH TTI, the first radio frame: 00, the fourth radio frame: 01, the eighth radio frame: 10, the last radio frame: 11).

MBMSCountingResponse field descriptions

countingResponseList

List of MBMS services which the UE is receiving or interested to receive. Value 0 for field *countingResponseService* corresponds to the first entry in *countingRequestList* within *MBMSCountingRequest*, value 1 corresponds to the second entry in this list and so on.

mbsfn-ArealIndex

Index of the entry in field *mbsfn-ArealInfoList* within *SystemInformationBlockType13*. Value 0 corresponds to the first entry in 1st *mbsfn-ArealInfoList* within *SystemInformationBlockType13*, value 1 corresponds to the second entry in the same list, or when no more entry are present within the same *mbsfn-ArealInfoList*, then the first entry in the subsequent *mbsfn-ArealInfoList* within the same *SystemInformationBlockType13* and so on.

— MBMSInterestIndication

The *MBMSInterestIndication* message is used to inform E-UTRAN that the UE is receiving/ interested to receive or no longer receiving/ interested to receive MBMS via an MRB or SC-MRB including MBMS service(s) in receive only mode.

Signalling radio bearer: SRB1

***MBMSInterestIndication* field descriptions**

mbms-Bandwidth

Indicates the UE received MBMS service frequency bandwidth configuration, N_{RB} in downlink, see TS 36.101 [42], table 5.6-1. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.

mbms-FreqList

List of MBMS frequencies on which the UE is receiving or interested to receive MBMS via an MRB or SC-MRB.

mbms-Priority

Indicates whether the UE prioritises MBMS reception above unicast reception. The field is present (i.e. value *true*), if the UE prioritises reception of all listed MBMS frequencies above reception of any of the unicast bearers. Otherwise the field is absent.

mbms-ROM-Freq

The value indicates the carrier frequency used by the UE to receive MBMS service(s) in receive only mode.

mbms-ROM-InfoList

List of receive only mode MBMS service(s) related parameters which the UE is receiving or interested to receive.

mbms-ROM-SubcarrierSpacing

The value indicates subcarrier spacing for MBSFN subframes received by UE in receive only mode and kHz15 refers to 15kHz, kHz7dot5 refers to 7.5kHz subcarrier spacing and so on as defined in TS 36.211 [21], clause 6.12.

MBSFNAreaConfiguration

The *MBSFNAreaConfiguration* message contains the MBMS control information applicable for an MBSFN area. For each MBSFN area included in *SystemInformationBlockType13* E-UTRAN configures an MCCH (i.e. the MCCH identifies the MBSFN area) and signals the *MBSFNAreaConfiguration* message.

Signalling radio bearer: N/A

MBSFNAreaConfiguration field descriptions

commonSF-Alloc

Indicates the subframes allocated to the MBSFN area. E-UTRAN always sets this field to cover at least the subframes configured by *SystemInformationBlockType13* for this MCCH, regardless of whether any MBMS sessions are ongoing. E-UTRAN includes *commonSF-Alloc-v1610* only when the cell is a MBMS-dedicated cell. If E-UTRAN includes *commonSF-Alloc-v1430* and/or *commonSF-Alloc-v1610*, it includes the same number of entries, and listed in the same order, as in *commonSF-Alloc-r9*.

commonSF-AllocPeriod

Indicates the period during which resources corresponding with field *commonSF-Alloc* are divided between the (P)MCH that are configured for this MBSFN area. The subframe allocation patterns, as defined by *commonSF-Alloc*, repeat continuously during this period. Value rf4 corresponds to 4 radio frames, rf8 corresponds to 8 radio frames and so on. The *commonSF-AllocPeriod* starts in the radio frames for which: SFN mod *commonSF-AllocPeriod* = 0.

pmch-InfoList

EUTRAN may include *pmch-InfoListExt* even if *pmch-InfoList* does not include *maxPMCH-PerMBSFN* entries. EUTRAN configures at most *maxPMCH-PerMBSFN* entries i.e. across *pmch-InfoList* and *pmch-InfoListExt*.

MCGFailureInformation

The *MCGFailureInformation* message is used to provide information regarding E-UTRA MCG failures detected by the UE.

Signalling radio bearer: SRB1

MCGFailureInformation field descriptions

measResultFreqListEUTRA

The field contains available results of measurements on EUTRA frequencies the UE is configured to measure by *measConfig*.

measResultFreqListGERAN

The field contains available results of measurements on GERAN frequencies the UE is configured to measure by *measConfig*.

measResultFreqListNR

The field contains available results of measurements on NR frequencies the UE is configured to measure by *measConfig*.

measResultFreqListUTRA

The field contains available results of measurements on UTRA frequencies the UE is configured to measure by *measConfig*.

measResultSCG

Includes the NR *MeasResultSCG-Failure* IE as specified in TS 38.331 [82]. The field contains available results of measurements on NR frequencies the UE is configured to measure by the NR RRConfiguration message.

– MeasReportAppLayer

The *MeasReportAppLayer* message is used for sending application layer measurement report.

Signalling radio bearer: SRB4

```

<i>MobilityFromEUTRACommand</i> field descriptions	
<i>bandIndicator</i>	Indicates how to interpret the ARFCN of the BCCH carrier.
<i>carrierFreq</i>	contains the carrier frequency of the target GERAN cell.
<i>cs-FallbackIndicator</i>	Value <i>true</i> indicates that the CS fallback procedure to UTRAN or GERAN is triggered.
<i>messageContCDMA2000-1XRTT</i>	This field contains a message specified in CDMA2000 1xRTT standard that either tells the UE to move to specific 1xRTT target cell(s) or indicates a failure to allocate resources for the enhanced CS fallback to CDMA2000 1xRTT.
<i>messageContCDMA2000-HRPD</i>	This field contains a message specified in CDMA2000 HRPD standard that either tells the UE to move to specific HRPD target cell(s) or indicates a failure to allocate resources for the handover to CDMA2000 HRPD.
<i>mobilityCDMA2000-HRPD</i>	This field indicates whether or not mobility to CDMA2000 HRPD is to be performed by the UE and it also indicates the type of mobility to CDMA2000 HRPD that is to be performed; If this field is not present the UE shall perform only the enhanced CS fallback to CDMA2000 1xRTT.
<i>nas-SecurityParamFromEUTRA</i>	If the <i>targetRAT-Type</i> is set to "eutra" and the source CN is 5GC, this field is used to deliver the key synchronisation and key freshness for the Key freshness for the 5GS to EPS handovers as specified in TS 33.501 [86] and the content of the parameter is defined in TS 24.501 [95]. Otherwise, this field is used to deliver the key synchronisation and Key freshness for the E-UTRAN to UTRAN handovers as specified in TS 33.401 [32] and the content of the parameter is defined in TS24.301 [35].
<i>networkControlOrder</i>	Parameter NETWORK_CONTROL_ORDER in TS 44.060 [36].
<i>purpose</i>	Indicates which type of mobility procedure the UE is requested to perform. EUTRAN always applies value e-CSFB in case of enhanced CS fallback to CDMA2000 (e.g. also when that procedure results in handover to CDMA2000 1XRTT only, in handover to CDMA2000 HRPD only or in redirection to CDMA2000 HRPD only),
<i>redirectCarrierCDMA2000-HRPD</i>	The <i>redirectCarrierCDMA2000-HRPD</i> indicates a CDMA2000 carrier frequency and is used to redirect the UE to a HRPD carrier frequency.
<i>smtc</i>	The SSB periodicity/offset/duration configuration of target cell for inter-RAT handover to NR. It is based on timing reference of EUTRA PCell. If the field is absent, the UE uses the SMTC in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing, as configured before the reception of the RRC message.
<i>SystemInfoListGERAN</i>	If <i>purpose</i> = CellChangeOrder and if the field is not present, the UE has to acquire SI/PSI from the GERAN cell.
<i>t304</i>	Timer T304 as described in clause 7.3. Value ms100 corresponds with 100 ms, ms200 corresponds with 200 ms and so on. EUTRAN includes extended value ms10000-v1310 only when UE supports CE.
<i>targetRAT-Type</i>	Indicates the target RAT type.
<i>targetRAT-MessageContainer</i>	The field contains a message specified in another standard, as indicated by the <i>targetRAT-Type</i> , and carries information about the target cell identifier(s) and radio parameters relevant for the target radio access technology. NOTE 1. A complete message is included, as specified in the other standard.

Conditional presence	Explanation
<i>concHO</i>	The field is mandatory present if the <i>mobilityCDMA2000-HRPD</i> is set to "handover"; otherwise the field is optional present, need ON.
<i>concRedir</i>	The field is mandatory present if the <i>mobilityCDMA2000-HRPD</i> is set to "redirection"; otherwise the field is not present.
<i>GERAN</i>	The field should be present if the <i>purpose</i> is set to "handover" and the <i>targetRAT-Type</i> is set to "geran"; otherwise the field is not present
<i>PSHO</i>	The field is mandatory present in case of PS handover toward GERAN; otherwise the field is optionally present, but not used by the UE
<i>UTRAGERANEPC</i>	The field is mandatory present if the <i>targetRAT-Type</i> is set to "utra" or "geran" or if the <i>targetRAT-Type</i> is set to "eutra" and the source CN is 5GC; otherwise the field is not present

NOTE 1: The correspondence between the value of the *targetRAT-Type*, the standard to apply and the message contained within the *targetRAT-MessageContainer* is shown in the table below:

targetRAT-Type	Standard to apply	targetRAT-MessageContainer
cdma2000-1XRTT	C.S0001 or later, C.S0007 or later, C.S0008 or later	
cdma2000-HRPD	C.S0024 or later	
eutra	TS 36.331 (clause 5.4.2)	RRCConnectionReconfiguration
	GSM TS 04.18, version 8.5.0 or later, or TS 44.018 (clause 9.1.15)	HANDOVER COMMAND
	TS 44.060, version 6.13.0 or later (clause 11.2.43)	PS HANDOVER COMMAND

IMSI ::=                      SEQUENCE (SIZE (6..21)) OF IMSI-Digit
IMSI-Digit ::=                 INTEGER (0..9)
-- ASN1STOP

```

Paging field descriptions	
accessType	If indicates whether Paging is originated due to the PDU sessions from the non-3GPP access when E-UTRA is connected to 5GC. E-UTRAN does not include both <i>accessType</i> (i.e., without suffix) and <i>accessType-r16</i> in a single paging message.
cmas-Indication	If present: indication of a CMAS notification.
cn-Domain	Indicates the origin of paging.
eab-ParamModification	If present: indication of an EAB parameters (SIB14) modification.
etws-Indication	If present: indication of an ETWS primary notification and/ or ETWS secondary notification.
imsi	The International Mobile Subscriber Identity, a globally unique permanent subscriber identity, see TS 23.003 [27]. The first element contains the first IMSI digit, the second element contains the second IMSI digit and so on.
mt-EDT	Indication of mobile terminating EDT.
pagingCause	Indicates whether the <i>Paging</i> message is originated due to IMS voice. If the field is present, it implies that the corresponding paging entry is for IMS voice. If upper layers indicate the support of paging cause and if this field is not present but <i>pagingRecordList-v1700</i> is present, it implies that the corresponding paging entry is for a service other than IMS voice. Otherwise, paging cause is undetermined.
pagingRecordList	If E-UTRAN includes <i>pagingRecordList-v1610</i> and/or <i>pagingRecordList-v1700</i> , it includes the same number of entries, and listed in the same order, as in <i>pagingRecordList</i> (i.e. without suffix).
redistributionIndication	If present: indication to trigger E-UTRAN inter-frequency redistribution procedure as specified in TS 36.304 [4], clause 5.2.4.10.
systemInfoModification	If present: indication of a BCCH modification other than SIB10, SIB11, SIB12, SIB14 and SIB31. This indication does not apply to UEs using eDRX cycle longer than the BCCH modification period.
systemInfoModification-eDRX	If present: indication of a BCCH modification other than SIB10, SIB11, SIB12, SIB14 and SIB31. This indication applies only to UEs using eDRX cycle longer than the BCCH modification period.
uac-ParamModification	If present: indication of UAC parameters (SIB25) modification.
ue-Identity	Provides the NAS identity of the UE that is being paged. The IMSI is not applicable for E-UTRA/5GC.

– *ProximityIndication*

The *ProximityIndication* message is used to indicate that the UE is entering or leaving the proximity of one or more CSG member cell(s).

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

-- ASN1STOP

```

ProximityIndication field descriptions

carrierFreq

Indicates the RAT and frequency of the CSG member cell(s), for which the proximity indication is sent. For E-UTRA and UTRA frequencies, the UE shall set the ARFCN according to a band it previously considered suitable for accessing (one of) the CSG member cell(s), for which the proximity indication is sent.

type

Used to indicate whether the UE is entering or leaving the proximity of CSG member cell(s).

PURConfigurationRequest

The *PURConfigurationRequest* message is used by BL UE or UE in CE to indicate to the E-UTRAN that the UE is interested to be configured with PUR and provide PUR related information to E-UTRAN.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

PURConfigurationRequest field descriptions		
requestedNumOccasions		
Indicates the requested number of PUR grant occasions. Value <i>one</i> corresponds to one occasion and value <i>infinite</i> corresponds to infinite occasions.		
requestedPeriodicityAndOffset		
Indicates the requested periodicity for the PUR occasions and time offset until the first PUR occasion.		
requestedTBS		
Indicates the requested TBS for the PUR. <i>b328</i> corresponds to 328 bits, <i>b344</i> corresponds to 344 bits and so on. The maximum requested TBS is limited to the UL TBS size supported by the UE.		
rrc-ACK		
Indicates RRC response message is preferred by the UE for acknowledging the reception of a transmission using PUR.		

— *RNReconfiguration*

The *RNReconfiguration* is a command to modify the RN subframe configuration and/or to convey changed system information.

Signalling radio bearer: SRB1

<i>RRCConnectionReconfiguration</i> field descriptions	
conditionalReconfiguration	This field is used to configure the UE with a conditional reconfiguration. The reconfiguration is applied when the execution condition(s) is fulfilled. The field is absent if <i>daps-HO</i> is configured for any DRB or if <i>MobilityControlInfo</i> is included in the <i>RRCConnectionReconfiguration</i> message. The <i>conditionalReconfiguration</i> is not configured in the <i>RRCConnectionReconfiguration</i> message included in a <i>conditionalReconfiguration</i> .
daps-SourceRelease	A one-shot field that indicates that the UE shall release the resources associated with source PCell at a DAPS HO, including reconfiguration of the PDCP entity to release DAPS.
dedicatedInfoNASList	This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for each PDU in the list. If <i>dedicatedInfoNASList-r15</i> is present, UE shall ignore the <i>dedicatedInfoNASList</i> (without suffix).
endc-ReleaseAndAdd	A one-shot field indicating whether the UE simultaneously releases and adds all the NR SCG related configuration within <i>nr-Config</i> , i.e. the configuration set by the NR <i>RRCReconfiguration</i> message (e.g. <i>secondaryCellGroup</i> , <i>SRB3</i> and <i>measConfig</i>).
fullConfig	Indicates the full configuration option is applicable for the RRC Connection Reconfiguration message for intra-system intra-RAT handover. For inter-RAT handover from NR to E-UTRA, <i>fullConfig</i> indicates whether or not delta signalling of SDAP/PDCP from source RAT is applicable. This field is absent when the <i>RRCConnectionReconfiguration</i> message is generated by the E-UTRA SCG.
keyChangeIndicator	If UE is connected to EPC, true is used only in an intra-cell handover when a K_{eNB} key is derived from a K_{ASME} key taken into use through the latest successful NAS SMC procedure, as described in TS 33.401 [32] for K_{eNB} re-keying. false is used in an intra-LTE handover when the new K_{eNB} key is obtained from the current K_{eNB} key or from the NH as described in TS 33.401 [32]. If UE is connected to 5GC, with <i>keyChangeIndicator-r15</i> , true is used in an intra-cell handover when a K_{eNB} key is derived from a K_{AMF} key taken into use through the latest successful NAS SMC procedure, as described in TS 33.501 [86] for K_{eNB} re-keying. False is used for intra-system handover when the new K_{eNB} key is obtained from the current K_{eNB} key or from the NH as described in TS 33.501 [86]. True is also used in NG based handover procedure with K_{AMF} change, when a K_{eNB} key is derived from the new K_{AMF} key as described in TS 33.501 [86].
lwa-Configuration	This field is used to provide parameters for LWA configuration. E-UTRAN does not simultaneously configure LWA with DC, LWIP or RCLWI for a UE.
lwip-Configuration	This field is used to provide parameters for LWIP configuration. E-UTRAN does not simultaneously configure LWIP with DC, LWA or RCLWI for a UE.
measConfig	Measurements that E-UTRAN may configure when the UE is not configured with NE-DC.
measConfigSN	Measurements that E-UTRAN may configure when the UE is configured with NE-DC and for which reports are carried within an NR RRC message.
nas-Container	This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for this field, although, if included, it affects activation of AS- security after handover within E-UTRA/5GC. The content is defined in TS 24.501 [95]. In case of NG based handover, the content of nas-Container is. the Intra N1 mode NAS transparent container IE. In case of inter-system handover to from 5GS to EPS, the content of NAS- Container is. the S1 mode to N1 mode NAS transparent container IE.
nas-securityParamToEUTRA	This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for this field, although, if included, it affects activation of AS- security after inter-RAT handover to E-UTRA/EPC or inter-system handover to E-UTRA/EPC. The content is defined in TS 24.301 [35]. This field is not used for handover from 5GC.
networkControlledSyncTx	This field indicates whether the UE shall transmit synchronisation information (i.e. become synchronisation source). Value <i>On</i> indicates the UE to transmit synchronisation information while value <i>Off</i> indicates the UE to not transmit such information.
nextHopChainingCount	Parameter NCC: See TS 33.401 [32] if UE is connected to EPC, else see 33.501 [86] if UE is connected to 5GC.
nr-Config	Includes the NR related configurations. This field is used to configure (NG)EN-DC configuration, possibly in conjunction with fields <i>sk-Counter</i> and <i>nr-RadioBearerConfig1/2</i> . NOTE 1.
nr-RadioBearerConfig1, nr-RadioBearerConfig2	Includes the NR RadioBearerConfig IE as specified in TS 38.331 [82]. The field includes the configuration of RBs configured with NR PDCP.

<i>RRCConnectionReconfiguration</i> field descriptions	
<i>nr-SecondaryCellGroupConfig</i>	Includes the NR <i>RRCReconfiguration</i> message as specified in TS 38.331 [82]. In this version of the specification, the NR RRC message only includes fields <i>secondaryCellGroup</i> , <i>conditionalReconfiguration</i> , <i>otherConfig</i> , <i>bap-Config</i> , <i>iab-IP-AddressConfigurationList</i> and/or <i>measConfig</i> . If <i>nr-SecondaryCellGroupConfig</i> is configured, the network always includes this field upon MN handover to initiate an NR SCG reconfiguration with sync and key change.
<i>perCC-GapIndicationRequest</i>	Indicates that UE shall include <i>perCC-GapIndicationList</i> and <i>numFreqEffective</i> in the <i>RRCConnectionReconfigurationComplete</i> message. <i>numFreqEffectiveReduced</i> may also be included if frequencies are configured for reduced measurement performance.
<i>p-MaxEUTRA</i>	Indicates the maximum power available for LTE.
<i>p-MaxUE-FR1</i>	The maximum total transmit power to be used by the UE across all serving cells in frequency range 1 (FR1) across all cell groups. The maximum transmit power that the UE may use may be additionally limited on cell- or cell-group level. The field is optionally present, if (NG)EN-DC (nr-Config-r15) has been configured. It is absent otherwise.
<i>p-MeNB</i>	Indicates the guaranteed power for the MeNB, as specified in TS 36.213 [23]. The value N corresponds to N-1 in TS 36.213 [23].
<i>powerControlMode</i>	Indicates the power control mode used in DC. Value 1 corresponds to DC power control mode 1 and value 2 indicates DC power control mode 2, as specified in TS 36.213 [23].
<i>p-SeNB</i>	Indicates the guaranteed power for the SeNB as specified in TS 36.213 [23], Table 5.1.4.2-1. The value N corresponds to N-1 in TS 36.213 [23].
<i>rclwi-Configuration</i>	WLAN traffic steering command as specified in 5.6.16.2. E-UTRAN does not simultaneously configure RCLWI with DC, LWA or LWIP for a UE.
<i>sCellConfigCommon</i>	Indicates the common configuration for the SCell group.
<i>sCellGroupIndex</i>	Indicates the identity of SCell groups for which a common configuration is provided.
<i>sCellIndex</i>	The <i>sCellIndex</i> is unique within the scope of the UE. In case of DC, an SCG cell can not use the same value as used for an MCG cell. For <i>pSCellToAddMod</i> , if <i>sCellIndex-r13</i> is present the UE shall ignore <i>sCellIndex-r12</i> .
<i>sCellGroupToAddModList, sCellGroupToAddModListSCG</i>	Indicates the SCell group to be added or modified. E-UTRAN only configures at most 4 SCell groups per UE over all cell groups. SCell groups can only be configured for LTE SCells, and all SCells in an SCell group must belong to the same cell group.
<i>sCellGroupToReleaseList</i>	Indicates the SCell group to be released.
<i>sCellState</i>	A one-shot field that indicates whether the SCell shall be considered to be in activated or dormant state upon SCell configuration.
<i>sCellToAddModList, sCellToAddModListExt</i>	Indicates the SCell to be added or modified. E-UTRAN uses field <i>sCellToAddModList-r10</i> to add or modify SCells (with <i>sCellIndex-r10</i>) for a UE that does not support carrier aggregation with more than 5 component carriers. If E-UTRAN includes <i>sCellToAddModListExt-v1430</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListExt-r13</i> . If E-UTRAN includes <i>sCellToAddModListExt-v1010</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListExt-r10</i> . If E-UTRAN includes <i>sCellToAddModListExt-v1370</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListExt-r13</i> . If E-UTRAN includes <i>sCellToAddModListExt-v13c0</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListExt-r13</i> .
<i>sCellToAddModListSCG, sCellToAddModListSCG-Ext</i>	Indicates the SCG cell to be added or modified. The field is used for SCG cells other than the PSCell (which is added/modified by field <i>pSCellToAddMod</i>). E-UTRAN uses field <i>sCellToAddModListSCG-r12</i> to add or modify SCells (with <i>sCellIndex-r10</i>) for a UE that does not support carrier aggregation with more than 5 component carriers. If E-UTRAN includes <i>sCellToAddModListSCG-v1010</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListSCG-r12</i> . If E-UTRAN includes <i>sCellToAddModListSCG-Ext-v1370</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListSCG-Ext-r13</i> . If E-UTRAN includes <i>sCellToAddModListSCG-Ext-v13c0</i> it includes the same number of entries, and listed in the same order, as in <i>sCellToAddModListSCG-Ext-r13</i> .
<i>sCellToReleaseList, sCellToReleaseListExt</i>	Indicates the SCell to be released. E-UTRAN uses field <i>sCellToReleaseList-r10</i> to release SCells for a UE that does not support carrier aggregation with more than 5 component carriers.

RRCConnectionReconfiguration field descriptions	
sCellToReleaseListSCG, sCellToReleaseListSCG-Ext	Indicates the SCG cell to be released. The field is also used to release the PSCell e.g. upon change of PSCell, upon system information change for the PSCell. E-UTRAN uses field <i>sCellToReleaseListSCG-r12</i> to release SCells for a UE that does not support carrier aggregation with more than 5 component carriers.
scg-Configuration	Covers the SCG configuration as used in case of DC and NE-DC. When the UE is configured with NE-DC, E-UTRAN neither applies value release nor configures <i>scg-ConfigPartMCG</i> . When resuming a connection with NE-DC, this field is included, containing at least the <i>mobilityControlInfoSCG</i> .
scg-Counter	A counter used upon initial configuration of SCG security as well as upon refresh of S-K _{ENB} . E-UTRAN includes the field upon SCG change when one or more SCG DRBs are configured. Otherwise E-UTRAN does not include the field.
scg-State	Indicates that the NR SCG is deactivated. The field is absent if CPA or CPC is configured for the UE, or if the <i>RRCConnectionReconfiguration</i> message is contained in <i>condReconfigurationToApply</i> .
securityConfigHO	This field contains the parameters required to update the security keys at handover. If E-UTRAN includes the <i>securityConfigHO</i> (i.e., without suffix), the choice <i>intraLTE</i> is used for handover within E-UTRA/EPC while the choice <i>interRAT</i> is used for handover from GERAN or UTRAN to E-UTRA/EPC. If E-UTRAN includes the <i>securityConfigHO-v1530</i> (i.e., with suffix), the choice <i>intra5GC</i> is used for handover from NR or E-UTRA/5GC to E-UTRA/5GC while the choice <i>fivegc-ToEPC</i> is used for inter-system handover from NR or E-UTRA/5GC to E-UTRA/EPC and the choice <i>epc-To5GC</i> is used for inter-system handover from E-UTRA/EPC to E-UTRA/5GC.
sk-Counter	A one-shot counter used upon initial configuration of S-K _{GNB} as well as upon refresh of S-K _{GNB} . E-UTRAN always provides this field either upon initial configuration of an NR SCG, or upon configuration of the first (SN terminated) RB using S-K _{GNB} , whichever happens first.
sl-ConfigDedicatedForNR	Container for providing the dedicated configurations for NR sidelink communication, the octet string contains the NR <i>RRCReconfiguration</i> message as specified in TS 38.331 [82]. In this version of the specification, the NR RRC message only includes fields related to NR sidelink communication, i.e. <i>sl-ConfigDedicatedNR</i> , <i>measConfig</i> and/or <i>otherConfig</i> . If the UE is configured by the current Pcell with <i>sl-ScheduledConfig</i> set to setup (i.e., NR sidelink communication mode 1), the network only includes <i>sl-PrioritizationThres</i> and <i>sl-ConfiguredGrantConfig</i> that only includes the configurations of configured sidelink grant Type 1 in the field <i>sl-ScheduledConfig</i> . This field is not applicable to 5GS Proximity based Services (ProSe) as defined in TS 23.304 [112] in this release.
sl-SSB-PriorityEUTRA	Indicates the priority of LTE PSSS/SSSS/PSBCH transmission and reception. NOTE 3.
sl-V2X-ConfigDedicated	Indicates sidelink configuration for non-P2X related V2X sidelink communication as well as P2X related V2X sidelink communication.
smtc	The SSB periodicity/offset/duration configuration of target cell for NR PSCell addition and SN change. It is based on timing reference of EUTRA PCell. NOTE 2. If the field is absent, the UE uses the SMTC in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing, as configured before the reception of the RRC message.
srs-SwitchFromServCellIndex	Indicates the serving cell whose UL transmission may be interrupted during SRS transmission on a PUSCH-less cell. During SRS transmission on a PUSCH-less cell, the UE may temporarily suspend the UL transmission on a serving cell with PUSCH in the same CG to allow the PUSCH-less cell to transmit SRS. The PUSCH-less cell is always a TDD cell but the serving cell with PUSCH may be either a FDD or TDD cell.
systemInformationBlockType1Dedicated	This field is used to transfer <i>SystemInformationBlockType1</i> or <i>SystemInformationBlockType1-BR</i> to the UE.
systemInformationBlockType2Dedicated	This field is used to transfer BR version of <i>SystemInformationBlockType2</i> to BL UEs or UEs in CE or <i>SystemInformationBlockType2</i> to non-BL UEs.
systemInformationBlockType31Dedicated	This field is used to transfer <i>SystemInformationBlockType31</i> to BL UEs or UEs in CE for an NTN cell.
t350	Timer T350 as described in clause 7.3. Value <i>minN</i> corresponds to N minutes.
tdm-PatternConfig	This field is used when power control or IMD issues require single UL transmission in (NG)EN-DC as specified in TS 38.101-3 [101] and TS 38.213 [88].
tdm-PatternConfig2	This field is used for dual UL transmission in EN-DC with LTE FDD PCell and for single UL transmission in EN-DC with LTE FDD/TDD PCell, as specified in TS 38.101-3 [101] and TS 38.213 [88]. The network sets at most one of <i>tdm-PatternConfig</i> and <i>tdm-PatternConfig2</i> to setup. When this field is configured in EN-DC with LTE TDD PCell, it is not applicable if TDD configuration is sa0 or sa6 in SIB1.

<i>RRCConnectionReconfiguration</i> field descriptions	
<i>tdm-PatternConfigNE-DC</i>	This field is used when power control or IMD issues require single UL transmission in NE-DC as specified in TS 38.101-3 [101] and TS 38.213 [88].

Conditional presence	Explanation
<i>EARFCN-max</i>	The field is mandatory present if <i>dl-CarrierFreq-r10</i> is included and set to <i>maxEARFCN</i> . Otherwise the field is not present.
<i>FDD-PCell</i>	This field is optionally present, need ON, for a FDD PCell if there is no SCell with configured uplink. Otherwise, the field is not present.
<i>FDD-PSCell</i>	This field is optionally present, need ON, for a FDD PSCell if there is no SCell with configured uplink. Otherwise, the field is not present.
<i>fullConfig</i>	This field is mandatory present for handover within E-UTRA when the <i>fullConfig</i> is included; otherwise it is optionally present, Need OP.
<i>HO</i>	The field is mandatory present in case of handover within E-UTRA or to E-UTRA and in a message contained in a NR <i>DLInformationTransferMRDC</i> message; otherwise the field is not present. The field is not present if source PCell resources after a DAPS handover have not been released.
<i>HO-Reestab</i>	The field is mandatory present in case of inter-system handover within E-UTRA or handover from NR to E-UTRA/EPC; it is optionally present, need ON, in case of intra-system handover within E-UTRA or upon the first reconfiguration after RRC connection re-establishment; or for intra-system handover from NR to E-UTRA, otherwise the field is not present.
<i>HO-5GC</i>	The field is mandatory present in case of handover within E-UTRA/5GC, handover to E-UTRA/5GC, handover from NR to E-UTRA/EPC, or handover from E-UTRA/5GC to E-UTRA/EPC, otherwise the field is not present.
<i>HO-toEPC</i>	The field is mandatory present in case of handover within E-UTRA/EPC or to E-UTRA/EPC, except handover from NR or E-UTRA/5GC, otherwise the field is not present.
<i>HO-toEUTRA</i>	The field is mandatory present in case of handover to E-UTRA or for reconfigurations when <i>fullConfig</i> is included; otherwise the field is optionally present, need ON.
<i>nonFullConfig</i>	The field is not present when the <i>fullConfig</i> is included or in case of handover to E-UTRA; otherwise it is optional present, need ON.
<i>nonHO</i>	The field is not present in case of handover within E-UTRA or to E-UTRA; otherwise it is optional present, need ON.
<i>NTN</i>	The field is mandatory present in case of handover to a NTN cell. Otherwise the field is optionally present, Need ON, in a NTN cell.
<i>SCellAdd</i>	The field is mandatory present upon SCell addition; otherwise it is not present.
<i>SCellAdd2</i>	The field is mandatory present upon SCell addition; otherwise it is optionally present, need ON.

NOTE 1: Fields *sk-Counter* and *nr-RadioBearerConfig1/2* are placed outside *nr-Config*, as these may be configured while the UE is not configured with (NG)EN-DC.

NOTE 2: It is not specified whether the timing reference for the SMTTC configuration is the source EUTRA PCell or the target EUTRA PCell in case the NR PSCell addition or SN change takes place simultaneously with handover. As a consequence, explicit SMTTC configuration is only supported when the source EUTRA PCell and the target EUTRA PCell of the handover are SFN/subframe-synchronized.

NOTE 3: For UEs in RRC_IDLE, RRC_INACTIVE or out-of coverage, and for the case that *sl-SSB-PriorityEUTRA* is absent, it is up to UE implementation to decide the priority of LTE PSSS/SSSS/PSBCH transmission and reception.

– *RRCConnectionReconfigurationComplete*

The *RRCConnectionReconfigurationComplete* message is used to confirm the successful completion of an RRC connection reconfiguration.

RRCCConnectionReconfigurationComplete field descriptions

numFreqEffective

This field is used to indicate the number of effective frequencies that a UE measures in series according to TS 36.133 [16]. Simultaneous measurement in parallel on multiple frequencies can be equivalent to a single effective frequency. The frequencies configured for reduced measurement performance should not be included.

numFreqEffectiveReduced

This field is used to indicate the number of effective frequencies that a UE measures in series according to TS 36.133 [16] for frequencies configured for reduced measurement performance. Simultaneous measurement in parallel on multiple frequencies can be equivalent to a single effective frequency.

perCC-GapIndicationList

This field is used to indicate per CC measurement gap preference by the UE.

scg-ConfigResponseNR

Includes the NR *RRCReconfigurationComplete* message as defined in TS 38.331 [82].

selectedCondReconfigurationToApply

This field indicates the selected conditional RRC connection reconfiguration the UE applied upon the execution of CPA or inter-SN CPC.

RRCCConnectionReestablishment

The *RRCCConnectionReestablishment* message is used to re-establish SRB1.

Signalling radio bearer: SRB0

RRConnectionReestablishmentRequest field descriptions

physCellId

The Physical Cell Identity of the PCell the UE was connected to prior to the failure.

reestablishmentCause

Indicates the failure cause that triggered the re-establishment procedure. eNB is not expected to reject a *RRConnectionReestablishmentRequest* due to unknown cause value being used by the UE.

ue-Identity

UE identity included to retrieve UE context and to facilitate contention resolution by lower layers.

RRConnectionReject

The *RRConnectionReject* message is used to reject the RRC connection establishment or to reject the EDT procedure.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: E-UTRAN to UE

RRCConnectionReject field descriptions

deprioritisationReq

Indicates whether the current frequency or RAT is to be de-prioritised. The UE shall be able to store a depriortisation request for up to 8 frequencies (applicable when receiving another frequency specific deprioritisation request before T325 expiry).

deprioritisationTimer

Indicates the period for which either the current carrier frequency or E-UTRA is deprioritised. Value *minN* corresponds to N minutes.

extendedWaitTime

Value in seconds for the wait time for Delay Tolerant access requests.

rrc-SuspendIndication

If present, this field indicates that the UE should remain suspended and not release its stored context.

waitTime

Wait time value in seconds.

RRCConnectionRelease

The *RRCConnectionRelease* message is used to command the release of an RRC connection, or to complete an UP-EDT procedure.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

}

-- ASN1STOP

```

RRCConnectionRelease field descriptions	
altFreqPriorities	Indicates that the UE shall apply the alternative cell reselectionpriorities, when available. This field is not configured together with <i>idleModeMobilityControlInfo</i> .
carrierFreq or bandClass	The carrier frequency (UTRA, E-UTRA, and NR) and band class (HRPD and 1xRTT) for which the associated cellReselectionPriority is applied. For NR, the ARFCN-ValueNR corresponds to a GSCN value as specified in TS 38.101 [85].
carrierFreqs	The list of GERAN carrier frequencies organised into one group of GERAN carrier frequencies.
cellInfoList	Used to provide system information of one or more cells on the redirected inter-RAT carrier frequency. The system information can be used if, upon redirection, the UE selects an inter-RAT cell indicated by the <i>physCellId</i> and <i>carrierFreq</i> (GERAN and UTRA TDD) or by the <i>physCellId</i> (other RATs). The choice shall match the <i>redirectedCarrierInfo</i> . In particular, E-UTRAN only applies value <i>utra-TDD-r10</i> in case <i>redirectedCarrierInfo</i> is set to <i>utra-TDD-r10</i> .
cellList	Indicates a list of cells configured as RAN area. For each element, in the absence of <i>plmn-Identity</i> the UE considers the registered PLMN. Total number of cells across all PLMNs does not exceed 32.
cn-Type	The <i>cn-Type</i> is used to indicate that the UE is redirected from 5GC to EPC or 5GC when <i>redirectedCarrierInfo</i> indicates E-UTRA frequency.
drb-ContinueROHC	This field indicates whether to continue or reset the header compression protocol context for the DRBs configured with the header compression protocol. Presence of the field indicates that the header compression protocol context continues when UE initiates UP-EDT in the same cell, while absence indicates that the header compression protocol context is reset.
dummy	This field is not used in the specification. If received it shall be ignored by the UE.
extendedWaitTime	Value in seconds for the wait time for Delay Tolerant access requests.
freqPriorityListX	Provides a cell reselection priority for each frequency, by means of separate lists for each RAT (including E-UTRA). The UE shall be able to store at least 3 occurrences of <i>FreqsPriorityGERAN</i> . If E-UTRAN includes <i>freqPriorityListEUTRA-v9e0</i> and/or <i>freqPriorityListEUTRA-v1310</i> it includes the same number of entries, and listed in the same order, as in <i>freqPriorityListEUTRA</i> (i.e. without suffix). Field <i>freqPriorityListExt</i> includes additional neighbouring inter-frequencies, i.e. extending the size of the inter-frequency carrier list using the general principles specified in 5.1.2. EUTRAN only includes <i>freqPriorityListExtEUTRA</i> if <i>freqPriorityListEUTRA</i> (i.e without suffix) includes <i>maxFreq</i> entries. If E-UTRAN includes <i>freqPriorityListExtEUTRA-v1310</i> it includes the same number of entries, and listed in the same order, as in <i>freqPriorityListExtEUTRA-r12</i> .
idleModeMobilityControlInfo	Provides dedicated cell reselection priorities. Used for cell reselection as specified in TS 36.304 [4]. For E-UTRA and UTRA frequencies, a UE that supports multi-band cells for the concerned RAT considers the dedicated priorities to be common for all overlapping bands (i.e. regardless of the ARFCN that is used).
measIdleConfig	Indicates a one-shot measurement configuration to be stored and used by the UE while in RRC_IDLE or RRC_INACTIVE.
mpsPriorityIndication	Indicates the UE can set the establishment cause to <i>highPriorityAccess</i> for a new connection following a redirect to E-UTRA or set the resume cause to <i>highPriorityAccess</i> for a resume following a redirect to E-UTRA. If the target RAT is NR, see TS 38.331 [82]. The eNB/ng-eNB sets the indication only for UEs authorized to receive MPS treatment as indicated by ARP and/or QoS characteristics at the eNB/ng-eNB, and it is applicable only for this instance of release with redirection to carrier/RAT included in the <i>redirectedCarrierInfo</i> field in the <i>RRCConnectionRelease</i> message.
noLastCellUpdate	Presence of the field indicates that the last used cell for (G)WUS shall not be updated.
periodic-RNAU-timer	Refers to the timer that triggers the periodic RNAU procedure in UE. Value min5 corresponds to 5 minutes, value min10 corresponds to 10 minutes and so on.
ran-Area	Indicates whether TA code(s) or RAN area code(s) are used for the RAN notification area. The network uses only TA code(s) or RAN area code(s) to configure a UE. Total number of TACs across all PLMNs does not exceed 16. Total number of RAN-AreaCode across all PLMNs does not exceed 32.
ran-NotificationAreaInfo	Network ensures that the UE in RRC_INACTIVE always has a valid <i>ran-NotificationAreaInfo</i> .
ranAreaConfigList	Indicates a list of RAN area codes or RA code(s) as RAN area. For each element, in the absence of <i>plmn-Identity</i> the UE considers the registered PLMN.

<i>RRCConnectionRelease</i> field descriptions	
<i>altFreqPriorities</i>	Indicates that the UE shall apply the alternative cell reselectionpriorities, when available. This field is not configured together with <i>idleModeMobilityControlInfo</i> .
<i>ran-pagingCycle</i>	Refers to the UE specific cycle for RAN-initiated paging. Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on.
<i>redirectedCarrierInfo</i>	The <i>redirectedCarrierInfo</i> indicates a carrier frequency (downlink for FDD) and is used to redirect the UE to an E-UTRA or an inter-RAT carrier frequency, by means of the cell selection upon leaving RRC_CONNECTED as specified in TS 36.304 [4]. The value <i>geran</i> can only be included after successful security activation when UE is connected to 5GC.
<i>releaseCause</i>	The <i>releaseCause</i> is used to indicate the reason for releasing the RRC Connection. The cause value <i>cs-FallbackHighPriority</i> is only applicable when <i>redirectedCarrierInfo</i> is present with the value set to <i>utra-FDD</i> , <i>utra-TDD</i> or <i>utra-TDD-r10</i> . E-UTRAN should not set the <i>releaseCause</i> to <i>loadBalancingTAURequired</i> or to <i>cs-FallbackHighPriority</i> if the <i>extendedWaitTime</i> is present. The network should not set the <i>releaseCause</i> to <i>loadBalancingTAURequired</i> if the UE is connected to 5GC. The network does not set the <i>releaseCause</i> to <i>rrc-Suspend</i> if the UE is configured with a DAPS bearer, i.e. if source PCell resources after a DAPS handover have not been released.
<i>releasidleMeasConfig</i>	Indicates that the UE shall release the idle/inactive measurement configurations, if configured.
<i>rrc-InactiveConfig</i>	Indicates configuration for the RRC_INACTIVE state. The network does not configure this field when the UE is redirected to an inter-RAT carrier frequency or if the UE is configured with a DAPS bearer.
<i>smtc</i>	The SSB periodicity/offset/duration configuration of the redirected target NR frequency. It is based on the timing reference of EUTRAN PCell. If the field is absent, the UE uses the SMTc configured in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing
<i>subcarrierSpacingSSB</i>	Indicate subcarrier spacing of SSB of redirected target NR frequency. Only the values 15 kHz or 30 kHz (FR1), 120 kHz or 240 kHz (FR2-1), 120kHz or 480kHz (FR2-2) are applicable.
<i>systemInformation</i>	Container for system information of the GERAN cell i.e. one or more System Information (SI) messages as defined in TS 44.018 [45], table 9.1.1.
<i>t320</i>	Timer T320 as described in clause 7.3. Value minN corresponds to N minutes.
<i>t323</i>	Timer T323 as described in clause 7.3. Value minN corresponds to N minutes.
<i>utra-BCCH-Container</i>	Contains System Information Container message as defined in TS 25.331 [19].
<i>waitTime</i>	Wait time value in seconds.

Conditional presence	Explanation
5GC	The field is optionally present, Need ON, if the UE is connected to 5GC; otherwise the field is not present.
BLCE-IDLEeDRX	The field is optionally present, Need OR, if the UE is a BL UE or UE in CE and the UE is connected to 5GC and IDLE mode eDRX is configured and <i>ran-PagingCycle-r15</i> is absent; otherwise the field is not present.
EARFCN-max	The field is mandatory present if the corresponding <i>carrierFreq</i> (i.e. without suffix) is set to <i>maxEARFCN</i> . Otherwise the field is not present.
EarlySec	When the UE is connected to 5GC, the field is mandatory present. When the UE is connected to EPC, the field is optionally present, Need ON, if the UE supports UP-EDT or UP transmission using PUR or early security reactivation and <i>releaseCause</i> is set to <i>rrc-Suspend</i> ; otherwise the field is not present.
IdleInfoEUTRA	The field is optionally present, Need OP, if the <i>IdleModeMobilityControlInfo</i> (i.e. without suffix) is included and includes <i>freqPriorityListEUTRA</i> ; otherwise the field is not present.
INACTIVE	The field is mandatory present in this release.
NoRedirect-r8	The field is optionally present, Need OP, if the <i>redirectedCarrierInfo</i> (i.e. without suffix) is not included; otherwise the field is not present.
Redirection	The field is optionally present, Need ON, if the <i>redirectedCarrierInfo</i> is included and set to <i>geran</i> , <i>utra-FDD</i> , <i>utra-TDD</i> or <i>utra-TDD-r10</i> ; otherwise the field is not present.
Redirection2	The field is optionally present, Need OR, if <i>redirectedCarrierInfo</i> is included; otherwise the field is not present.
UP-EDTOrPUR	The field is optionally present, Need ON, if the UE supports UP-EDT or UP transmission using PUR and <i>releaseCause</i> is set to <i>rrc-Suspend</i> ; otherwise the field is not present.

RRCConnectionRequest

The *RRCConnectionRequest* message is used to request the establishment of an RRC connection.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: UE to E-UTRAN

RRCConnectionRequest message

```
-- ASN1START

RRCConnectionRequest ::= SEQUENCE {

-- ASN1STOP

```

RRCConnectionRequest field descriptions

establishmentCause

Provides the establishment cause for the RRC connection request as provided by the upper layers. W.r.t. the cause value names: highPriorityAccess concerns AC11..AC15, 'mt' stands for 'Mobile Terminating' and 'mo' for 'Mobile Originating. eNB is not expected to reject a *RRCConnectionRequest* due to unknown cause value being used by the UE. The cause value of *delayTolerantAccess* is not used for E-UTRA/5GC in this release.

randomValue

Integer value in the range 0 to $2^{40} - 1$.

ng-5G-S-TMSI-Part1

The rightmost 40 bits of 5G-S-TMSI.

ue-Identity

UE identity included to facilitate contention resolution by lower layers.

RRCConnectionResume

The *RRCConnectionResume* message is used to resume the suspended RRC connection.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

<i>RRCConnectionResume</i> field descriptions	
<i>drb-ContinueROHC</i>	This field indicates whether to continue or reset the header compression protocol context for the DRBs configured with EUTRA PDCP and the header compression protocol. Presence of the field indicates that the header compression protocol context continues while absence indicates that the header compression protocol context is reset.
<i>fullConfig</i>	Indicates that the full configuration option is applicable for the <i>RRCConnectionResume</i> message.
<i>idleModeMeasurementReq</i>	This field indicates that the UE shall report the idle/inactive measurements to the network in the <i>RRCConnectionResumeComplete</i> message
<i>p-MaxEUTRA</i>	Indicates the maximum power available for E-UTRA.
<i>p-MaxUE-FR1</i>	The maximum total transmit power to be used by the UE across all serving cells in frequency range 1 (FR1) across all cell groups. The maximum transmit power that the UE may use may be additionally limited on cell- or cell-group level.
<i>nr-RadioBearerConfig1, nr-RadioBearerConfig2</i>	Includes the NR <i>RadioBearerConfig</i> IE as specified in TS 38.331 [82]. The field includes the configuration of RBs configured with NR PDCP.
<i>nr-SecondaryCellGroupConfig</i>	Includes the NR <i>RRCReconfiguration</i> message as specified in TS 38.331 [82]. In this version of the specification, the NR RRC message only includes fields <i>secondaryCellGroup</i> , with at least <i>reconfigurationWithSync</i> , <i>otherConfig</i> and/or <i>measConfig</i> .
<i>restoreMCG-Scells</i>	Indicates that the UE shall restore the MCG Scell configurations from the UE AS Context or UE Inactive AS Context, if configured.
<i>restoreSCG</i>	If included, the UE shall restore the SCG configurations from the UE AS Context or UE Inactive AS Context.
<i>sCellGroupToAddModList</i>	Indicates the SCell group to be added or modified.
<i>sCellGroupToReleaseList</i>	Indicates the SCell group to be released.
<i>sCellToAddModList</i>	List of SCells to be added or modified.
<i>sCellToReleaseList</i>	List of SCells to be released.
<i>scg-State</i>	Indicates that the SCG is deactivated.
<i>sk-Counter</i>	A one-shot counter used upon initial configuration of S-K _{gNB} as well as upon refresh of S-K _{gNB} . E-UTRAN provides this field when the UE is configured with an (SN-terminated) RB using S-K _{gNB} or NR SCG is configured.
<i>tdm-PatternConfig</i>	This field is used when power control or IMD issues require single UL transmission in (NG)EN-DC as specified in TS 38.101-3 [101] and TS 38.213 [88].
<i>tdm-PatternConfig2</i>	This field is used for dual UL transmission in EN-DC with LTE FDD PCell and for single UL transmission in EN-DC with LTE FDD/TDD PCell, as specified in TS 38.101-3 [101] and TS 38.213 [88]. The network sets at most one of <i>tdm-PatternConfig</i> and <i>tdm-PatternConfig2</i> to setup. When this field is configured in EN-DC with LTE TDD PCell, it is not applicable if TDD configuration is sa0 or sa6 in SIB1.

Conditional presence	Explanation
<i>EarlySec</i>	For EPC, the field is optionally present, Need ON, if the UE supports early security reactivation; otherwise the field is not present. For 5GC, the field is optionally present, Need ON.
<i>RestoreSCG</i>	The field is mandatory present if <i>restoreSCG</i> is configured. It is optionally present, Need ON, otherwise. For EPC, this field can be present only if the UE supports early security reactivation.
<i>FDD-PCell</i>	This field is optionally present, need ON, for an FDD PCell if there is no SCell with configured uplink. Otherwise, the field is not present, need OR.
<i>SCG</i>	This field is optionally present, need OR, if <i>nr-SecondaryCellGroupConfig</i> is present, otherwise it is absent, need OR.

RRCConnectionResumeComplete

The *RRCConnectionResumeComplete* message is used to confirm the successful completion of an RRC connection resumption.

<i>RRCConnectionResumeComplete</i> field descriptions	
<i>idleMeasAvailable</i>	Indication that the UE has idle/inactive measurement report available.
<i>selectedPLMN-Identity</i>	Index of the PLMN selected by the UE from the <i>plmn-IdentityList</i> fields included in SIB1. 1 if the 1st PLMN is selected from the 1st <i>plmn-IdentityList</i> included in SIB1, 2 if the 2nd PLMN is selected from the same <i>plmn-IdentityList</i> , or when no more PLMN are present within the same <i>plmn-IdentityList</i> , then the PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on. The <i>selectedPLMN-Identity</i> is referred to the PLMN list for 5GC if the UE is in RRC_INACTIVE state.

— *RRCConnectionResumeRequest*

The *RRCConnectionResumeRequest* message is used to request the resumption of a suspended RRC connection or to perform UP-EDT.

RRCConnectionSetupComplete field descriptions	
attachWithoutPDN-Connectivity	This field is used to indicate that the UE performs an Attach without PDN connectivity procedure, as indicated by the upper layers and specified in TS 24.301 [35].
cp-CIoT-5GS-Optimisation	This field is included when the UE supports the Control plane CIoT 5GS optimisation, as indicated by the upper layers, see TS 24.501 [95].
cp-CIoT-EPS-Optimisation	This field is included when the UE supports the Control plane CIoT EPS Optimisation, as indicated by the upper layers, see TS 24.301 [35].
ce-ModeB	Indicates whether the UE supports operation in CE mode B, as specified in TS 36.306 [5].
connectTo5GC	This field is not used in the specification. It shall not be sent by the UE.
dcn-ID	The Dedicated Core Network Identity, see TS 23.401 [41].
guami-Type	This field is used to indicate whether the GUAMI included is native (derived from native 5G-GUTI) or mapped (from EPS, derived from EPS GUTI) as specified in TS 24.501 [95].
gummei-Type	This field is used to indicate whether the GUMMEI included is native (assigned by EPC) or mapped. The value native indicates the GUMMEI is native, mapped indicates the GUMMEI is mapped from 2G/3G identifiers, and mappedFrom5G indicates the GUMMEI is mapped from 5G identifiers. A UE that sets <i>gummei-Type-v1540</i> to mappedFrom5G shall also include <i>gummei-Type-r10</i> and set it to native.
iab-NodeIndication	This field is used to indicate that the connection is being established by an IAB-node as specified in TS 38.300 [106].
idleMeasAvailable	Indication that the UE has idle/inactive measurement report available.
ite-M	Indicates the UE is category M.
mmei	Provides the Group Identity of the registered MME within the PLMN, as provided by upper layers, see TS 23.003 [27].
mobilityState	This field indicates the UE mobility state (as defined in TS 36.304 [4], clause 5.2.4.3) just prior to UE going into RRC_CONNECTED state. The UE indicates the value of <i>medium</i> and <i>high</i> when being in Medium-mobility and High-mobility states respectively. Otherwise the UE indicates the value <i>normal</i> .
ng-5G-S-TMSI-Part2	The leftmost 8 bits of 5G-S-TMSI.
registeredAMF	This field is used to transfer the GUAMI of the AMF where the UE is registered, as provided by upper layers, see TS 23.003 [27].
registeredMME	This field is used to transfer the GUMMEI of the MME where the UE is registered, as provided by upper layers.
rlos-Request	Indicates whether the UE is initiating RLOS as specified in TS 23.401 [41].
rn-SubframeConfigReq	If present, this field indicates that the connection establishment is for an RN and whether a subframe configuration is requested or not.
selectedPLMN-Identity	Index of the PLMN selected by the UE from the <i>plmn-IdentityList</i> fields included in SIB1. 1 if the 1st PLMN is selected from the 1st <i>plmn-IdentityList</i> included in SIB1, 2 if the 2nd PLMN is selected from the same <i>plmn-IdentityList</i> , or when no more PLMN are present within the same <i>plmn-IdentityList</i> , then the PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on.
s-NSSAI-List	This field is a list of S-NSSAI as indicated by the upper layers. The UE can report up to eight S-NSSAI per NSSAI, see TS 23.003 [27].
ue-CE-NeedULGaps	Indicates whether the UE needs uplink gaps during continuous uplink transmission in FDD as specified in TS 36.211 [21] and TS 36.306 [5].
ul-RRC-Segmentation	This field indicates the UE supports uplink RRC segmentation of <i>UECapabilityInformation</i> .
up-CIoT-5GS-Optimisation	This field is included when the UE supports the User plane CIoT 5GS optimisation, as indicated by the upper layers, see TS 24.501 [95].
up-CIoT-EPS-Optimisation	This field is included when the UE supports the User plane CIoT EPS Optimisation, as indicated by the upper layers, see TS 24.301 [35].

RRCEarlyDataComplete

The *RRCEarlyDataComplete* message is used to confirm the successful completion of the CP-EDT procedure.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: E-UTRAN to UE

RRCEarlyDataComplete message

```
-- ASN1START

RRCEarlyDataComplete-r15 ::= SEQUENCE {

```

RRCEarlyDataComplete field descriptions

extendedWaitTime

Value in seconds for the wait time for Delay Tolerant access requests.

Conditional presence	Explanation
<i>IdleInfoEUTRA</i>	The field is optionally present, Need OP, if the <i>IdleModeMobilityControlInfo-r15</i> is included and includes <i>freqPriorityListEUTRA</i> ; otherwise the field is not present.

RRCEarlyDataRequest

The *RRCEarlyDataRequest* message is used to initiate CP-EDT.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: UE to E-UTRAN

RRCEarlyDataRequest message

```
-- ASN1START

```

RRCEarlyDataRequest field descriptions

establishmentCause

Provides the establishment cause for the RRC Early Data Request as provided by the upper layers. W.r.t. the cause value names: 'mo' stands for 'Mobile Originating'. eNB is not expected to reject a *RRCEarlyDataRequest* due to unknown cause value being used by the UE. If *establishmentCause-v1610* is included, E-UTRAN ignores *establishmentCause-r15*.

SCGFailureInformation

The *SCGFailureInformation* message is used to provide information regarding E-UTRA SCG failures detected by the UE.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

SCGFailureInformation message

```

SCGFailureInformationNR field descriptions

failureType

Indicates the cause of the SCG failure. When the field *failureType-v1610* is included, the network ignores the field *failureType-r15*.

measResultFreqListNR

The field contains available results of measurements on NR frequencies the UE is configured to measure by *measConfig*.

measResultSCG

Includes the NR *MeasResultSCG-Failure* IE as specified in TS 38.331 [82]. The field contains available results of measurements on NR frequencies the UE is configured to measure by the NR RRCConfiguration message.

— *SCPTMConfiguration*

The *SCPTMConfiguration* message contains the control information applicable for MBMS services transmitted via SC-MRB.

Signalling radio bearer: N/A

RLC-SAP: UM

Logical channel: SC-MCCH

Direction: E-UTRAN to UE

SCPTMConfiguration message

```
-- ASN1START

SCPTMConfiguration-r13 ::= SEQUENCE {
    sc-mtch-InfoList-r13           SC-MTCH-InfoList-r13,

    nonCriticalExtension          SCPTMConfiguration-v1340      OPTIONAL
}

SCPTMConfiguration-v1340 ::= SEQUENCE {
    p-b-r13                      INTEGER (0..3)            OPTIONAL,   -- Need ON
    nonCriticalExtension          SEQUENCE {}                OPTIONAL
}

-- ASN1STOP
```

SCPTMConfiguration field descriptions

sc-mtch-InfoList

Provides the configuration of each SC-MTCH in the current cell.

scptm-NeighbourCellList

List of neighbour cells providing MBMS services via SC-MRB. When absent, the UE shall assume that MBMS services listed in the *SCPTMConfiguration* message are not provided via SC-MRB in any neighbour cell.

p-b

Parameter: P_B for the PDSCH scrambled by G-RNTI, see TS 36.213 [23], Table 5.2-1.

— *SCPTMConfiguration-BR*

The *SCPTMConfiguration-BR* message contains the control information applicable for MBMS services transmitted via SC-MRB for BL UEs or UEs in CE.

Signalling radio bearer: N/A

RLC-SAP: UM

Logical channel: SC-MCCH

Direction: E-UTRAN to UE

SCPTMConfiguration-BR message

```
-- ASN1START

SCPTMConfiguration-BR-r14 ::= SEQUENCE {

--	--------------	----------------------------------

SCPTMConfiguration-BR field descriptions

p-b

Parameter: P_B for the PDSCH scrambled by G-RNTI, see TS 36.213 [23], Table 5.2-1.

multiTB-Gap

Indicates scheduling gaps in sub-frames for SC-MTCH using multi-TB scheduling. Value sf2 corresponds to 2 sub-frames, value sf4 corresponds to 4 sub-frames and so on. If the field is absent, there is no scheduling gap.

sc-mtch-InfoList

Provides the configuration of each SC-MTCH not using multi-TB scheduling in the current cell for BL UEs or UEs in CE.

sc-MTCH-InfoList-MultiTB

Provides the configuration of each SC-MTCH using multi-TB scheduling in the current cell for BL UEs or UEs in CE. When this field is included, the total number of SC-MTCH configurations in **sc-mtch-InfoList** and **sc-MTCH-InfoList-MultiTB** cannot be more than *maxSC-MTCH-BR-r14*.

scptm-NeighbourCellList

List of neighbour cells providing MBMS services via SC-MRB. When absent, the BL UE or UE in CE shall assume that MBMS services listed in the **SCPTMConfiguration-BR** message are not provided via SC-MRB in any neighbour cell.

SecurityModeCommand

The **SecurityModeCommand** message is used to command the activation of AS security.

Signalling radio bearer: SRB1

RLC-SAP: AM

SidelinkUEInformation field descriptions	
carrierFreqCommTx	Indicates the index of the frequency on which the UE is interested to transmit V2X sidelink communication. The value 1 corresponds to the frequency of first entry in <i>v2x-InterFreqInfoList</i> broadcast in SIB21, the value 2 corresponds to the frequency of second entry in <i>v2x-InterFreqInfoList</i> broadcast in SIB21 and so on. If SIB26 is broadcast and the number of entries included in <i>v2x-InterFreqInfoList</i> of SIB21 is N, the value N+1 corresponds to the frequency of the first entry which is included in <i>v2x-InterFreqInfoList</i> broadcast in SIB26 and has a frequency not included in SIB21, the value N+2 corresponds to the frequency of the second entry which is included in <i>v2x-InterFreqInfoList</i> broadcast in SIB26 and has a frequency not included in SIB21, and so on. The value 0 corresponds the PCell's frequency.
carrierFreqDiscTx	Indicates the frequency by the index of the entry in field <i>discInterFreqList</i> within <i>SystemInformationBlockType19</i> . Value 1 corresponds to the first entry in <i>discInterFreqList</i> within <i>SystemInformationBlockType19</i> , value 2 corresponds to the second entry in this list and so on.
commRxInterestedFreq	Indicates the frequency on which the UE is interested to receive sidelink communication.
commTxResourceReq	Indicates the frequency on which the UE is interested to transmit non-relay related sidelink communication as well as the one-to-many sidelink communication transmission destination(s) for which the UE requests E-UTRAN to assign dedicated resources. NOTE 1.
commTxResourceReqRelay	Indicates the relay related one-to-many sidelink communication transmission destination(s) for which the sidelink relay UE requests E-UTRAN to assign dedicated resources.
commTxResourceReqRelayUC	Indicates the relay related one-to-one sidelink communication transmission destination(s) for which the sidelink relay UE or sidelink remote UE requests E-UTRAN to assign dedicated resources i.e. either contains the unicast destination identity of the sidelink relay UE or of the sidelink remote UE.
commTxResourceReqUC	Indicates the frequency on which the UE is interested to transmit non-relay related one-to-one sidelink communication as well as the sidelink communication transmission destination(s) for which the UE requests E-UTRAN to assign dedicated resources. NOTE 1.
destinationInfoList	Indicates the destination(s) for relay or non-relay related one-to-one or one-to-many sidelink communication. For one-to-one sidelink communication the destination is identified by the ProSe UE ID for unicast communication, while for one-to-many the destination it is identified by the ProSe Layer-2 Group ID as specified in TS 23.303 [68].
discRxInterest	Indicates that the UE is interested to monitor sidelink discovery announcements.
discSysInfoReportFreqList	Indicates, for one or more frequencies, a list of sidelink discovery related parameters acquired from system Information of cells on configured inter-frequency carriers.
discTxResourceReq	Indicates the number of separate discovery message(s) the UE wants to transmit every discovery period. This field concerns the resources the UE requires every discovery period for transmitting sidelink discovery announcement(s).
discTxResourceReqAddFreq	Indicates, for any frequencies in addition to the one covered by <i>discTxResourceReq</i> , the number of separate discovery message(s) the UE wants to transmit every discovery period. This field concerns the resources the UE requires every discovery period for transmitting sidelink discovery announcement(s).
discTxResourceReqPS	Indicates the number of separate PS related discovery message(s) the UE wants to transmit every discovery period. This field concerns the resources the UE requires every discovery period for transmitting PS related sidelink discovery announcement(s).
p2x-CommTxType	Indicates that the requested transmission resource pool is for P2X related V2X sidelink communication.
reliabilityInfoListSL	Indicates the reliability(ies) (i.e., PPPRs as specified in TS 36.300 [9]), associated with the reported traffic to be transmitted for V2X sidelink communication.
v2x-CommRxInterestedFreqList	Indicates the index(es) of the frequency(ies) on which the UE is interested to receive V2X sidelink communication. The value 1 corresponds to the frequency of first entry in <i>v2x-InterFreqInfoList</i> broadcast in SIB21, the value 2 corresponds to the frequency of second entry in <i>v2x-InterFreqInfoList</i> broadcast in SIB21 and so on. If SIB26 is broadcast and the number of entries included in <i>v2x-InterFreqInfoList</i> of SIB21 is N, the value N+1 corresponds to the frequency of the first entry which is included in <i>v2x-InterFreqInfoList</i> broadcast in SIB26 and has a frequency not included in SIB21, the value N+2 corresponds to the frequency of the second entry which is included in <i>v2x-InterFreqInfoList</i> broadcast in SIB26 and has a frequency not included in SIB21, and so on. The value 0 corresponds the PCell's frequency.
v2x-DestinationInfoList	Indicates the destination(s) for V2X sidelink communication.
v2x-TypeTxSync	Indicates the synchronization reference used by the UE.

NOTE 1: When configuring *commTxResourceReq*, *commTxResourceReqUC*, *commTxResourceReqRelay* and *commTxResourceReqRelayUC*, E-UTRAN configures at most *maxSL-Dest-r12* destinations in total (i.e. as included in the four fields together).

– *SystemInformation*

The *SystemInformation* message is used to convey one or more System Information Blocks or Positioning System Information Blocks. All the SIBs or posSIBs included are transmitted with the same periodicity. *SystemInformation-BR* and *SystemInformation-MBMS* use the same structure as *SystemInformation*.

<i>SystemInformationBlockType1</i> field descriptions	
<i>bandwidthReducedAccessRelatedInfo</i>	Access related information for BL UEs and UEs in CE. NOTE 3.
<i>campingAllowedInCE</i>	Indicates whether non-BL UE is allowed to camp in the non-standalone BL cell in enhanced coverage mode when S-criterion for normal coverage is fulfilled. The field is not applicable for standalone BL cell.
<i>category0Allowed</i>	The presence of this field indicates category 0 UEs are allowed to access the cell.
<i>cellAccessRelatedInfoList</i>	This field contains a list allowing signalling of access related information per PLMN. One PLMN can be included in only one entry of this list. NOTE 4.
<i>cellAccessRelatedInfoList-5GC</i>	This field contains a PLMN list and a list allowing signalling of access related information per PLMN for PLMNs that provides connectivity to 5GC. One PLMN can be included in only one entry of this list. NOTE 4.
<i>cellBarred, cellBarred-CRS</i>	barred means the cell is barred, as defined in TS 36.304 [4].
<i>cellBarred-5GC, cellBarred-5GC-CRS</i>	barred means the cell is barred for connectivity to 5GC, as defined in TS 36.304 [4].
<i>cellBarred-NTN</i>	barred means the cell is barred for connectivity to NTN, as defined in TS 36.304 [4]. E-UTRAN always includes <i>cellBarred-NTN</i> and sets <i>cellBarred</i> to 'barred' in an NTN cell.
<i>cellIdentity</i>	Indicates the cell identity. NOTE 2.
<i>cellId-Index</i>	The index of the cell ID in the PLMN lists for EPC, indicates UE the corresponding cell ID is used for 5GC. Value 1 indicates the cell ID of the 1st PLMN list for EPC in the SIB1. Value 2 indicates the cell ID of the 2nd PLMN list for EPC, and so on.
<i>cellReservedForOperatorUse, cellReservedForOperatorUse-CRS</i>	As defined in TS 36.304 [4].
<i>cellSelectionInfoCE</i>	Cell selection information for BL UEs and UEs in CE. If absent, coverage enhancement S criteria is not applicable. NOTE 3.
<i>cellSelectionInfoCE1</i>	Cell selection information for BL UEs and UEs in CE supporting CE Mode B. E-UTRAN includes this IE only if <i>cellSelectionInfoCE</i> is present in <i>SystemInformationBlockType1-BR</i> . NOTE 3.
<i>cp-CIoT-5GS-Optimisation</i>	Indicates whether the UE is allowed to establish the connection with Control plane CiOT 5GS optimisation, see TS 24.501 [95].
<i>crs-IntfMitigConfig</i>	<i>crs-IntfMitigEnabled</i> indicates CRS interference mitigation is enabled for the cell, as specified in TS 36.133 [16], clause 3.6.1.1. For BL UEs supporting ce-CRS-IntfMitig, presence of <i>crs-IntfMitigNumPRBs</i> indicates CRS interference mitigation is enabled in the cell, as specified in TS 36.133 [16], clauses 3.6.1.2 and 3.6.1.3, and the value of <i>crs-IntfMitigNumPRBs</i> indicates number of PRBs, i.e. 6 or 24 PRBs, for CRS transmission in the central cell BW when CRS interference mitigation is enabled. For UEs not supporting this feature, the behaviour is undefined if this field is configured and the field <i>cellBarred</i> in <i>SystemInformationBlockType1</i> (<i>SystemInformationBlockType1-BR</i> for BL UEs or UEs in CE) is set to <i>notbarred</i> .
<i>csg-Identity</i>	Identity of the Closed Subscriber Group the cell belongs to.
<i>csg-Indication</i>	If set to TRUE the UE is only allowed to access the cell if it is a CSG member cell, if selected during manual CSG selection or to obtain limited service, see TS 36.304 [4].
<i>eCallOverIMS-Support</i>	Indicates whether the cell supports eCall over IMS services via EPC for UEs as defined in TS 23.401 [41]. If absent, eCall over IMS via EPC is not supported by the network in the cell. NOTE 2.
<i>eCallOverIMS-Support5GC</i>	Indicates whether the cell supports eCall over IMS services via 5GC as defined in TS 23.401 [41]. If absent, eCall over IMS via 5GC is not supported by the network in the cell. NOTE 2.
<i>eDRX-Allowed</i>	The presence of this field indicates if idle mode extended DRX is allowed in the cell for the UE connected to EPC. The UE shall stop using extended DRX in idle mode if <i>eDRX-Allowed</i> is not present when connected to EPC.
<i>eDRX-Allowed-5GC</i>	The presence of this field indicates if idle mode extended DRX is allowed in the cell for the UE connected to 5GC. The UE shall stop using extended DRX in idle mode if <i>eDRX-Allowed-5GC</i> is not present when connected to 5GC.
<i>encrypted</i>	The presence of this field indicates that the posSibType is encrypted as specified in TS 36.355 [54].

SystemInformationBlockType1 field descriptions	
fdd-DownlinkOrTddSubframeBitmapBR	The set of valid subframes for FDD downlink or TDD transmissions, see TS 36.213 [23]. If this field is present, <i>SystemInformationBlockType1-BR-r13</i> is transmitted in <i>RRCConnectionReconfiguration</i> , and if <i>RRCConnectionReconfiguration</i> does not include <i>systemInformationBlockType2Dedicated</i> , UE may assume the valid subframes in <i>fdd-DownlinkOrTddSubframeBitmapBR</i> are not indicated as MBSFN subframes. If this field is not present, the set of valid subframes is the set of non-MBSFN subframes as indicated by <i>mbsfn-SubframeConfigList</i> . If neither this field nor <i>mbsfn-SubframeConfigList</i> is present, all subframes are considered as valid subframes for FDD downlink transmission, all DL subframes according to the uplink-downlink configuration (see TS 36.211 [21]) are considered as valid subframes for TDD DL transmission, and all UL subframes according to the uplink-downlink configuration (see TS 36.211 [21]) are considered as valid subframes for TDD UL transmission. The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod $x = 0$, where x is the size of the bit string divided by 10. Value 0 in the bitmap indicates that the corresponding subframe is invalid for transmission. Value 1 in the bitmap indicates that the corresponding subframe is valid for transmission.
fdd-UplinkSubframeBitmapBR	The set of valid subframes for FDD uplink transmissions for BL UEs, see TS 36.213 [23]. If the field is not present, then UE considers all uplink subframes as valid subframes for FDD uplink transmissions. The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod $x = 0$, where x is the size of the bit string divided by 10. Value 0 in the bitmap indicates that the corresponding subframe is invalid for transmission. Value 1 in the bitmap indicates that the corresponding subframe is valid for transmission.
freqBandIndicatorPriority	If the field is present and supported by the UE, the UE shall prioritize the frequency bands in the <i>multiBandInfoList</i> field in decreasing priority order. Only if the UE does not support any of the frequency band in <i>multiBandInfoList</i> , the UE shall use the value in <i>freqBandIndicator</i> field. Otherwise, the UE applies frequency band according to the rules defined in <i>multiBandInfoList</i> . NOTE 2.
freqBandInfo	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, for the frequency band in <i>freqBandIndicator</i> . If E-UTRAN includes <i>freqBandInfo-v10I0</i> it includes the same number of entries, and listed in the same order, as in <i>freqBandInfo-r10</i> .
freqHoppingParametersDL	Downlink frequency hopping parameters for BR versions of SI messages, MPDCCH/PDSCH of paging, MPDCCH/PDSCH of RAR/Msg4 and unicast MPDCCH/PDSCH. If not present, the UE is not configured downlink frequency hopping.
gnss-ID	The presence of this field indicates that the <i>posSibType</i> is for a specific GNSS.
hsdn-Cell	This field indicates this is a HSDN cell as specified in TS 36.304 [4].
hyperSFN	Indicates hyper SFN which increments by one when the SFN wraps around.
iab-Support	This field combines both the support of IAB-node and the cell status for IAB-node. If the field is present, the cell supports IAB-nodes and the cell is also considered as a candidate for cell (re)selection for IAB-nodes; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node.
ims-EmergencySupport	Indicates whether the cell supports IMS emergency bearer services via EPC for UEs in limited service mode. If absent, IMS emergency call via EPC is not supported by the network in the cell for UEs in limited service mode. NOTE 2.
ims-EmergencySupport5GC	Indicates whether the cell supports IMS emergency bearer services for UEs in limited service mode via 5GC. If absent, IMS emergency call via 5GC is not supported by the network in the cell for UEs in limited service mode. NOTE 2.
intraFreqReselection	Used to control cell reselection to intra-frequency cells when the highest ranked cell is barred, or treated as barred by the UE, as specified in TS 36.304 [4]. NOTE 2.
multiBandInfoList	A list of additional frequency band indicators, as defined in TS 36.101 [42], table 5.5-1 and TS 36.102 [113], table 5.2-1, for NTN capable UE that the cell belongs to. If the UE supports the frequency band in the <i>freqBandIndicator</i> field it shall apply that frequency band. Otherwise, the UE shall apply the first listed band which it supports in the <i>multiBandInfoList</i> field. If E-UTRAN includes <i>multiBandInfoList-v9e0</i> it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList</i> (i.e. without suffix). See Annex D for more descriptions. The UE shall ignore the rule defined in this field description if <i>freqBandIndicatorPriority</i> is present and supported by the UE.

SystemInformationBlockType1 field descriptions	
<i>multiBandInfoList-v10j0</i>	
A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, for the frequency bands in <i>multiBandInfoList</i> (i.e. without suffix) and <i>multiBandInfoList-v9e0</i> . If E-UTRAN includes <i>multiBandInfoList-v10j0</i> , it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList</i> (i.e. without suffix). If E-UTRAN includes <i>multiBandInfoList-v10j0</i> it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList-v10j0</i> .	
<i>plmn-IdentityList</i>	
List of PLMN identities. The first listed <i>PLMN-Identity</i> is the primary PLMN. If <i>plmn-IdentityList-v1530</i> is included, E-UTRAN includes the same number of entries, and listed in the same order, as in <i>plmn-IdentityList</i> (without suffix). If <i>plmn-IdentityList-v1610</i> is included, E-UTRAN includes the same number of entries, and listed in the same order, as in <i>plmn-IdentityList-r15</i> . If <i>plmn-IdentityList-v1700</i> is included, E-UTRAN includes the same number of entries, and listed in the same order, as in <i>plmn-IdentityList</i> (without suffix). NOTE 2.	
<i>plmn-Index</i>	
Index of the PLMN in the <i>plmn-IdentityList</i> fields included in SIB1 for EPC, indicating the same PLMN ID is connected to 5GC. Value 1 indicates the 1st PLMN in the 1st <i>plmn-IdentityList</i> included in SIB1, value 2 indicates the 2nd PLMN in the same <i>plmn-IdentityList</i> , or when no more PLMNs are present within the same <i>plmn-IdentityList</i> , then the PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on. NOTE 6.	
<i>p-Max</i>	
Value applicable for the cell. If absent the UE applies the maximum power according to its capability as specified in TS 36.101 [42], clause 6.2.2. NOTE 2. This field is ignored by IAB-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [107].	
<i>posSchedulingInfoList-BR</i>	
Indicates additional scheduling information of positioning SI messages for BL UEs and UEs in CE. E-UTRAN always includes this field if <i>posSchedulingInfoList-r15</i> is included in <i>SystemInformationBlockType1-BR</i> , and includes the same number of entries, and listed in the same order, as in <i>posSchedulingInfoList-r15</i> .	
<i>posSIB-MappingInfo</i>	
List of the posSIBs mapped to this <i>SystemInformation</i> message.	
<i>posSibType</i>	
The positioning SIB type is defined in TS 36.355 [54].	
<i>q-QualMin</i>	
Parameter "Q _{qualmin} " in TS 36.304 [4]. If <i>cellSelectionInfo-v920</i> is not present, the UE applies the (default) value of negative infinity for Q _{qualmin} . NOTE 1.	
<i>q-QualMinRSRQ-OnAllSymbols</i>	
If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, perform RSRQ measurement on all OFDM symbols in accordance with TS 36.214 [48]. NOTE 1.	
<i>q-QualMinOffset</i>	
Parameter "Q _{qualminoffset} " in TS 36.304 [4]. Actual value Q _{qualminoffset} = field value [dB]. If <i>cellSelectionInfo-v920</i> is not present or the field is not present, the UE applies the (default) value of 0 dB for Q _{qualminoffset} . Affects the minimum required quality level in the cell.	
<i>q-QualMinWB</i>	
If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, use a wider bandwidth in accordance with TS 36.133 [16]. NOTE 1.	
<i>q-RxLevMinOffset</i>	
Parameter Q _{rxlevminoffset} in TS 36.304 [4]. Actual value Q _{rxlevminoffset} = field value * 2 [dB]. If absent, the UE applies the (default) value of 0 dB for Q _{rxlevminoffset} . Affects the minimum required Rx level in the cell.	
<i>sbas-ID</i>	
The presence of this field indicates that the <i>posSibType</i> is for a specific SBAS.	
<i>schedulingInfoList</i>	
Indicates scheduling information of SI messages. The <i>schedulingInfoList-v12j0</i> (if present) provides additional SIBs mapped into the SI message scheduled via <i>schedulingInfoList</i> (without suffix). If E-UTRAN includes <i>schedulingInfoList-v12j0</i> , it includes the same number of entries, and listed in the same order, as in <i>schedulingInfoList</i> (without suffix).	
<i>schedulingInfoListExt</i>	
Indicates scheduling information of additional SI messages. The UE concatenates the entries of <i>schedulingInfoListExt</i> to the entries in <i>schedulingInfoList</i> , according to the general concatenation principles for list extension as defined in 5.1.2. If the <i>schedulingInfoListExt</i> is present, E-UTRAN ensures that the total number of entries of this field plus <i>schedulingInfoList</i> (without suffix) shall not exceed the value of <i>maxSI-Message</i> .	
<i>sib-MappingInfo</i>	
List of the SIBs mapped to this <i>SystemInformation</i> message. There is no mapping information of SIB2; it is always present in the first <i>SystemInformation</i> message listed in the <i>schedulingInfoList</i> (without suffix) list. If present, <i>sib-MappingInfo-v12j0</i> indicates one or more additional SIBs mapped to the concerned SI message listed in the <i>schedulingInfoList</i> (without suffix) list. If <i>schedulingInfoList-v12j0</i> or <i>schedulingInfoListExt-r12</i> is present, E-UTRAN does not include any value indicating SIB of type 19 or higher in <i>sib-MappingInfo</i> (without suffix). If <i>schedulingInfoList-v12j0</i> is present, E-UTRAN ensures that the total number of entries of this field plus <i>sib-MappingInfo</i> (without suffix) shall not exceed the value of <i>maxSIB-1</i> .	

SystemInformationBlockType1 field descriptions	
si-HoppingConfigCommon	Frequency hopping activation/deactivation for BR versions of SI messages and MPDCCH/PDSCH of paging.
si-Narrowband	This field indicates the index of a narrowband used to broadcast the SI message towards BL UEs and UEs in CE, see TS 36.211 [21], clause 6.4.1 and TS 36.213 [23], clause 7.1.6. Field values (1..maxAvailNarrowBands-r13) correspond to narrowband indices (0..maxAvailNarrowBands-r13-1) as specified in TS 36.211 [21].
si-RepetitionPattern	Indicates the radio frames within the SI window used for SI message transmission. Value everyRF corresponds to every radio frame, value every2ndRF corresponds to every 2 radio frames, and so on. The first transmission of the SI message is transmitted from the first radio frame of the SI window.
si-Periodicity, posSI-Periodicity	Periodicity of the SI-message in radio frames, such that rf8 denotes 8 radio frames, rf16 denotes 16 radio frames, and so on. If the <i>si-posOffset</i> is configured, the <i>posSI-Periodicity</i> of rf8 cannot be used.
si-posOffset	This field, if present and set to <i>true</i> indicates that the SI messages in <i>PosSchedulingInfoList</i> are scheduled with an offset of 8 radio frames compared to SI messages in <i>SchedulingInfoList</i> . <i>si-posOffset</i> may be present only if the shortest configured SI message periodicity for SI messages in <i>SchedulingInfoList</i> is 80ms.
si-TBS	This field indicates the transport block size information used to broadcast the SI message towards BL UEs and UEs in CE, see TS 36.213 [23], Table 7.1.7.2.1-1, for a 6 PRB bandwidth and a QPSK modulation.
schedulingInfoList-BR	Indicates additional scheduling information of SI messages for BL UEs and UEs in CE. It includes the same number of entries, and listed in the same order, as in <i>schedulingInfoList</i> (without suffix).
si-ValidityTime	Indicates system information validity timer. If set to TRUE, the timer is set to 3h, otherwise the timer is set to 24h.
si-WindowLength, si-WindowLength-BR	Common SI scheduling window for all SIs. Unit in milliseconds, where ms1 denotes 1 millisecond, ms2 denotes 2 milliseconds and so on. In case <i>si-WindowLength-BR-r13</i> is present and the UE is a BL UE or a UE in CE, the UE shall use <i>si-WindowLength-BR-r13</i> and ignore the original field <i>si-WindowLength</i> (without suffix). UEs other than BL UEs or UEs in CE shall ignore the extension field <i>si-WindowLength-BR-r13</i> .
startSymbolBR	For BL UEs and UEs in CE, indicates the OFDM starting symbol for any MPDCCH, PDSCH scheduled on the same cell except the PDSCH carrying <i>SystemInformationBlockType1-BR</i> , see TS 36.213 [23]. Values 1, 2, and 3 are applicable for <i>dl-Bandwidth</i> greater than 10 resource blocks. Values 2, 3, and 4 are applicable otherwise.
systemInfoValueTagList	Indicates SI message specific value tags for BL UEs and UEs in CE. It includes the same number of entries, and listed in the same order, as in <i>schedulingInfoList</i> (without suffix).
systemInfoValueTagSI	SI message specific value tag as specified in clause 5.2.1.3. Common for all SIBs within the SI message other than MIB, SIB1, SIB10, SIB11, SIB12, SIB14, SIB31 and SIB33.
systemInfoValueTag	Common for all SIBs other than MIB, MIB-MBMS, SIB1, SIB1-MBMS, SIB10, SIB11, SIB12, SIB14 and SIB31. Change of MIB, MIB-MBMS, SIB1 and SIB1-MBMS is detected by acquisition of the corresponding message.
tdd-Config	Specifies the TDD specific physical channel configurations. NOTE 2.
trackingAreaCode/trackingAreaCode-5GC	A <i>trackingAreaCode</i> that is common for all the PLMNs listed. NOTE2. NOTE 5.
trackingAreaList	A list of tracking area codes for the PLMN listed. For the first entry in <i>plmn-IdentityList-v1700</i> : If this field is present, the list of tracking area codes include the tracking area code in <i>trackingAreaCode</i> (without suffix) and the tracking area codes in <i>trackingAreaList</i> . If this field is absent, <i>trackingAreaCode</i> (without suffix) applies. For other entries in <i>plmn-IdentityList-v1700</i> : If this field is present, the list of tracking area codes include the tracking area codes in <i>trackingAreaList</i> . If this field is absent, the list of tracking area codes of the preceding entry in <i>plmn-IdentityList-v1700</i> applies. The total number of signalled tracking area codes across all PLMNs cannot be more than <i>maxTAC-r17</i> .
transmissionInControlChRegion	Indicates, for BL UEs and UEs in CE, LTE control channel region may be used for DL broadcast transmission. NOTE 3.
up-CIoT-5GS-Optimisation	Indicates whether the UE is allowed to resume the connection with User plane CIoT 5GS optimisation, see TS 24.501 [95].

NOTE 1: The value the UE applies for parameter " $Q_{qualmin}$ " in TS 36.304 [4] depends on the q -*QualMin* fields signalled by E-UTRAN and supported by the UE. In case multiple candidate options are available, the UE shall select the highest priority candidate option according to the priority order indicated by the following table (top row is highest priority).

q-QualMinRSRQ-OnAllSymbols	q-QualMinWB	Value of parameter "$Q_{qualmin}$" in TS 36.304 [4]
Included	Included	q - <i>QualMinRSRQ-OnAllSymbols</i> – (q - <i>QualMin</i> – q - <i>QualMinWB</i>)
Included	Not included	q - <i>QualMinRSRQ-OnAllSymbols</i>
Not included	Included	q - <i>QualMinWB</i>
Not included	Not included	q - <i>QualMin</i>

NOTE 2: E-UTRAN sets this field to the same value for all instances of SIB1 message that are broadcasted within the same cell.

NOTE 3: E-UTRAN configures this field only in the BR version of SIB1 message.

NOTE 4: E-UTRAN configures at most 6 EPC PLMNs in total (i.e. across all the PLMN lists except for PLMN lists in *cellAccessRelatedInfoList-5GC* in SIB1). E-UTRAN configures at most 6 5GC PLMNs in total (i.e. across all the PLMN lists in *cellAccessRelatedInfoList-5GC* in SIB1).

NOTE 5: E-UTRAN configures only one value for this parameter per PLMN.

NOTE 6: E-UTRAN configures *plmn-Index* only if the *cellBarred* is set to *notBarred*.

Conditional presence	Explanation
<i>BW-reduced</i>	The field is optional present, Need OR, if <i>schedulingInfoSIB1-BR</i> in MIB is set to a value greater than 0. Otherwise the field is not present.
<i>FBI-max</i>	The field is mandatory present if <i>freqBandIndicator</i> (i.e. without suffix) is set to <i>maxFBI</i> . Otherwise the field is not present.
<i>mFBI</i>	The field is optional present, Need OR, if <i>multiBandInfoList</i> is present. Otherwise the field is not present.
<i>mFBI-max</i>	The field is mandatory present if one or more entries in <i>multiBandInfoList</i> (i.e. without suffix, introduced in -v8h0) is set to <i>maxFBI</i> . Otherwise the field is not present.
<i>RSRQ</i>	The field is mandatory present if SIB3 is being broadcast and <i>threshServingLowQ</i> is present in SIB3; otherwise optionally present, Need OP.
<i>RSRQ2</i>	The field is mandatory present if <i>q-QualMinRSRQ-OnAllSymbols</i> is present in SIB3; otherwise it is not present and the UE shall delete any existing value for this field.
<i>Hopping</i>	The field is mandatory present if <i>si-HoppingConfigCommon</i> field is broadcasted and set to <i>on</i> . Otherwise the field is optionally present, need OP.
<i>QrxlevminCE1</i>	The field is optionally present, Need OR, if <i>q-RxLevMinCE1-r13</i> is set below -140 dBm. Otherwise the field is not present.
<i>TDD</i>	This field is mandatory present for TDD; it is not present for FDD and the UE shall delete any existing value for this field.
<i>TDD-OR</i>	The field is optional present for TDD, need OR; it is not present for FDD.
<i>WB-RSRQ</i>	The field is optionally present, need OP if the measurement bandwidth indicated by <i>allowedMeasBandwidth</i> in <i>systemInformationBlockType3</i> is 50 resource blocks or larger; otherwise it is not present.
<i>SI-BR</i>	The field is mandatory present if <i>schedulingInfoSIB1-BR</i> is included in MIB with a value greater than 0. Otherwise the field is not present.

– *SystemInformationBlockType1-MBMS*

SystemInformationBlockType1-MBMS contains information relevant for receiving service from MBMS-dedicated cell and defines the scheduling of other system information.

<i>SystemInformationBlockType1-MBMS</i> field descriptions	
<i>cellAccessRelatedInfoList</i>	This field contains a list allowing signalling of access related information per PLMN. One PLMN can be included in only one entry of this list. NOTE 2.
<i>cellIdentity</i>	Indicates the cell identity. NOTE 1.
<i>freqBandIndicator</i>	A list of as defined in TS 36.101 [42], table 6.2.4-1, for the frequency band in <i>freqBandIndicator</i> .
<i>multiBandInfoList</i>	A list of additional frequency band indicators, as defined in TS 36.101 [42], table 5.5-1, that the cell belongs to. If the UE supports the frequency band in the <i>freqBandIndicator</i> field it shall apply that frequency band. Otherwise, the UE shall apply the first listed band which it supports in the <i>multiBandInfoList</i> field.
<i>nonMBSFN-SubframeConfig</i>	Defines the non-MBSFN subframes within the radio frame allocation period defined by the <i>radioFrameAllocationPeriod</i> and the <i>radioFrameAllocationOffset</i> .
<i>plmn-IdentityList</i>	List of PLMN identities. The first listed <i>PLMN-Identity</i> is the primary PLMN. NOTE 1.
<i>radioFrameAllocationPeriod, radioFrameAllocationOffset</i>	Radio-frames that contain non-MBSFN subframes occur when equation $SFN \bmod radioFrameAllocationPeriod = radioFrameAllocationOffset$ is satisfied. Value rf4 for <i>radioframeAllocationPeriod</i> denotes 4 radio frames, rf8 denotes 8 radion frames, and so on.
<i>schedulingInfoList-MBMS</i>	Indicates additional scheduling information of SI messages on MBMS-dedicated cell.
<i>sib-MappingInfo</i>	List of the SIBs mapped to this <i>SystemInformation</i> message.
<i>si-Periodicity</i>	Periodicity of the SI-message in radio frames, such that rf16 denotes 16 radio frames, rf32 denotes 32 radio frames, and so on.
<i>si-WindowLength</i>	Common SI scheduling window for all SIs. Unit in milliseconds, where ms1 denotes 1 millisecond, ms2 denotes 2 milliseconds and so on.
<i>subframeAllocation</i>	Defines the subframes that are allocated for non-MBSFN within the radio frame allocation period defined by the <i>radioFrameAllocationPeriod</i> and the <i>radioFrameAllocationOffset</i> . "0" denotes that the corresponding subframe is a MBSFN subframe. "1" denotes that the corresponding subframe is a non-MBSFN subframe. If E-UTRAN configures a value other than "0" for <i>additionalNonMBSFNSubframes</i> within <i>MasterInformationBlock-MBMS</i> , <i>subframeAllocation</i> configuration should also indicate subframes pointed out by <i>additionalNonMBSFNSubframes</i> as non-MBSFN subframes.
<i>systemInformationBlockType13</i>	E-UTRAN does not configure this field if <i>schedulingInfoList-MBMS</i> indicates that <i>SystemInformationBlockType13</i> is present.
<i>systemInfoValueTag</i>	Common for all SIBs other than MIB, SIB1, SIB10, SIB11, SIB12 and SIB14. Change of MIB and SIB1 is detected by acquisition of the corresponding message.
<i>trackingAreaCode</i>	A <i>trackingAreaCode</i> that is common for all the PLMNs listed. NOTE1.

NOTE 1: E-UTRAN sets this field to the same value for all instances of SIB1-MBMS message that are broadcasted within the same cell.

UEAssistanceInformation

UEAssistanceInformation field descriptions	
delayBudgetReport	Indicates the UE-preferred adjustment to connected mode DRX or coverage enhancement configuration.
dl-Preference	Indicates UE's preference on configuration of maximum PDSCH bandwidth. The value mhz1dot4 corresponds to CE mode usage in 1.4MHz bandwidth, mhz5 corresponds to CE mode usage in 5MHz bandwidth, and mhz20 corresponds to CE mode usage in 20MHz bandwidth or normal coverage.
excessRep-MPDCCH	Indicates the excess number of repetitions on MPDCCH. Value excessRep1 and excessRep2 indicate the excess number of repetitions defined in TS 36.133 [16].
logicalChannelIdentityUL	Indicates the logical channel identity associated with the reported traffic pattern in the uplink logical channel.
messageSize	Indicates the maximum TB size based on the observed traffic pattern. The value refers to the index of TS 36.321 [6], table 6.1.3.1-1.
overheatingAssistanceForSCG	Includes the NR OverheatingAssistance IE as specified in TS 38.331 [82]. The field indicates UE's preference on reduced configuration for NR SCG to address overheating in FR1 and/or FR2-1.
overheatingAssistanceForSCG-FR2-2	Includes the NR OverheatingAssistance-r17 IE for FR2-2 as specified in TS 38.331 [82]. The field indicates UE's preference on reduced configuration for NR SCG to address overheating in FR2-2.
powerPrefIndication	Value <i>lowPowerConsumption</i> indicates the UE prefers a configuration that is primarily optimised for power saving. Otherwise the value is set to <i>normal</i> .
priorityInfoSL	Indicates the traffic priority (i.e., PPPP) associated with the reported traffic pattern for V2X sidelink communication.
reducedCCsDL	Indicates the UE's preference on reduced configuration corresponding to the maximum number of downlink SCells indicated by the field, to address overheating. This maximum number includes both SCells of E-UTRA and PSCell/SCells of NR in (NG)EN-DC.
reducedCCsUL	Indicates the UE's preference on reduced configuration corresponding to the maximum number of uplink SCells indicated by the field, to address overheating. This maximum number includes both SCells of E-UTRA and PSCell/SCells of NR in (NG)EN-DC.
reducedUE-CategoryDL, reducedUE-CategoryUL	Indicates that UE prefers a configuration corresponding to the reduced UE category, to address overheating. The reduced UE DL category and reduced UE UL category should be indicated according to supported combinations for UE UL and DL Categories, see TS 36.306 [5], Table 4.1A-6.
reliabilityInfoSL	Indicates the traffic reliability (i.e., PPPR) associated with the reported traffic pattern for V2X sidelink communication.
rIm-Event	This field provides the RLM event ("early-out-of-sync" or "early-in-sync").
rIm-Report	This field provides the RLM report for BL UEs and UEs in CE.
sps-AssistanceInformation	Indicates the UE assistance information to assist E-UTRAN to configure SPS.
timingOffset	This field indicates the estimated timing for a packet arrival in a SL/UL logical channel. Specifically, the value indicates the timing offset with respect to subframe#0 of SFN#0 in milliseconds.
trafficDestination	Indicates the destination associated with the reported traffic pattern for V2X sidelink communication.
trafficPatternInfoListSL	This field provides the traffic characteristics of sidelink logical channel(s) that are setup for V2X sidelink communication. If <i>trafficPatternInfoListSL-v1530</i> is included, it includes the same number of entries, and listed in the same order, as in <i>trafficPatternInfoListSL-r14</i> .
trafficPatternInfoListUL	This field provides the traffic characteristics of uplink logical channel(s).
trafficPeriodicity	This field indicates the estimated data arrival periodicity in a SL/UL logical channel. Value sf20 corresponds to 20 ms, sf50 corresponds to 50 ms and so on.
type1	Indicates the preferred amount of increment/decrement to the connected mode DRX cycle length with respect to the current configuration. Value in number of milliseconds. Value ms40 corresponds to 40 milliseconds, msMinus40 corresponds to -40 milliseconds and so on.

<i>UEAssistanceInformation</i> field descriptions	
<i>type2</i>	Indicates the preferred amount of increment/decrement to the coverage enhancement configuration with respect to the current configuration so that the Uu air interface delay changes by the indicated amount. Value in number of milliseconds. Value ms24 corresponds to 24 milliseconds, msMinus24 corresponds to -24 milliseconds and so on.
<i>ul-Preference</i>	Indicates UE's preference on configuration of maximum PUSCH bandwidth. The value mhz1dot4 corresponds to CE mode usage in 1.4MHz bandwidth, and mhz5 corresponds to CE mode usage in 5MHz bandwidth.

UECapabilityEnquiry

The *UECapabilityEnquiry* message is used to request the transfer of UE radio access capabilities for E-UTRA as well as for other RATs.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

-- ASN1STOP

```

<i>UECapabilityEnquiry</i> field descriptions	
<i>eutra-nr-only</i>	Indicates that the UE is requested to provide UE capabilities related to (NG)EN-DC only as specified in TS38.331 [82].
<i>requestDiffFallbackCombList</i>	List of CA band combinations for which the UE is requested to provide different capabilities for their fallback band combinations in conjunction with the capabilities supported for the CA band combinations in this list. The UE shall exclude fallback band combinations for which their supported UE capabilities are the same as the CA band combination indicated in this list.
<i>requestReducedFormat</i>	Indicates that the UE is requested to provide supported CA band combinations in the <i>supportedBandCombinationReduced-r13</i> instead of the <i>supportedBandCombination-r10</i> . The E-UTRAN includes this field if <i>requestSkipFallbackComb</i> or <i>requestDiffFallbackCombList</i> is included in the message.
<i>requestSkipFallbackComb</i>	Indicates that the UE shall explicitly exclude fallback CA band combinations in capability signalling.
<i>ue-CapabilityRequest</i>	List of the RATs for which the UE is requested to transfer the UE radio access capabilities i.e. E-UTRA, UTRA, GERAN-CS, GERAN-PS, CDMA2000. A separate <i>RAT-Type</i> value applies for some EUTRA-NR capabilities that are transferred by a separate UE capability container, used in case of MRDC.
<i>requestedFrequencyBands</i>	List of frequency bands for which the UE is requested to provide supported CA band combinations and non CA bands.
<i>requestedFreqBandsNR-MRDC</i>	Interpreted as <i>FreqBandList</i> IE as specified in TS 38.331 [82]. It concerns a list of NR and/ or E-UTRA frequency bands for which the UE is requested to provide its supported NR CA and/or MR-DC band combinations (i.e. within the UE capability containers for NR and MR-DC, as requested by E-UTRAN) and feature sets corresponding to the MR-DC band combinations (i.e. within the UE capability containers for LTE and NR, as requested by E-UTRAN).
<i>requestedCapabilityCommon</i>	Contains the filter common for all requested MR-DC related capability containers as defined by <i>UE-CapabilityRequestFilterCommon</i> IE in TS 38.331 [82].
<i>requestedCapabilityNR</i>	Interpreted as <i>UE-CapabilityRequestFilterNR</i> IE as specified in TS 38.331 [82], in which the field <i>frequencyBandListFilter</i> is omitted.
<i>requestedMaxCCsDL, requestedMaxCCsUL</i>	Indicates the maximum number of CCs for which the UE is requested to provide supported CA band combinations and non-CA bands.
<i>requestReducedIntNonContComb</i>	Indicates that the UE shall explicitly exclude supported intra-band non-contiguous CA band combinations other than included in capability signalling as specified in TS 36.306 [5], clause 4.3.5.21.
<i>requestSTTI-SPT-Capability</i>	Indicates that the UE is requested to provide its supported short TTI and SPT capabilities in capability signalling.
<i>rrc-SegAllowed</i>	A one-shot field that indicates that the UE is enabled to segment the response message into a series of <i>ULDedicatedMessageSegment</i> messages.

— ***UECapabilityInformation***

The *UECapabilityInformation* message is used to transfer of UE radio access capabilities requested by the E-UTRAN.

}

-- ASN1STOP

```

***ULDedicatedMessageSegment* field descriptions**

segmentNumber

Identifies the sequence number of a segment within the encoded UL DCCH message.

rrc-MessageSegmentContainer

Includes a segment of the encoded UL DCCH message. The size of the included segment in this container should be small enough that the resulting encoded RRC message PDU is less than or equal to the PDCP SDU size limit.

rrc-MessageSegmentType

Indicates whether the included UL DCCH message segment is the last segment or not.

UEInformationRequest

The *UEInformationRequest* is the command used by E-UTRAN to retrieve information from the UE.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

<i>UEInformationResponse</i> field descriptions	
<i>absoluteTimeStamp</i>	Indicates the absolute time when the logged measurement configuration logging is provided, as indicated by E-UTRAN within <i>absoluteTimeInfo</i> .
<i>anyCellSelectionDetected</i>	This field is used to indicate the detection of <i>any cell selection</i> state, as defined in TS 36.304 [4]. The UE sets this field when performing the logging of measurement results in RRC_IDLE and there is no suitable cell or no acceptable cell.
<i>bler</i>	Indicates the measured BLER value. The coding of BLER value is defined in TS 36.133 [16].
<i>blocksReceived</i>	Indicates total number of MCH blocks, which were received by the UE and used for the corresponding BLER calculation, within the measurement period as defined in TS 36.133 [16].
<i>carrierFreq</i>	In case the UE includes <i>carrierFreq-v9e0</i> and/ or <i>carrierFreq-v1090</i> , the UE shall set the corresponding entry of <i>carrierFreq-r9</i> and/ or <i>carrierFreq-r10</i> respectively to <i>maxEARFCN</i> . For E-UTRA and UTRA frequencies, the UE sets the ARFCN according to the band used when obtaining the concerned measurement results.
<i>carrierFreqNR</i>	In case the UE includes <i>measResultListNR</i> , the UE uses this field to indicate the ARFCN value according to the band used when obtaining the concerned measurement results
<i>cellIdListNR</i>	This field is used to indicate the unique NR cell identities of the RA procedure information stored in <i>RA-ReportList</i> IE, which is specified in TS 38.331 [82].
<i>connectionFailureType</i>	This field is used to indicate whether the connection failure is due to radio link failure or handover failure.
<i>contentionDetected</i>	This field is used to indicate that contention was detected for at least one of the transmitted preambles, see TS 36.321 [6].
<i>coarseLocationInfo</i>	This field indicates the coarse location information reported by the UE. This field is coded as the <i>Ellipsoid-Point</i> IE defined in TS 37.355 [109]. The first/leftmost bit of the first octet contains the most significant bit. The least significant bits of <i>degreesLatitude</i> and <i>degreesLongitude</i> are set to 0 to meet the accuracy requirement which corresponds to a granularity of approximately 2 km. It is up to UE implementation as to how many LSBs are set to 0 to meet the accuracy requirement.
<i>c-RNTI</i>	This field indicates the C-RNTI used in the PCell upon detecting radio link failure or the C-RNTI used in the source PCell upon handover failure.
<i>dataBLER-MCH-ResultList</i>	Includes a BLER result per MCH on subframes using <i>dataMCS</i> , with the applicable MCH(s) listed in the same order as in <i>pmch-InfoList</i> within <i>MBSFNAreaConfiguration</i> .
<i>drb-EstablishedWithQCI-1</i>	This field is used to indicate the radio link failure occurred while a bearer with QCI value equal to 1 was configured, see TS 24.301 [35].
<i>dummy</i>	This field is not used in the specification. It shall not be sent by the UE.
<i>edt-Fallback</i>	Value TRUE indicates the last successfully completed random access procedure was initiated with EDT PRACH resource and succeeded after receiving EDT fallback indication from lower layers.
<i>failedCellId</i>	This field is used to indicate the cell in which connection establishment failed.
<i>failedPCellId</i>	This field is used to indicate the PCell in which RLF is detected or the target PCell of the failed handover. The UE sets the EARFCN according to the band used for transmission/ reception when the failure occurred.
<i>inDeviceCoexDetected</i>	Indicates that measurement logging is suspended due to IDC problem detection.
<i>initialCEL</i>	Indicates the initial CE level used for the last successfully completed random access procedure for BL UEs and UEs in CE.
<i>logMeasResultListBT</i>	This field refers to the Bluetooth measurement results.
<i>logMeasResultListWLAN</i>	This field refers to the WLAN measurement results.
<i>maxTxPowerReached</i>	This field is used to indicate whether or not the maximum power level was used for the last transmitted preamble, see TS 36.321 [6].
<i>mch-Index</i>	Indicates the MCH by referring to the entry as listed in <i>pmch-InfoList</i> within <i>MBSFNAreaConfiguration</i> .

<i>UEInformationResponse</i> field descriptions	
<i>measResultFailedCell</i>	This field refers to the last measurement results taken in the cell, where connection establishment failure happened. For UE supporting CE Mode B, when CE mode B is not restricted by upper layers, <i>measResultFailedCell-v1360</i> is reported if the measured RSRP is less than -140 dBm.
<i>measResultLastServCell</i>	This field refers to the last measurement results taken in the PCell, where radio link failure or handover failure happened. For BL UEs or UEs in CE, when operating in CE Mode B, <i>measResultLastServCell-v1360</i> is reported if the measured RSRP is less than -140 dBm.
<i>measResultListEUTRA</i>	If <i>measResultListEUTRA-v9e0</i> , <i>measResultListEUTRA-v1090</i> or <i>measResultListEUTRA-v1130</i> is included, the UE shall include the same number of entries, and listed in the same order, as in <i>measResultListEUTRA-r9</i> , <i>measResultListEUTRA-r10</i> and/ or <i>measResultListEUTRA-r11</i> respectively.
<i>measResultListEUTRA-v1250</i>	If included in <i>RLF-Report-r9</i> the UE shall include the same number of entries, and listed in the same order, as in <i>measResultListEUTRA-r9</i> . If included in <i>LogMeasInfo-r10</i> the UE shall include the same number of entries, and listed in the same order, as in <i>measResultListEUTRA-r10</i> . If included in <i>ConnEstFailReport-r11</i> the UE shall include the same number of entries, and listed in the same order, as in <i>measResultListEUTRA-r11</i> .
<i>measResultListIdle</i>	This field indicates the E-UTRA measurement results done during RRC_IDLE and RRC_INACTIVE at network request.
<i>measResultListIdleNR</i>	This field indicates the NR measurement results done during RRC_IDLE and RRC_INACTIVE at network request.
<i>measResultListNR</i>, <i>measResultListExtNR</i>	Includes NR measurement results, with <i>measResultListNR</i> including results of a first NR frequency and <i>measResultListExtNR</i> including results of additional NR frequencies, if available.
<i>measResultServCell</i>	This field refers to the log measurement results taken in the Serving cell. For UE supporting CE Mode B, when CE mode B is not restricted by upper layers, <i>measResultServCell-v1360</i> is reported if the measured RSRP is less than -140 dBm.
<i>mobilityHistoryReport</i>	This field is used to indicate the time of stay in 16 most recently visited E-UTRA cells or of stay out of E-UTRA.
<i>numberOfPreamblesSent</i>	This field is used to indicate the number of RACH preambles that were transmitted. Corresponds to parameter PREAMBLE_TRANSMISSION_COUNTER in TS 36.321 [6].
<i>previousPCellId</i>	This field is used to indicate the source PCell of the last handover (source PCell when the last RRConnectionReconfiguration message including <i>mobilityControlInfo</i> was received).
<i>previousUTRA-CellId</i>	This field is used to indicate the source UTRA cell of the last successful handover to E-UTRAN, when RLF occurred at the target PCell. The UE sets the ARFCN according to the band used for transmission/ reception on the concerned cell.
<i>rach-ReportListNR</i>	This field is used to indicate the list of NR RACH report information, including the <i>NR RA-ReportList</i> IE, which is specified in TS 38.331 [82].
<i>reconnectCellId</i>	This field is used to indicate the cell in which the UE comes back to connected after connection failure and after failing to perform reestablishment. This field is absent if the selected cell after <i>MobilityFromNRCommand</i> execution failure is an acceptable cell. If the UE comes back to RRC CONNECTED in an NR cell then <i>nrReconnectCellID</i> is included and if the UE comes back to RRC CONNECTED in an LTE cell then <i>eutraReconnectCellID</i> is included.
<i>reestablishmentCellId</i>	This field is used to indicate the cell in which the re-establishment attempt was made after connection failure.
<i>relativeTimeStamp</i>	Indicates the time of logging measurement results, measured relative to the <i>absoluteTimeStamp</i> . Value in seconds.
<i>rlf-Cause</i>	This field is used to indicate the cause of the last radio link failure that was detected. In case of handover failure information reporting (i.e., the <i>connectionFailureType</i> is set to 'hof'), the UE is allowed to set this field to any value.
<i>selectedUTRA-CellId</i>	This field is used to indicate the UTRA cell that the UE selects after RLF is detected, while T311 is running. The UE sets the ARFCN according to the band selected for transmission/ reception on the concerned cell.
<i>signallingBLER-Result</i>	Includes a BLER result of MBSFN subframes using <i>signallingMCS</i> .
<i>tac-FailedPCell</i>	This field is used to indicate the Tracking Area Code of the PCell in which RLF is detected.

<i>UEInformationResponse</i> field descriptions	
<i>tce-Id</i>	Parameter Trace Collection Entity Id: See TS 32.422 [58].
<i>timeConnFailure</i>	This field is used to indicate the time elapsed since the last HO initialization until connection failure. Actual value = field value * 100ms. The maximum value 1023 means 102.3s or longer.
<i>timeSinceFailure</i>	This field is used to indicate the time that elapsed since the connection (establishment) failure. Value in seconds. The maximum value 172800 means 172800s or longer.
<i>timeStamp</i>	Includes time stamps for the waypoints that describe planned locations for the UE.
<i>timeUntilReconnection</i>	This field is used to indicate the time that elapsed between the connection (radio link or handover) failure and the next time the UE comes to RRC CONNECTED in an NR or EUTRA cell, after failing to perform reestablishment or after cell selection to an acceptable cell after <i>MobilityFromNRCommand</i> execution failure including fallback indication. Value in seconds. The maximum value 172800 means 172800s or longer.
<i>traceRecordingSessionRef</i>	Parameter Trace Recording Session Reference: See TS 32.422 [58].
<i>uncomBarPreMeasResult</i>	This field provides barometric pressure measurements as <i>Sensor-MeasurementInformation</i> defined in TS 37.355 [109]. The first/leftmost bit of the first octet contains the most significant bit.
<i>voiceFallbackHO</i>	This field is set if the radio link failure occurred after a successful mobility from NR, and the <i>voiceFallbackIndication</i> was included in the <i>MobilityFromNRCommand</i> message in TS 38.331 [82].
<i>wayPointLocation</i>	Includes location coordinates for a UE for Aerial UE operation. The waypoints describe planned locations for the UE.

ULHandoverPreparationTransfer (CDMA2000)

The *ULHandoverPreparationTransfer* message is used for the uplink transfer of handover related CDMA2000 information when requested by the higher layers.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

}

-- ASN1STOP
```

ULInformationTransferIRAT field descriptions

ul-DCCH-MessageNR

Includes the *UL-DCCH-Message* as defined in TS 38.331 [82]. In this version of the specification, the field is only used to transfer the NR RRC *MeasurementReport*, NR RRC *SidelinkUEInformationNR* and the NR RRC *UEAssistanceInformation* messages.

This field is not applicable to 5GS Proximity based Services (ProSe) as defined in TS 23.304 [112] in this release.

ULInformationTransferMRDC

The *ULInformationTransferMRDC* message is used for the uplink transfer of MR DC information (i.e. for the case the SCG employs another RAT e.g. for transferring the NR RRC Measurement Report message).

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

ULInformationTransferMRDC message

```
-- ASN1START

ULInformationTransferMRDC-r15 ::= SEQUENCE {

    ul-DCCH-MessageNR-r15 OCTET STRING OPTIONAL,
    lateNonCriticalExtension OCTET STRING OPTIONAL,
    nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

ULInformationTransferMRDC field descriptions

ul-DCCH-MessageNR

Includes the *UL-DCCH-Message* as defined in TS 38.331 [82]. In this version of the specification, the field is only used to transfer the NR RRC *MeasurementReport*, NR RRC *UEAssistanceInformation*, NR RRC *IABOtherInformation*, NR RRC *FailureInformation*, and the NR RRC *RRCReconfigurationComplete* messages.

- ***WLANConnectionStatusReport***

The *WLANConnectionStatusReport* message is used to inform the successful connection to WLAN or failure of the WLAN connection or connection attempt(s).

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

WLANConnectionStatusReport message

```
-- ASN1START

WLANConnectionStatusReport-r13 ::= SEQUENCE {
    criticalExtensions CHOICE {
        c1 CHOICE {
            wlanConnectionStatusReport-r13 WLANConnectionStatusReport-r13-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture SEQUENCE {}
    }
}

WLANConnectionStatusReport-r13-IEs ::= SEQUENCE {
    wlan-Status-r13 WLAN-Status-r13,
    lateNonCriticalExtension OCTET STRING OPTIONAL,
    nonCriticalExtension WLANConnectionStatusReport-v1430-IEs OPTIONAL
}

WLANConnectionStatusReport-v1430-IEs ::= SEQUENCE {
    wlan-Status-v1430 WLAN-Status-v1430,
    nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

WLANConnectionStatusReport field descriptions

wlan-Status

Indicates the connection status to WLAN and the cause of failures. If the *wlan-Status-v1430* is included, E-UTRAN ignores the *wlan-Status-r13*.

6.3 RRC information elements

6.3.0 Parameterized types

- ***SetupRelease***

SetupRelease allows the *ElementTypeParam* to be used as the referenced data type for the setup and release entries. See A.3.8 for guidelines.

```
-- ASN1START

SetupRelease { ElementTypeParam } ::= CHOICE {
    release NULL,
```

```

} setup ElementTypeParam
}
-- ASN1STOP

```

6.3.1 System information blocks

- *SystemInformationBlockPos*

The IE *SystemInformationBlockPos* contains positioning assistance data as defined in TS 36.355 [54].

SystemInformationBlockPos information element

```

-- ASN1START

SystemInformationBlockPos-r15 ::= SEQUENCE {
    assistanceDataSIB-Element-r15      OCTET STRING,
    lateNonCriticalExtension          OCTET STRING
                                         OPTIONAL,
    ...
}

-- ASN1STOP

```

SystemInformationBlockPos field descriptions

assistanceDataSIB-Element

Parameter *AssistanceDataSIBElement* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

- *SystemInformationBlockType2*

The IE *SystemInformationBlockType2* contains radio resource configuration information that is common for all UEs.

NOTE: UE timers and constants related to functionality for which parameters are provided in another SIB are included in the corresponding SIB.

SystemInformationBlockType2 information element

}

-- ASN1STOP
```

SystemInformationBlockType2 field descriptions	
ac-BarringFactor	If the random number drawn by the UE is lower than this value, access is allowed. Otherwise the access is barred. The values are interpreted in the range [0,1]: p00 = 0, p05 = 0.05, p10 = 0.10,..., p95 = 0.95. Values other than p00 can only be set if all bits of the corresponding ac-BarringForSpecialAC are set to 0.
ac-BarringForCSFB	Access class barring for mobile originating CS fallback.
ac-BarringForEmergency	Access class barring for AC 10.
ac-BarringForMO-Data	Access class barring for mobile originating calls.
ac-BarringForMO-Signalling	Access class barring for mobile originating signalling.
ac-BarringForSpecialAC	Access class barring for AC 11-15. The first/ leftmost bit is for AC 11, the second bit is for AC 12, and so on.
ac-BarringTime	Mean access barring time value in seconds.
acdc-BarringConfig	Barring configuration for an ACDC category. If the field is absent, access to the cell is considered as not barred for the ACDC category in accordance with clause 5.3.3.13.
acdc-Category	Indicates the ACDC category as defined in TS 24.105 [72].
acdc-OnlyForHPLMN	Indicates whether ACDC is applicable for UEs not in their HPLMN for the corresponding PLMN. <i>TRUE</i> indicates that ACDC is applicable only for UEs in their HPLMN for the corresponding PLMN. <i>FALSE</i> indicates that ACDC is applicable for both UEs in their HPLMN and UEs not in their HPLMN for the corresponding PLMN.
additionalSpectrumEmission	The UE requirements related to IE <i>AdditionalSpectrumEmission</i> are defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs and TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs. NOTE 1.
attachWithoutPDN-Connectivity	If present, the field indicates that attach without PDN connectivity as specified in TS 24.301 [35] is supported for this PLMN.
barringPerACDC-CategoryList	A list of barring information per ACDC category according to the order defined in TS 22.011 [10]. The first entry in the list corresponds to the highest ACDC category of which applications are the least restricted in access attempts at a cell, the second entry in the list corresponds to the ACDC category of which applications are restricted more than applications of the highest ACDC category in access attempts at a cell, and so on. The last entry in the list corresponds to the lowest ACDC category of which applications are the most restricted in access attempts at a cell.
cloT-EPS-OptimisationInfo	A list of CloT EPS related parameters. Value 1 indicates parameters for the PLMN listed 1st in the 1st <i>plmn-IdentityList</i> included in SIB1. Value 2 indicates parameters for the PLMN listed 2nd in the same <i>plmn-IdentityList</i> , or when no more PLMN are present within the same <i>plmn-IdentityList</i> , then the value indicates parameters for PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on. NOTE 1.
cp-CloT-EPS-Optimisation	This field indicates if the UE is allowed to establish the connection with Control plane CloT EPS Optimisation, see TS 24.301 [35].
cp-EDT	This field indicates whether the UE is allowed to initiate CP-EDT when connected to EPC, see 5.3.3.1b.
cp-EDT-5GC	This field indicates whether the UE is allowed to initiate CP-EDT when connected to 5GC, see 5.3.3.1b.
cp-PUR-5GC	This field indicates whether CP transmission using PUR is supported in the cell when connected to 5GC, see 5.3.3.1c.
cp-PUR-EPC	This field indicates whether CP transmission using PUR is supported in the cell when connected to EPC, see 5.3.3.1c.
dummy	This field is not used in the specification. If received it shall be ignored by the UE.
earlySecurityReactivation	If present, this field indicates that early security reactivation when resuming a suspended RRC connection as specified in 5.3.3.18 is supported.
gnss-PositionFixDurationReporting	If present, this field indicates that UEs capable of performing GNSS position fix in RRC_CONNECTED are configured to include the time duration required to acquire a GNSS position in <i>RRCConnectionSetupComplete</i> , <i>RRCConnectionResumeComplete</i> , and <i>RRCConnectionReestablishmentComplete</i> .
idleModeMeasurements	This field indicates that a UE that is configured for EUTRA idle/inactive measurements shall perform the measurements while camping in this cell and report availability of these measurements when establishing or resuming a connection in this cell. If absent, a UE is not required to perform EUTRA idle/inactive measurements.

SystemInformationBlockType2 field descriptions	
idleModeMeasurementsNR	
This field indicates that a UE that is configured for NR idle/inactive measurements shall perform the measurements while camping in this cell and report availability of these measurements when establishing or resuming a connection in this cell. If absent, a UE is not required to perform NR idle/inactive measurements.	
mbms-RO-MServiceIndication	
This field indicates whether the UE is allowed to send <i>MBMS/Interest/Indication</i> message for the purpose of indicating receive only mode MBMS service parameters.	
mbsfn-SubframeConfigList	
Defines the subframes that are reserved for MBSFN in downlink. NOTE 1. If the cell is a FeMBMS/Unicast mixed cell, EUTRAN includes <i>mbsfn-SubframeConfigList-v1430</i> . If a FeMBMS/Unicast mixed cell does not use sub-frames #4 or #9 as MBSFN sub-frames, <i>mbsfn-SubframeConfigList-v1430</i> is still included and indicates all sub-frames as non-MBSFN sub-frames.	
mpdcch-CQI-Reporting	
This field indicates if downlink channel quality reporting during random access procedure is allowed, see TS 36.321 [6]. Value 'fourBits' indicates 4-bit CQI reporting is allowed and value 'both' indicates both 2-bit and 4-bit reporting are allowed.	
multiBandInfoList	
A list of <i>AdditionalSpectrumEmission</i> i.e. one for each additional frequency band included in <i>multiBandInfoList</i> in <i>SystemInformationBlockType1</i> , listed in the same order. If E-UTRAN includes <i>multiBandInfoList-v1010</i> it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList</i> .	
plmn-IdentityIndex	
Index of the PLMN across the <i>plmn-IdentityList</i> fields included in SIB1. Value 1 indicates the PLMN listed 1st in the 1st <i>plmn-IdentityList</i> included in SIB1. Value 2 indicates the PLMN listed 2nd in the same <i>plmn-IdentityList</i> , or when no more PLMN are present within the same <i>plmn-IdentityList</i> , then the PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on. NOTE 1.	
plmn-InfoList	
If E-UTRAN includes this field, it includes the same number of entries, and listed in the same order as PLMNs across the <i>plmn-IdentityList</i> fields included in SIB1. I.e. the first entry corresponds to the first entry of the combined list that results from concatenating the entries included in the second to the original <i>plmn-IdentityList</i> field.	
rai-ActivationEnh	
Indicates whether UE connected to EPC is allowed to report the AS release assistance indication using the DCQR and AS RAI MAC CE in the cell as specified in TS 36.321 [6].	
reducedCP-LatencyEnabled	
If present, reduced control plane latency is enabled. UEs supporting reduced CP latency transmit Msg3 according to $k_1 \geq 5$ timing as specified in TS 36.213 [23] when transmitting <i>RRCConnectionResumeRequest</i> in Msg3.	
rlos-Enabled	
Indicates whether access to RLOS is allowed as specified in TS 23.401 [41].	
ssac-BarringForMMTEL-Video	
Service specific access class barring for MMTEL video originating calls.	
ssac-BarringForMMTEL-Voice	
Service specific access class barring for MMTEL voice originating calls.	
udt-Restricting	
Value TRUE indicates that the UE should indicate to the higher layers to restrict unattended data traffic TS 22.101 [77] irrespective of the UE being in RRC_IDLE or RRC_CONNECTED. The UE shall not indicate to the higher layers if the UE has one or more Access Classes, as stored on the USIM, with a value in the range 11..15, which is valid for the UE to use according to TS 22.011 [10] and TS 23.122 [11].	
udt-RestrictingTime	
If present and when the <i>udt-Restricting</i> changes from TRUE, the UE runs a timer for a period equal to rand * <i>udt-RestrictingTime</i> , where rand is a random number drawn that is uniformly distributed in the range $0 \leq \text{rand} < 1$ value in seconds. The timer stops if <i>udt-Restricting</i> changes to TRUE. Upon timer expiry, the UE indicates to the higher layers that the restriction is alleviated.	
unicastFreqHoppingInd	
This field indicates if the UE is allowed to indicate support of frequency hopping for unicast MPDCCH/PDSCH/PUSCH as described in TS 36.321 [6]. This field is included only in the BR version of SI message carrying <i>SystemInformationBlockType2</i> .	
ul-Bandwidth	
Parameter: transmission bandwidth configuration, N_{RB} , in uplink, see TS 36.101 [42], table 5.6-1 and TS 36.108 [114], table 5.3A-1. Value n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on. If for FDD this parameter is absent, the uplink bandwidth is equal to the downlink bandwidth. For TDD this parameter is absent and it is equal to the downlink bandwidth. NOTE 1.	
ul-CarrierFreq	
For FDD: If absent, the (default) value determined from the default TX-RX frequency separation defined in TS 36.101 [42], table 5.7.3-1 and 36.108 [114], table 5.4A.2-1, applies.	
For TDD: This parameter is absent and it is equal to the downlink frequency. NOTE 1.	

SystemInformationBlockType2 field descriptions	
up-CIoT-EPS-Optimisation	This field indicates if the UE is allowed to resume the connection with User plane CIoT EPS Optimisation, see TS 24.301 [35].
up-EDT	This field indicates whether the UE is allowed to initiate UP-EDT when connected to EPC, see 5.3.3.1b.
up-EDT-5GC	This field indicates whether the UE is allowed to initiate UP-EDT when connected to 5GC, see 5.3.3.1b.
up-PUR-5GC	This field indicates whether UP transmission using PUR is supported in the cell when connected to 5GC, see 5.3.3.1c.
up-PUR-EPC	This field indicates whether UP transmission using PUR is supported in the cell when connected to EPC, see 5.3.3.1c.
upperLayerIndication	Indication to be provided to upper layers.
useFullResumeID	This field indicates if the UE indicates full resume ID of 40 bits in <i>RRCConnectionResumeRequest</i> .
videoServiceCauseIndication	Indicates whether the UE is requested to use the establishment cause <i>mo-VoiceCall</i> for mobile originating MMTEL video calls.
voiceServiceCauseIndication	Indicates whether UE is requested to use the establishment cause <i>mo-VoiceCall</i> for mobile originating MMTEL voice calls.

Conditional presence	Explanation
<i>ul-FreqMax</i>	The field is mandatory present if <i>ul-CarrierFreq</i> (i.e. without suffix) is present and set to <i>maxEARFCN</i> . Otherwise the field is not present.

NOTE 1: E-UTRAN sets this field to the same value for all instances of SI message that are broadcasted within the same cell.

– *SystemInformationBlockType3*

The IE *SystemInformationBlockType3* contains cell re-selection information common for intra-frequency, inter-frequency and/ or inter-RAT cell re-selection (i.e. applicable for more than one type of cell re-selection but not necessarily all) as well as intra-frequency cell re-selection information other than neighbouring cell related.

SystemInformationBlockType3 field descriptions	
allowedMeasBandwidth	If absent, the value corresponding to the downlink bandwidth indicated by the <i>dl-Bandwidth</i> included in <i>MasterInformationBlock</i> applies.
altCellReselectionPriority	Alternative cell reselection priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRCConnectionRelease</i> message.
altCellReselectionSubPriority	Alternative cell reselection sub-priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRCConnectionRelease</i> message.
cellEquivalentSize	The number of cell count used for mobility state estimation for this cell as specified in TS 36.304 [4].
cellSelectionInfoCE	Parameters included in coverage enhancement S criteria for BL UEs and UEs in CE, applicable for intra-frequency neighbour cells. If absent, coverage enhancement S criteria is not applicable.
cellSelectionInfoCE1	Parameters included in coverage enhancement S criteria for BL UEs and UEs in CE supporting CE Mode B, applicable for intra-frequency neighbour cells. E-UTRAN includes this IE only if <i>cellSelectionInfoCE</i> in SIB3 is present.
cellReselectionInfoCommon	Cell re-selection information common for cells.
cellReselectionServingFreqInfo	Information common for Cell re-selection to inter-frequency and inter-RAT cells.
crs-IntfMitigNeighCellsCE	For BL UEs supporting ce-CRS-IntfMitig, this field indicates CRS interference mitigation, as specified in TS 36.133 [16], clause 3.6.1.2 and 3.6.1.3, is enabled in any of the intra-frequency neighbour cells, and the UE shall perform intra-frequency neighbour cell RRM measurements in the center 6 PRBs.
freqBandInfo	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, applicable for the intra-frequency neighbouring E-UTRA cells if the UE selects the frequency band from <i>freqBandIndicator</i> in <i>SystemInformationBlockType1</i> . If E-UTRAN includes <i>freqBandInfo-v10I0</i> it includes the same number of entries, and listed in the same order, as in <i>freqBandInfo-r10</i> .
intraFreqCellReselectionInfo	Cell re-selection information common for intra-frequency cells.
multiBandInfoList-v10j0	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, applicable for the intra-frequency neighbouring E-UTRA cells if the UE selects the frequency bands in <i>multiBandInfoList</i> (i.e. without suffix) or <i>multiBandInfoList-v9e0</i> . If E-UTRAN includes <i>multiBandInfoList-v10j0</i> , it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList</i> (i.e. without suffix). If E-UTRAN includes <i>multiBandInfoList-v10I0</i> it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList-v10j0</i> .
p-Max	Value applicable for the intra-frequency neighbouring E-UTRA cells. If absent the UE applies the maximum power according to its capability as specified in TS 36.101 [42], clause 6.2.2. This field is ignored by IAB-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [107].
redistrOnPagingOnly	If this field is present and the UE is redistribution capable, the UE shall only wait for the paging message to trigger E-UTRAN inter-frequency redistribution procedure as specified in clause 5.2.4.10 of TS 36.304 [4].
q-Hyst	Parameter Q_{hyst} in TS 36.304 [4], Value in dB. Value dB1 corresponds to 1 dB, dB2 corresponds to 2 dB and so on.
q-HystSF	Parameter "Speed dependent ScalingFactor for Q_{hyst} " in TS 36.304 [4]. The sf-Medium and sf-High concern the additional hysteresis to be applied, in Medium and High Mobility state respectively, to Q_{hyst} as defined in TS 36.304 [4]. In dB. Value dB-6 corresponds to -6dB, dB-4 corresponds to -4dB and so on.
q-QualMin	Parameter " $Q_{qualmin}$ " in TS 36.304 [4], applicable for intra-frequency neighbour cells. If the field is not present, the UE applies the (default) value of negative infinity for $Q_{qualmin}$. NOTE 1.
q-QualMinRSRQ-OnAllSymbols	If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, perform RSRQ measurement on all OFDM symbols in accordance with TS 36.214 [48]. NOTE 1.
q-QualMinWB	If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, use a wider bandwidth in accordance with TS 36.133 [16]. NOTE 1.
q-RxLevMin	Parameter " $Q_{rxlevmin}$ " in TS 36.304 [4], applicable for intra-frequency neighbour cells.

SystemInformationBlockType3 field descriptions		
<i>redistributionFactorCell</i>		
If <i>redistributionFactorCell</i> is present, <i>redistributionFactorServing</i> is only applicable for the serving cell otherwise it is applicable for serving frequency		
<i>redistributionFactorServing</i>		
Parameter <i>redistributionFactorServing</i> in TS 36.304 [4].		
<i>s-IntraSearch</i>		
Parameter "S _{IntraSearchP} " in TS 36.304 [4]. If the field <i>s-IntraSearchP</i> is present, the UE applies the value of <i>s-IntraSearchP</i> instead. Otherwise if neither <i>s-IntraSearch</i> nor <i>s-IntraSearchP</i> is present, the UE applies the (default) value of infinity for S _{IntraSearchP} .		
<i>s-IntraSearchP</i>		
Parameter "S _{IntraSearchP} " in TS 36.304 [4]. See descriptions under <i>s-IntraSearch</i> .		
<i>s-IntraSearchQ</i>		
Parameter "S _{IntraSearchQ} " in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of 0 dB for S _{IntraSearchQ} .		
<i>s-NonIntraSearch</i>		
Parameter "S _{NonIntraSearchP} " in TS 36.304 [4]. If the field <i>s-NonIntraSearchP</i> is present, the UE applies the value of <i>s-NonIntraSearchP</i> instead. Otherwise if neither <i>s-NonIntraSearch</i> nor <i>s-NonIntraSearchP</i> is present, the UE applies the (default) value of infinity for S _{NonIntraSearchP} .		
<i>s-NonIntraSearchP</i>		
Parameter "S _{NonIntraSearchP} " in TS 36.304 [4]. See descriptions under <i>s-NonIntraSearch</i> .		
<i>s-NonIntraSearchQ</i>		
Parameter "S _{NonIntraSearchQ} " in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of 0 dB for S _{NonIntraSearchQ} .		
<i>s-SearchDeltaP</i>		
Parameter "S _{SearchDeltaP} " in TS 36.304 [4]. This parameter is only applicable for UEs supporting relaxed monitoring as specified in TS 36.306 [5]. Value dB6 corresponds to 6 dB, dB9 corresponds to 9 dB and so on.		
<i>satelliteAssistanceInfoList</i>		
List of satellite ID(s), used to associate with the satellite assistance information for intra-frequency neighbour cell measurements.		
<i>speedStateReselectionPars</i>		
Speed dependent reselection parameters, see TS 36.304 [4]. If this field is absent, i.e., <i>mobilityStateParameters</i> is also not present, UE behaviour is specified in TS 36.304 [4].		
<i>t-Service</i>		
Time information on when a NTN quasi-Earth fixed cell is going to stop serving the area it is currently covering, as specified in TS 36.304 [4].		
<i>t360</i>		
Parameter "T360" in TS 36.304 [4]. Value min4 corresponds to 4 minutes, value min8 corresponds to 8 minutes, and so on.		
<i>threshServingLow</i>		
Parameter "Thresh _{Serving, LowP} " in TS 36.304 [4].		
<i>threshServingLowQ</i>		
Parameter "Thresh _{Serving, LowQ} " in TS 36.304 [4].		
<i>t-ReselectionEUTRA</i>		
Parameter "Treselection _{EUTRA} " in TS 36.304 [4].		
<i>t-ReselectionEUTRA-SF</i>		
Parameter "Speed dependent ScalingFactor for Treselection _{EUTRA} " in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].		

NOTE 1: The value the UE applies for parameter "Q_{qualmin}" in TS 36.304 [4] depends on the *q-QualMin* fields signalled by E-UTRAN and supported by the UE. In case multiple candidate options are available, the UE shall select the highest priority candidate option according to the priority order indicated by the following table (top row is highest priority).

q-QualMinRSRQ-OnAllSymbols	q-QualMinWB	Value of parameter "Q_{qualmin}" in TS 36.304 [4]
Included	Included	$q\text{-QualMinRSRQ-OnAllSymbols} - (q\text{-QualMin} - q\text{-QualMinWB})$
Included	Not included	$q\text{-QualMinRSRQ-OnAllSymbols}$
Not included	Included	$q\text{-QualMinWB}$
Not included	Not included	$q\text{-QualMin}$

Conditional presence	Explanation
<i>QrxlevminCE1</i>	The field is optionally present, Need OR, if $q\text{-}RxLevMinCE1\text{-}r13$ is set below -140 dBm. Otherwise the field is not present.
<i>RSRQ</i>	The field is optionally present, Need OR, if <i>threshServingLowQ</i> is present in SIB3; otherwise it is not present.
<i>WB-RSRQ</i>	The field is optionally present, need OP if the measurement bandwidth indicated by <i>allowedMeasBandwidth</i> is 50 resource blocks or larger; otherwise it is not present.

– *SystemInformationBlockType4*

The IE *SystemInformationBlockType4* contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters as well as exclude-listed cells.

SystemInformationBlockType4 information element

```
-- ASN1START

SystemInformationBlockType4 ::= SEQUENCE {

}

IntraFreqExcludedCellList ::= SEQUENCE (SIZE (1..maxExcludedCell)) OF PhysCellIdRange

-- ASN1STOP
```

<i>SystemInformationBlockType4</i> field descriptions	
<i>csg-PhysCellIdRange</i>	Set of physical cell identities reserved for CSG cells on the frequency on which this field was received. The received <i>csg-PhysCellIdRange</i> applies if less than 24 hours has elapsed since it was received and the UE is camped on a cell of the same primary PLMN where this field was received. The 3 hour validity restriction (clause 5.2.1.3) does not apply to this field. The UE shall not apply any stored <i>csg-PhysCellIdRange</i> when it is in any cell selection state defined in TS 36.304 [4].
<i>intraFreqExcludedCellList</i>	List of exclude-listed intra-frequency neighbouring cells.
<i>intraFreqNeighCellList</i>	List of intra-frequency neighbouring cells with specific cell re-selection parameters. <i>intraFreqNeighCellList-v1610</i> indicates list of RSS assistance information which is used for the corresponding <i>physCellId</i> . If E-UTRAN includes <i>intraFreqNeighCellList-v1610</i> , it includes the same number of entries, and listed in the same order, as in <i>intraFreqNeighCellList</i> (i.e. without suffix). If <i>intraFreqNeighCellList-v1610</i> is absent, measurement based on RSS is not applicable for all the neighbour cells in <i>intraFreqNeighCellList</i> (i.e. without suffix).
<i>intraFreqNeighHSDN-CellList</i>	List of intra-frequency neighbouring HSDN cells as specified in TS 36.304 [4].
<i>q-OffsetCell</i>	Parameter "Qoffset _{s,n} " in TS 36.304 [4].
<i>rss-ConfigCarrierInfo</i>	RSS configurations for this carrier frequency. If absent and <i>rss-MeasConfig</i> is included in SIB2, RSS is collocated (time and frequency domain) in all cells.

Conditional presence	Explanation
CSG	This field is optional, need OP, for non-CSG cells, and mandatory for CSG cells.
RSS	This field is optional, need OP, if <i>rss-MeasConfig</i> is included in SIB2. Otherwise the field is not present, and the UE shall delete any existing value for this field.

– ***SystemInformationBlockType5***

The IE *SystemInformationBlockType5* contains information relevant for inter-frequency cell re-selection (i.e. information about other E-UTRA frequencies and inter-frequency neighbouring cells relevant for cell re-selection) and information relevant for E-UTRA and NR idle/inactive measurements. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

SystemInformationBlockType5 field descriptions	
altCellReselectionPriority	Alternative cell reselection priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRConnectionRelease</i> message.
altCellReselectionSubPriority	Alternative cell reselection sub-priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRConnectionRelease</i> message.
cellSelectionInfoCE	Parameters included in coverage enhancement S criteria for BL UEs and UEs in CE, applicable for inter-frequency neighbour cells. If absent, coverage enhancement S criteria is not applicable.
cellSelectionInfoCE1	Parameters included in coverage enhancement S criteria for BL UEs and UEs in CE supporting CE Mode B. E-UTRAN includes this IE only in an entry of <i>InterFreqCarrierFreqList-v1350</i> or <i>InterFreqCarrierFreqListExt-v1350</i> if <i>cellSelectionInfoCE</i> is present in the corresponding entry of <i>InterFreqCarrierFreqList-v1310</i> or <i>InterFreqCarrierFreqListExt-v1310</i> is present.
freqBandInfo	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, for the frequency band represented by <i>dl-CarrierFreq</i> for which cell reselection parameters are common. If E-UTRAN includes <i>freqBandInfo-v10j0</i> it includes the same number of entries, and listed in the same order, as in <i>freqBandInfo-r10</i> .
hsdn-Indication	Indicates whether there are deployed HSDN cells or not on the the DL carrier frequency indicated by <i>dl-CarrierFreq-r12</i> .
interFreqCarrierFreqList	List of neighbouring inter-frequencies. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the E-ARFCN used to indicate this. If E-UTRAN includes <i>interFreqCarrierFreqList-v8h0</i> , <i>interFreqCarrierFreqList-v9e0</i> , <i>interFreqCarrierFreqList-v1250</i> , <i>interFreqCarrierFreqList-v1310</i> , <i>interFreqCarrierFreqList-v1350</i> , <i>interFreqCarrierFreqList-v13a0</i> , <i>interFreqCarrierFreqList-v1530</i> , <i>interFreqCarrierFreqList-v1610</i> , and/or <i>interFreqCarrierFreqList-v1800</i> , it includes the same number of entries, and listed in the same order, as in <i>interFreqCarrierFreqList</i> (i.e. without suffix). See Annex D for more descriptions.
interFreqCarrierFreqListExt	List of additional neighbouring inter-frequencies, i.e. extending the size of the inter-frequency carrier list using the general principles specified in 5.1.2. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the E-ARFCN used to indicate this. EUTRAN may include <i>interFreqCarrierFreqListExt</i> even if <i>interFreqCarrierFreqList</i> (i.e without suffix) does not include <i>maxFreq</i> entries. If E-UTRAN includes <i>interFreqCarrierFreqListExt-v1310</i> , <i>interFreqCarrierFreqListExt-v1350</i> , <i>interFreqCarrierFreqListExt-v1360</i> , <i>interFreqCarrierFreqListExt-v1530</i> , <i>interFreqCarrierFreqListExt-v1610</i> , and/or <i>interFreqCarrierFreqListExt-v1800</i> , it includes the same number of entries, and listed in the same order, as in <i>interFreqCarrierFreqListExt-r12</i> .
interFreqExcludedCellList	List of exclude-listed inter-frequency neighbouring cells.
interFreqNeighCellList	List of inter-frequency neighbouring cells with specific cell re-selection parameters. <i>interFreqNeighCellList-v1610</i> indicates list of RSS assistance information which is used for the corresponding <i>physCellId</i> . If E-UTRAN includes <i>interFreqNeighCellList-v1610</i> in <i>interFreqCarrierFreqList-v1610</i> / <i>interFreqCarrierFreqListExt-v1610</i> , it includes the same number of entries, and listed in the same order, as in <i>interFreqNeighCellList</i> (i.e. without suffix) / <i>interFreqNeighCellList-r12</i> . If <i>interFreqNeighCellList-v1610</i> is absent in <i>interFreqCarrierFreqList-v1610</i> / <i>interFreqCarrierFreqListExt-v1610</i> , measurement based on RSS is not applicable for all the neighbour cells in <i>interFreqNeighCellList</i> (i.e. without suffix) / <i>interFreqNeighCellList-r12</i> .
interFreqNeighHSDN-CellList	List of inter-frequency neighbouring HSDN cells as specified in TS 36.304 [4].
measIdleConfigSIB	Indicates E-UTRA measurement configuration to be stored and used by the UE while in RRC_IDLE or RRC_INACTIVE.
measIdleConfigSIB-NR	Indicates the NR measurement configuration to be stored and used by the UE while in RRC_IDLE or RRC_INACTIVE.
multiBandInfoList	Indicates the list of frequency bands in addition to the band represented by <i>dl-CarrierFreq</i> for which cell reselection parameters are common. E-UTRAN indicates at most <i>maxMultiBands</i> frequency bands (i.e. the total number of entries across both <i>multiBandInfoList</i> and <i>multiBandInfoList-v9e0</i> is below this limit).
multiBandInfoList-v10j0	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, for the frequency bands in <i>multiBandInfoList</i> (i.e. without suffix) and <i>multiBandInfoList-v9e0</i> . If E-UTRAN includes <i>multiBandInfoList-v10j0</i> , it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList</i> (i.e. without suffix). If E-UTRAN includes <i>multiBandInfoList-v10j0</i> it includes the same number of entries, and listed in the same order, as in <i>multiBandInfoList-v10j0</i> .

SystemInformationBlockType5 field descriptions	
altCellReselectionPriority	Alternative cell reselection priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRConnectionRelease</i> message.
altCellReselectionSubPriority	Alternative cell reselection sub-priorities to be used by the UEs for which the <i>altFreqPriorities</i> is set to <i>true</i> in the <i>RRConnectionRelease</i> message.
p-Max	Value applicable for the neighbouring E-UTRA cells on this carrier frequency. If absent the UE applies the maximum power according to its capability as specified in TS 36.101 [42], clause 6.2.2. This field is ignored by IAB-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [107].
q-OffsetCell	Parameter "Qoffset _{s,n} " in TS 36.304 [4].
q-OffsetFreq	Parameter "Qoffset _{frequency} " in TS 36.304 [4].
q-QualMin	Parameter "Q _{qualmin} " in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of negative infinity for Q _{qualmin} . NOTE 1.
q-QualMinRSRQ-OnAllSymbols	If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, perform RSRQ measurement on all OFDM symbols in accordance with TS 36.214 [48]. NOTE 1.
q-QualMinWB	If this field is present and supported by the UE, the UE shall, when performing RSRQ measurements, use a wider bandwidth in accordance with TS 36.133 [16]. NOTE 1.
redistributionFactorFreq	Parameter <i>redistributionFactorFreq</i> in TS 36.304 [4].
redistributionFactorCell	Parameter <i>redistributionFactorCell</i> in TS 36.304 [4].
reducedMeasPerformance	Value <i>TRUE</i> indicates that the neighbouring inter-frequency is configured for reduced measurement performance, see TS 36.133 [16]. If the field is not included, the neighbouring inter-frequency is configured for normal measurement performance, see TS 36.133 [16].
rss-ConfigCarrierInfo	RSS configuration for this carrier frequency. If absent and <i>rss-MeasConfig</i> is included in <i>SIB2</i> , RSS is collocated (time and frequency domain) in all cells on this carrier.
satelliteAssistanceInfoList	List of satellite ID(s), used to associate with the satellite assistance information for neighbour cell measurements on this frequency. If the field is not present for a frequency and <i>SystemInformationBlockType33</i> is broadcast, the UE considers the cells on the frequency to be terrestrial cells.
scptm-FreqOffset	Parameter Qoffset _{SCPTM} in TS 36.304 [4]. Actual value Qoffset _{SCPTM} = field value * 2 [dB]. If the field is not present, the UE uses infinite dBs for the SC-PTM frequency offset with cell ranking as specified in TS 36.304 [4].
threshX-High	Parameter "Thresh _{X, HighP} " in TS 36.304 [4].
threshX-HighQ	Parameter "Thresh _{X, HighQ} " in TS 36.304 [4].
threshX-Low	Parameter "Thresh _{X, LowP} " in TS 36.304 [4].
threshX-LowQ	Parameter "Thresh _{X, LowQ} " in TS 36.304 [4].
t-ReselectionEUTRA	Parameter "Treselection _{EUTRA} " in TS 36.304 [4].
t-ReselectionEUTRA-SF	Parameter "Speed dependent ScalingFactor for Treselection _{EUTRA} " in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].

NOTE 1: The value the UE applies for parameter "Q_{qualmin}" in TS 36.304 [4] depends on the *q-QualMin* fields signalled by E-UTRAN and supported by the UE. In case multiple candidate options are available, the UE shall select the highest priority candidate option according to the priority order indicated by the following table (top row is highest priority).

q-QualMinRSRQ-OnAllSymbols	q-QualMinWB	Value of parameter "Q_{qualmin}" in TS 36.304 [4]
Included	Included	<i>q-QualMinRSRQ-OnAllSymbols – (q-QualMin – q-QualMinWB)</i>
Included	Not included	<i>q-QualMinRSRQ-OnAllSymbols</i>
Not included	Included	<i>q-QualMinWB</i>
Not included	Not included	<i>q-QualMin</i>

Conditional presence	Explanation
<i>dl-FreqMax</i>	The field is mandatory present if, for the corresponding entry in <i>InterFreqCarrierFreqList</i> (i.e. without suffix), <i>dl-CarrierFreq</i> (i.e. without suffix) is set to <i>maxEARFCN</i> . Otherwise the field is not present.
<i>QrxlevminCE1</i>	The field is optionally present, Need OR, if <i>q-RxLevMinCE1-r13</i> is set below -140 dBm. Otherwise the field is not present.
<i>RSRQ</i>	The field is mandatory present if <i>threshServingLowQ</i> is present in <i>systemInformationBlockType3</i> ; otherwise it is not present.
<i>RSRQ2</i>	The field is mandatory present for all EUTRA carriers listed in SIB5 if <i>q-QualMinRSRQ-OnAllSymbols</i> is present in SIB3; otherwise it is not present and the UE shall delete any existing value for this field.
<i>RSS</i>	This field is optional, need OP, if <i>rss-MeasConfig</i> is included in SIB2. Otherwise the field is not present, and the UE shall delete any existing value for this field.
<i>WB-RSRQ</i>	The field is optionally present, need OP if the measurement bandwidth indicated by <i>allowedMeasBandwidth</i> is 50 resource blocks or larger; otherwise it is not present.

– *SystemInformationBlockType6*

The IE *SystemInformationBlockType6* contains information relevant only for inter-RAT cell re-selection i.e. information about UTRA frequencies and UTRA neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency.

```

<i>SystemInformationBlockType6</i> field descriptions	
<i>carrierFreqListUTRA-FDD</i>	List of carrier frequencies of UTRA FDD. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the ARFCN used to indicate this. If E-UTRAN includes <i>carrierFreqListUTRA-FDD-v8h0</i> and/or <i>carrierFreqListUTRA-FDD-v1250</i> , it includes the same number of entries, and listed in the same order, as in <i>carrierFreqListUTRA-FDD</i> (i.e. without suffix). See Annex D for more descriptions.
<i>carrierFreqListUTRA-FDD-Ext</i>	List of additional carrier frequencies of UTRA FDD. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the ARFCN used to indicate this. EUTRAN may include <i>carrierFreqListUTRA-FDD-Ext</i> even if <i>carrierFreqListUTRA-FDD</i> (i.e without suffix) does not include <i>maxUTRA-FDD-Carrier</i> entries.
<i>carrierFreqListUTRA-TDD</i>	List of carrier frequencies of UTRA TDD. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the ARFCN used to indicate this. If E-UTRAN includes <i>carrierFreqListUTRA-TDD-v1250</i> , it includes the same number of entries, and listed in the same order, as in <i>carrierFreqListUTRA-TDD</i> (i.e. without suffix).
<i>carrierFreqListUTRA-TDD-Ext</i>	List of additional carrier frequencies of UTRA TDD. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the ARFCN used to indicate this. EUTRAN may include <i>carrierFreqListUTRA-TDD-Ext</i> even if <i>carrierFreqListUTRA-TDD</i> (i.e without suffix) does not include <i>maxUTRA-TDD-Carrier</i> entries.
<i>multiBandInfoList</i>	Indicates the list of frequency bands in addition to the band represented by <i>carrierFreq</i> in the <i>CarrierFreqUTRA-FDD</i> for which UTRA cell reselection parameters are common.
<i>p-MaxUTRA</i>	The maximum allowed transmission power on the (uplink) carrier frequency, see TS 25.304 [40]. In dBm
<i>q-QualMin</i>	Parameter "Q _{qualmin} " in TS 25.304 [40]. Actual value = field value [dB].
<i>q-RxLevMin</i>	Parameter "Q _{rxlevmin} " in TS 25.304 [40]. Actual value = field value * 2+1 [dBm].
<i>reducedMeasPerformance</i>	Value TRUE indicates that the UTRA carrier frequency is configured for reduced measurement performance, see TS 36.133 [16]. If the field is not included, the UTRA carrier frequency is configured for normal measurement performance, see TS 36.133 [16].
<i>t-ReselectionUTRA</i>	Parameter "TreselectionUTRAN" in TS 36.304 [4].
<i>t-ReselectionUTRA-SF</i>	Parameter "Speed dependent ScalingFactor for TreselectionUTRA" in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].
<i>threshX-High</i>	Parameter "Thresh _{X, HighP} " in TS 36.304 [4].
<i>threshX-HighQ</i>	Parameter "Thresh _{X, HighQ} " in TS 36.304 [4].
<i>threshX-Low</i>	Parameter "Thresh _{X, LowP} " in TS 36.304 [4].
<i>threshX-LowQ</i>	Parameter "Thresh _{X, LowQ} " in TS 36.304 [4].

Conditional presence	Explanation
<i>RSRQ</i>	The field is mandatory present if the <i>threshServingLowQ</i> is present in <i>systemInformationBlockType3</i> ; otherwise it is not present.
<i>UTRA-FDD</i>	The field is optionally present, need OR, if the <i>carrierFreqListUTRA-FDD</i> is present. Otherwise it is not present.
<i>UTRA-TDD</i>	The field is optionally present, need OR, if the <i>carrierFreqListUTRA-TDD</i> is present. Otherwise it is not present.

– *SystemInformationBlockType7*

The IE *SystemInformationBlockType7* contains information relevant only for inter-RAT cell re-selection i.e. information about GERAN frequencies relevant for cell re-selection. The IE includes cell re-selection parameters for each frequency.

***SystemInformationBlockType7* field descriptions**

carrierFreqs

The list of GERAN carrier frequencies organised into one group of GERAN carrier frequencies.

carrierFreqsInfoList

Provides a list of neighbouring GERAN carrier frequencies, which may be monitored for neighbouring GERAN cells. The GERAN carrier frequencies are organised in groups and the cell reselection parameters are provided per group of GERAN carrier frequencies.

commonInfo

Defines the set of cell reselection parameters for the group of GERAN carrier frequencies.

ncc-Permitted

Field encoded as a bit map, where bit N is set to "0" if a BCCH carrier with NCC = N-1 is not permitted for monitoring and set to "1" if the BCCH carrier with NCC = N-1 is permitted for monitoring; N = 1 to 8; bit 1 of the bitmap is the leading bit of the bit string.

p-MaxGERAN

Maximum allowed transmission power for GERAN on an uplink carrier frequency, see TS 45.008 [28]. Value in dBm. Applicable for the neighbouring GERAN cells on this carrier frequency. If *pmaxGERAN* is absent, the maximum power according to the UE capability is used.

q-RxLevMin

Parameter "*Q_{rxlevmin}*" in TS 36.304 [4], minimum required RX level in the GSM cell. The actual value of *Q_{rxlevmin}* in dBm = (field value * 2) – 115.

threshX-High

Parameter "*Thresh_{X, HighP}*" in TS 36.304 [4].

threshX-Low

Parameter "*Thresh_{X, LowP}*" in TS 36.304 [4].

t-ReselectionGERAN

Parameter "*Treselection_{GERAN}*" in TS 36.304 [4].

t-ReselectionGERAN-SF

Parameter "Speed dependent ScalingFactor for *Treselection_{GERAN}*" in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].

SystemInformationBlockType8

The IE *SystemInformationBlockType8* contains information relevant only for inter-RAT cell re-selection i.e. information about CDMA2000 frequencies and CDMA2000 neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

| <b><i>cellReselectionParametersHRPD-Ext</i></b>              | Cell reselection parameters applicable for cell reselection to CDMA2000 HRPD system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>cellReselectionParametersHRPD-v920</i></b>             | Cell reselection parameters applicable for cell reselection to CDMA2000 HRPD system. The field is not present if <i>cellReselectionParametersHRPD</i> is not present; otherwise it is optionally present.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>csfb-DualRxTxSupport</i></b>                           | Value TRUE indicates that the network supports dual Rx/Tx enhanced 1xCSFB, which enables UEs capable of dual Rx/Tx enhanced 1xCSFB to switch off their 1xRTT receiver/transmitter while camped in E-UTRAN [51].                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>csfb-RegistrationParam1XRTT</i></b>                    | Contains the parameters the UE will use to determine if it should perform a CDMA2000 1xRTT Registration/Re-Registration. This field is included if either CSFB or enhanced CS fallback to CDMA2000 1xRTT is supported.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>csfb-SupportForDualRxUEs</i></b>                       | Value TRUE indicates that the network supports dual Rx CSFB [51].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>longCodeState1XRTT</i></b>                             | The state of long code generation registers in CDMA2000 1XRTT system as defined in C.S0002 [12], clause 1.3, at $\lceil t / 10 \rceil \times 10 + 320$ ms, where $t$ equals to the <i>cdma-SystemTime</i> . This field is required for reporting CGI for 1xRTT, SRVCC handover and enhanced CS fallback to CDMA2000 1xRTT operation. Otherwise this IE is not needed. This field is excluded when estimating changes in system information, i.e. changes of <i>longCodeState1XRTT</i> should neither result in system information change notifications nor in a modification of <i>systemInfoValueTag</i> in SIB1. |
| <b><i>neighCellList</i></b>                                  | List of CDMA2000 neighbouring cells. The total number of neighbouring cells in <i>neighCellList</i> for each RAT (1XRTT or HRPD) is limited to 32.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>neighCellList-v920</i></b>                             | Extended List of CDMA2000 neighbouring cells. The combined total number of CDMA2000 neighbouring cells in both <i>neighCellList</i> and <i>neighCellList-v920</i> is limited to 32 for HRPD and 40 for 1xRTT.                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>plmn-Identity</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| Indicates the PLMN associated with this CDMA2000 network. Value 1 indicates the PLMN listed 1st in the 1st <i>plmn-IdentityList</i> included in SIB1, value 2 indicates the PLMN listed 2nd in the same <i>plmn-IdentityList</i> , or when no more PLMN are present within the same <i>plmn_identityList</i> , then the PLMN listed 1st in the subsequent <i>plmn-IdentityList</i> within the same SIB1 and so on. A PLMN which identity is not indicated in the <i>sib8-PerPLMN-List</i> , does not support inter-working with CDMA2000.                                 |  |

| The CDMA2000 HRPD Pre-Registration Information tells the UE if it should pre-register with the CDMA2000 HRPD network and identifies the Pre-registration zone to the UE.                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| <b>searchWindowSize</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| The search window size is a CDMA2000 parameter to be used to assist in searching for the neighbouring pilots. For values see C.S0005 [25], Table 2.6.6.2.1-1, and C.S0024 [26], Table 8.7.6.2-4. This field is required for a UE with <i>rx-ConfigHRPD= single</i> and/ or <i>rx-Config1XRTT= single</i> to perform handover, cell re-selection, UE measurement based redirection and enhanced 1xRTT CS fallback from E-UTRAN to CDMA2000 according to this specification and TS 36.304 [4].                                                                              |  |
| <b>sib8-PerPLMN-List</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| This field provides the values for the interworking CDMA2000 networks corresponding, if any, to the UE's RPLMN.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| <b>systemTimeInfo</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| Information on CDMA2000 system time. This field is required for a UE with <i>rx-ConfigHRPD= single</i> and/ or <i>rx-Config1XRTT= single</i> to perform handover, cell re-selection, UE measurement based redirection and enhanced 1xRTT CS fallback from E-UTRAN to CDMA2000 according to this specification and TS 36.304 [4]. This field is excluded when estimating changes in system information, i.e. changes of <i>systemTimeInfo</i> should neither result in system information change notifications nor in a modification of <i>systemInfoValueTag</i> in SIB1. |  |
| For the field included in <i>ParametersCDMA2000</i> , a choice is used to indicate whether for this PLMN the parameters are signalled explicitly or set to the (default) value common for all PLMNs i.e. the value not included in <i>sib8-PerPLMN-List</i> .                                                                                                                                                                                                                                                                                                             |  |
| <b>threshX-High</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
| Parameter "Thresh <sub>X, HighP</sub> " in TS 36.304 [4]. This specifies the high threshold used in reselection towards this CDMA2000 band class expressed as an unsigned binary number equal to FLOOR (-2 x 10 x log <sub>10</sub> E/I <sub>0</sub> ) in units of 0.5 dB, as defined in C.S0005 [25].                                                                                                                                                                                                                                                                    |  |
| <b>threshX-Low</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
| Parameter "Thresh <sub>X, LowP</sub> " in TS 36.304 [4]. This specifies the low threshold used in reselection towards this CDMA2000 band class expressed as an unsigned binary number equal to FLOOR (-2 x 10 x log <sub>10</sub> E/I <sub>0</sub> ) in units of 0.5 dB, as defined in C.S0005 [25].                                                                                                                                                                                                                                                                      |  |

### ***SystemInformationBlockType11* field descriptions**

#### ***warningMessageSegmentType***

Indicates whether the included ETWS warning message segment is the last segment or not.

| <b>Conditional presence</b> | <b>Explanation</b>                                                                         |
|-----------------------------|--------------------------------------------------------------------------------------------|
| Segment1                    | The field is mandatory present in the first segment of SIB11, otherwise it is not present. |

## – ***SystemInformationBlockType12***

The IE *SystemInformationBlockType12* contains a CMAS notification.

### ***SystemInformationBlockType12* information element**

```
-- ASN1START

SystemInformationBlockType12-r9 ::= SEQUENCE {
 messageIdentifier-r9 BIT STRING (SIZE (16)),
 serialNumber-r9 BIT STRING (SIZE (16)),
 warningMessageSegmentType-r9 ENUMERATED {notLastSegment, lastSegment},
 warningMessageSegmentNumber-r9 INTEGER (0..63),
 warningMessageSegment-r9 OCTET STRING,
 dataCodingScheme-r9 OCTET STRING (SIZE (1)) OPTIONAL, -- Cond Segment1
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 ...
 [[warningAreaCoordinatesSegment-r15 OCTET STRING OPTIONAL -- Need OR
]]
}

-- ASN1STOP
```

### ***SystemInformationBlockType12* field descriptions**

#### ***dataCodingScheme***

Identifies the alphabet/coding and the language applied variations of a CMAS notification. The octet (which is equivalent to the octet of the equivalent IE defined in TS 36.413 [39], clause 9.2.1.52), contains the octet of the equivalent IE defined in TS 23.041 [37], clause 9.4.3.2.3, and encoded according to TS 23.038 [38].

#### ***messageIdentifier***

Identifies the source and type of CMAS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39], clause 9.2.1.44) contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37], clause 9.4.3.2.1, while the trailing bit contains bit 0 of second octet of the same equivalent IE.

#### ***serialNumber***

Identifies variations of a CMAS notification. The leading bit (which is equivalent to the leading bit of the equivalent IE defined in TS 36.413 [39], clause 9.2.1.45), contains bit 7 of the first octet of the equivalent IE, defined in and encoded according to TS 23.041 [37], clause 9.4.3.2.2, while the trailing bit contains bit 0 of second octet of the same equivalent IE.

#### ***warningAreaCoordinatesSegment***

If present, carries a segment, with one or more octets, of the geographical area where the CMAS warning message is valid as defined in [98]. The first octet of the first *warningAreaCoordinatesSegment* is equivalent to the first octet of Warning Area Coordinates IE defined in and encoded according to TS 23.041 [37] and so on.

#### ***warningMessageSegment***

Carries a segment, with one or more octets, of the *Warning Message Contents* IE defined in TS 36.413 [39]. The first octet of the *Warning Message Contents* IE is equivalent to the first octet of the *CB data* IE defined in and encoded according to TS 23.041 [37], clause 9.4.2.2.5, and so on.

#### ***warningMessageSegmentNumber***

Segment number of the CMAS warning message segment contained in the SIB. A segment number of zero corresponds to the first segment, one corresponds to the second segment, and so on. If warning area coordinates are provided for the warning message, then this field applies to both warning message segment and warning area coordinates segment.

#### ***warningMessageSegmentType***

Indicates whether the included CMAS warning message segment is the last segment or not. If warning area coordinates are provided for the warning message, then this field applies to both warning message segment and warning area coordinates segment.

| Conditional presence | Explanation                                                                                |
|----------------------|--------------------------------------------------------------------------------------------|
| Segment1             | The field is mandatory present in the first segment of SIB12, otherwise it is not present. |

### – *SystemInformationBlockType13*

The IE *SystemInformationBlockType13* contains the information required to acquire the MBMS control information associated with one or more MBSFN areas.

#### ***SystemInformationBlockType13* information element**

```
-- ASN1START

SystemInformationBlockType13-r9 ::= SEQUENCE {
 mbsfn-AreaInfoList-r9 MBSFN-AreaInfoList-r9,
 notificationConfig-r9 MBMS-NotificationConfig-r9,
 lateNonCriticalExtension OCTET STRING
 OPTIONAL,
 ...
 [
 notificationConfig-v1430 MBMS-NotificationConfig-v1430
],
 [
 mbsfn-AreaInfoList-r16 MBSFN-AreaInfoList-r16
],
 [
 mbsfn-AreaInfoList-r17 MBSFN-AreaInfoList-r17
] OPTIONAL -- Need OR
}
}

-- ASN1STOP
```

#### ***SystemInformationBlockType13* field descriptions**

##### ***notificationConfig***

Indicates the MBMS notification related configuration parameters. The UE shall ignore this field when *dl-Bandwidth* included in *MasterInformationBlock* is set to n6.

| Conditional presence | Explanation                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ded15or25PRB         | The field is optionally present, need OR, for an MBMS-dedicated cell when <i>dl-Bandwidth-MBMS</i> is set to n15 or n25. Otherwise the field is not present. |

### – *SystemInformationBlockType14*

The IE *SystemInformationBlockType14* contains the EAB parameters.

#### ***SystemInformationBlockType14* information element**

```
-- ASN1START

SystemInformationBlockType14-r11 ::= SEQUENCE {
 eab-Param-r11
 CHOICE {
 eab-Common-r11
 eab-PerPLMN-List-r11
 }
 lateNonCriticalExtension OCTET STRING
 OPTIONAL, -- Need OR
 ...
 [
 eab-PerRSRP-r15
] ENUMERATED {thresh0, thresh1, thresh2, thresh3} OPTIONAL --
 Need OR
]
}

EAB-ConfigPLMN-r11 ::= SEQUENCE {
 eab-Config-r11
}
}

EAB-Config-r11 ::= SEQUENCE {
 eab-Category-r11
 eab-BarringBitmap-r11
}
```

-- ASN1STOP

### ***SystemInformationBlockType14 field descriptions***

**eab-BarringBitmap**

Extended access class barring for AC 0-9. The first/ leftmost bit is for AC 0, the second bit is for AC 1, and so on.

**eab-Category**

Indicates the category of UEs for which EAB applies. Value *a* corresponds to all UEs, value *b* corresponds to the UEs that are neither in their HPLMN nor in a PLMN that is equivalent to it, and value *c* corresponds to the UEs that are neither in the PLMN listed as most preferred PLMN of the country where the UEs are roaming in the operator-defined PLMN selector list on the USIM, nor in their HPLMN nor in a PLMN that is equivalent to their HPLMN, see TS 22.011 [10].

**eab-Common**

The EAB parameters applicable for all PLMN(s).

**eab-PerPLMN-List**

The EAB parameters per PLMN, listed in the same order as the PLMN(s) listed across the *plmn-IdentityList* fields in *SystemInformationBlockType1*.

**eab-PerRSRP**

Access barring per RSRP. Value *thresh0* means access to the cell is barred when in enhanced coverage as specified in TS 36.304 [4] and does not apply to UEs satisfying S criteria for normal coverage. Value *thresh1* is compared to the first entry configured in *rsrp-ThresholdsPrachInfoList*, value *thresh2* is compared to the second entry configured in *rsrp-ThresholdsPrachInfoList* and so on.

## – ***SystemInformationBlockType15***

The IE *SystemInformationBlockType15* contains the MBMS Service Area Identities (SAI) of the current and/ or neighbouring carrier frequencies.

### ***SystemInformationBlockType15 information element***

-- ASN1START

```

SystemInformationBlockType15-r11 ::= SEQUENCE {

| <b>SystemInformationBlockType15 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierType</b>                                     | Indicates whether the carrier is pre-Rel-14 MBMS carrier ( <i>mbms</i> ) or FeMBMS/Unicast mixed carrier ( <i>fembmsMixed</i> ) or MBMS-dedicated carrier ( <i>fembmsDedicated</i> ).                                                                                                                                                                    |
| <b>frameOffset</b>                                     | For MBMS-dedicated carrier, the <i>frameOffset</i> gives the radio frame which contains PBCH by SFN mod 4 = <i>frameOffset</i> .                                                                                                                                                                                                                         |
| <b>mbms-InterFreqCarrierTypeList</b>                   | Indicates whether this is an feMBMS carrier. The field is included only if <i>mbms-SAI-InterFreqList-r11</i> is included. The number of entries is the same in both fields and carrier type relates to the frequency indicated in <i>mbms-SAI-InterFreqList-r11</i> in the corresponding entry index.                                                    |
| <b>mbms-IntraFreqCarrierType</b>                       | Contains indication whether the carrier is pre-Rel-14 MBMS carrier, FeMBMS/Unicast mixed carrier or MBMS-dedicated carrier.                                                                                                                                                                                                                              |
| <b>mbms-SAI-InterFreqList</b>                          | Contains a list of neighboring frequencies including additional bands, if any, that provide MBMS services and the corresponding MBMS SAIs.                                                                                                                                                                                                               |
| <b>mbms-SAI-IntraFreq</b>                              | Contains the list of MBMS SAIs for the current frequency. A duplicate MBMS SAI indicates that this and all following SAIs are not offered by this cell but only by neighbour cells on the current frequency. For MBMS service continuity, the UE shall use all MBMS SAIs listed in <i>mbms-SAI-IntraFreq</i> to derive the MBMS frequencies of interest. |
| <b>mbms-SAI-List</b>                                   | Contains a list of MBMS SAIs for a specific frequency.                                                                                                                                                                                                                                                                                                   |
| <b>multiBandInfoList</b>                               | A list of additional frequency bands applicable for the cells participating in the MBSFN transmission.                                                                                                                                                                                                                                                   |

| Conditional presence | Explanation                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>InterFreq</i>     | The field is optionally present, need OR, if the <i>mbms-SAI-InterFreqList-r11</i> is present. Otherwise it is not present. |

## – *SystemInformationBlockType16*

The IE *SystemInformationBlockType16* contains information related to GPS time and Coordinated Universal Time (UTC). The UE may use the parameters provided in this system information block to obtain the UTC, the GPS and the local time.

NOTE: The UE may use the time information for numerous purposes, possibly involving upper layers e.g. to assist GPS initialisation, to synchronise the UE clock (a.o. to determine MBMS session start/ stop).

|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dayLightSavingTime</i></b>                              | It indicates if and how daylight saving time (DST) is applied to obtain the local time. The semantics is the same as the semantics of the <i>Daylight Saving Time</i> IE in TS 24.301 [35] and TS 24.008 [49]. The first/leftmost bit of the bit string contains the b2 of octet 3, i.e. the value part of the <i>Daylight Saving Time</i> IE, and the second bit of the bit string contains b1 of octet 3.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>leapSeconds</i></b>                                     | Number of leap seconds offset between GPS Time and UTC. UTC and GPS time are related i.e. GPS time - <i>leapSeconds</i> = UTC time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>localTimeOffset</i></b>                                 | Offset between UTC and local time in units of 15 minutes. Actual value = field value * 15 minutes. Local time of the day is calculated as UTC time + <i>localTimeOffset</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>timeInfoUTC</i></b>                                     | Coordinated Universal Time corresponding to the SFN boundary at or immediately after the ending boundary of the SI-window in which <i>SystemInformationBlockType16</i> is transmitted. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE. The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900). NOTE 1.<br>This field is excluded when estimating changes in system information, i.e. changes of <i>timeInfoUTC</i> should neither result in system information change notifications nor in a modification of <i>systemInfoValueTag</i> in SIB1. |

NOTE 1: The UE may use this field together with the *leapSeconds* field to obtain GPS time as follows: GPS Time (in seconds) = *timeInfoUTC* (in seconds) - 2,524,953,600 (seconds) + *leapSeconds*, where 2,524,953,600 is the number of seconds between 00:00:00 on Gregorian calendar date 1 January, 1900 and 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time).

## — *SystemInformationBlockType17*

The IE *SystemInformationBlockType17* contains information relevant for traffic steering between E-UTRAN and WLAN.

### ***SystemInformationBlockType18 field descriptions***

#### ***commRxPool***

Indicates the resources by which the UE is allowed to receive sidelink communication while in RRC\_IDLE and while in RRC\_CONNECTED.

#### ***commSyncConfig***

Indicates the configuration by which the UE is allowed to receive and transmit synchronisation information. E-UTRAN configures *commSyncConfig* including *txParameters* when configuring UEs by dedicated signalling to transmit synchronisation information.

#### ***commTxAllowRelayCommon***

Indicates whether the UE is allowed to transmit relay related sidelink communication data using the transmission pools included in *SystemInformationBlockType18* i.e. either via *commTxPoolNormalCommon*, *commTxPoolNormalCommonExt* or via *commTxPoolExceptional*.

#### ***commTxPoolExceptional***

Indicates the resources by which the UE is allowed to transmit sidelink communication in exceptional conditions, as specified in 5.10.4.

#### ***commTxPoolNormalCommon***

Indicates the resources by which the UE is allowed to transmit sidelink communication while in RRC\_IDLE or when in RRC\_CONNECTED while transmitting sidelink via a frequency other than the primary.

#### ***commTxPoolNormalCommonExt***

Indicates transmission resource pool(s) in addition to the pool(s) indicated by field *commTxPoolNormalCommon*, by which the UE is allowed to transmit sidelink communication while in RRC\_IDLE or when in RRC\_CONNECTED while transmitting sidelink via a frequency other than the primary. E-UTRAN configures *commTxPoolNormalCommonExt* only when it configures *commTxPoolNormalCommon*.

#### ***commTxResourceUC-ReqAllowed***

Indicates whether the UE is allowed to request transmission pools for non-relay related one-to-one sidelink communication.

## – ***SystemInformationBlockType19***

The IE *SystemInformationBlockType19* indicates E-UTRAN supports the sidelink UE information procedure and may contain sidelink discovery related resource configuration information.

### ***SystemInformationBlockType19 field descriptions***

***discCellSelectionInfo***

Parameters that may be used by the UE to select/ reselect a cell on the concerned non serving frequency. If absent, the UE acquires the information from the target cell on the concerned frequency. See TS 36.304 [4], clause 11.4.

***discInterFreqList***

Indicates the neighbouring frequencies on which sidelink discovery announcement is supported. May also provide further information i.e. reception resource pool and/ or transmission resource pool, or an indication how resources could be obtained.

***discRxPool***

Indicates the resources by which the UE is allowed to receive non-PS related sidelink discovery announcements while in RRC\_IDLE and while in RRC\_CONNECTED.

***discRxPoolPS***

Indicates the resources by which the UE is allowed to receive PS related sidelink discovery announcements while in RRC\_IDLE and while in RRC\_CONNECTED.

***discRxResourcesInterFreq***

Indicates the resource pool configuration for receiving discovery announcements on a carrier frequency.

***discSyncConfig***

Indicates the configuration by which the UE is allowed to receive and transmit synchronisation information. E-UTRAN configures *discSyncConfig* including *txParameters* when configuring UEs by dedicated signalling to transmit synchronisation information.

***discTxPoolCommon***

Indicates the resources by which the UE is allowed to transmit non-PS related sidelink discovery announcements while in RRC\_IDLE.

***discTxPoolPS-Common***

Indicates the resources by which the UE is allowed to transmit PS related sidelink discovery announcements while in RRC\_IDLE.

***discTxResourcesInterFreq***

For the concerned frequency, either provides the UE with a pool of sidelink discovery announcement transmission resources the UE is allowed to use while in RRC\_IDLE, or indicates whether such transmission is allowed, and if so how the UE may obtain the required resources. Value *noTxOnCarrier* indicates that the UE is not allowed to transmit sidelink discovery announcements on the concerned frequency. Value *acquireSI-FromCarrier* indicates that the required resources are to be obtained by autonomously acquiring SIB19 and other relevant SIBs from the concerned frequency. Value *requestDedicated* indicates, that for the concerned carrier, the required sidelink discovery resources are to be obtained by means of a dedicated resource request using the *SidelinkUEInformation* message.

***plmn-IdentityList***

List of PLMN identities for the neighbouring frequency indicated by *carrierFreq*. Absence of the field indicates the same PLMN identities as listed across the *plmn-IdentityList* fields (without suffix) in *SystemInformationBlockType1*.

***plmn-Index***

Index of the corresponding entry across the *plmn-IdentityList* fields (without suffix) within *SystemInformationBlockType1*.

***refCarrierCommon***

Indicates if the PCell (RRC\_CONNECTED)/ serving cell (RRC\_IDLE) is to be used as reference for DL measurements and synchronization, instead of the DL frequency paired with the one used to transmit sidelink discovery announcements on, see TS 36.213 [23], clause 14.3.1.

***reselectionInfoC***

Includes the parameters used by the UE when selecting/ reselecting a sidelink relay UE.

***SL-CarrierFreqInfoList-v1310***

If included, the UE shall include the same number of entries, and listed in the same order, as in *SL-CarrierFreqInfoList-r12*.

### ***SystemInformationBlockType19 field descriptions***

***threshHigh, threshLow (relayUE)***

Indicates when a sidelink remote UE or sidelink relay UE that is in network coverage may use the broadcast PS related sidelink discovery Tx resource pool, if broadcast, or request Tx resources by dedicated signalling otherwise. For remote UEs, this parameter is used similarly for relay related sidelink communication.

| Conditional presence | Explanation                                                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ThreshHigh</i>    | The field is mandatory present if <i>threshHigh</i> is included in the corresponding IE. Otherwise the field is not present and UE shall delete any existing value for this field. |
| <i>ThreshLow</i>     | The field is mandatory present if <i>threshLow</i> is included. Otherwise the field is not present UE shall delete any existing value for this field.                              |
| <i>Tx</i>            | The field is mandatory present if <i>discTxPoolCommon</i> is included. Otherwise the field is optional present, need OR.                                                           |

## ***SystemInformationBlockType20***

The IE *SystemInformationBlockType20* contains the information required to acquire the control information associated transmission of MBMS using SC-PTM.

### ***SystemInformationBlockType20 information element***

| <b>pdsch-maxNumRepetitionCEmodeB-SC-MTCH</b>           | Maximum value to indicate the set of PDSCH repetition numbers for SC-MTCH CE to UEs in mode B, see TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>schedulingPeriodStartOffsetSCPTM</b>                | SCPTM-SchedulingCycle and SCPTM-SchedulingOffset in TS 36.321 [6]. The value of SCPTM-SchedulingCycle is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. The value of SCPTM-SchedulingOffset is in number of sub-frames.                                                                                                                                                                                                                                                                           |
| <b>sc-mcch-CarrierFreq</b>                             | Downlink carrier used for all multicast SC-MCCH transmissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>sc-mcch-duration</b>                                | Indicates, starting from the subframe indicated by <i>sc-mcch-FirstSubframe</i> , the duration in subframes during which SC-MCCH may be scheduled in PDCCH sub-frames, see TS 36.321 [6]. Absence of this IE means that SC-MCCH is only scheduled in the subframe indicated by <i>sc-mcch-FirstSubframe</i> .                                                                                                                                                                                                                                                     |
| <b>sc-mcch-ModificationPeriod</b>                      | Defines periodically appearing boundaries, i.e. radio frames for which SFN mod <i>sc-mcch-ModificationPeriod</i> = 0. The contents of different transmissions of SC-MCCH information can only be different if there is at least one such boundary in-between them. Value rf2 corresponds to 2 radio frames, value rf4 corresponds to 4 radio frames and so on. In case <i>sc-mcch-ModificationPeriod-v1470</i> is configured, the UE shall ignore the configuration of <i>sc-mcch-ModificationPeriod-r13</i> .                                                    |
| <b>sc-mcch-ModificationPeriod-BR</b>                   | Defines periodically appearing boundaries for BL UE or UE in CE, i.e. radio frames for which (H-SFN*1024 + SFN) mod <i>sc-mcch-ModificationPeriod-BR</i> = 0 if hyperSFN is present in <i>SystemInformationBlockType1-BR</i> or radio frames for which SFN mod <i>sc-mcch-ModificationPeriod-BR</i> = 0 otherwise. The contents of different transmissions of SC-MCCH information can only be different if there is at least one such boundary in-between them. Value rf32 corresponds to 32 radio frames, value rf128 corresponds to 128 radio frames and so on. |
| <b>sc-mcch-FirstSubframe</b>                           | Indicates the first subframe in which SC-MCCH is scheduled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>sc-mcch-Offset</b>                                  | Indicates, together with the <i>sc-mcch-RepetitionPeriod</i> , the radio frames in which SC-MCCH is scheduled i.e. SC-MCCH is scheduled in radio frames for which: SFN mod <i>sc-mcch-RepetitionPeriod</i> = <i>sc-mcch-Offset</i> .                                                                                                                                                                                                                                                                                                                              |
| <b>sc-mcch-Offset-BR</b>                               | Indicates, together with the <i>sc-mcch-RepetitionPeriod-BR</i> , the boundary of the SC-MCCH repetition period for BL UE or UE in CE: (H-SFN*1024 + SFN) mod <i>sc-mcch-RepetitionPeriod-BR</i> = <i>sc-mcch-Offset-BR</i> if hyperSFN is present in <i>SystemInformationBlockType1-BR</i> or radio frames for which (SFN mod mod <i>sc-mcch-RepetitionPeriod-BR</i> ) = <i>sc-mcch-Offset-BR</i> otherwise.                                                                                                                                                     |
| <b>sc-mcch-RepetitionPeriod</b>                        | Defines the interval between transmissions of SC-MCCH information, in radio frames. Value rf2 corresponds to 2 radio frames, rf4 corresponds to 4 radio frames and so on. In case <i>sc-mcch-RepetitionPeriod-v1470</i> is configured, the UE shall ignore the configuration of <i>sc-mcch-RepetitionPeriod-r13</i> .                                                                                                                                                                                                                                             |
| <b>sc-mcch-RepetitionPeriod-BR</b>                     | Defines the interval between transmissions of SC-MCCH information for BL UE or UE in CE, in radio frames. Value rf32 corresponds to 32 radio frames, rf128 corresponds to 128 radio frames and so on.                                                                                                                                                                                                                                                                                                                                                             |
| <b>sc-mcch-SchedulingInfo</b>                          | DRX information for the SC-MCCH. If this field is absent, DRX is not used for SC-MCCH reception.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## – *SystemInformationBlockType21*

The IE *SystemInformationBlockType21* contains V2X sidelink communication configuration.

|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| <b><i>a2x-CommRxPool</i></b>                                  | Indicates the resources by which the UE is allowed to receive sidelink communication for A2X services.                                                                                                                                                                                   |  |  |
| <b><i>a2x-CommTxPool</i></b>                                  | Indicates the resources by which the UE is allowed to transmit sidelink communication for A2X services.                                                                                                                                                                                  |  |  |
| <b><i>anchorCarrierFreqList</i></b>                           | Indicates EUTRA carrier frequencies which may include inter-carrier resource configuration for V2X sidelink communication.                                                                                                                                                               |  |  |
| <b><i>anchorCarrierFreqListNR</i></b>                         | Indicates NR carrier frequencies which may include inter-carrier resource configuration for V2X sidelink communication.                                                                                                                                                                  |  |  |
| <b><i>cbr-CommonTxConfigList</i></b>                          | Indicates the common list of CBR ranges and the list of PSSCH transmissions parameter configurations available to configure congestion control to the UE for V2X sidelink communication.                                                                                                 |  |  |
| <b><i>offsetDFN</i></b>                                       | Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference for the PCell. Value 0 corresponds to 0 milliseconds, value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on.                             |  |  |
| <b><i>p2x-CommTxPoolNormalCommon</i></b>                      | Indicates the resources by which the UE is allowed to transmit P2X related V2X sidelink communication. <i>zoneID</i> is not configured in the pools in this field.                                                                                                                       |  |  |
| <b><i>thresSL-TxPrioritization</i></b>                        | Indicates the threshold used to determine whether SL V2X transmission is prioritized over uplink transmission if they overlap in time (see TS 36.321 [6]). This value shall overwrite <i>thresSL-TxPrioritization</i> configured in <i>SL-V2X-Preconfiguration</i> if any.               |  |  |
| <b><i>typeTxSync</i></b>                                      | Indicates the prioritized synchronization type (i.e. eNB or GNSS) for performing V2X sidelink communication on the carrier frequency on which this field is broadcast.                                                                                                                   |  |  |
| <b><i>v2x-CommRxPool</i></b>                                  | Indicates the resources by which the UE is allowed to receive V2X sidelink communication while in RRC_IDLE and in RRC_CONNECTED.                                                                                                                                                         |  |  |
| <b><i>v2x-CommTxPoolExceptional</i></b>                       | Indicates the resources by which the UE is allowed to transmit V2X sidelink communication in exceptional conditions, as specified in 5.10.13.                                                                                                                                            |  |  |
| <b><i>v2x-CommTxPoolNormalCommon</i></b>                      | Indicates the resources by which the UE is allowed to transmit non-P2X related V2X sidelink communication when in RRC_IDLE or when in RRC_CONNECTED while transmitting V2X sidelink communication via a frequency other than the primary. E-UTRAN configures one resource pool per zone. |  |  |
| <b><i>v2x-InterFreqInfoList</i></b>                           | Indicates synchronization and resource allocation configurations of neighboring frequencies for V2X sidelink communication.                                                                                                                                                              |  |  |
| <b><i>v2x-ResourceSelectionConfig</i></b>                     | Indicates V2X sidelink communication configurations used for UE autonomous resource selection.                                                                                                                                                                                           |  |  |
| <b><i>v2x-SyncConfig</i></b>                                  | Indicates the configuration by which the UE is allowed to receive and transmit synchronisation information for V2X sidelink communication. E-UTRAN configures <i>v2x-SyncConfig</i> including <i>txParameters</i> when configuring UEs to transmit synchronisation information.          |  |  |
| <b><i>zoneConfig</i></b>                                      | Indicates zone configurations used for V2X sidelink communication in 5.10.13.2.                                                                                                                                                                                                          |  |  |

## – ***SystemInformationBlockType24***

The IE *SystemInformationBlockType24* contains information relevant for inter-RAT cell re-selection (i.e. information about NR frequencies and NR neighbouring cells relevant for cell re-selection), which can also be used for NR idle/inactive measurements. The IE includes cell re-selection parameters common for a frequency.

| <b><i>SystemInformationBlockType24</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>allowedCellListNR</i></b>                               | List of allow-listed neighbouring NR cells.                                                                                                                                                                                                                                                                                                                                          |
| <b><i>carrierFreqListNR</i></b>                               | List of carrier frequencies of NR carriers. These frequencies correspond to GSCN values as specified in TS 38.101 [85]. If the <i>carrierFreqListNR-v1610</i> is present, it contains the same number of entries, listed in the same order as in the <i>carrierFreqListNR</i> (without suffix).                                                                                      |
| <b><i>cellReselectionPriority</i></b>                         | The field concerns the absolute priority of the concerned carrier frequency as used by the cell reselection procedure. Corresponds with parameter "priority" in TS 36.304 [4].                                                                                                                                                                                                       |
| <b><i>deriveSSB-IndexFromCell</i></b>                         | The field indicates whether the UE may use, to derive the SSB index of a cell on the indicated SSB frequency and subcarrier spacing, the timing of any detected cell with the same SSB frequency and subcarrier spacing. If this field is set to TRUE, the UE assumes SFN and frame boundary alignment across cells on the same NR carrier frequency as specified in TS 36.133 [16]. |
| <b><i>highSpeedCarrierNR</i></b>                              | If the field is present, the UE shall apply the enhanced inter-RAT NR measurement requirements to support high speed up to 500 km/h as specified in TS 36.133 [16] to the NR carrier.                                                                                                                                                                                                |
| <b><i>maxRS-IndexCellQual</i></b>                             | Number of SS blocks to average for cell measurement derivation. Corresponds to the parameter <i>nrofSS-BlocksToAverage</i> in TS 38.304 [92].                                                                                                                                                                                                                                        |
| <b><i>measTimingConfig</i></b>                                | Used to configure measurement timing configurations, i.e., timing occasions at which the UE measures SSBs. If the field is absent, the UE assumes that SSB periodicity is 5ms in this frequency.                                                                                                                                                                                     |
| <b><i>mobileIAB-CellList</i></b>                              | List of neighbouring mobile IAB cells as specified in TS 36.304 [4].                                                                                                                                                                                                                                                                                                                 |
| <b><i>mobileIAB-Freq</i></b>                                  | If present, it indicates that a mobile IAB node may be deployed on the NR frequency.                                                                                                                                                                                                                                                                                                 |
| <b><i>multiBandInfoList</i></b>                               | Indicates the list of frequency bands for which the NR cell reselection parameters apply. The UE shall select the first listed band which it supports in the <i>multiBandInfoList</i> field to represent the NR neighbour carrier frequency. The network always includes this field.                                                                                                 |
| <b><i>multiBandInfoListAerial</i></b>                         | Indicates the list of frequency bands for which the NR cell reselection parameters apply. The aerial UE shall select the first listed band which it supports in the <i>multiBandInfoListAerial</i> field to represent the NR neighbour carrier frequency.                                                                                                                            |
| <b><i>multiBandInfoListSUL</i></b>                            | Indicates the list of frequency bands for which the NR cell reselection parameters apply. The UE shall select the first listed band which it supports in the <i>multiBandInfoListSUL</i> field to represent the NR neighbour carrier frequency.                                                                                                                                      |
| <b><i>multiBandNsPmaxListNR</i></b>                           | Indicates the <i>NS-PmaxListNR</i> configuration for the NR frequency band(s) listed in <i>multiBandInfoList</i> . The first entry corresponds to the second listed band in <i>multiBandInfoList</i> , and second entry corresponds to the third listed band in <i>multiBandInfoList</i> , and so on.                                                                                |
| <b><i>multiBandNsPmaxListNR-Aerial</i></b>                    | Indicates the <i>NS-PmaxListNR-Aerial</i> configuration for the NR frequency band(s) listed in <i>multiBandInfoListAerial</i> . The first entry corresponds to the second listed band in <i>multiBandInfoListAerial</i> , and second entry corresponds to the third listed band in <i>multiBandInfoListAerial</i> , and so on.                                                       |
| <b><i>multiBandNsPmaxListNR-SUL</i></b>                       | Indicates the <i>NS-PmaxListNR</i> configuration for the NR SUL frequency band(s) listed in <i>multiBandInfoListSUL</i> . The first entry corresponds to the first listed band in <i>multiBandInfoListSUL</i> , and second entry corresponds to the second listed band in <i>multiBandInfoListSUL</i> , and so on.                                                                   |
| <b><i>nr-FreqNeighHSDN-CellList</i></b>                       | List of neighbouring NR HSDN cells as specified in TS 38.304 [92].                                                                                                                                                                                                                                                                                                                   |
| <b><i>ns-PmaxListNR</i></b>                                   | Indicates a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> , corresponds to the first listed band in the <i>multiBandInfoList</i> .                                                                                                                                                                                                                             |
| <b><i>ns-PmaxListNR-Aerial</i></b>                            | Indicates a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> for aerial UE, corresponds to the first listed band in the <i>multiBandInfoListAerial</i> .                                                                                                                                                                                                          |
| <b><i>p-MaxNR</i></b>                                         | Indicates the maximum power for NR (see TS 38.104 [91]).                                                                                                                                                                                                                                                                                                                             |
| <b><i>q-QualMin</i></b>                                       | Parameter " <i>Qqualmin</i> " in TS 38.304 [4], applicable for NR neighbour cells. If the field is not present, the UE applies the (default) value of negative infinity for <i>Qqualmin</i> . The actual value $Q_{\text{qualmin}} = \text{field value } [\text{dB}]$ .                                                                                                              |
| <b><i>q-RxLevMin</i></b>                                      | Parameter " <i>Qrxlevmin</i> " in TS 38.304 [92], applicable for NR neighbour cells. The actual value $Q_{\text{rxlevmin}} = \text{field value } * 2 [\text{dBm}]$ .                                                                                                                                                                                                                 |

***q-RxLevMinSUL***

Parameter "Q<sub>rxlevmin</sub>" in TS 38.304 [92], applicable for NR neighbouring cells. The actual value Q<sub>rxlevmin</sub> = field value \* 2 [dBm].

***smtc2-LP***

Measurement timing configuration for inter-RAT neighbour cells in NR with a Long Periodicity (LP) indicated by periodicity in *smtc2-LP*. The timing offset and duration are equal to the offset and duration indicated in *measTimingConfig* in *CarrierFreqNR*. The periodicity in *smtc2-LP* can only be set to a value strictly larger than the periodicity in *measTimingConfig* in *CarrierFreqNR* (e.g. if *measTimingConfig* indicates sf20 the Long Periodicity can only be set to sf40, sf80 or sf160, if *measTimingConfig* indicates sf160, *smtc2-LP* cannot be configured). The *pci-List*, if present, includes the physical cell identities of the inter-RAT neighbour cells with Long Periodicity. If *smtc2-LP* is absent, the UE assumes that there are no inter-RAT neighbour cells with a Long Periodicity.

***ssb-PositionQCL-CommonNR***

Indicates the QCL relationship between SS/PBCH blocks for NR neighbor cells on the indicated frequency as specified in TS 38.213 [88], clause 4.1. If *ssb-PositionQCL-CommonNR-r17* is present, the UE ignores *ssb-PositionQCL-CommonNR-r16*.

***ssb-ToMeasure***

The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [89]). When the field is absent the UE measures on all SS-blocks.

***ss-RSSI-Measurements***

Indicates the SSB-based RSSI measurement configuration. If the field is absent, the UE behaviour is defined in TS 38.215 [89], clause 5.1.3.

***subcarrierSpacingSSB***

Indicates the subcarrier spacing of SSB of NR frequency. Only the values 15 kHz or 30 kHz (FR1), 120 kHz or 240 kHz (FR2-1), 120 kHz or 480 kHz (FR2-2) are applicable. If *subcarrierSpacingSSB-r17* is present, the UE ignores *subcarrierSpacingSSB-r15*.

***threshRS-Index***

List of thresholds for consolidation of L1 measurements per RS index. Corresponds to the parameter *absThreshSS-BlocksConsolidation* in TS 38.304 [92].

***threshX-High***

Parameter "Thresh<sub>X, HighP</sub>" in TS 36.304 [4].

***threshX-HighQ***

Parameter "Thresh<sub>X, HighQ</sub>" in TS 36.304 [4].

***threshX-Low***

Parameter "Thresh<sub>X, LowP</sub>" in TS 36.304 [4].

***threshX-LowQ***

Parameter "Thresh<sub>X, LowQ</sub>" in TS 36.304 [4].

***t-ReselectionNR***

Parameter "Treselection<sub>NR</sub>" in TS 36.304 [4].

***t-ReselectionNR-SF***

Parameter "Speed dependent ScalingFactor for Treselection<sub>NR</sub>" in TS 36.304 [4]. If the field is not present, the UE behaviour is specified in TS 36.304 [4].

| Conditional presence   | Explanation                                                                                                                                    |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>RSRQ</i>            | The field is mandatory present if the <i>threshServingLowQ</i> is present in <i>systemInformationBlockType3</i> ; otherwise it is not present. |
| <i>RSRQ2</i>           | The field is optional Need OP if the <i>threshServingLowQ</i> is present in <i>systemInformationBlockType3</i> ; otherwise it is not present.  |
| <i>SharedSpectrum</i>  | The field is optional Need OP if NR operates with shared spectrum channel access; otherwise, it is not present.                                |
| <i>SharedSpectrum2</i> | The field is mandatory present if NR operates with shared spectrum channel access; otherwise, it is not present.                               |

## – *SystemInformationBlockType25*

The IE *SystemInformationBlockType25* contains the UAC parameters.

### SystemInformationBlockType25 field descriptions

**accessCategory**

The Access Category according to TS 22.261 [96].

**ab-PerRSRP**

Access barring per RSRP. Value *thresh0* means access to the cell is barred when UE is in enhanced coverage as specified in TS 36.304 [4] and does not apply to UEs satisfying S criteria for normal coverage. Value *thresh1* is compared to the first entry configured in *rsrp-ThresholdsPrachInfoList*, value *thresh2* is compared to the second entry configured in *rsrp-ThresholdsPrachInfoList* and so on. E-UTRA/5GC includes this field only in the BR version of *SystemInformationBlockType25*.

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b><i>uac-AC-BarringListType</i></b>       | Access control parameters for each access category valid only for a specific PLMN. UE behaviour upon absence of this field is specified in clause 5.3.16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>uac-AC1-SelectAssistInfo</i></b>     | Information used to determine whether Access Category 1 applies to the UE, as defined in TS 22.261 [96]. If <i>plmnCommon</i> is chosen, the <i>UAC-AC1-SelectAssistInfo</i> is applicable to all the PLMNs in <i>cellAccessRelatedInfoList-5GC</i> . If <i>individualPLMNList</i> is chosen, the 1 <sup>st</sup> entry in the list corresponds to the first PLMN in <i>cellAccessRelatedInfoList-5GC</i> , the 2 <sup>nd</sup> entry in the list corresponds to the second PLMN in <i>cellAccessRelatedInfoList-5GC</i> and so on. If <i>uac-AC1-SelectAssistInfo-r16</i> is present, the UE shall ignore the <i>uac-AC1-SelectAssistInfo-r15</i> . Value <i>notConfigured</i> indicates that Access Category1 is not configured for the corresponding PLMN. The corresponding <i>UAC-AC1-SelectAssistInfo</i> for the selected PLMN is forwarded to upper layers, if present and set to a, b or c. |
| <b><i>uac-BarringFactor</i></b>            | Represents the probability that access attempt would be allowed during access barring check.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>uac-BarringFactorForAI3</i></b>      | Barring factor applicable for Access Identity 3. Represents the probability that access attempt would be allowed during access barring check. If absent, the UE considers the access attempt as allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>uac-BarringForAccessIdentity</i></b> | Indicates whether access attempt is allowed for each Access Identity. The leftmost bit, bit 0 in the bit string corresponds to Access Identity 1, bit 1 in the bit string corresponds to Access Identity 2, bit 2 in the bit string corresponds to Access Identity 11, bit 3 in the bit string corresponds to Access Identity 12 and so on. Value 0 means that access attempt is allowed for the corresponding access identity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>uac-BarringForCommon</i></b>         | Common access control parameters for each access category. Common values are used for all PLMNs, unless overwritten by the PLMN specific configuration provided in <i>uac-BarringPerPLMN-List</i> . The parameters are specified by providing an index to the set of configurations ( <i>uac-BarringInfoSetList</i> ). UE behaviour upon absence of this field is specified in clause 5.3.16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>uac-barringInfoSetIndex</i></b>      | Index of the entry in field <i>uac-BarringInfoSetList</i> . Value 1 corresponds to the first entry in <i>uac-BarringInfoSetList</i> , value 2 corresponds to the second entry in this list and so on. An index value referring to an entry not included in <i>uac-BarringInfoSetList</i> indicates no barring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>uac-BarringInfoSetList</i></b>       | List of access control parameter sets. Each access category can be configured with access parameters corresponding to a particular set by <i>uac-barringInfoSetIndex</i> . Association of an access category with an index that has no corresponding entry in the <i>uac-BarringInfoSetList</i> is valid configuration and indicates no barring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>uac-BarringPerPLMN-List</i></b>      | Access control parameters for each access category valid only for a specific PLMN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>uac-BarringTime</i></b>              | The average time in seconds before a new access attempt is to be performed after an access attempt was barred at access barring check for the same access category, see 5.3.16.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Conditional presence | Explanation                                                                                                                     |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| MINT                 | The field is optionally present, Need OR, in a cell that provides a configuration for disaster roaming, otherwise it is absent. |

## – *SystemInformationBlockType26*

The IE *SystemInformationBlockType26* contains V2X sidelink communication configurations which can be used jointly with those included in *SystemInformationBlockType21*.

| <b><i>SystemInformationBlockType26</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cbr-pssch-TxConfigList</i></b>                          | Indicates the mapping between PPPPs, CBR ranges by using indexes of the entry in <i>cbr-RangeCommonConfigList</i> included in SIB21, and PSSCH transmission parameters and CR limit by using indexes of the entry in <i>sl-CBR-PSSCH-TxConfigList</i> included in SIB21. The configurations in this field apply to all the resource pools on all the carrier frequencies included in SIB26 for V2X sidelink communication transmission. The <i>mcs-PSSCH-RangeList-r15</i> included in this field also applies to all the resource pools on all the carrier frequencies included in SIB21 for V2X sidelink communication transmission. |
| <b><i>slss-TxMultiFreq</i></b>                                | Value TRUE indicates the UE transmits SLSS on multiple carrier frequencies for V2X sidelink communication. If this field is absent, the UE transmits SLSS only on the synchronisation carrier frequency.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>syncFreqList</i></b>                                    | Indicates a list of candidate carrier frequencies that can be used for the synchronisation of V2X sidelink communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>threshS-RSSI-CBR</i></b>                                | Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the CBR measurement, as specified in TS 36.214 [48]. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value n to (-112 + n*2) dBm, and so on. If included, the <i>threshS-RSSI-CBR</i> in <i>SL-CommResourcePool/V2X</i> in SIB26 is absent.                                                                                                                                                                                                                                                                                                  |
| <b><i>v2x-FreqSelectionConfigList</i></b>                     | Indicates the configuration information for the carrier selection for V2X sidelink communication transmission on the carrier frequency where the field is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>v2x-PacketDuplicationConfig</i></b>                     | Indicates the configuration information for sidelink packet duplication for V2X sidelink communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>v2x-InterFreqInfoList</i></b>                           | If this field includes a carrier frequency which is included in SIB21 and some configuration(s) for that carrier are already included in SIB21, the corresponding configuration(s) for that carrier frequency are not included in this field.                                                                                                                                                                                                                                                                                                                                                                                          |

## – *SystemInformationBlockType26a*

The IE *SystemInformationBlockType26a* contains NR bands list which can be used for EN-DC operation with the serving cell.

| Provides the ARFCN applicable for the NB-IoT carrier frequency as defined in TS 36.101 [42], Table 5.7.3-1.                                                                                                                               |  |  |
| <b><i>carrierFreqOffset</i></b>                                                                                                                                                                                                           |  |  |
| Offset of the NB-IoT channel number to EARFCN as defined in TS 36.101 [42], clause 5.7.3F. Value v-10 means -10, v-9 means -9, and so on. The values v-8dot5, v-4dot5, v3dot5 and v7dot5 are only applicable for a carrier in a TDD band. |  |  |

## – *SystemInformationBlockType28*

The IE *SystemInformationBlockType28* contains NR sidelink communication configuration.

### ***SystemInformationBlockType28*** information element

```
-- ASN1START

SystemInformationBlockType28-r16 ::= SEQUENCE {
 segmentNumber-r16 INTEGER (0..63),
 segmentType-r16 ENUMERATED {notLastSegment, lastSegment},
 segmentContainer-r16 OCTET STRING,
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 ...
}
```

-- ASN1STOP

#### ***SystemInformationBlockType28 field descriptions***

***segmentContainer***

Container for the configuration for NR sidelink communication, this field includes a segment of *SIB12-IEs* as specified in TS 38.331 [82]. The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a LTE SI i.e. 2216 bits.

This field is not applicable to 5GS Proximity based Services (ProSe) as defined in TS 23.304 [112] in this release.

***segmentNumber***

This field identifies the sequence number of a segment of *SIB12-IEs* IE as specified in TS 38.331 [82]. A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.

***segmentType***

This field indicates whether the included segment is the last segment or not.

### ***SystemInformationBlockType29***

The IE *SystemInformationBlockType29* contains common resource reservation, e.g. for coexistence with NR.

#### ***SystemInformationBlockType29 information element***

-- ASN1START

```
SystemInformationBlockType29-r16 ::= SEQUENCE {
 resourceReservationConfigCommonDL-r16 ResourceReservationConfigDL-r16 OPTIONAL, -- Need OR

| A list indicating the applicable disaster roaming information for the networks indicated by <i>plmn-IdentityList-r15</i> in <i>CellAccessRelatedInfo-5GC-r15</i> . The first entry in this list indicates the disaster roaming information applicable for the network(s) in the first entry of <i>plmn-IdentityList</i> , the second entry in this list indicates the disaster roaming information applicable for the network(s) in the second entry of <i>plmn-IdentityList</i> , and so on. Each entry in this list can either be having the value <i>noDisasterRoaming</i> , <i>disasterRelatedIndication</i> , <i>commonPLMNs</i> , or <i>dedicatedPLMNs</i> . If an entry in this list takes the value <i>noDisasterRoaming</i> , disaster inbound roaming is not allowed in this network(s). If an entry in this list takes the value <i>disasterRelatedIndication</i> , the meaning of this field for this network(s) is as specified for "disaster related indication" in TS 23.122 [11], clause 4.4.3.1.1. If an entry in this list takes the value <i>commonPLMNs</i> , the PLMN(s) with disaster conditions indicated in the field <i>commonPLMNsWithDisasterCondition</i> apply for this network(s). If an entry in this list contains the value <i>dedicatedPLMNs</i> , the listed PLMN(s) are the PLMN(s) with disaster conditions that the network(s) corresponding to this entry accepts disaster inbound roammers from. |  |

## *SystemInformationBlockType31*

The IE *SystemInformationBlockType31* contains satellite assistance information for the serving cell. *SystemInformationBlockType31* is only signalled for an NTN cell.

| <b><i>distanceThresh</i></b>                                  | Distance from the serving cell reference location and is used in location-based measurement initiation in RRC_IDLE (as specified in TS 36.304 [4]) and RRC_CONNECTED. Each step represents 50m.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>epochTime</i></b>                                       | <p>Epoch time of the satellite ephemeris data and common TA parameters, see TS 36.213 [23]. This field also indicates the epoch time for the reference location of earth moving cells if present. The reference point for epoch time of the serving satellite ephemeris and Common TA parameters is the uplink time synchronization reference point.</p> <p><i>epochTime</i> is the starting time of a DL subframe indicated by <i>startSFN</i> and <i>startSubframe</i>. For serving cell, the <i>startSFN</i> indicates the current SFN or the next upcoming SFN after the frame where the message indicating the <i>epochTime</i> is received.</p> <p>If the field is absent, the UE uses the starting time of the DL subframe corresponding to the end of the SI window during which the SI message carrying SIB31(-NB) is transmitted.</p> <p>E-UTRAN always includes <i>epochTime</i> when SIB31(-NB) is provided through dedicated signalling.</p> <p>In case of handover or conditional handover, this field is based on the timing of the target cell, i.e. the <i>startSFN</i> and <i>startSubFrame</i> number indicated in this field refers to the SFN and sub-frame of the target cell, and UE considers the target cell epoch time (indicated by the <i>startSFN</i> and <i>startSubFrame</i> in this field) to be the frame nearest to the frame where <i>RRCConnectionReconfiguration</i> message is received.</p> |
| <b><i>k-Mac</i></b>                                           | Scheduling offset used when downlink and uplink frame timing are not aligned at the eNB, see TS 36.213 [23]. Unit in ms.<br>If the field is absent, the UE uses the (default) value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>k-Offset</i></b>                                        | Scheduling offset used in the timing relationships in NTN, see TS 36.213 [23]. Unit in ms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### SystemInformationBlockType32 field descriptions

***carrierFreqList***

Includes a list of E-UTRA frequencies, see TS 36.304 [4].

***elevationAngleLeft, elevationAngleRight***

Leftmost and rightmost (with reference to the satellite direction) elevation angle. Unit in degree.

Step of 5 degree. Actual value = field value \* 5.

If the field *elevationAngleLeft* is absent, the leftmost elevation angle is equal to the value of field *elevationAngleRight*.

***footprintInfo***

Satellite footprint.

E-UTRAN may configure *elevationAngles* and/or *radius* for earth moving cell.

E-UTRAN may configure *referencePoint* and *radius* for quasi-earth fixed cell.

***latitude***

Latitude of the reference point. Unit in degree.

Step of 360 / 262144 degree. Actual value = field value \* (360 / 262144).

***longitude***

Longitude of the reference point. Unit in degree.

Step of 360 / 262144 degree. Actual value = field value \* (360 / 262144).

***radius***

Distance between the reference point and the edge of the satellite or beam coverage. Unit in km.

Step of 10 km. Actual value = field value \* 10.

***satelliteInfoList***

List of satellite information. If E-UTRAN includes *satelliteInfoList-v1800*, it includes the same number of entries, and listed in the same order, as in *satelliteInfoList-r17*.

***serviceInfo***

Information on when the satellite will provide coverage.

E-UTRAN always configures *tle-EphemerisParameters* for a satellite with earth moving cell(s) and always configures *t-ServiceStart* for a quasi-earth fixed cell.

***tle-EphemerisParameters***

Mean values of the satellite orbital parameters based on the TLE set format for estimating in-coverage and out-of-coverage periods for a satellite with earth moving cell(s), see TS 36.304 [4].

***t-ServiceStart***

Time information on when the incoming satellite is going to start serving the area for quasi-earth fixed cell.

## – *SystemInformationBlockType33*

The IE *SystemInformationBlockType33* contains satellite assistance information for neighbour cells.

| <b>SystemInformationBlockType33 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>epochTime</b>                                       | Epoch time of the neighbour satellite ephemeris data and common TA parameters, see TS 36.213 [23]. The reference point for epoch time of the neighbour satellite ephemeris and Common TA parameters is the uplink time synchronization reference point when this field is provided in an NTN cell and the eNB when this field is provided in a TN cell.<br><i>epochTime</i> is the starting time of a DL subframe indicated by <i>startSFN</i> and <i>startSubframe</i> . If this field is absent, the UE uses epoch time of the serving cell, otherwise the field is based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the serving cell. <i>The startSFN</i> indicates the SFN nearest to the frame where the message indicating the <i>epochTime</i> is received. |
| <b>k-Mac</b>                                           | Scheduling offset used when downlink and uplink frame timing are not aligned at the eNB, see TS 36.213 [23]. Unit in ms.<br>If the field is absent, the UE uses the (default) value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>neighValidityDuration</b>                           | Validity duration of the neighbour satellite ephemeris data and common TA parameters, i.e. maximum time duration (from <i>epochTime</i> ) during which the UE can apply the satellite ephemeris without acquiring new satellite ephemeris, see TS 36.213 [23]. Unit in second.<br>Value s5 corresponds to 5 seconds, value s10 corresponds to 10 seconds and so on.<br>If this field is absent, the UE uses validity duration from the serving cell assistance information.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>nta-Common</b>                                      | Network-controlled common TA, see TS 36.213 [23]. Unit of $\mu\text{s}$ .<br>Step of $32.55208 \times 10^{-3} \mu\text{s}$ . | <b>nta-CommonDriftVariation</b>                        | Drift rate variation of the common TA, see TS 36.213 [23]. Unit of $\mu\text{s}/\text{s}^2$ .<br>Step of $0.2 \times 10^{-4} \mu\text{s}/\text{s}^2$ . Actual value = field value * $0.2 \times 10^{-4}$ .<br>If the field is absent, the UE uses the (default) value of 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>t-ServiceStartNeigh</b>                             | Indicates the earliest time when the area covered by the current serving cell is going to be covered by the neighbour cell(s) served by the satellite indicated by <i>satelliteId</i> , see 5.5.3.1, 5.5.8 and 36.304 [4]. This field is only present for the neighbour cell(s) provided via NTN quasi-Earth fixed system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 6.3.2 Radio resource control information elements

- **Alpha**

The IE *Alpha* is used to indicate parameter  $\alpha$ , see TS 36.213 [23], clause 5.1.1.1 and 5.1.3.1. Value al0 corresponds to 0, al04 corresponds to value 0.4, al05 to 0.5, al06 to 0.6, al07 to 0.7, al08 to 0.8, al09 to 0.9 and al1 corresponds to 1.

#### **Alpha information element**

```
-- ASN1START
Alpha-r12 ::= ENUMERATED {al0, al04, al05, al06, al07, al08, al09, al1}
-- ASN1STOP
```

- **AntennaInfo**

The IE *AntennaInfoCommon* and the *AntennaInfoDedicated* are used to specify the common and the UE specific antenna configuration respectively.

#### **AntennaInfo information elements**

```

| <b>alternativeCodebookEnabledFor4TX</b>                             | Indicates whether code book in TS 36.213 [23] Table 7.2.4-0A to Table 7.2.4-0D is being used for deriving CSI feedback and reporting. E-UTRAN only configures the field if the UE is configured with a) <i>tm8</i> with 4 CRS ports, <i>tm9</i> or <i>tm10</i> with 4 CSI-RS ports and b) PMI/RI reporting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>antennaPortsCount</b>                                            | Parameter represents the number of cell specific antenna ports where an1 corresponds to 1, an2 to 2 antenna ports etc. see TS 36.211 [21], clause 6.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ce-ue-TxAntennaSelection-config</b>                              | Configuration of UL closed-loop transmit antenna selection for non-BL UE in CE Mode A, see TS 36.212 [22].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>codebookSubsetRestriction</b>                                    | Parameter: <i>codebookSubsetRestriction</i> , see TS 36.213 [23], clause 7.2 and TS 36.211 [21], clause 6.3.4.2.3. The number of bits in the <i>codebookSubsetRestriction</i> for applicable transmission modes is defined in TS 36.213 [23], Table 7.2-1b. If the UE is configured with <i>transmissionMode tm8</i> , E-UTRAN configures the field <i>codebookSubsetRestriction</i> if PMI/RI reporting is configured. If the UE is configured with <i>transmissionMode tm9</i> , E-UTRAN configures the field <i>codebookSubsetRestriction</i> if PMI/RI reporting is configured and if the number of CSI-RS ports is greater than 1. E-UTRAN does not configure the field <i>codebookSubsetRestriction</i> in other cases where the UE is configured with <i>transmissionMode tm8</i> or <i>tm9</i> . Furthermore, E-UTRAN does not configure the field <i>codebookSubsetRestriction</i> if the UE is configured with eMIMO-Type unless it is set to <i>beamformed</i> , <i>alternativeCodebookEnabledBeamformed</i> is set to <i>FALSE</i> and <i>csi-RS-ConfigNZPIdListExt</i> is not configured. |
| <b>maxLayersMIMO</b>                                                | Indicates the maximum number of layers for spatial multiplexing used to determine the rank indication bit width and Kc determination of the soft buffer size for the corresponding serving cell according to TS 36.212 [22]. EUTRAN configures this field only when <i>transmissionMode</i> is set to <i>tm3</i> , <i>tm4</i> , <i>tm9</i> or <i>tm10</i> for the corresponding serving cell. When configuring the field for a serving cell which <i>transmissionMode</i> is set to <i>tm3</i> or <i>tm4</i> , EUTRAN only configures value <i>fourLayers</i> : For a serving cell which <i>transmissionMode</i> is set to <i>tm9</i> or <i>tm10</i> , EUTRAN only configures the field only if <i>intraBandContiguousCC-InfoList</i> or <i>FeatureSetDL-PerCC</i> is indicated for the band and the band combination of the corresponding serving cell or the UE supports <i>maxLayersMIMO-Indication</i> .                                                                                                                                                                                           |
| <b>maxLayersMIMO-STTI</b>                                           | Indicates the maximum number of layers, for each serving cell, to be used when determining if the shifted DMRS pattern is applicable TS 36.211 [21], clause 6.10.3.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>slotSubslotPDSCH-TxDiv-2Layer, slotSubslotPDSCH-TxDiv-4Layer</b> | Indicates the table to be used in case of dynamic TX diversity fallback for TM9 and 10 for up to 2-layer/4-layer slot or subslot PDSCH operation, see TS 36.212 [22], clause 5.3.3.1.22.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>transmissionMode</b>                                             | Points to one of Transmission modes defined in TS 36.213 [23], clause 7.1, where <i>tm1</i> refers to transmission mode 1, <i>tm2</i> to transmission mode 2 etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>transmissionModeDL-MBSFN</b>                                     | Indicates, for MBSFN, the transmission mode as defined in TS 36.213 [23], clause 7.1, where <i>tm1</i> refers to transmission mode 1, <i>tm2</i> to transmission mode 2 etc for slot or subslot operation. In case of FDD, TM8 is not applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>transmissionModeDL-nonMBSFN</b>                                  | Indicates, for non-MBSFN, the transmission mode as defined in TS 36.213 [23], clause 7.1, where <i>tm1</i> refers to transmission mode 1, <i>tm2</i> to transmission mode 2 etc. for slot or subslot operation. In case of FDD, TM8 is not applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ue-TransmitAntennaSelection</b>                                  | For value <i>setup</i> , the field indicates whether UE transmit antenna selection control is closed-loop or open-loop as described in TS 36.213 [23], clause 8.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ue-TxAntennaSelection-SRS-1T4R-Config</b>                        | Configuration of UL closed-loop transmit antenna selection for UE to select one antenna among four antennas to transmit SRS for the corresponding serving cell as described in TS 36.213 [23]. When <i>ue-TxAntennaSelection-SRS-1T4R-Config</i> and <i>ue-TransmitAntennaSelection</i> are configured simultaneously for a given serving cell, the UE selects one of the first two antennas for PUSCH transmission and selects one antenna among four antennas at each SRS instance for SRS transmission for the corresponding serving cell as described in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ue-TxAntennaSelection-SRS-2T4R-NrOfPairs</b>                     | Presence of the field indicates configuration of UL closed-loop transmit antenna selection for UE to select two antennas among four antennas to transmit SRS simultaneously for the corresponding serving cell as described in TS 36.213 [23]. Further, the field indicates the number of antenna pairs to select from for SRS transmission for a given serving cell as described in TS 36.213 [23]. Value two indicates the UE to select one antenna pair between two antenna pairs to transmit SRS simultaneously at each SRS instance for the corresponding serving cell. Value three indicates the UE to select one antenna pair among three antenna pairs to transmit SRS simultaneously at each SRS instance for the corresponding serving cell. EUTRAN does not simultaneously configure <i>ue-TransmitAntennaSelection</i> and <i>ue-TxAntennaSelection-SRS-2T4R-NrOfPairs</i> for a given serving cell.                                                                                                                                                                                       |

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                                    |

| <i>TMX</i>           | The field is mandatory present if the <i>transmissionMode-r10</i> is set to <i>tm3</i> , <i>tm4</i> , <i>tm5</i> or <i>tm6</i> . The field is optionally present, need OR, if the <i>transmissionMode-r10</i> is set to <i>tm8</i> or <i>tm9</i> . Otherwise the field is not present and the UE shall delete any existing value for this field.                               |

### – *AntennaInfoUL*

The IE *AntennaInfoUL* is used to specify the UL antenna configuration.

#### ***AntennaInfoUL* information elements**

```
-- ASN1START

AntennaInfoUL-r10 ::= SEQUENCE {
 transmissionModeUL-r10 ENUMERATED {tm1, tm2, spare6, spare5,
 spare4, spare3, spare2, spare1} OPTIONAL, --
Need OR
 fourAntennaPortActivated-r10 ENUMERATED {setup} OPTIONAL -- Need OR
}

AntennaInfoUL-STTI-r15 ::= SEQUENCE {
 transmissionModeUL-STTI-r15 ENUMERATED {tm1, tm2} OPTIONAL -- Need OR
}

-- ASN1STOP
```

#### ***AntennaInfoUL* field descriptions**

##### ***fourAntennaPortActivated***

Parameter indicates if four antenna ports are used. See TS 36.213 [23], clause 8.2. E-UTRAN optionally configures *fourAntennaPortActivated* only if *transmissionModeUL* is set to *tm2*.

##### ***transmissionModeUL***

Points to one of UL Transmission modes defined in TS 36.213 [23], clause 8.0, where *tm1* refers to transmission mode 1, *tm2* to transmission mode 2 etc.

##### ***transmissionModeUL-STTI***

Indicates the UL transmission mode as defined in TS 36.213 [23], clause 8.0, where *tm1* refers to transmission mode 1 and *tm2* to transmission mode 2 for slot or subslot operation.

### – *AUL-Config*

The IE *AUL-Config* is used to specify the autonomous uplink configuration.

#### ***AUL-Config* information element**

```
-- ASN1START

| <b>AUL-Config field descriptions</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>aul-CRNTI</b>                         | AUL C-RNTI, see TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>aul-HARQ-Proceses</b>                 | This field indicates which HARQ process IDs are configured for AUL operation as described in TS 36.321 [6]. In case tm1 is configured for the <i>transmissionModeUL-AUL</i> the number of configured HARQ processes equals to field value. In case tm2 is configured for the <i>transmissionModeUL-AUL</i> the number of configured HARQ processes equals to double of the field value. The largest value of the HARQ process ID is equal to the number of configured HARQ processes - 1.                                                         |
| <b>aul-RetransmissionTimer</b>           | This timer is used to restrict both new transmission and retransmission for the same HARQ process for AUL operation as described in TS 36.321 [6]. Value psf4 corresponds to 4 PDCCH subframes etc.                                                                                                                                                                                                                                                                                                                                               |
| <b>aul-StartingFullBW-InsideMCOT</b>     | This field indicates the AUL-specific set of PUSCH starting offset values for the AUL transmission inside of eNB obtained MCOT when a UE configured with AUL configuration is allocated to occupy the full channel bandwidth as described in TS 36.213 [23], clause 8.0. The first/leftmost bit corresponds to value 34, second bit corresponds to value 43, third bit corresponds to value 52, fourth bit corresponds to value 61 and last bit corresponds to value OS#1.                                                                        |
| <b>aul-StartingFullBW-OutsideMCOT</b>    | This field indicates the AUL-specific set of PUSCH starting offset values for the AUL transmission outside of eNB obtained MCOT when a UE configured with AUL configuration is allocated to occupy the full channel bandwidth as described in TS 36.213 [23], clause 8.0. The first/leftmost bit corresponds to value 16, second bit corresponds to value 25, third bit corresponds to value 34, fourth bit corresponds to value 43, fifth bit corresponds to value 52, sixth bit corresponds to value 61 and last bit corresponds to value OS#1. |
| <b>aul-StartingPartialBW-InsideMCOT</b>  | This field indicates the exact AUL-specific PUSCH starting offset value for the AUL transmission inside of eNB obtained MCOT when a UE configured with AUL configuration is allocated to occupy partial channel bandwidth as described in TS 36.213 [23], clause 8.0. The value o34 corresponds to 34, and the value o43 corresponds to 43 and so on.                                                                                                                                                                                             |
| <b>aul-StartingPartialBW-OutsideMCOT</b> | This field indicates the exact AUL-specific PUSCH starting offset value for the AUL transmission outside of eNB obtained MCOT when a UE configured with AUL configuration is allocated to occupy partial channel bandwidth as described in TS 36.213 [23], clause 8.0. The value o16 corresponds to 16, the value o25 corresponds to 25 and so on.                                                                                                                                                                                                |
| <b>aul-Subframes</b>                     | This field indicates which subframes are allowed for AUL operation as described in TS 36.321 [6]. The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod 4 = 0. Value 0 in the bitmap indicates that the corresponding subframe is not allowed for AUL. Value 1 in the bitmap indicates that the corresponding subframe is allowed for AUL.                                                                                                                                                                  |
| <b>contentionWindowSizeTimer</b>         | This field indicates contention window size adjustment timer as described in TS 37.213 [94], clause 4.2.2. The value n0 corresponds to 0ms, value n5 corresponds to 5ms, value n10 corresponds to 10ms. The value is set to n0 or n5 if the absence of other technologies on the same carrier cannot be guaranteed. The value is set to n0 or n10 if the absence of other technologies on the same carrier can be guaranteed.                                                                                                                     |
| <b>endingSymbolAUL</b>                   | This field indicates PUSCH ending symbol of the last AUL subframe in an AUL burst as described in TS 36.211 [21], clause 4.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>subframeOffsetCOT-Sharing</b>         | This field is COT sharing indication parameter X indicating if subframe n+X is an applicable subframe for UL to DL sharing as described in TS 37.213 [94], clause 4.1.3.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>transmissionModeUL-AUL</b>            | This field indicates which UL transmission mode is used for AUL as described in TS 36.213 [23], clause 8.0, where tm1 refers to transmission mode 1, tm2 to transmission mode 2.                                                                                                                                                                                                                                                                                                                                                                  |

| <b>aperiodicCSI-Trigger</b>                                                   | Indicates for which serving cell(s) the aperiodic CSI report is triggered when one or more SCells are configured. <i>trigger1-r10</i> corresponds to the CSI request field 10 while <i>trigger1-r13</i> corresponds to the CSI request field 010, <i>trigger2-r10</i> corresponds to the CSI request field 11 while <i>trigger2-r13</i> corresponds to the CSI request field 011, <i>trigger3-r13</i> corresponds to the CSI request field 100, see TS 36.213 [23], table 7.2.1-1A and table 7.2.1-1D, and so on. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex=0</i> and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex=1</i> etc. Each bit has either value 0 (means no aperiodic CSI report is triggered) or value 1 (means the aperiodic CSI report is triggered). At most 5 bits can be set to value 1 in the bit string in <i>aperiodicCSI-Trigger-r10</i> and in <i>aperiodicCSI-Trigger-v1250</i> and at most 32 bits can be set to value 1 in the bit string in <i>aperiodicCSI-Trigger-v1310</i> . E-UTRAN configures value 1 only for cells configured with <i>transmissionMode</i> set in range <i>tm1</i> to <i>tm9</i> . One value applies for all serving cells configured with <i>transmissionMode</i> set in range <i>tm1</i> to <i>tm9</i> and belonging to the same PUCCH group (the associated functionality is common i.e. not performed independently for each cell). |
| <b>trigger-SubframeSetIndicator</b>                                           | For a serving cell configured with <i>csi-MeasSubframeSets-r12</i> , indicates for which CSI subframe set the aperiodic CSI report is triggered for the serving cell if the aperiodic CSI is triggered by the CSI request field 01 or 001, see TS 36.213 [23], table 7.2.1-1C or table 7.2.1-1E. Value s1 corresponds to CSI subframe set 1 and value s2 corresponds to CSI subframe set 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>trigger001</b>                                                             | Indicates whether or not reporting for this CSI-process or reporting for this CSI-process corresponding to a CSI subframe set is triggered by CSI request field set to 001, for a CSI request applicable for the serving cell on the same frequency as the CSI process, see TS 36.213 [23], table 7.2.1-1D and 7.2.1-E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>trigger001-IndicatorN.. trigger111-IndicatorN</b>                          | Indicates for which eMIMO-Type the aperiodic CSI report is triggered (the corresponding CSI process, CSI subframe set)-pair(s) and/or a serving cell) as applicable, See TS 36.213 [23], table 7.2.1-1A, 7.2.1-1B, and 7.2.1-1C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>trigger01</b>                                                              | Indicates whether or not reporting for this CSI-process or reporting for this CSI-process corresponding to a CSI subframe set is triggered by CSI request field set to 01, for a CSI request applicable for the serving cell on the same frequency as the CSI process, see TS 36.213 [23], table 7.2.1-1D and 7.2.1-1E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>trigger010, trigger011, trigger100, trigger101, Trigger110, Trigger111</b> | Indicates whether or not reporting for this CSI-process or reporting for this CSI-process corresponding to a CSI subframe set is triggered by CSI request field set to 010, 011, 100, 101, 110 or 111, see TS 36.213 [23], table 7.2.1-1D and 7.2.1-1E.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>trigger10, trigger11</b>                                                   | Indicates whether or not reporting for this CSI-process or reporting for this CSI-process corresponding to a CSI subframe set is triggered by CSI request field set to 10 or 11, see TS 36.213 [23], table 7.2.1-1B. EUTRAN configures at most 5 CSI processes, across all serving frequencies within each CG, to be triggered by a CSI request field set to value 10. The same restriction applies for value 11. In case E-UTRAN simultaneously triggers CSI requests for more than 5 CSI processes some limitations apply, see TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>trigger1-SubframeSetIndicator</b>                                          | If signalled in the <i>aperiodicCSI-Trigger-v1250</i> , indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 10, see TS 36.213 [23], table 7.2.1-1C, or by the CSI request field 010, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex=0</i> and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex=1</i> etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>trigger2-SubframeSetIndicator</b>                                          | If signalled in the <i>aperiodicCSI-Trigger-v1250</i> , indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 11, see TS 36.213 [23], table 7.2.1-1C, or by the CSI request field 011, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex=0</i> and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex=1</i> etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>trigger3-SubframeSetIndicator</b>                                          | Indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 100, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex=0</i> and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex=1</i> etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>trigger4-SubframeSetIndicator</b>                                          | Indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 101, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex=0</i> and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex=1</i> etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>CQI-ReportAperiodic field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>trigger5-SubframeSetIndicator</b>          | Indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 110, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex</i> =0 and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex</i> =1 etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2). |
| <b>trigger6-SubframeSetIndicator</b>          | Indicates for which CSI subframe set the aperiodic CSI report is triggered when aperiodic CSI is triggered by the CSI request field 111, see TS 36.213 [23], table 7.2.1-1E. The leftmost bit, bit 0 in the bit string corresponds to the cell with <i>ServCellIndex</i> =0 and bit 1 in the bit string corresponds to the cell with <i>ServCellIndex</i> =1 etc. Each bit has either value 0 (means that aperiodic CSI report is triggered for CSI subframe set 1) or value 1 (means that aperiodic CSI report is triggered for CSI subframe set 2). |

## — *CQI-ReportBoth*

The IE *CQI-ReportBoth* is used to specify the CQI reporting configuration common to both periodic and aperiodic configurations.

|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-IM-ConfigToAddModList</b>         | For a serving frequency E-UTRAN configures one or more <i>CSI-IM-Config</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-ProcessToAddModList</b>           | For a serving frequency E-UTRAN configures one or more <i>CSI-Process</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>cqi-ReportModeAperiodic</b>           | Parameter: <i>reporting mode</i> . Value rm12 corresponds to Mode 1-2, rm20 corresponds to Mode 2-0, rm22 corresponds to Mode 2-2 etc. PUSCH reporting modes are described in TS 36.213 [23], clause 7.2.1. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> when transmission mode 10 is configured for the serving cell on this carrier frequency. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> configured for the PCell/ PSCell when the transmission bandwidth of the PCell/PSCell in downlink is 6 resource blocks. |
| <b>pmi-RI-Report</b>                     | See TS 36.213 [23], clause 7.2. The presence of this field means PMI/RI reporting is configured; otherwise the PMI/RI reporting is not configured. EUTRAN configures this field only when <i>transmissionMode</i> is set to <i>tm8</i> , <i>tm9</i> or <i>tm10</i> . The UE shall ignore <i>pmi-RI-Report-r9</i> / <i>pmi-RI-Report-r10</i> when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                      |
| <b>ri-Ref-CSI-ProcessId</b>              | CSI process whose RI value the UE inherits when reporting RI, in the same subframe, for CSI reporting. E-UTRAN ensures that the CSI process that inherits the RI value is configured in accordance with the conditions specified in TS 36.213 [23], clauses 7.2.1 and 7.2.2.                                                                                                                                                                                                                                                             |

| <b>CQI-ReportConfig field descriptions</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>altCQI-Table</i>, <i>altCQI-Table-1024QAM</i></b>         | Indicates the applicability of the alternative CQI table (i.e. Table 7.2.3-2 and Table 7.2.3-4 in TS 36.213 [23]) for both aperiodic and periodic CSI reporting for the concerned serving cell. Value <i>allSubframes</i> means the alternative CQI table applies to all the subframes and CSI processes, if configured, and value <i>csi-SubframeSet1</i> means the alternative CQI table applies to CSI subframe set1, and value <i>csi-SubframeSet2</i> means the alternative CQI table applies to CSI subframe set2. EUTRAN sets the value to <i>csi-SubframeSet1</i> or <i>csi-SubframeSet2</i> only if <i>transmissionMode</i> is set in range <i>tm1</i> to <i>tm9</i> and <i>csi-SubframePatternConfig-r10</i> is configured for the concerned serving cell and different CQI tables apply to the two CSI subframe sets; otherwise EUTRAN sets the value to <i>allSubframes</i> . EUTRAN does not configure <i>altCQI-Table-r12</i> in <i>CQI-ReportConfig-v1250</i> and <i>altCQI-Table-1024QAM-r15</i> in <i>CQI-ReportConfig-v1530</i> or in <i>CQI-ReportConfigSCell-r15</i> in the same serving cell simultaneously. If <i>altCQI-Table-r12</i> and <i>altCQI-Table-1024QAM-r15</i> are absent, the UE shall use Table 7.2.3-1 in TS 36.213 [23] for all subframes and CSI processes, if configured. |
| <b><i>cqi-Mask</i></b>                                          | Limits CQI/PMI/PTI/RI reports to the on-duration period of the DRX cycle, see TS 36.321 [6]. One value applies for all CSI processes and all serving cells (the associated functionality is common i.e. not performed independently for each cell).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>cqi-ReportAperiodic</i></b>                               | E-UTRAN does not configure <i>CQI-ReportAperiodic</i> when transmission mode 10 is configured for all serving cells. E-UTRAN configures <i>cqi-ReportAperiodic-v1250</i> only if <i>cqi-ReportAperiodic-r10</i> and <i>csi-MeasSubframeSets-r12</i> are configured. E-UTRAN configures <i>cqi-ReportAperiodic-v1310</i> only if <i>cqi-ReportAperiodic-r10</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>cqi-ReportModeAperiodic</i></b>                           | Parameter: <i>reporting mode</i> . Value <i>rm12</i> corresponds to Mode 1-2, <i>rm20</i> corresponds to Mode 2-0, <i>rm22</i> corresponds to Mode 2-2 etc. PUSCH reporting modes are described in TS 36.213 [23], clause 7.2.1. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> when transmission mode 10 is configured for the serving cell on this carrier frequency. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> configured for the PCell/ PSCell when the transmission bandwidth of the PCell/PSCell in downlink is 6 resource blocks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>cqi-ReportPeriodic</i></b>                                | E-UTRAN does not configure <i>CQI-ReportPeriodic</i> for sTTI within <i>CQI-ReportConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>csi-MeasSubframeSets</i></b>                              | Indicates the two CSI subframe sets. Value 0 means the subframe belongs to CSI subframe set 1 and value 1 means the subframe belongs to CSI subframe set 2. CSI subframe set 1 refers to <i>C<sub>CSI,0</sub></i> in TS 36.213 [23], clause 7.2, and CSI subframe set 2 refers to <i>C<sub>CSI,1</sub></i> in TS 36.213 [23], clause 7.2. EUTRAN does not configure <i>csi-MeasSubframeSet1-r10</i> and <i>csi-MeasSubframeSet2-r10</i> if either <i>csi-MeasSubframeSets-r12</i> for PCell or <i>eimta-MainConfigPCell-r12</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>csi-MeasSubframeSet1</i>, <i>csi-MeasSubframeSet2</i></b> | Indicates the CSI measurement subframe sets. <i>csi-MeasSubframeSet1</i> refers to <i>C<sub>CSI,0</sub></i> in TS 36.213 [23], clause 7.2 and <i>csi-MeasSubframeSet2</i> refers to <i>C<sub>CSI,1</sub></i> in TS 36.213 [23], clause 7.2. E-UTRAN only configures the two CSI measurement subframe sets for the PCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>nomPDSCH-RS-EPRE-Offset</i></b>                           | Parameter: $\Delta_{\text{offset}}$ see TS 36.213 [23], clause 7.2.3. Actual value = field value * 2 [dB].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>pmi-RI-Report</i></b>                                     | See TS 36.213 [23], clause 7.2. The presence of this field means PMI/RI reporting is configured; otherwise the PMI/RI reporting is not configured. EUTRAN configures this field only when <i>transmissionMode</i> is set to <i>tm8</i> , <i>tm9</i> or <i>tm10</i> . The UE shall ignore <i>pmi-RI-Report-r9</i> / <i>pmi-RI-Report-r10</i> when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>cqi-Setup</i>     | This field is not present for an SCell except for the PSCell, while it is conditionally present for the PCell and the PSCell according to the following. The field is optional present, need OR, if the <i>cqi-ReportPeriodic</i> in the <i>cqi-ReportConfig</i> is set to <i>setup</i> . If the field <i>cqi-ReportPeriodic</i> is present and set to <i>release</i> , the field is not present and the UE shall delete any existing value for this field. Otherwise the field is not present.                                                                                                       |
| <i>PMIRI</i>         | The field is optional present, need OR, if <i>cqi-ReportPeriodic</i> is included and set to <i>setup</i> , or <i>cqi-ReportModeAperiodic</i> is included. If the field <i>cqi-ReportPeriodic</i> is present and set to <i>release</i> and <i>cqi-ReportModeAperiodic</i> is absent, the field is not present and the UE shall delete any existing value for this field. Otherwise the field is not present.                                                                                                                                                                                           |
| <i>PMIRIPCell</i>    | The field is optional present, need OR, if <i>cqi-ReportPeriodic</i> is included in the <i>CQI-ReportConfig-r10</i> and set to <i>setup</i> , or <i>cqi-ReportAperiodic</i> is included in the <i>CQI-ReportConfig-r10</i> and set to <i>setup</i> . If the field <i>cqi-ReportPeriodic</i> is present in the <i>CQI-ReportConfig-r10</i> and set to <i>release</i> and <i>cqi-ReportAperiodic</i> is included in the <i>CQI-ReportConfig-r10</i> and set to <i>release</i> , the field is not present and the UE shall delete any existing value for this field. Otherwise the field is not present. |
| <i>PMIRISCell</i>    | The field is optional present, need OR, if <i>cqi-ReportPeriodicSCell</i> is included and set to <i>setup</i> , or <i>cqi-ReportModeAperiodic-r10</i> is included in the <i>CQI-ReportConfigSCell</i> . If the field <i>cqi-ReportPeriodicSCell</i> is present and set to <i>release</i> and <i>cqi-ReportModeAperiodic-r10</i> is absent in the <i>CQI-ReportConfigSCell</i> , the field is not present and the UE shall delete any existing value for this field. Otherwise the field is not present.                                                                                               |

### *CQI-ReportPeriodic*

The IE *CQI-ReportPeriodic* is used to specify the periodic CQI reporting configuration elements.

#### *CQI-ReportPeriodic* information elements

```

| <b>CQI-ReportPeriodic field descriptions</b>              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cqi-FormatIndicatorPeriodic</b>                        | Parameter: <i>PUCCH CQI Feedback Type</i> , see TS 36.213 [23], table 7.2.2-1. Depending on transmissionMode, reporting mode is implicitly given from the table.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cqi-Mask</b>                                           | Limits CQI/PMI/PTI/RI reports to the on-duration period of the DRX cycle, see TS 36.321 [6]. One value applies for all CSI processes and all serving cells (the associated functionality is common i.e. not performed independently for each cell).                                                                                                                                                                                                                                                                                      |
| <b>cqi-pmi-ConfigIndex</b>                                | Parameter: <i>CQI/PMI Periodicity and Offset Configuration Index</i> $I_{CQI/PMI}$ , see TS 36.213 [23], tables 7.2.2-1A and 7.2.2-1C. If subframe patterns for CSI (CQI/PMI/PTI/RI) reporting are configured (i.e. <i>csi-SubframePatternConfig</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet1</i> or corresponding to the CSI subframe set 1 indicated by <i>csi-MeasSubframeSets-r12</i> .                                                                                |
| <b>cqi-pmi-ConfigIndexDormant</b>                         | If subframe patterns for CSI (CQI/PMI/PTI/RI) reporting for dormant SCell are configured (i.e. <i>csi-SubframePatternDormant</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet1-r15</i> .                                                                                                                                                                                                                                                                                        |
| <b>cqi-pmi-ConfigIndex2</b>                               | Parameter: <i>CQI/PMI Periodicity and Offset Configuration Index</i> $I_{CQI/PMI}$ , see TS 36.213 [23], tables 7.2.2-1A and 7.2.2-1C. The parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet2</i> or corresponding to the CSI subframe set 2 indicated by <i>csi-MeasSubframeSets-r12</i> .                                                                                                                                                                                                              |
| <b>cqi-pmi-ConfigIndex2Dormant</b>                        | If subframe patterns for CSI (CQI/PMI/PTI/RI) reporting for dormant SCell are configured (i.e. <i>csi-SubframePatternDormant</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet2-r15</i> .                                                                                                                                                                                                                                                                                        |
| <b>cqi-PUCCH-ResourceIndex, cqi-PUCCH-ResourceIndexP1</b> | Parameter $n_{\text{PUCCH}}^{(2,p)}$ for antenna port P0 and for antenna port P1 respectively, see TS 36.213 [23], clause 7.2. E-UTRAN does not apply value 1185. One value applies for all CSI processes.                                                                                                                                                                                                                                                                                                                               |
| <b>cqi-ReportAperiodic</b>                                | E-UTRAN does not configure <i>CQI-ReportAperiodic</i> when transmission mode 10 is configured for all serving cells. E-UTRAN configures <i>cqi-ReportAperiodic-v1250</i> only if <i>cqi-ReportAperiodic-r10</i> and <i>csi-MeasSubframeSets-r12</i> are configured. E-UTRAN configures <i>cqi-ReportAperiodic-v1310</i> only if <i>cqi-ReportAperiodic-r10</i> is configured.                                                                                                                                                            |
| <b>cqi-ReportModeAperiodic</b>                            | Parameter: <i>reporting mode</i> . Value rm12 corresponds to Mode 1-2, rm20 corresponds to Mode 2-0, rm22 corresponds to Mode 2-2 etc. PUSCH reporting modes are described in TS 36.213 [23], clause 7.2.1. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> when transmission mode 10 is configured for the serving cell on this carrier frequency. The UE shall ignore <i>cqi-ReportModeAperiodic-r10</i> configured for the PCell/ PSCell when the transmission bandwidth of the PCell/PSCell in downlink is 6 resource blocks. |
| <b>CQI-ReportPeriodicProcExt</b>                          | A set of periodic CQI related parameters for which E-UTRAN may configure different values for each CSI process. For a serving frequency E-UTRAN configures one or more <i>CQI-ReportPeriodicProcExt</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                     |
| <b>cri-ConfigIndex</b>                                    | Parameter: <i>cri-ConfigIndex</i> $I_{CRI}$ see TS 36.213 [23]. The parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet1</i> . EUTRAN configures the field if subframe patterns for CSI (CQI/PMI/PTI/RI/CRI) reporting are configured (i.e. <i>csi-SubframePatternConfig</i> is configured).                                                                                                                                                                                                               |
| <b>cri-ConfigIndex2</b>                                   | Parameter: <i>cri-ConfigIndex</i> $I_{CRI}$ see TS 36.213 [23]. The parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet2</i> or corresponding to the CSI subframe set 2 indicated by <i>csi-MeasSubframeSets</i> . E-UTRAN configures <i>cri-ConfigIndex2</i> only if <i>cri-ConfigIndex</i> is configured.                                                                                                                                                                                                |
| <b>cri-ReportConfig</b>                                   | E-UTRAN configures the field only if the UE is configured with <i>eMIMO-Type</i> set to "beamformed" and if multiple references to RS configuration using non-zero power transmission are configured (i.e. if <i>csi-RS-ConfigNZPIdListExt</i> is configured).                                                                                                                                                                                                                                                                           |
| <b>csi-ConfigIndex</b>                                    | E-UTRAN configures <i>csi-ConfigIndex</i> only for PCell and only if <i>csi-SubframePatternConfig</i> is configured. The UE shall release <i>csi-ConfigIndex</i> if <i>csi-SubframePatternConfig</i> is released.                                                                                                                                                                                                                                                                                                                        |
| <b>csi-ProcessToAddModList</b>                            | For a serving frequency E-UTRAN configures one or more <i>CSI-Process</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>csi-ReportMode</b>                                     | Parameter: <i>PUCCH_format1-1_CSI_reporting_mode</i> , see TS 36.213 [23], clause 7.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>K</b>                                                  | Parameter: K, see TS 36.213 [23], clause 7.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>nomPDSCH-RS-EPRE-Offset</b>                            | Parameter: $\Delta_{\text{offset}}$ see TS 36.213 [23], clause 7.2.3. Actual value = field value * 2 [dB].                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>CQI-ReportPeriodic field descriptions</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>periodicityFactor, periodicityFactorWB</b>    | Parameter: $H'$ , see TS 36.213 [23], clause 7.2.2. EUTRAN configures field <i>periodicityFactorWB</i> only when the UE is configured with eMIMO-Type set to <i>nonPrecoded</i> and with <i>cqi-FormatIndicatorPeriodic</i> set to <i>widebandCQI</i> .                                                                                                                                                                                                    |
| <b>ri-ConfigIndex</b>                            | Parameter: <i>RI Config Index</i> $I_{RI}$ , see TS 36.213 [23], clause 7.2.2-1B. If subframe patterns for CSI (CQI/PMI/PTI/RI/CRI) reporting are configured (i.e. <i>csi-SubframePatternConfig</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet1</i> .                                                                                                                                           |
| <b>ri-ConfigIndexDormant</b>                     | If subframe patterns for CSI (CQI/PMI/PTI/RI) reporting for dormant SCell are configured (i.e. <i>csi-SubframePatternDormant</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet1-r15</i> .                                                                                                                                                                                                          |
| <b>ri-ConfigIndex2</b>                           | Parameter: <i>RI Config Index</i> $I_{RI}$ , see TS 36.213 [23], clause 7.2.2-1B. The parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet2</i> or corresponding to the CSI subframe set 2 indicated by <i>csi-MeasSubframeSets-r12</i> . E-UTRAN configures <i>ri-ConfigIndex2</i> only if <i>ri-ConfigIndex</i> is configured.                                                                                              |
| <b>ri-ConfigIndex2Dormant</b>                    | If subframe patterns for CSI (CQI/PMI/PTI/RI) reporting for dormant SCell are configured (i.e. <i>csi-SubframePatternDormant</i> is configured), the parameter applies to the subframe pattern corresponding to <i>csi-MeasSubframeSet2-r15</i> .                                                                                                                                                                                                          |
| <b>simultaneousAckNackAndCQI</b>                 | Parameter: <i>Simultaneous-AN-and-CQI</i> , see TS 36.213 [23], clause 10.1. TRUE indicates that simultaneous transmission of ACK/NACK and CQI is allowed. One value applies for all CSI processes. For SCells except for the PSCell and PUCCH SCell this field is not applicable and the UE shall ignore the value.                                                                                                                                       |
| <b>simultaneousAckNackAndCQI-Format3</b>         | Indicates that the UE shall perform simultaneous transmission of HARQ A/N and periodic CQI report multiplexing on PUCCH format 3, see TS 36.213 [23], clauses 7.2 and 10.1.1. E-UTRAN configures this information only when <i>pucch-Format</i> is set to <i>format3</i> . One value applies for all CSI processes. For SCells except for the PSCell and PUCCH SCell this field is not applicable and the UE shall ignore the value.                       |
| <b>simultaneousAckNackAndCQI-Format4-Format5</b> | Indicates that the UE shall perform simultaneous transmission of HARQ A/N and periodic CSI report multiplexing on PUCCH format 4 and format 5, see TS 36.213 [23], clause 10.1.1. E-UTRAN configures this information only when <i>pucch-Format</i> is set to <i>format4</i> or <i>format5</i> . One value applies for all CSI processes. For SCells except for the PSCell and PUCCH SCell this field is not applicable and the UE shall ignore the value. |

### — **CQI-ReportPeriodicProcExtId**

The IE *CQI-ReportPeriodicProcExtId* is used to identify a periodic CQI reporting configuration that E-UTRAN may configure in addition to the configuration specified by the IE *CQI-ReportPeriodic-r10*. These additional configurations are specified by the IE *CQI-ReportPeriodicProcExt-r11*. The identity is unique within the scope of a carrier frequency.

#### **CQI-ReportPeriodicProcExtId** information elements

```
-- ASN1START
CQI-ReportPeriodicProcExtId-r11 ::= INTEGER (1..maxCQI-ProcExt-r11)
-- ASN1STOP
```

### — **CrossCarrierSchedulingConfig**

The IE *CrossCarrierSchedulingConfig* is used to specify the configuration when the cross carrier scheduling is used in a cell.

#### **CrossCarrierSchedulingConfig** information elements

```
-- ASN1START
CrossCarrierSchedulingConfig-r10 ::= SEQUENCE {
 schedulingCellInfo-r10 CHOICE {
 own-r10 SEQUENCE {
 scheduling CHOICE {
 cif-Presence-r10 BOOLEAN
 }
 }
 }
}
-- No cross carrier
```

```

 other-r10
scheduling SEQUENCE { -- Cross carrier
 schedulingCellId-r10
 pdsch-Start-r10
 }
}

CrossCarrierSchedulingConfig-r13 ::= SEQUENCE {
 schedulingCellInfo-r13 CHOICE {
 own-r13 SEQUENCE { -- No cross carrier
 cif-Presence-r13 BOOLEAN
 },
 other-r13 SEQUENCE { -- Cross carrier scheduling
 schedulingCellId-r13
 pdsch-Start-r13
 cif-InSchedulingCell-r13
 }
 }
}

CrossCarrierSchedulingConfigLAA-UL-r14 ::= SEQUENCE {
 schedulingCellId-r14 ServCellIndex-r13,
 cif-InSchedulingCell-r14 INTEGER (1..7)
}
-- ASN1STOP

```

#### CrossCarrierSchedulingConfig field descriptions

##### cif-Presence

The field is used to indicate whether carrier indicator field is present (value TRUE) or not (value FALSE) in PDCCH/EPDCCH DCI formats, see TS 36.212 [22], clause 5.3.3.1.

##### cif-InSchedulingCell

The field indicates the CIF value used in the scheduling cell to indicate this cell, see TS 36.212 [22], clause 5.3.3.1. In case of carrier indicator field is present, the CIF value is 0.

##### pdsch-Start

The starting OFDM symbol of PDSCH for the concerned SCell, see TS 36.213 [23]. clause 7.1.6.4. Values 1, 2, 3 are applicable when *dl-Bandwidth* for the concerned SCell is greater than 10 resource blocks, values 2, 3, 4 are applicable when *dl-Bandwidth* for the concerned SCell is less than or equal to 10 resource blocks, see TS 36.211 [21], Tables 6 and 7-1.

##### schedulingCellId

Indicates which cell signals the downlink allocations and uplink grants, if applicable, for the concerned SCell. In case the UE is configured with DC, the scheduling cell is part of the same cell group (i.e. MCG or SCG) as the scheduled cell. In case the UE is configured with *crossCarrierSchedulingConfigLAA-UL*, *schedulingCellId* indicated in *crossCarrierSchedulingConfigLAA-UL* only indicates which cell signals the uplink grants.

### – CRS-ChEstMPDCCH-Config

The IE *CRS-ChEstMPDCCH-Config* is used to configure and enable use of CRS for MPDCCH performance improvement, see TS 36.211 [21], clause 6.8B.5 and TS 36.213 [23], clause 9.1.5.

#### CRS-ChEstMPDCCH-Config information elements

```

-- ASN1START

CRS-ChEstMPDCCH-ConfigCommon-r16 ::= SEQUENCE {
 powerRatio-r16 ENUMERATED {dB-4dot77, dB-3, dB-1dot77, dB0, dB1, dB2, dB3, dB4dot77}
}

CRS-ChEstMPDCCH-ConfigDedicated-r16 ::= SEQUENCE {
 powerRatio-r16 ENUMERATED {dB-4dot77, dB-3, dB-1dot77, dB0, dB1, dB2, dB3, dB4dot77} OPTIONAL, -- Cond setup
 localizedMappingType-r16 ENUMERATED {predefined, csi-Based, reciprocityBased}
 DEFAULT predefined
}

-- ASN1STOP

```

| <b><i>CRS-ChEstMPDCCH-Config</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>powerRatio</i></b>                                | Power ratio in dB between DMRS and CRS antenna ports of MPDCCH, see TS 36.213 [23], clause 5.2. Value dB-4dot77 corresponds to -4.77 dB, value dB-3 corresponds to -3 dB and so on.                                                                                                                                                                                                                                |
| <b><i>localizedMappingType</i></b>                      | DMRS mapping type for MPDCCH performance improvement with localized MPDCCH allocation for CE mode A or B in RRC_CONNECTED, see TS 36.213 [23], clause 9.1.5. Value <i>predefined</i> corresponds to predefined mapping, value <i>csi-Based</i> corresponds to CSI-based mapping, and value <i>reciprocityBased</i> corresponds to reciprocity based mapping. Reciprocity based mapping is only applicable for TDD. |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                                                                        |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>setup</i>                | The field is mandatory present if <i>CRS-ChEstMPDCCH-ConfigDedicated</i> is set to <i>setup</i> and this field has not been configured in <i>CRS-ChEstMPDCCH-ConfigCommon</i> ; otherwise the field is optional, need ON. |

## – ***CSI-IM-Config***

The IE *CSI-IM-Config* is the CSI Interference Measurement (IM) configuration that E-UTRAN may configure on a serving frequency, see TS 36.213 [23], clause 7.2.6.

### ***CSI-IM-Config* information elements**

```
-- ASN1START

CSI-IM-Config-r11 ::= SEQUENCE {
 csi-IM-ConfigId-r11 CSI-IM-ConfigId-r11,
 resourceConfig-r11 INTEGER (0..31),
 subframeConfig-r11 INTEGER (0..154),
 ...
 [[interferenceMeasRestriction-r13 BOOLEAN OPTIONAL -- Need ON
]]
}

CSI-IM-ConfigExt-r12 ::= SEQUENCE {
 csi-IM-ConfigId-v1250 CSI-IM-ConfigId-v1250,
 resourceConfig-r12 INTEGER (0..31),
 subframeConfig-r12 INTEGER (0..154),
 ...
 [[interferenceMeasRestriction-r13 BOOLEAN OPTIONAL, -- Need ON
 csi-IM-ConfigId-v1310 CSI-IM-ConfigId-v1310 OPTIONAL -- Need ON
]]
}
-- ASN1STOP
```

| <b><i>CSI-IM-Config</i> field descriptions</b> |                                                                                                                                                 |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>resourceConfig</i></b>                   | Parameter: CSI reference signal configuration, see TS 36.213 [23], clause 7.2.6 and TS 36.211 [21], tables 6.10.5.2-1 and 6.10.5.2-2 for 4 REs. |
| <b><i>subframeConfig</i></b>                   | Parameter: $I_{CSI-RS}$ , see TS 36.213 [23], clause 7.2.6 and TS 36.211 [21], table 6.10.5.3-1.                                                |

## – ***CSI-IM-ConfigId***

The IE *CSI-IM-ConfigId* is used to identify a CSI-IM configuration that is configured by the IE *CSI-IM-Config*. The identity is unique within the scope of a carrier frequency.

### ***CSI-IM-ConfigId* information elements**

```
-- ASN1START

CSI-IM-ConfigId-r11 ::= INTEGER (1..maxCSI-IM-r11)
CSI-IM-ConfigId-r12 ::= INTEGER (1..maxCSI-IM-r12)
CSI-IM-ConfigId-v1250 ::= INTEGER (maxCSI-IM-r12)
CSI-IM-ConfigId-v1310 ::= INTEGER (minCSI-IM-r13..maxCSI-IM-r13)
```

```
CSI-IM-ConfigId-r13 ::= INTEGER (1..maxCSI-IM-r13)
-- ASN1STOP
```

## — CSI-Process

The IE *CSI-Process* is the CSI process configuration that E-UTRAN may configure on a serving frequency.

### CSI-Process information elements

```
-- ASN1START

CSI-Process-r11 ::= SEQUENCE {
 csi-ProcessId-r11 CSI-ProcessId-r11,

| <b>CSI-Process field descriptions</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>advancedCodebookEnabled</b>              | Value TRUE indicates that the UE should use the advanced code book defined in TS 36.213 [23]. EUTRAN does not configure the field when the UE is configured with eMIMO-Type is set to <i>beamformed</i> , when the UE is configured with eMIMO-Hybrid or when the UE is configured with <i>semiOpenLoop</i> .                                                                                                                                                                                                                                                         |
| <b>alternativeCodebookEnabledFor4TXProc</b> | Indicates whether code book in TS 36.213 [23] Table 7.2.4-0A to Table 7.2.4-0D is being used for deriving CSI feedback and reporting for a CSI process. EUTRAN may configure the field only if the number of CSI-RS ports for non-zero power transmission CSI-RS configuration is 4.                                                                                                                                                                                                                                                                                  |
| <b>cqi-ReportAperiodicProc</b>              | If <i>csi-MeasSubframeSets-r12</i> is configured for the same frequency as the CSI process, <i>cqi-ReportAperiodicProc</i> applies for CSI subframe set 1. If <i>csi-MeasSubframeSet1-r10</i> or <i>csi-MeasSubframeSet2-r10</i> are configured for the same frequency as the CSI process, <i>cqi-ReportAperiodicProc</i> applies for CSI subframe set 1 or CSI subframe set 2. Otherwise, <i>cqi-ReportAperiodicProc</i> applies for all subframes. E-UTRAN configures <i>cqi-ReportAperiodicProc-v1310</i> only if <i>cqi-ReportAperiodicProc-r11</i> is configured |
| <b>cqi-ReportAperiodicProc2</b>             | <i>cqi-ReportAperiodicProc2</i> is configured only if <i>csi-MeasSubframeSets-r12</i> is configured for the same frequency as the CSI process. <i>cqi-ReportAperiodicProc2</i> is for CSI subframe set 2. E-UTRAN shall set <i>cqi-ReportModeAperiodic-r11</i> in <i>cqi-ReportAperiodicProc2</i> the same as in <i>cqi-ReportAperiodicProc</i> . E-UTRAN configures <i>cqi-ReportAperiodicProc2-v1310</i> only if <i>cqi-ReportAperiodicProc2-r12</i> is configured.                                                                                                 |
| <b>cqi-ReportBothProc</b>                   | Includes CQI configuration parameters applicable for both aperiodic and periodic CSI reporting, for which CSI process specific values may be configured. E-UTRAN configures the field if and only if <i>cqi-ReportPeriodicProcId</i> is included and/or if <i>cqi-ReportAperiodicProc</i> is included.                                                                                                                                                                                                                                                                |
| <b>cqi-ReportPeriodicProcId</b>             | Refers to a periodic CQI reporting configuration that is configured for the same frequency as the CSI process. Value 0 refers to the set of parameters defined by the REL-10 CQI reporting configuration fields, while the other values refer to the additional configurations E-UTRAN assigns by <i>CQI-ReportPeriodicProcExt-r11</i> (and as covered by <i>CQI-ReportPeriodicProcExtId</i> ).                                                                                                                                                                       |
| <b>csi-IM-ConfigId</b>                      | Refers to a CSI-IM configuration that is configured for the same frequency as the CSI process. If <i>csi-IM-ConfigId-v1250</i> or <i>csi-IM-ConfigId-v1310</i> is configured, the UE only considers this extension (i.e., UE ignores <i>csi-IM-ConfigId-r11</i> and <i>csi-IM-ConfigId-r12</i> ).                                                                                                                                                                                                                                                                     |
| <b>csi-IM-ConfigIdList</b>                  | Refers to one or two CSI-IM configurations that are configured for the same frequency as the CSI process. <i>csi-IM-ConfigIdList</i> can include 2 entries only if <i>csi-MeasSubframeSets-r12</i> is configured for the same frequency as the CSI process.                                                                                                                                                                                                                                                                                                           |
| <b>csi-RS-ConfigNZPId</b>                   | Refers to a CSI RS configuration using non-zero power transmission that is configured for the same frequency as the CSI process.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>dummy</b>                                | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>eMIMO-Type</b>                           | Parameter: <i>eMIMO-Type</i> , see TS 36.213 [23], TS 36.211 [21]. If <i>eMIMO-Type</i> is set to <i>nonPrecoded</i> , the codebooks used for deriving CSI feedback are in TS 36.213 [23], Table 7.2.4-10 to Table 7.2.4-17. Choice values <i>nonPrecoded</i> and <i>beamformed</i> correspond to 'CLASS A' and 'CLASS B' respectively, see TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                        |
| <b>feCOMP-CSI-Enabled</b>                   | Parameter: <i>FeCoMPCSIEnabled</i> , see TS 36.213 [23], clause 7.1.10. Refers to CSI feedback based on FeCoMP. E-UTRAN only configures the field when the UE is configured with <i>eMIMO-Type-r13</i> set to <i>beamformed</i> with two NZP CSI-RS resources using the IE <i>CSI-RS-ConfigBeamformed-r13</i> which contains the two NZP CSI-RS resources configured with <i>csi-RS-ConfigNZPIdListExt-r13</i> .                                                                                                                                                      |
| <b>p-C-AndCBSRList</b>                      | The UE shall ignore <i>p-C-AndCBSRList-r11</i> if configured with <i>eMIMO-Type</i> unless it is set to <i>beamformed</i> , <i>alternativeCodebookEnabledBeamformed</i> (in <i>CSI-RS-ConfigBeamformed</i> ) is set to <i>FALSE</i> and <i>csi-RS-ConfigNZPIdListExt</i> is not configured,                                                                                                                                                                                                                                                                           |

## – *CSI-ProcessId*

The IE *CSI-ProcessId* is used to identify a CSI process that is configured by the IE *CSI-Process*. The identity is unique within the scope of a carrier frequency.

### **CSI-ProcessId information elements**

```
-- ASN1START
CSI-ProcessId-r11 ::= INTEGER (1..maxCSI-Proc-r11)
```

-- ASN1STOP

## - *CSI-RS-Config*

The IE *CSI-RS-Config* is used to specify the CSI (Channel-State Information) reference signal configuration.

### **CSI-RS-Config information elements**

```
-- ASN1START

CSI-RS-Config-r10 ::= SEQUENCE {
 csi-RS-r10 CHOICE {
 release NULL,
 setup SEQUENCE {
 antennaPortsCount-r10 ENUMERATED {an1, an2, an4, an8},
 resourceConfig-r10 INTEGER (0..31),
 subframeConfig-r10 INTEGER (0..154),
 p-C-r10 INTEGER (-8..15)
 }
 }
 zeroTxPowerCSI-RS-r10 ZeroTxPowerCSI-RS-Conf-r12 OPTIONAL, -- Need ON
} OPTIONAL, -- Need ON

CSI-RS-Config-v1250 ::= SEQUENCE {
 zeroTxPowerCSI-RS2-r12 ZeroTxPowerCSI-RS-Conf-r12 OPTIONAL, -- Need ON
 ds-ZeroTxPowerCSI-RS-r12 CHOICE {
 release NULL,
 setup SEQUENCE {
 zeroTxPowerCSI-RS-List-r12 SEQUENCE (SIZE (1..maxDS-ZTP-CSI-RS-r12)) OF ZeroTxPowerCSI-
RS-r12
 }
 }
} OPTIONAL, -- Need ON

CSI-RS-Config-v1310 ::= SEQUENCE {

 zeroTxPowerResourceConfigList-r12 BIT STRING (SIZE (16)),
 zeroTxPowerSubframeConfig-r12 INTEGER (0..154)
}

-- ASN1STOP
```

| <b>CSI-RS-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                         |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>advancedCodebookEnabled</b>                                                                                                                                                                                                                                                                                                                                  |  |
| Value TRUE indicates that the UE should use the advanced code book defined in TS 36.213 [23]. EUTRAN does not configure the field when the UE is configured with eMIMO-Type is set to <i>beamformed</i> , when the UE is configured with eMIMO-Hybrid or when the UE is configured with <i>semiOpenLoop</i> .                                                   |  |
| <b>antennaPortsCount</b>                                                                                                                                                                                                                                                                                                                                        |  |
| Parameter represents the number of antenna ports used for transmission of CSI reference signals where value an1 corresponds to 1 antenna port, an2 to 2 antenna ports and so on, see TS 36.211 [21], clause 6.10.5.                                                                                                                                             |  |
| <b>ds-ZeroTxPowerCSI-RS</b>                                                                                                                                                                                                                                                                                                                                     |  |
| Parameter for additional zeroTxPowerCSI-RS for a serving cell, concerning the CSI-RS included in discovery signals.                                                                                                                                                                                                                                             |  |
| <b>dummy</b>                                                                                                                                                                                                                                                                                                                                                    |  |
| This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                         |  |
| <b>eMIMO-Type</b>                                                                                                                                                                                                                                                                                                                                               |  |
| Parameter: eMIMO-Type, see TS 36.213 [23], TS 36.211 [21]. If eMIMO-Type is set to <i>nonPrecoded</i> , the codebooks used for deriving CSI feedback are in TS 36.213 [23], Table 7.2.4-10 to Table 7.2.4-17. Choice values <i>nonPrecoded</i> and <i>beamformed</i> correspond to 'CLASS A' and 'CLASS B' respectively, see TS 36.212 [22] and TS 36.213 [23]. |  |
| <b>p-C</b>                                                                                                                                                                                                                                                                                                                                                      |  |
| Parameter: $P_c$ , see TS 36.213 [23], clause 7.2.5. The UE shall ignore p-C-r10 if configured with eMIMO-Type unless it is set to <i>beamformed</i> , alternativeCodebookEnabledBeamformed (in CSI-RS-ConfigBeamformed) is set to FALSE and csi-RS-ConfigNZPIdListExt is not configured.                                                                       |  |
| <b>resourceConfig</b>                                                                                                                                                                                                                                                                                                                                           |  |
| Parameter: CSI reference signal configuration, see TS 36.211 [21], tables 6.10.5.2-1 and 6.10.5.2-2.                                                                                                                                                                                                                                                            |  |
| <b>subframeConfig</b>                                                                                                                                                                                                                                                                                                                                           |  |
| Parameter: $I_{CSI-RS}$ , see TS 36.211 [21], table 6.10.5.3-1.                                                                                                                                                                                                                                                                                                 |  |
| <b>zeroTxPowerCSI-RS2</b>                                                                                                                                                                                                                                                                                                                                       |  |
| Parameter for additional zeroTxPowerCSI-RS for a serving cell. E-UTRAN configures the field only if csi-MeasSubframeSets-r12 and TM 1 – 9 are configured for the serving cell.                                                                                                                                                                                  |  |
| <b>zeroTxPowerResourceConfigList</b>                                                                                                                                                                                                                                                                                                                            |  |
| Parameter: ZeroPowerCSI-RS, see TS 36.213 [23], clause 7.2.7.                                                                                                                                                                                                                                                                                                   |  |
| <b>zeroTxPowerSubframeConfig</b>                                                                                                                                                                                                                                                                                                                                |  |
| Parameter: $I_{CSI-RS}$ , see TS 36.211 [21], table 6.10.5.3-1.                                                                                                                                                                                                                                                                                                 |  |

### – **CSI-RS-ConfigBeamformed**

The IE *CSI-RS-ConfigBeamformed* is used to specify the beamforming configuration of EBF/ FD-MIMO.

#### **CSI-RS-ConfigBeamformed information elements**

| <b>CSI-RS-ConfigBeamformed field descriptions</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ace-For4Tx-PerResourceConfigList</b>                       | The field indicates the <i>alternativeCodeBookEnabledFor4TX-r12</i> per CSI-RS resource. E-UTRAN configures the field only if <i>csi-RS-ConfigNZPIdListExt</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>activatedResources</b>                                     | The number of activated CSI-RS resources, which concerns a subset of the aperiodic CSI-RS resources (for both semi-persistent and aperiodic mode). E-UTRAN configures at most the minimum between <i>nMaxResource</i> as configured by <i>MIMO-UE-ParametersPerTM-r1430</i> and the number of resources as configured by <i>csi-RS-ConfigNZP-ApList-r14</i> .                                                                                                                                                                                                                                                                                                                                         |
| <b>alternativeCodebookEnabledBeamformed</b>                   | The field indicates whether code book in TS 36.213 [23], Table 7.2.4-18 to Table 7.2.4-20, is being used for deriving CSI feedback and reporting for a CSI process. E-UTRAN configures the field only for a process referring to a single RS configuration using non-zero power transmission (i.e. a process for which <i>csi-RS-ConfigNZPIdListExt</i> is not configured). Field <i>alternativeCodebookEnabledBeamformed</i> corresponds to parameter <i>alternativeCodebookEnabledCLASSB_K1</i> in TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                               |
| <b>csi-IM-ConfigIdList</b>                                    | E-UTRAN configures the field <i>csi-IM-ConfigIdList</i> only if the IE is included in CSI-Process is configured (i.e. when TM10 is configured for the serving cell).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>CSI-RS-ConfigBeamformed</b>                                | If <i>csi-RS-ConfigNZPIdListExt-r13</i> is configured, E-UTRAN configures the same total number of entries for NZP, <i>csi-IM-ConfigIdList-r13</i> and <i>p-C-AndCBSR-PerResourceConfigList-r13</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-RS-ConfigNZP-ApList</b>                                | The field is used to configure NZP configurations for aperiodic or semi-persistent CSI RS reporting for which MAC controls activation. EUTRAN configures this field only when the UE is configured to use 2, 4 or 8 ports CSI-RS, in which case EUTRAN configures the number of entries to be the same as the number of NZP resource configurations. For all these entries the UE shall ignore field <i>subframeConfig</i> . EUTRAN always configures this field together with <i>csi-RS-NZP-Activation</i> . Furthermore, for a given process, E-UTRAN does not simultaneously configure the periodic NZP configuration(s) and NZP CSI RS configurations for aperiodic or semi-persistent reporting. |
| <b>csi-RS-ConfigNZP-EMIMO</b>                                 | The field is used to configure NZP configurations additional to the one defined by the original NZP configuration as included in <i>CSI-RS-Config/ CSI-Process</i> when using 12 and 16 ports CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-RS-ConfigNZPIdListExt (in CSI-RS-ConfigBeamformed)</b> | Indicates the NZP configuration(s) in addition to the original NZP configuration, as defined by <i>csi-RS-Config-r10</i> (TM9) or <i>csi-RS-ConfigNZPId-r11</i> (TM10). I.e. extends the size of the NZP configuration list (originally a single entry i.e. list of size 1) using the general principles specified in 5.1.2.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>p-C-AndCBSR-PerResourceConfigList</b>                      | E-UTRAN does not configure the field <i>p-C-AndCBSR-PerResourceConfigList</i> if the UE is configured with eMIMO-Type set to <i>beamformed</i> , <i>alternativeCodebookEnabledBeamformed</i> is set to <i>FALSE</i> and <i>csi-RS-ConfigNZPIdListExt</i> is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## – CSI-RS-ConfigEMIMO

The IE *CSI-RS-ConfigEMIMO* is used to specify the CSI (Channel-State Information) reference signal configuration for EBF/ FD-MIMO.

### CSI-RS-ConfigEMIMO information elements

```
-- ASN1START

CSI-RS-ConfigEMIMO-r13 ::= CHOICE {
 release NULL,
 setup CHOICE {
 nonPrecoded-r13 CSI-RS-ConfigNonPrecoded-r13,
 beamformed-r13 CSI-RS-ConfigBeamformed-r13
 }
}

CSI-RS-ConfigEMIMO-v1430 ::= CHOICE {
 release NULL,
 setup CHOICE {
 nonPrecoded-v1430 CSI-RS-ConfigNonPrecoded-v1430,
 beamformed-v1430 CSI-RS-ConfigBeamformed-v1430
 }
}

CSI-RS-ConfigEMIMO-v1480 ::= CHOICE {
 release NULL,
 setup CHOICE {
 nonPrecoded-v1480 CSI-RS-ConfigNonPrecoded-v1480,
 beamformed-v1480 CSI-RS-ConfigBeamformed-v1480
 }
}

CSI-RS-ConfigEMIMO-v1530 ::= CHOICE {
 release NULL,
 setup CHOICE {
 nonPrecoded-v1530 CSI-RS-ConfigNonPrecoded-v1530
 }
}

CSI-RS-ConfigEMIMO2-r14 ::= CHOICE {
 release NULL,
 setup CSI-RS-ConfigBeamformed-r14
}

CSI-RS-ConfigEMIMO-Hybrid-r14 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 periodicityOffsetIndex-r14 INTEGER (0..1023) OPTIONAL, -- Need OR
 eMIMO-Type2-r14 CSI-RS-ConfigEMIMO2-r14 OPTIONAL -- Need ON
 }
}

-- ASN1STOP
```

#### CSI-RS-ConfigEMIMO field descriptions

##### **periodicityOffsetIndex**

This parameter is associated with the first EMIMO configuration of the hybrid eMIMO configuration.

#### – CSI-RS-ConfigNonPrecoded

The IE *CSI-RS-ConfigNonPrecoded* is used to specify the non-precoded EBF/ FD-MIMO configuration.

```
-- ASN1START

CSI-RS-ConfigNonPrecoded-r13 ::= SEQUENCE {
 p-C-AndCBSRList-r13 P-C-AndCBSR-Pair-r13 OPTIONAL, -- Need OR
 codebookConfigN1-r13 ENUMERATED {n1, n2, n3, n4, n8},
 codebookConfigN2-r13 ENUMERATED {n1, n2, n3, n4, n8},
 codebookOverSamplingRateConfig-O1-r13 ENUMERATED {n4, n8} OPTIONAL, -- Need OR
 codebookOverSamplingRateConfig-O2-r13 ENUMERATED {n4, n8} OPTIONAL, -- Need OR
 codebookConfig-r13 INTEGER (1..4),
 csi-IM-ConfigIdList-r13 SEQUENCE (SIZE (1..2)) OF CSI-IM-ConfigId-r13
 OPTIONAL, -- Need OR
 csi-RS-ConfigNZP-EMIMO-r13 CSI-RS-ConfigNZP-EMIMO-r13 OPTIONAL -- Need ON
```

```

}

CSI-RS-ConfigNonPrecoded-v1430 ::= SEQUENCE {
 csi-RS-ConfigNZP-EMIMO-v1430 CSI-RS-ConfigNZP-EMIMO-v1430 OPTIONAL, -- Need ON
 codebookConfigN1-v1430 ENUMERATED {n5, n6, n7, n10, n12, n14, n16},
 codebookConfigN2-v1430 ENUMERATED {n5, n6, n7},
 nzp-ResourceConfigTM9-Original-v1430 CSI-RS-Config-NZP-v1430
}

CSI-RS-ConfigNonPrecoded-v1480 ::= SEQUENCE {

 codebookConfigN1-v1480 ENUMERATED {n5, n6, n7, n10, n12, n14, n16}
 OPTIONAL, -- Need OR
 codebookConfigN2-r1480 ENUMERATED {n5, n6, n7} OPTIONAL, -- Need OR
 nzp-ResourceConfigTM9-Original-v1480 CSI-RS-Config-NZP-v1430
}

CSI-RS-ConfigNonPrecoded-v1530 ::= SEQUENCE {
 p-C-AndCBSRList-r15 P-C-AndCBSR-Pair-r15 OPTIONAL -- Need OR
}

-- ASN1STOP

```

### CSI-RS-ConfigNonPrecoded field descriptions

#### **codebookConfig**

Indicates a sub-set of the codebook entry, see TS 36.213 [23].

#### **codebookConfigNx**

Indicates the number of antenna ports per polarization in dimension x as used for transmission of CSI reference signals. Value n1 corresponds to 1, value n2 corresponds to 2 and so on, see TS 36.213 [23]. E-UTRAN configures the field in accordance with the restrictions as specified in TS 36.213 [23]. If *codebookConfigNx* in *CSI-RS-ConfigNonPrecoded-v1480* is configured, the UE shall ignore the field *codebookConfigNx* in *CSI-RS-ConfigNonPrecoded-r13*.

#### **codebookOverSamplingRateConfig-Ox**

Indicates the spatial over-sampling rate in dimension x as used for transmission of CSI reference signals. Value n4 corresponds to 4 and value n8 corresponds to 8, see TS 36.213 [23].

#### **csi-IM-ConfigId(List)**

E-UTRAN configures the field *csi-IM-ConfigIdList* only if the IE is included in CSI-Process is configured (i.e. when TM10 is configured for the serving cell).

#### **csi-RS-ConfigNZP-EMIMO**

The field is used to configure NZP configurations additional to the one defined by the original NZP configuration as included in *CSI-RS-Config/ CSI-Process* when using more than 8 ports CSI-RS as defined in TS 36.211 [21], table 6.10.5-1.

## CSI-RS-ConfigNZP

The IE *CSI-RS-ConfigNZP* is the CSI-RS resource configuration using non-zero power transmission that E-UTRAN may configure on a serving frequency.

### CSI-RS-ConfigNZP information elements

```

-- ASN1START

CSI-RS-ConfigNZP-r11 ::= SEQUENCE {
 csi-RS-ConfigNZPId-r11 CSI-RS-ConfigNZPId-r11,
 antennaPortsCount-r11 ENUMERATED {an1, an2, an4, an8},

]
}

ResourceConfig-r13 ::= INTEGER (0..31)

NZP-TransmissionComb-r14 ::= INTEGER (0..2)
NZP-FrequencyDensity-r14 ::= ENUMERATED {d1, d2, d3}

-- ASN1STOP

```

### CSI-RS-ConfigNZP field descriptions

***antennaPortsCount***

Parameter represents the number of antenna ports used for transmission of CSI reference signals where an1 corresponds to 1, an2 to 2 antenna ports etc. see TS 36.211 [21], clause 6.10.5.

***cdmType***

Parameter: *CDMType*, see TS 36.211 [21], clause 6.10.5.2.

***csi-RS-ConfigNZPId***

Refers to a CSI RS configuration using non-zero power transmission that is configured for the same frequency as the CSI process. UE shall ignore *CSI-RS-ConfigNZPId-r11* if *CSI-RS-ConfigNZPId-v1310* is signalled.

***frequencyDensity***

Indicates the frequency-domain density reduction. E-UTRAN configures the values in accordance with the restrictions specified in TS 36.213 [23].

***mbsfn-SubframeConfigList***

Indicates the MBSFN configuration for the CSI-RS resources. If *qcl-CRS-Info-r11* is absent, the field is released.

***nzp-resourceConfigList***

Indicate a list of non-zero power transmission CSI-RS resources using parameter *resourceConfig*.

***qcl-CRS-Info***

Indicates CRS antenna ports that is quasi co-located with the CSI-RS antenna ports, see TS 36.213 [23], clause 7.2.5. EUTRAN configures this field if and only if the UE is configured with *qcl-Operation* set to *typeB*.

***resourceConfig***

Parameter: CSI reference signal configuration, see TS 36.211 [21], table 6.10.5.2-1 and 6.10.5.2-2.

***subframeConfig***

Parameter: *I<sub>CSI-RS</sub>*, see TS 36.211 [21], table 6.10.5.3-1.

***scramblingIdentity***

Parameter: Pseudo-random sequence generator parameter, *n<sub>ID</sub>*, see TS 36.213 [23], clause 7.2.5.

***transmissionComb***

Indicates the transmission combining offset. E-UTRAN configures the values in accordance with the restrictions specified in TS 36.213 [23].

## – *CSI-RS-ConfigNZPId*

The IE *CSI-RS-ConfigNZPId* is used to identify a CSI-RS resource configuration using non-zero transmission power, as configured by the IE *CSI-RS-ConfigZP*. The identity is unique within the scope of a carrier frequency.

### **CSI-RS-ConfigNZPId information elements**

```
-- ASN1START

CSI-RS-ConfigNZPId-r11 ::= INTEGER (1..maxCSI-RS-NZP-r11)
CSI-RS-ConfigNZPId-v1310 ::= INTEGER (minCSI-RS-NZP-r13..maxCSI-RS-NZP-r13)
CSI-RS-ConfigNZPId-r13 ::= INTEGER (1..maxCSI-RS-NZP-r13)

-- ASN1STOP
```

## – *CSI-RS-ConfigZP*

The IE *CSI-RS-ConfigZP* is the CSI-RS resource configuration, for which UE assumes zero transmission power, that E-UTRAN may configure on a serving frequency.

### **CSI-RS-ConfigZP information elements**

```
-- ASN1START

CSI-RS-ConfigZP-r11 ::= SEQUENCE {
 csi-RS-ConfigZPId-r11 CSI-RS-ConfigZPId-r11,
 resourceConfigList-r11 BIT STRING (SIZE (16)),
 subframeConfig-r11 INTEGER (0..154),
 ...
}

CSI-RS-ConfigZP-ApList-r14 ::= CHOICE {
 release NULL,
 setup SEQUENCE (SIZE (1.. maxCSI-RS-ZP-r11)) OF CSI-RS-ConfigZP-r11
}

-- ASN1STOP
```

### **CSI-RS-ConfigZP field descriptions**

#### ***CSI-RS-ConfigZP-ApList***

Indicates the aperiodic zero power CSI-RS present in a given subframe. See 36.213 [23], Table 7.1.9-2. First entry in the list corresponds to aperiodic trigger 00, second entry in the list corresponds to aperiodic trigger 01 and so on.

#### ***resourceConfigList***

Parameter: *ZeroPowerCSI-RS*, see TS 36.213 [23], clause 7.2.7.

#### ***subframeConfig***

Parameter:  $I_{CSI-RS}$ , see TS 36.211 [21], table 6.10.5.3-1.

## – *CSI-RS-ConfigZPId*

The IE *CSI-RS-ConfigZPId* is used to identify a CSI-RS resource configuration for which UE assumes zero transmission power, as configured by the IE *CSI-RS-ConfigZP*. The identity is unique within the scope of a carrier frequency.

### **CSI-RS-ConfigZPId information elements**

```
-- ASN1START

CSI-RS-ConfigZPId-r11 ::= INTEGER (1..maxCSI-RS-ZP-r11)

-- ASN1STOP
```

- ***DataInactivityTimer***

The IE *DataInactivityTimer* is used to control Data inactivity operation. Corresponds to the timer for data inactivity monitoring in TS 36.321 [6]. Value s1 corresponds to 1 second, s2 corresponds to 2 seconds and so on.

#### ***DataInactivityTimer* information element**

```
-- ASN1START
DataInactivityTimer-r14 ::= ENUMERATED {
 s1, s2, s3, s5, s7, s10, s15, s20, s40, s50, s60,
 s80, s100, s120, s150, s180}
-- ASN1STOP
```

- ***DMRS-Config***

The IE *DMRS-Config* is the DMRS configuration that E-UTRAN may configure on a serving frequency.

#### ***DMRS-Config* information elements**

```
-- ASN1START
DMRS-Config-r11 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 scramblingIdentity-r11 INTEGER (0..503),
 scramblingIdentity2-r11 INTEGER (0..503)
 }
}
DMRS-Config-v1310 ::= SEQUENCE {
 dmrs-tableAlt-r13 ENUMERATED {true} OPTIONAL -- Need OR
}
-- ASN1STOP
```

#### ***DMRS-Config* field descriptions**

***scramblingIdentity, scramblingIdentity2***

Parameter:  $n_{ID}^{DMRS,i}$ , see TS 36.211 [21], clause 6.10.3.1.

***dmrs-tableAlt***

The field indicates whether to use an alternative table for DMRS upon PDSCH transmission, see TS 36.213 [23].

- ***DRB-Identity***

The IE *DRB-Identity* is used to identify a DRB used by a UE.

#### ***DRB-Identity* information elements**

```
-- ASN1START
DRB-Identity ::= INTEGER (1..32)
-- ASN1STOP
```

- ***EPDCCH-Config***

The IE *EPDCCH-Config* specifies the subframes and resource blocks for EPDCCH monitoring that E-UTRAN may configure for a serving cell.

#### ***EPDCCH-Config* information element**

```
-- ASN1START
```

```

EPDCCH-Config-r11 ::= SEQUENCE{
 config-r11 CHOICE {
 release NULL,
 setup SEQUENCE {
 subframePatternConfig-r11 CHOICE {
 release NULL,

| <b><i>csi-NumRepetitionCE</i></b>              | Number of subframes for CSI reference resource, see TS 36.213 [23]. Value sf1 corresponds to 1 subframe, sf2 corresponds to 2 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>csi-RS-ConfigZPId2</i></b>               | Indicates the rate matching parameters in addition to those indicated by <i>re-MappingQCL-ConfigId</i> . E-UTRAN configures this field only when tm10 is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>dmrs-ScramblingSequenceInt</i></b>       | The DMRS scrambling sequence initialization parameter $n_{ID,i}^{\text{EPDCCH}}$ or $n_{ID,i}^{\text{MPDCCH}}$ defined in TS 36.211 [21], clause 6.10.3A.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>EPDCCH-SetConfig</i></b>                 | Provides EPDCCH configuration set. See TS 36.213 [23], clause 9.1.4. E-UTRAN configures at least one <i>EPDCCH-SetConfig</i> when <i>EPDCCH-Config</i> is configured. For BL UEs or UEs in CE, EUTRAN does not configure more than one <i>EPDCCH-SetConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mpdcch-Narrowband</i></b>                | Parameter:  , see TS 36.211 [21], clause 6.8B.5. Field values (1..maxAvailNarrowBands-r13) correspond to narrowband indices (0..maxAvailNarrowBands-r13-1) as specified in TS 36.211 [21].                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>mpdcch-NumRepetition</i></b>             | Maximum numbers of repetitions for UE-SS for MPDCCH, see TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>mpdcch-pdsch-HoppingConfig</i></b>       | Frequency hopping activation/deactivation for unicast MPDCCH/PDSCH, see TS 36.211 [21]. E-UTRAN does not configure the value on if freqHoppingParametersDL is not present in SystemInformationBlockType1.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>mpdcch-StartSF-UESS</i></b>              | Starting subframe configuration for an MPDCCH UE-specific search space, see TS 36.213 [23]. Value v1 corresponds to 1, value v1dot5 corresponds to 1.5, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>numberPRB-Pairs</i></b>                  | Indicates the number of physical resource-block pairs used for the EPDCCH set. Value n2 corresponds to 2 physical resource-block pairs; n4 corresponds to 4 physical resource-block pairs and so on. Value n8 is not supported if <i>dl-Bandwidth</i> is set to 6 resource blocks. EUTRAN only configures values up to n6 for BL UEs or UEs in CE. Value n6 is only applicable to BL UEs or UEs in CE.                                                                                                                                                                                                                                                    |
| <b><i>pucch-ResourceStartOffset</i></b>        | PUCCH format 1a, 1b and 3 resource starting offset for the EPDCCH set. See TS 36.213 [23], clause 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>re-MappingQCL-ConfigId</i></b>           | Indicates the starting OFDM symbol, the related rate matching parameters and quasi co-location assumption for EPDCCH when the UE is configured with tm10. This field provides the identity of a configured <i>PDSCH-RE-MappingQCL-Config</i> . E-UTRAN configures this field only when tm10 is configured.                                                                                                                                                                                                                                                                                                                                                |
| <b><i>resourceBlockAssignment</i></b>          | Indicates the index to a specific combination of physical resource-block pair for EPDCCH set. See TS 36.213 [23], clause 9.1.4.4. The size of <i>resourceBlockAssignment</i> is specified in TS 36.213 [23], clause 9.1.4.4, and based on <i>numberPRB-Pairs</i> and the signalled value of <i>dl-Bandwidth</i> . If <i>numberPRB-Pairs-v1310</i> field is present, the total number of physical resource-block pairs is 6 and it is composed of one subset of 2 physical resource-block pairs and another subset of 4 physical resource-block pairs, and the <i>resourceBlockAssignment</i> field defines the subset of 2 physical resource-block pairs. |
| <b><i>setConfigId</i></b>                      | Indicates the identity of the EPDCCH configuration set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>startSymbol</i></b>                      | Indicates the OFDM starting symbol for any EPDCCH and PDSCH scheduled by EPDCCH on the same cell, see TS 36.213 [23], clause 9.1.4.1. If not present, the UE shall release the configuration and shall derive the starting OFDM symbol of EPDCCH and PDSCH scheduled by EPDCCH from PCFICH. Values 1, 2, and 3 are applicable for <i>dl-Bandwidth</i> greater than 10 resource blocks. Values 2, 3, and 4 are applicable otherwise. E-UTRAN does not configure the field for UEs configured with tm10.                                                                                                                                                    |
| <b><i>subframePatternConfig</i></b>            | Configures the subframes which the UE shall monitor the UE-specific search space on EPDCCH, except for pre-defined rules in TS 36.213 [23], clause 9.1.4. If the field is not configured when EPDCCH is configured, the UE shall monitor the UE-specific search space on EPDCCH in all subframes except for pre-defined rules in TS 36.213 [23], clause 9.1.4.                                                                                                                                                                                                                                                                                            |
| <b><i>transmissionType</i></b>                 | Indicates whether distributed or localized EPDCCH transmission mode is used as defined in TS 36.211 [21], clause 6.8A.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## — *EIMTA-MainConfig*

The IE *EIMTA-MainConfig* is used to specify the eIMTA-RNTI used for eIMTA and the subframes used for monitoring PDCCH with eIMTA-RNTI. The IE *EIMTA-MainConfigServCell* is used to specify the eIMTA related parameters applicable for the concerned serving cell.

### ***EIMTA-MainConfig* field descriptions**

#### ***eimta-CommandPeriodicity***

Configures the periodicity to monitor PDCCH with eIMTA-RNTI, see TS 36.213 [23], clause 13.1. Value sf10 corresponds to 10 subframes, sf20 corresponds to 20 subframes and so on.

#### ***eimta-CommandSubframeSet***

Configures the subframe(s) to monitor PDCCH with eIMTA-RNTI within the periodicity configured by *eimta-CommandPeriodicity*. The 10 bits correspond to all subframes in the last radio frame within each periodicity. The left most bit is for subframe 0 and so on. Each bit can be of value 0 or 1. The value of 1 means that the corresponding subframe is configured for monitoring PDCCH with eIMTA-RNTI, and the value of 0 means otherwise. In case of TDD as PCell, only the downlink and the special subframes indicated by the UL/ DL configuration in SIB1 can be configured for monitoring PDCCH with eIMTA-RNTI. In case of FDD as PCell, any of the ten subframes can be configured for monitoring PDCCH with eIMTA-RNTI.

#### ***eimta-HARQ-ReferenceConfig***

Indicates UL/ DL configuration used as the DL HARQ reference configuration for this serving cell. Value sa2 corresponds to Configuration2, sa4 to Configuration4 etc, as specified in TS 36.211 [21], table 4.2-2. E-UTRAN configures the same value for all serving cells residing on same frequency band.

#### ***eimta-UL-DL-ConfigIndex***

Index of *I*, see TS 36.212 [22], clause 5.3.3.1.4. E-UTRAN configures the same value for all serving cells residing on same frequency band.

#### ***mbsfn-SubframeConfigList***

Configure the MBSFN subframes for the UE on this serving cell. An uplink subframe indicated by the DL/UL subframe configuration in SIB1 can be configured as MBSFN subframe.

## — *GWUS-Config*

The IE *GWUS-Config* is used to specify the Group WUS configuration. For the UEs supporting GWUS, E-UTRAN uses GWUS to indicate that the UE shall attempt to receive paging in that cell, see TS 36.304 [4].

| <b>GWUS-Config field descriptions</b>                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>commonSequence</b>                                                         | Presence of the field indicates common WUS sequence is configured. Value $g_0$ indicates common WUS sequence for the shared WUS resource corresponds to $g = 0$ , and value $g_{126}$ indicates common WUS sequence for the shared WUS resource corresponds to $g = 126$ , see TS 36.211 [21].                                                                                                                                                                                                                                                        |
| <b>groupAlternation</b>                                                       | Presence of the field enables WUS group alternation between the two or more WUS resources for the gap type, see TS 36.304 [4].                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>groupNarrowBandList</b>                                                    | List indicating which paging narrowbands support group WUS see TS 36.304 [4]. First entry in the list indicates WUS support for first paging narrowband, second entry in the list indicates WUS support for second paging narrowband, and so on. If E-UTRAN includes <i>groupNarrowBandList</i> , the number of entries is equal to the value of <i>paging-narrowBands</i> . If this list is absent, group WUS is supported on all paging narrowbands.<br>E-UTRAN does not configure this field when RRC_INACTIVE is used in the cell.                |
| <b>groupsForServiceList</b>                                                   | Number of WUS groups for each paging probability group see TS 36.304 [4]. The first entry corresponds to the first probability group, the second entry corresponds to the second paging probability group, and so on. Total number of WUS groups in this list cannot be more than the total number of WUS groups in <i>numGroupsList</i> . If E-UTRAN includes <i>groupsForServiceList</i> , it includes the same number of entries and listed in the same order as in <i>probThreshList</i> .                                                        |
| <b>numGroupsList</b>                                                          | List of WUS groups for each WUS resource see TS 36.304 [4]. First entry corresponds to the first resource, second entry corresponds to the second resource, and so on. <i>numGroupsList</i> is mandatory present in <i>resourceConfigDRX</i> . If <i>numGroupsList</i> is not present in <i>resourceConfig-eDRX-Short</i> , parameter for DRX WUS resource applies for short eDRX WUS resource. If <i>numGroupsList</i> is not present in <i>resourceConfig-eDRX-Long</i> , parameter for short eDRX WUS resource applies for long eDRX WUS resource. |
| <b>probThreshList</b>                                                         | Paging probability thresholds corresponding to the paging probability groups, see TS 36.304 [4]. Value $p_{20}$ corresponds to 20%, value $p_{30}$ corresponds to 30%, and so on.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>resourceConfigDRX, resourceConfig-eDRX-Short, resourceConfig-eDRX-Long</b> | WUS resource configured for each gap type see TS 36.304 [4]. If <i>resourceConfig-eDRX-Short</i> is not present, DRX WUS parameters apply for short eDRX WUS resource. If <i>resourceConfig-eDRX-Long</i> is not present, short eDRX WUS parameters apply for long eDRX WUS resource.                                                                                                                                                                                                                                                                 |
| <b>resourceMappingPattern</b>                                                 | Identifies the WUS resource mapping to time/frequency as defined in TS 36.304 [4]. If <i>wus-Config-r15</i> is present in <i>SystemInformationBlockType2</i> , the field is set to value <i>resourceLocationWithWUS</i> ; otherwise the field is set to value <i>resourceLocationWithoutWUS</i> .                                                                                                                                                                                                                                                     |
| <b>timeParameters</b>                                                         | Time domain WUS configuration information. For individual field descriptions, see <i>WUS-Config</i> . If the field is absent, the parameters in <i>wus-Config</i> apply.                                                                                                                                                                                                                                                                                                                                                                              |

| Conditional presence    | Explanation                                                                                                                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>NoWUSr15</i>         | The field is mandatory present if <i>wus-Config-r15</i> is not present in <i>SystemInformationBlockType2</i> ; otherwise the field is not present.                                                            |
| <i>ProbabilityBased</i> | The field is mandatory present if paging probability based WUS group selection is configured; otherwise the field is not present and the UE shall delete any existing value for this field.                   |
| <i>TimeOffset</i>       | The field is optionally present, Need OP, if <i>timeOffset-eDRX-Long</i> is present in <i>timeParameters</i> ; otherwise the field is not present, and the UE shall delete any existing value for this field. |

|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>allowedHARQ-Mode</i></b>                        | Indicates the allowed HARQ mode of a HARQ process mapped to this logical channel. If the parameter is absent, there is no restriction for HARQ mode for the mapping. This field applies to SRB1, SRB2 and DRBs.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>allowedTTI-Lengths</i></b>                      | Indicates the allowed TTI lengths for the logical channel. If not configured, the UE is allowed to transmit the logical channel using any TTI length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>bitRateMultiplier</i></b>                       | Bit rate multiplier for recommended bit rate MAC CE as specified in TS 36.321 [6]. Value <i>x40</i> indicates bit rate multiplier 40, value <i>x70</i> indicates bit rate multiplier 70 and so on.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>bitRateQueryProhibitTimer</i></b>               | The timer is used for bit rate recommendation query in TS 36.321 [6], clause 5.18, in seconds. Value <i>s0</i> means 0s, <i>s0dot4</i> means 0.4s and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>bucketSizeDuration</i></b>                      | Bucket Size Duration for logical channel prioritization in TS 36.321 [6]. Value in milliseconds. Value <i>ms50</i> corresponds to 50 ms, <i>ms100</i> corresponds to 100 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>channelAccessPriority</i></b>                   | Indicates the channel access priority class for the logical channel. UE shall select the lowest channel access priority class (i.e. highest signalled value) of the logical channel with MAC SDU multiplexed into the MAC PDU. MAC CEs except padding BSR apply the highest channel access priority class (i.e. lowest signalled value), as defined in TS 36.300 [9].                                                                                                                                                                                                                                                       |
| <b><i>laa-UL-Allowed</i></b>                          | Indicates whether the data of a logical channel is allowed to be transmitted via UL of LAA SCells. Value <i>TRUE</i> indicates that the logical channel is allowed to be sent via UL of LAA SCells. Value <i>FALSE</i> indicates that the logical channel is not allowed to be sent via UL of LAA SCells.                                                                                                                                                                                                                                                                                                                   |
| <b><i>lch-CellRestriction</i></b>                     | Indicates cells which are restricted for the logical channel. The bit is set to 1 if the cell is restricted and to 0 if the cell is not restricted, for each cell. The least significant bit corresponds to the serving cell with index 0, the next bit corresponds to the serving cell with index 1, and so on. If the cell is restricted for the logical channel, then data for the logical channel is not allowed to be sent using that cell. If the field is not included, no cells are restricted. See also TS 36.321 [6], clause 5.4.3.1. The restriction is only active when PDCP duplication using CA is activated. |
| <b><i>logicalChannelGroup</i></b>                     | Mapping of logical channel to logical channel group for BSR reporting in TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>logicalChannelSR-Mask</i></b>                   | Controlling SR triggering on a logical channel basis when an uplink grant is configured. See TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>logicalChannelSR-Prohibit</i></b>               | Value <i>TRUE</i> indicates that the <i>logicalChannelSR-ProhibitTimer</i> is enabled for the logical channel. E-UTRAN only (optionally) configures the field (i.e. indicates value <i>TRUE</i> ) if <i>logicalChannelSR-ProhibitTimer</i> is configured. See TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                |
| <b><i>logicalChannelSR-Restriction</i></b>            | Defines the restricted SR configuration for the logical channel. Value <i>succh</i> indicates that the SR cannot be sent on SPUCH and value <i>pucch</i> indicates that the SR cannot be sent on PUCCH. If not configured, the UE is allowed to transmit the SR on any SR resource.                                                                                                                                                                                                                                                                                                                                         |
| <b><i>prioritisedBitRate</i></b>                      | Prioritized Bit Rate for logical channel prioritization in TS 36.321 [6]. Value in kilobytes/second. Value <i>kBps0</i> corresponds to 0 kB/second, <i>kBps8</i> corresponds to 8 kB/second, <i>kBps16</i> corresponds to 16 kB/second and so on. <i>Infinity</i> is the only applicable value for SRB1 and SRB2                                                                                                                                                                                                                                                                                                            |
| <b><i>priority</i></b>                                | Logical channel priority in TS 36.321 [6]. Value is an integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>shortTTI, subframeTTI</i></b>                   | For short TTIs and subframe TTIs respectively: Value <i>TRUE</i> indicates that the UE is allowed to transmit using this TTI length for the logical channel and the value <i>FALSE</i> indicates that the UE is not allowed to transmit using this TTI length for the logical channel. If not configured for a TTI length, then the UE is allowed to transmit this logical channel using this TTI length.                                                                                                                                                                                                                   |

| Conditional presence | Explanation                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>SRmask</i>        | The field is optionally present if <i>ul-SpecificParameters</i> is present, need OR; otherwise it is not present. |
| <i>UL</i>            | The field is mandatory present for UL logical channels; otherwise it is not present.                              |

## – *LWA-Configuration*

The IE *LWA-Configuration* is used to setup/modify/release LTE-WLAN Aggregation.

-- ASN1START

```

LWA-Configuration-r13 ::= CHOICE {
 release
 setup
 lwa-Config-r13
 }
}

LWA-Config-r13 ::= SEQUENCE {
 lwa-MobilityConfig-r13 WLAN-MobilityConfig-r13 OPTIONAL, -- Need ON
 lwa-WT-Counter-r13 INTEGER (0..65535) OPTIONAL, -- Need ON
 ...
 [[wt-MAC-Address-r14 OCTET STRING (SIZE (6)) OPTIONAL -- Need ON
]]
}

-- ASN1STOP

```

#### LWA-Configuration field descriptions

##### **Iwa-MobilityConfig**

Indicates the parameters used for WLAN mobility.

##### **Iwa-WT-Counter**

Indicates the parameter used by UE for WLAN authentication.

##### **wt-MAC-Address**

Indicates the WT MAC address of the WT handling the LWA operation for the UE. The UE uses this MAC address in uplink transmissions to enable routing of LWA uplink data from the AP to the WT. E-UTRAN configures the field only if *ul-LWA-Config-r14* is configured for at least one LWA bearer.

### — LWIP-Configuration

The IE *LWIP-Configuration* is used to add, modify or release DRBs that are using LWIP Tunnel.

```

-- ASN1START

LWIP-Configuration-r13 ::= CHOICE {
 release
 setup
 lwip-Config-r13
 }
}

LWIP-Config-r13 ::= SEQUENCE {
 lwip-MobilityConfig-r13 WLAN-MobilityConfig-r13 OPTIONAL, -- Need ON
 tunnelConfigLWIP-r13 TunnelConfigLWIP-r13 OPTIONAL, -- Need ON
 ...
}

-- ASN1STOP

```

#### LWIP-Configuration field descriptions

##### **lwip-MobilityConfig**

Indicates the WLAN mobility set for LWIP.

##### **tunnelConfigLWIP**

Indicates the parameters used for establishing the LWIP tunnel.

### — MAC-MainConfig

The IE *MAC-MainConfig* is used to specify the MAC main configuration for signalling and data radio bearers. All MAC main configuration parameters can be configured independently per Cell Group (i.e. MCG or SCG), unless explicitly specified otherwise.

#### MAC-MainConfig information element

```

-- ASN1START

MAC-MainConfig ::= SEQUENCE {

|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ce-ETWS-CMAS-RxInConn</b>              | Indicates UE shall monitor for ETWS/CMAS notification on control channels associated with the shared data channel in RRC_CONNECTED as specified in TS 36.213 [23], clause 7.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>dl-PathlossChange</b>                  | DL Pathloss Change and the change of the required power backoff due to power management (as allowed by P-MPRc, see TS 36.101 [42]) for PHR reporting in TS 36.321 [6]. Value in dB. Value dB1 corresponds to 1 dB, dB3 corresponds to 3 dB and so on. The same value applies for each serving cell (although the associated functionality is performed independently for each cell).                                                                                                                                                                                                                                                                                                                             |
| <b>dormantSCellDeactivationTimer</b>      | SCell deactivation timer for UEs supporting dormant state as specified in TS 36.321 [6]. Value in number of radio frames. Value rf4 corresponds to 4 radio frames, value rf8 corresponds to 8 radio frames and so on. E-UTRAN only configures the field if the UE is configured with one or more SCells other than the PSCell and PUCCH SCell. The same value applies for each SCell of a Cell Group (i.e. MCG or SCG) (although the associated functionality is performed independently for each SCell). Field <i>dormantSCellDeactivationTimer</i> does not apply for the PUCCH SCell.                                                                                                                         |
| <b>drx-Config</b>                         | Used to configure DRX as specified in TS 36.321 [6]. E-UTRAN configures the values in <i>DRX-Config-v1130</i> only if the UE indicates support for IDC indication. E-UTRAN configures <i>drx-Config-v1130</i> , <i>drx-Config-v1310</i> and <i>drx-Config-r13</i> only if <i>drx-Config</i> (without suffix) is configured. E-UTRAN configures <i>drx-Config-r13</i> only if UE supports CE or if the UE is configured with uplink of an LAA SCell.                                                                                                                                                                                                                                                              |
| <b>drx-InactivityTimer</b>                | Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf0 corresponds to 0 PDCCH sub-frame and behaviour as specified in 7.3.2 applies, value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>drx-RetransmissionTimer</b>            | Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf0 corresponds to 0 PDCCH sub-frame and behaviour as specified in 7.3.2 applies, value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on. In case <i>drx-RetransmissionTimer-v1130</i> or <i>drx-RetransmissionTimer-v1310</i> is signalled, the UE shall ignore <i>drx-RetransmissionTimer</i> (i.e. without suffix).                                                                                                                                                                                                                                                                        |
| <b>drx-RetransmissionTimerShortTTI</b>    | Timer for DRX in TS 36.321 [6]. Value in number of short TTIs when short TTI is configured. Value <i>tti10</i> corresponds to 10 TTIs, value <i>tti20</i> corresponds to 20 TTIs and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>drx-ULRetransmissionTimer</b>          | Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf0 corresponds to 0 PDCCH sub-frame and behaviour as specified in 7.3.2 applies, value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>drx-UL-RetransmissionTimerShortTTI</b> | Timer for DRX in TS 36.321 [6]. Value in number of short TTIs when short TTI is configured. Value <i>tti0</i> corresponds to 0 TTIs and behaviour as specified in 7.3.2 applies, value <i>tti1</i> corresponds to 1 TTI and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>drxShortCycleTimer</b>                 | Timer for DRX in TS 36.321 [6]. Value in multiples of shortDRX-Cycle. A value of 1 corresponds to shortDRX-Cycle, a value of 2 corresponds to 2 * shortDRX-Cycle and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>dualConnectivityPHR</b>                | Indicates if power headroom shall be reported using Dual Connectivity Power Headroom Report MAC Control Element defined in TS 36.321 [6] (value <i>setup</i> ). For both LTE DC and (NG)EN-DC, if PHR functionality is configured, E-UTRAN always configures the value <i>setup</i> for this field and configures <i>phr-Config</i> and <i>dualConnectivityPHR</i> . For LTE DC, E-UTRAN configures the field for both CGs while for (NG)EN-DC, E-UTRAN configures the field only for MCG. E-UTRAN does not configure this field when a DAPS bearer is configured.                                                                                                                                               |
| <b>e-HARQ-Pattern</b>                     | TRUE indicates that enhanced HARQ pattern for TTI bundling is enabled for FDD. E-UTRAN enables this field only when <i>ttiBundling</i> is set to TRUE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>eDRX-Config-CycleStartOffset</b>       | Indicates <i>longDRX-Cycle</i> and <i>drxStartOffset</i> in TS 36.321 [6]. The value of <i>longDRX-Cycle</i> is in number of sub-frames. The value of <i>drxStartOffset</i> , in number of subframes, is indicated by the value of <i>eDRX-Config-CycleStartOffset</i> multiplied by 2560 plus the offset value configured in <i>longDRX-CycleStartOffset</i> . E-UTRAN only configures value <i>setup</i> when the value in <i>longDRX-CycleStartOffset</i> is sf2560.                                                                                                                                                                                                                                          |
| <b>extendedBSR-Sizes</b>                  | If value <i>setup</i> is configured, the BSR index indicates extended BSR size levels as defined in TS 36.321 [6], Table 6.1.3.1-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>extendedPHR</b>                        | Indicates if power headroom shall be reported using the Extended Power Headroom Report MAC control element defined in TS 36.321 [6] (value <i>setup</i> ). E-UTRAN always configures the value <i>setup</i> if more than one and up to eight Serving Cell(s) with uplink is configured and none of the serving cells with uplink configured has a <i>servingCellIndex</i> higher than seven and if PUCCH on SCell is not configured and if dual connectivity is not configured. E-UTRAN configures <i>extendedPHR</i> only if <i>phr-Config</i> is configured. E-UTRAN does not configure this field when a DAPS bearer is configured. The UE shall release <i>extendedPHR</i> if <i>phr-Config</i> is released. |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>extendedPHR2</b>                     | Indicates if power headroom shall be reported using the Extended Power Headroom Report MAC Control Element defined in TS 36.321 [6] (value <i>setup</i> ). E-UTRAN always configures the value <i>setup</i> if any of the serving cells with uplink configured has a <i>servingCellIndex</i> higher than seven in case dual connectivity is not configured or if PUCCH SCell (with any number of serving cells with uplink configured) is configured. E-UTRAN configures <i>extendedPHR2</i> only if <i>phr-Config</i> is configured. E-UTRAN does not configure this field when a DAPS bearer is configured. The UE shall release <i>extendedPHR2</i> if <i>phr-Config</i> is released.                                                                           |
| <b>logicalChannelSR-ProhibitTimer</b>   | Timer used to delay the transmission of an SR for logical channels enabled by <i>logicalChannelSR-Prohibit</i> . Value sf20 corresponds to 20 subframes, sf40 corresponds to 40 subframes, and so on. See TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>longDRX-CycleStartOffset</b>         | <i>longDRX-Cycle</i> and <i>drxStartOffset</i> in TS 36.321 [6] unless <i>eDRX-Config-CycleStartOffset</i> is configured. The value of <i>longDRX-Cycle</i> is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. If <i>shortDRX-Cycle</i> is configured, the value of <i>longDRX-Cycle</i> shall be a multiple of the <i>shortDRX-Cycle</i> value. The value of <i>drxStartOffset</i> value is in number of sub-frames. In case <i>longDRX-CycleStartOffset-v1130</i> is signalled, the UE shall ignore <i>longDRX-CycleStartOffset</i> (i.e. without suffix). In case <i>longDRX-CycleStartOffset-v1310</i> is signalled, the UE shall ignore <i>longDRX-CycleStartOffset</i> (i.e. without suffix). |
| <b>maxHARQ-Tx</b>                       | Maximum number of transmissions for UL HARQ in TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>mpdch-UL-HARQ-ACK-FeedbackConfig</b> | TRUE indicates E-UTRAN may send UL HARQ-ACK feedback or UL grant corresponding to a new transmission for early termination of PUSCH transmission, or positive acknowledgement of completed PUSCH transmissions as specified in TS 36.321 [6] and TS 36.212 [22]. In case of acknowledgement of RRC Connection Release, MPDCCH monitoring is terminated.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>offsetThresholdTA</b>                | Offset for TA reporting as specified in TS 36.321 [6]. Value <i>ms0dot5</i> corresponds to 0.5 millisecond, value <i>ms1</i> corresponds to 1 millisecond and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>onDurationTimer</b>                  | Timer for DRX in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value <i>psf1</i> corresponds to 1 PDCCH sub-frame, <i>psf2</i> corresponds to 2 PDCCH sub-frames and so on. In case <i>onDurationTimer-v1310</i> is signalled, the UE shall ignore <i>onDurationTimer</i> (i.e. without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>periodicBSR-Timer</b>                | Timer for BSR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>periodicPHR-Timer</b>                | Timer for PHR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 subframes, sf20 corresponds to 20 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>phr-ModeOtherCG</b>                  | Indicates the mode (i.e. <i>real</i> or <i>virtual</i> ) used for the PHR of the activated cells that are part of the other Cell Group (i.e. MCG or SCG), when DC is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>proc-Timeline</b>                    | Minimum processing timeline for short TTI with subslot operation. Value <i>nplus4set1</i> indicates processing time n+4 for set 1, value <i>nplus6set1</i> indicates processing time n+6 for set 1, value <i>nplus6set2</i> indicates processing time n+6 for set 2 and value <i>nplus8set2</i> indicates processing time n+8 for set 2. See also UE capability <i>min-Proc-TimelineSubslot</i> for sTTI.                                                                                                                                                                                                                                                                                                                                                          |
| <b>prohibitPHR-Timer</b>                | Timer for PHR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf0 corresponds to 0 subframes and behaviour as specified in 7.3.2 applies, sf100 corresponds to 100 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>rai-Activation</b>                   | Activation of release assistance indication (RAI) in TS 36.321 [6] for BL UEs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>retxBSR-Timer</b>                    | Timer for BSR reporting in TS 36.321 [6]. Value in number of sub-frames. Value sf640 corresponds to 640 sub-frames, sf1280 corresponds to 1280 sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>sCellDeactivationTimer</b>           | SCell deactivation timer in TS 36.321 [6]. Value in number of radio frames. Value <i>rf4</i> corresponds to 4 radio frames, value <i>rf8</i> corresponds to 8 radio frames and so on. E-UTRAN only configures the field if the UE is configured with one or more SCells other than the PSCell and PUCCH SCell. If the field is absent, the UE shall delete any existing value for this field and assume the value to be set to <i>infinity</i> . The same value applies for each SCell of a Cell Group (i.e. MCG or SCG) (although the associated functionality is performed independently for each SCell). Field <i>sCellDeactivationTimer</i> does not apply for the PUCCH SCell.                                                                                |
| <b>sCellHibernationTimer</b>            | SCell hibernation timer for UEs supporting dormant SCell state as specified in TS 36.321 [6]. Value in number of radio frames. Value <i>rf4</i> corresponds to 4 radio frames, value <i>rf8</i> corresponds to 8 radio frames and so on. E-UTRAN only configures the field if the UE is configured with one or more SCells other than the PSCell and PUCCH SCell. The same value applies for each SCell of a Cell Group (i.e. MCG or SCG) (although the associated functionality is performed independently for each SCell). Field <i>sCellHibernationTimer</i> does not apply for the PUCCH SCell.                                                                                                                                                                |

|                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>shortDRX-Cycle</b>                        | Short DRX cycle in TS 36.321 [6]. Value in number of sub-frames. Value sf2 corresponds to 2 sub-frames, sf5 corresponds to 5 subframes and so on. In case <i>shortDRX-Cycle-v1130</i> is signalled, the UE shall ignore <i>shortDRX-Cycle</i> (i.e. without suffix). Short DRX cycle is not configured for UEs in CE.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>skipUplinkTxDynamic</b>                   | If configured, the UE skips UL transmissions for an uplink grant other than a configured uplink grant if no data is available for transmission in the UE buffer as described in TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>skipUplinkTxSPS</b>                       | If configured, the UE skips UL transmissions for a configured uplink grant if no data is available for transmission in the UE buffer as described in TS 36.321 [6]. E-UTRAN always configures <i>skipUplinkTxSPS</i> when there is at least one SPS configuration with <i>semiPersistSchedIntervalUL</i> shorter than sf10 or when at least one SPS-ConfigUL-STI is configured for the cell group.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sr-ProhibitTimer</b>                      | Timer for SR transmission on PUCCH in TS 36.321 [6]. Value in number of SR period(s) of shortest SR period of any serving cell with PUCCH. Value 0 means that behaviour as specified in 7.3.2 applies. Value 1 corresponds to one SR period, Value 2 corresponds to 2*SR periods and so on. SR period is defined in TS 36.213 [23], table 10.1.5-1. If <i>sr-ProhibitTimerOffset</i> is present, actual value of <i>sr-ProhibitTimer</i> = CEIL ( <i>sr-ProhibitTimerOffset</i> / SR period) + signalled value of <i>sr-ProhibitTimer</i> .                                                                                                                                                                                                                         |
| <b>sr-ProhibitTimerOffset</b>                | Time offset for SR transmission on PUCCH. Value in milliseconds. Value <i>ms90</i> corresponds to 90 ms, value <i>ms180</i> corresponds to 180 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ssr-ProhibitTimer</b>                     | Timer for prohibiting SR transmission on SPUCC in TS 36.321 [6]. Value in number of SR period(s) of shortest SR period of any serving cell with SPUCC. Value 0 means that behaviour as specified in 7.3.2 applies. Value 1 corresponds to one SR period, value 2 corresponds to 2 SR periods and so on. SR period is defined in TS 36.213 [23], table 10.1.5-1.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>stag-Id</b>                               | Indicates the TAG of an SCell, see TS 36.321 [6]. Uniquely identifies the TAG within the scope of a Cell Group (i.e. MCG or SCG). If the field is not configured for an SCell (e.g. absent in <i>MAC-MainConfigSCell</i> ), the SCell is part of the PTAG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>stag-ToAddModList, stag-ToReleaseList</b> | Used to configure one or more STAGs. E-UTRAN ensures that a STAG contains at least one SCell with configured uplink. If, due to SCell release a reconfiguration would result in an 'empty' TAG, E-UTRAN includes release of the concerned TAG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>timeAlignmentTimerSTAG</b>                | Indicates the value of the time alignment timer for an STAG, see TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ttiBundling</b>                           | TRUE indicates that TTI bundling TS 36.321 [6] is enabled while FALSE indicates that TTI bundling is disabled. TTI bundling can be enabled for FDD and for TDD for configurations 0, 1 and 6 and additionally for configurations 2 and 3 when <i>symPUSCH-UpPTS-r14</i> is configured. The functionality is performed independently per Cell Group (i.e. MCG or SCG), but E-UTRAN does not configure TTI bundling for the SCG. For a TDD PCell, E-UTRAN does not simultaneously enable TTI bundling and semi-persistent scheduling in this release of specification. Furthermore, for a Cell Group, E-UTRAN does not simultaneously configure TTI bundling and SCells with configured uplink, and E-UTRAN does not simultaneously configure TTI bundling and eIMTA. |

## P-C-AndCBSR

The IE *P-C-AndCBSR* is used to specify the power control and codebook subset restriction configuration.

### P-C-AndCBSR information elements

```
-- ASN1START

P-C-AndCBSR-r11 ::= SEQUENCE {
 p-C-r11 INTEGER (-8..15),
 codebookSubsetRestriction-r11 BIT STRING
}

P-C-AndCBSR-r13 ::= SEQUENCE {
 p-C-r13 INTEGER (-8..15),
 cbsr-Selection-r13 CHOICE{
 nonPrecoded-r13 SEQUENCE {
 codebookSubsetRestriction1-r13 BIT STRING,
 codebookSubsetRestriction2-r13 BIT STRING
 },
 beamformedKla-r13 SEQUENCE {
 codebookSubsetRestriction3-r13 BIT STRING
 }
 }
}
```

```

beamformedKN-r13 SEQUENCE {
 codebookSubsetRestriction-r13 BIT STRING
}
},
...
}

P-C-AndCBSR-r15 ::= SEQUENCE {
 p-C-r15 INTEGER (-8..15),
 codebookSubsetRestriction4-r15 BIT STRING
}

P-C-AndCBSR-Pair-r13a ::= SEQUENCE (SIZE (1..2)) OF P-C-AndCBSR-r11
P-C-AndCBSR-Pair-r13 ::= SEQUENCE (SIZE (1..2)) OF P-C-AndCBSR-r13
P-C-AndCBSR-Pair-r15 ::= SEQUENCE (SIZE (1..2)) OF P-C-AndCBSR-r15

-- ASN1STOP

```

### P-C-AndCBSR field descriptions

#### **cbsr-Selection**

Indicates which codebook subset restriction parameter(s) are to be used. E-UTRAN applies values *nonPrecoded* when *eMIMO-Type* is set to *nonPrecoded*. E-UTRAN applies value *beamformedK1a* when *eMIMO-Type* is set to *beamformed*, *alternativeCodebookEnabledBeamformed* is set to *TRUE* and *csi-RS-ConfigNZPIdListExt* is not configured. E-UTRAN applies value *beamformedKN* when *csi-RS-ConfigNZPIdListExt* is configured. E-UTRAN applies value *beamformedKN* when *eMIMO-Type* is set to *beamformed*, *csi-RS-ConfigNZPIdListExt* is not configured and *alternativeCodebookEnabledBeamformed* is set to *FALSE*.

#### **codebookSubsetRestriction**

Parameter: *codebookSubsetRestriction*, see TS 36.213 [23] and TS 36.211 [21]. The number of bits in the *codebookSubsetRestriction* for applicable transmission modes is defined in TS 36.213 [23].

#### **codebookSubsetRestriction1**

Parameter: *codebookSubsetRestriction1*, see TS 36.213 [23], Table 7.2-1d. The number of bits in the *codebookSubsetRestriction1* for applicable transmission modes is defined in TS 36.213 [23].

#### **codebookSubsetRestriction2**

Parameter: *codebookSubsetRestriction2*, see TS 36.213 [23], Table 7.2-1e. The number of bits in the *codebookSubsetRestriction2* for applicable transmission modes is defined in TS 36.213 [23].

#### **codebookSubsetRestriction3**

Parameter: *codebookSubsetRestriction3*, see TS 36.213 [23], Table 7.2-1f. The UE shall ignore *codebookSubsetRestriction-r11* or *codebookSubsetRestriction-r10* if *codebookSubsetRestriction3-r13* is configured. The number of bits in the *codebookSubsetRestriction3* for applicable transmission modes is defined in TS 36.213 [23].

#### **codebookSubsetRestriction4**

Parameter: *codebookSubsetRestriction4*, see TS 36.213 [23], Table 7.2. The number of bits in the *codebookSubsetRestriction4* for applicable transmission modes is defined in TS 36.213 [23].

#### **p-C**

Parameter:  $P_c$ , see TS 36.213 [23], clause 7.2.5.

#### **P-C-AndCBSR-Pair**

E-UTRAN includes a single entry if the UE is configured with TM9. If the UE is configured with TM10 and E-UTRAN includes 2 entries, this indicates that the subframe patterns configured for CSI (CQI/PMI/PTI/RI/CRI) reporting (i.e. as defined by field *csi-MeasSubframeSet1* and *csi-MeasSubframeSet2*, or as defined by *csi-MeasSubframeSets-r12*) are to be used for this CSI process, while including a single entry indicates that the subframe patterns are not to be used for this CSI process. For a UE configured with TM10, E-UTRAN does not include 2 entries with *csi-MeasSubframeSet1* and *csi-MeasSubframeSet2* for CSI processes concerning a secondary frequency. Furthermore, E-UTRAN includes 2 entries when configuring both *cqi-pmi-ConfigIndex* and *cqi-pmi-ConfigIndex2*.

## PDCCH-ConfigSCell

The IE *PDCCH-ConfigSCell* specifies PDCCH monitoring parameters that E-UTRAN may configure for a serving cell.

### PDCCH-ConfigSCell information element

```

-- ASN1START

PDCCH-ConfigSCell-r13 ::= SEQUENCE {
 skipMonitoringDCI-format0-1A-r13 ENUMERATED {true} OPTIONAL -- Need OR
}

PDCCH-ConfigLAA-r14 ::= SEQUENCE {

```

```

maxNumberOfSchedSubframes-Format0B-r14 ENUMERATED {sf2, sf3, sf4} OPTIONAL, -- Need OR
maxNumberOfSchedSubframes-Format4B-r14 ENUMERATED {sf2, sf3, sf4} OPTIONAL, -- Need OR
skipMonitoringDCI-Format0A-r14 ENUMERATED {true} OPTIONAL, -- Need OR

 pdcch-candidateReductionAL4-r13 PDCCH-CandidateReductionValue-r13,
 pdcch-candidateReductionAL5-r13 PDCCH-CandidateReductionValue-r13
 }
}

PDCCH-CandidateReductionsLAA-UL-r14 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 pdcch-candidateReductionAL1-r14 PDCCH-CandidateReductionValue-r13,
 pdcch-candidateReductionAL2-r14 PDCCH-CandidateReductionValue-r13,
 pdcch-candidateReductionAL3-r14 PDCCH-CandidateReductionValue-r14,
 pdcch-candidateReductionAL4-r14 PDCCH-CandidateReductionValue-r14,
 pdcch-candidateReductionAL5-r14 PDCCH-CandidateReductionValue-r14
 }
}

-- ASN1STOP

```

#### PDCCH-ConfigSCell field descriptions

##### **maxNumberOfSchedSubframes-Format0B**

Indicates maximum number of schedulable subframes for DCI format 0B as specified in TS 36.213 [23]. Value sf2 corresponds to 2 subframes, value sf3 corresponds to 3 subframes and so on.

##### **maxNumberOfSchedSubframes-Format4B**

Indicates maximum number of schedulable subframes for DCI format 4B as specified in TS 36.213 [23]. Value sf2 corresponds to 2 subframes, value sf3 corresponds to 3 subframes and so on.

##### **skipMonitoringDCI-format0-1A**

Indicates whether the UE is configured to omit monitoring DCI fromat 0/1A, see TS 36.213 [23], clause 9.1.1.

##### **skipMonitoringDCI-Format0A**

Indicates whether the UE is configured to omit monitoring DCI fromat 0A as specified in TS 36.213 [23].

##### **skipMonitoringDCI-Format4A**

Indicates whether the UE is configured to omit monitoring DCI fromat 4A as specified in TS 36.213 [23].

##### **pdcch-candidateReductionALx**

Indicates reduced (E)PDCCH monitoring requirements on UE specific search space of the x-th aggregation level, see TS 36.213 [23], clause 9.1.1. Value n0 corresponds to 0%, value n33 corresponds to 33% and so on.

##### **pdcch-CandidateReductions-Formatx**

Indicates number of blind detections on UE specific search space for each aggregation layer as specified in TS 36.213 [23]. The field can only be present when the UE is configured with uplink of an LAA SCell. If *pdcch-CandidateReductions-Formatx* is not configured, *pdcch-CandidateReductions-r13* applies to the corresponding DCIs (if configured).

## - PDCP-Config

The IE *PDCP-Config* is used to set the configurable PDCP parameters for data radio bearers.

**PDCP-Config information element**

```
-- ASN1START

| <b>bufferSize</b>                     | Indicates the buffer size applied for UDC specified in TS 36.323 [8]. Value <i>kbyte2</i> means 2048 bytes, <i>kbyte4</i> means 4096 bytes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>dictionary</b>                     | Indicates which pre-defined dictionary is used for UDC as specified in TS 36.323 [8]. The value <i>sip-SDP</i> means that UE shall prefill the buffer with standard dictionary for SIP and SDP defined in TS 36.323 [8], and the value <i>operator</i> means that UE shall prefill the buffer with operator-defined dictionary.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>discardTimer</b>                   | Indicates the discard timer value specified in TS 36.323 [8]. Value in milliseconds. Value ms50 means 50 ms, ms100 means 100 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>discardTimerExt</b>                | Indicates the discard timer value specified in TS 36.323 [8]. Value in milliseconds. Value ms2000 means 2000 ms. The UE shall use the extended value <i>discardTimerExt</i> , if present, and ignore the value signaled by <i>discardTimer</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>drb-ContinueEHC-DL</b>             | Indicates whether the PDCP entity continues or resets the downlink EHC header compression protocol during PDCP re-establishment, as specified in TS 36.323 [8]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>drb-ContinueEHC-UL</b>             | Indicates whether the PDCP entity continues or resets the uplink EHC header compression protocol during PDCP re-establishment, as specified in TS 36.323 [8]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ehc-CID-Length</b>                 | Indicates the length of the CID field for EHC packet. Once the field <i>ethernetHeaderCompression-r16</i> is configured for a DRB, the value of the field <i>ehc-CID-Length</i> for this DRB is not reconfigured to a different value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ehc-Common</b>                     | Indicates the configurations that apply for both downlink and uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ehc-Downlink</b>                   | Indicates the configurations that apply for only downlink. If the field is configured, then Ethernet header compression is configured for downlink. Otherwise, it is not configured for downlink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ehc-Uplink</b>                     | Indicates the configurations that apply for only uplink. If the field is configured, then Ethernet header compression is configured for uplink. Otherwise, it is not configured for uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ethernetHeaderCompression</b>      | This field configures Ethernet Header Compression. This field can only be configured for DRB.<br>E-UTRAN does not reconfigure <i>ethernetHeaderCompression</i> for an MCG DRB except for upon handover and upon the first reconfiguration after RRC connection re-establishment. E-UTRAN does not reconfigure <i>ethernetHeaderCompression</i> for a SCG DRB except for upon SCG change involving PDCP re-establishment. E-UTRAN does not configure this field if <i>uplinkDataCompression</i> is configured. E-UTRAN does not configure this field for split and LWA DRBs.                                                                                                                                                                                                     |
| <b>headerCompression</b>              | E-UTRAN does not reconfigure header compression for an MCG DRB except for upon handover and upon the first reconfiguration after RRC connection re-establishment, and without any <i>drb-ContinueROHC</i> . E-UTRAN does not reconfigure header compression for a SCG DRB except for upon SCG change involving PDCP re-establishment. E-UTRAN does not configure header compression while <i>t-Reordering</i> is configured except for DAPS bearers. E-UTRAN only configures this field when neither <i>uplinkOnlyHeaderCompression</i> nor <i>uplinkDataCompression</i> is configured. If <i>headerCompression</i> is configured, the UE shall apply the configured ROHC profile(s) in both uplink and downlink. ROHC and EHC can be both configured simultaneously for a DRB. |
| <b>maxCID</b>                         | Indicates the value of the MAX_CID parameter as specified in TS 36.323 [8]. The total value of MAX_CIDs across all bearers for the UE should be less than or equal to the value of <i>maxNumberROHC-ContextSessions</i> parameter as indicated by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>maxCID-EHC-UL</b>                  | Indicates the value of the MAX_CID_EHC_UL parameter as specified in TS 36.323 [8]. The total value of MAX_CID_EHC_UL across all bearers for the UE should be less than or equal to the value of <i>maxNumberEHC-Contexts</i> parameter as indicated by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pdcn-Duplication</b>               | Parameter for configuring PDCP duplication as specified in TS 36.323 [8]. Value <i>configured</i> indicates that PDCP duplication is configured but initially deactivated and value <i>activated</i> indicates that PDCP duplication is configured and activated upon configuration. For EN-DC, E-UTRAN configures PDCP duplication for MCG DRB only if PDCP duplication is not configured for any split DRB. PDCP duplication is not supported during a DAPS handover.                                                                                                                                                                                                                                                                                                         |
| <b>pdcn-SN-Size</b>                   | Indicates the PDCP Sequence Number length in bits. For RLC UM: value <i>len7bits</i> means that the 7-bit PDCP SN format is used and <i>len12bits</i> means that the 12-bit PDCP SN format is used. For RLC AM: value <i>len15bits</i> means that the 15-bit PDCP SN format is used, value <i>len18bits</i> means that the 18-bit PDCP SN format is used, otherwise if the field is not included upon setup of the PCDP entity 12-bit PDCP SN format is used, as specified in TS 36.323 [8].                                                                                                                                                                                                                                                                                    |

| <b>PDCP-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>profiles</b>                       | The profiles used by both compressor and decompressor in both UE and E-UTRAN. The field indicates which of the ROHC profiles specified in TS 36.323 [8] are supported, i.e. value <i>true</i> indicates that the profile is supported. Profile 0x0000 shall always be supported when the use of ROHC is configured. If support of two ROHC profile identifiers with the same 8 LSB's is signalled, only the profile corresponding to the highest value shall be applied.                                                                                                                                                                                                                 |
| <b>statusFeedback</b>                 | Indicates whether the UE shall send PDCP Status Report periodically or by E-UTRAN polling as specified in TS 36.323 [8]. E-UTRAN configures this field only for LWA DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>statusPDU-TypeForPolling</b>       | Indicates the PDCP Control PDU option when it is triggered by E-UTRAN polling. Value <i>type1</i> indicates using the legacy PDCP Control PDU for PDCP status reporting and value <i>type2</i> indicates using the LWA specific PDCP Control PDU for LWA status reporting as specified in TS 36.323 [8].                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>statusPDU-Periodicity-Type1</b>    | Indicates the value of the PDCP Status reporting periodicity for <i>type1</i> Status PDU, as specified in TS 36.323 [8]. Value in milliseconds. Value ms5 means 5 ms, ms10 means 10 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>statusPDU-Periodicity-Type2</b>    | Indicates the value of the PDCP Status reporting periodicity for <i>type2</i> Status PDU, as specified in TS 36.323 [8]. Value in milliseconds. Value ms5 means 5 ms, ms10 means 10 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>statusPDU-Periodicity-Offset</b>   | Indicates the value of the offset for <i>type2</i> Status PDU periodicity, as specified in TS 36.323 [8]. Value in milliseconds. Value ms1 means 1 ms, ms2 means 2 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>t-Reordering</b>                   | Indicates the value of the reordering timer, as specified in TS 36.323 [8]. Value in milliseconds. Value ms0 means 0 ms and behaviour as specified in 7.3.2 applies, ms20 means 20 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>rn-IntegrityProtection</b>         | Indicates that integrity protection or verification shall be applied for all subsequent packets received and sent by the RN on the DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>statusReportRequired</b>           | Indicates whether or not the UE shall send a PDCP Status Report upon re-establishment of the PDCP entity, upon PDCP data recovery, upon uplink data switching during DAPS handover and upon release of the source cell after DAPS handover as specified in TS 36.323 [8]. If the UE supports DAPS handover, for RLC UM radio bearers, the field has the value FALSE if it has not been configured.                                                                                                                                                                                                                                                                                       |
| <b>ul-DataSplitDRB-ViaSCG</b>         | Indicates whether the UE shall send PDCP PDUs via SCG as specified in TS 36.323 [8]. E-UTRAN only configures the field (i.e. indicates value <i>TRUE</i> ) for split DRBs. For PDCP duplication, if this field is set to <i>TRUE</i> , the primary RLC entity is SCG RLC entity and the secondary RLC entity is MCG RLC entity. If this field is not configured or set to <i>FALSE</i> , the primary RLC entity is MCG RLC entity and the secondary RLC entity is SCG RLC entity.                                                                                                                                                                                                        |
| <b>ul-DataSplitThreshold</b>          | Indicates the threshold value for uplink data split operation specified in TS 36.323 [8]. Value b100 means 100 Bytes, b200 means 200 Bytes and so on. E-UTRAN only configures this field for split DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ul-LWA-DRB-ViaWLAN</b>             | Indicates whether the UE shall send PDCP PDUs via the LWAAP entity as specified in TS 36.323 [8]. E-UTRAN only configures this field (i.e. indicates value <i>TRUE</i> ) for LWA DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ul-LWA-DataSplitThreshold</b>      | Indicates the threshold value for uplink data split operation as specified in TS 36.323 [8]. Value b0 means 0 Bytes, b100 means 100 Bytes and so on. E-UTRAN only configures this field for LWA DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>uplinkDataCompression</b>          | Indicates the UDC configuration that the UE shall apply. E-UTRAN does not configure <i>uplinkDataCompression</i> for a DRB, if <i>ethernetHeaderCompression</i> , <i>headerCompression</i> or <i>uplinkOnlyHeaderCompression</i> is already configured for the DRB. E-UTRAN does not configure <i>uplinkDataCompression</i> for the split and LWA DRBs. The maximum number of DRBs where <i>uplinkDataCompression</i> can be applied is two. In this version of the specification, for existing DRBs, E-UTRAN can only (re)configure <i>uplinkDataCompression</i> via handover procedure or the first <i>RRCConnectionReconfiguration</i> message after RRC connection re-establishment. |
| <b>uplinkOnlyHeaderCompression</b>    | Indicates the ROHC configuration that the UE shall apply uplink-only ROHC operations, see TS 36.323 [8]. E-UTRAN only configures this field when <i>headerCompression</i> is not configured. E-UTRAN does not reconfigure header compression for an MCG DRB except for upon handover and upon the first reconfiguration after RRC connection re-establishment. E-UTRAN does not reconfigure header compression for a SCG DRB except for upon SCG change involving PDCP re-establishment. For split and LWA DRBs E-UTRAN configures only <i>notUsed</i> .                                                                                                                                 |

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Rlc-AM-UM</i>     | The field is mandatory present upon setup of a PDCP entity for a radio bearer configured with RLC AM. The field is optional, need ON, in case of reconfiguration of a PDCP entity at handover, at the first reconfiguration after RRC re-establishment or at SCG change involving PDCP re-establishment or PDCP data recovery for a radio bearer configured with RLC AM. If the UE supports DAPS handover, this field is optional, need ON, for a radio bearer configured with RLC UM. Otherwise the field is not present.                                                            |
| <i>Rlc-AM2</i>       | The field is optionally present, need OP, upon setup of a PDCP entity for a radio bearer configured with RLC AM. Otherwise the field is not present.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Rlc-AM3</i>       | The field is optionally present, need OP, upon setup of a PDCP entity for a radio bearer configured with RLC AM, if <i>pdcp-SN-Size-v1130</i> is absent. Otherwise the field is not present.                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>Rlc-AM4</i>       | The field is optionally present, need ON, upon setup of a PDCP entity for a radio bearer configured with RLC AM. The field is optional, need OP, in case of reconfiguration of a PDCP entity at handover, or at the first reconfiguration after RRC re-establishment. Otherwise the field is not present and the UE shall continue to use the existing value.                                                                                                                                                                                                                         |
| <i>Rlc-UM</i>        | The field is mandatory present upon setup of a PDCP entity for a radio bearer configured with RLC UM. It is optionally present, Need ON, upon handover within E-UTRA, upon the first reconfiguration after re-establishment and upon SCG change involving PDCP re-establishment. Otherwise the field is not present.                                                                                                                                                                                                                                                                  |
| <i>RN</i>            | The field is optionally present when signalled to the RN, need OR. Otherwise the field is not present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>Setup</i>         | The field is mandatory present in case of radio bearer setup. Otherwise the field is optionally present, need ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>SetupS</i>        | The field is mandatory present in case of setup of or reconfiguration to a split DRB or LWA DRB as well as in case of setup of or reconfiguration to a DRB associated with at least one RLC entity configured with <i>rlc-OutOfOrderDelivery</i> . The field is optionally present upon reconfiguration of a split DRB or LWA DRB or upon DRB type change from split to MCG DRB or from LWA to LTE only as well as upon reconfiguration of a DRB associated with at least one RLC entity configured with <i>rlc-OutOfOrderDelivery</i> , need ON. Otherwise the field is not present. |

## PDSCH-Config

The IE *PDSCH-ConfigCommon* and the IE *PDSCH-ConfigDedicated* are used to specify the common and the UE specific PDSCH configuration respectively.

### PDSCH-Config information element

```
-- ASN1START

|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>altMCS-TableScalingConfig</b>             | Presence of the field indicates activation of 6-bit MCS table (i.e., <i>altMCS-Table</i> ) for UE indicating support for <i>altMCS-Table</i> , see TS 36.212 [22] and TS 36.213 [23]. The indicated value configures the parameter <i>altMCS-Table-Scaling</i> where value oDot5 corresponds to scaling factor 0.5, value oDot625 corresponds to scaling factor 0.625 and so on, see TS 36.213 [23].                                                                                                 |
| <b>ce-CQI-AlternativeTableConfig</b>         | Configures the UE supporting alternative CQI table to use the alternative CQI table in CE mode A. See TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                |
| <b>ce-HARQ-AckBundling</b>                   | Activation of PDSCH HARQ-ACK bundling in half duplex FDD in CE mode A, see TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ce-HARQ-AckDelay</b>                      | Configures the HARQ ACK delay between different subframe types and absolute subframes when UE is configured with 14 HARQ, see TS 36.212 [22] and TS 36.213 [23]. Value <i>alt-1</i> corresponds to Alt-1 and value <i>alt-2e</i> corresponds to Alt-2e.                                                                                                                                                                                                                                              |
| <b>ce-PDSCH-14HARQ-Config</b>                | Indicates whether 14-HARQ is enabled for HD-FDD Cat M1 UE, see TS 36.211 [21], TS 36.212 [22] and TS 36.213 [23]. E-UTRAN may set this field to setup only when DL multi-TB scheduling is not enabled and PUCCH repetition with HARQ-ACK bundling is not configured.                                                                                                                                                                                                                                 |
| <b>ce-PDSCH-64QAM-Config</b>                 | Activation of 64 QAM for non-repeated unicast PDSCH in CE mode A.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ce-PDSCH-FlexibleStartPRB-AllocConfig</b> | Activation of flexible starting PRB for PDSCH resource allocation in CE mode A or B. E-UTRAN does not configure this field when E-UTRA system bandwidth is 1.4 MHz.                                                                                                                                                                                                                                                                                                                                  |
| <b>ce-PDSCH-MaxBandwidth</b>                 | Maximum PDSCH channel bandwidth in CE mode A and B, see TS 36.212 [22] and TS 36.213 [23]. Value <i>bw5</i> corresponds to 5 MHz, and value <i>bw20</i> corresponds to 20 MHz. If this field is absent, the UE shall release any existing value and set the maximum PDSCH channel bandwidth in CE mode A and B to 1.4 MHz. Parameter: transmission bandwidth configuration, see TS 36.101 [42], table 5.6-1. The max bandwidth can be configured to 5MHz for BL UEs and 5MHz or 20MHz for UEs in CE. |
| <b>ce-PDSCH-maxTBS</b>                       | Indicates whether DL TBS of 1736 bits is enabled for HD-FDD Cat M1 UE in CE mode A, see TS 36.213 [23], clause 7.1.7.2.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ce-PDSCH-MultiTB-Config</b>               | Indicates whether DL multi-TB scheduling is enabled, i.e., a single DCI can schedule up to 8 PDSCH transport blocks in CE mode A and up to 4 PDSCH transport blocks in CE mode B. See TS 36.213 [23], clause 7.1.11.                                                                                                                                                                                                                                                                                 |
| <b>ce-PDSCH-TenProcesses</b>                 | Configuration of 10 (instead of 8) DL HARQ processes in FDD in CE mode A, see TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ce-SchedulingEnhancement</b>              | Activation of dynamic HARQ-ACK delay for HD-FDD for PDSCH in CE mode A controlled by the DCI, see TS 36.212 [22] and TS 36.213 [23]. Value <i>range1</i> corresponds to the first range of HARQ-ACK delays, and value <i>range2</i> corresponds to second range of HARQ-ACK delays.                                                                                                                                                                                                                  |
| <b>codewordOneConfig</b>                     | The field corresponds to codeword 1, see TS 36.213 [23], clause 7.1.10. If absent, the UE applies the values from the serving cell configured on the same frequency.                                                                                                                                                                                                                                                                                                                                 |
| <b>downlinkHARQ-FeedbackDisabledBitmap</b>   | Used to disable the DL HARQ feedback, sent in the uplink, per HARQ process ID, see TS 36.321 [6]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. A bit set to one identifies a HARQ process with disabled DL HARQ feedback and a bit set to zero identifies a HARQ process with enabled DL HARQ feedback.                                                    |
| <b>downlinkHARQ-FeedbackDisabledDCI</b>      | Presence of this field indicates that DCI indication is used to directly indicate or override RRC configuration for disabling HARQ feedback.                                                                                                                                                                                                                                                                                                                                                         |
| <b>harq-AckBundling</b>                      | Indicates whether HARQ-ACK bundling for DL multi-TB scheduling is enabled, see TS 36.213 [23], clause 7.3.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>interleaving</b>                          | Indicates whether interleaving for DL multi-TB scheduling is enabled, see TS 36.213 [23], clause 7.1.11.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>mbsfn-SubframeConfigList</b>              | Indicates the MBSFN configuration for the CSI-RS resources. If <i>optionalSetOfFields</i> is absent, the fields <i>mbsfn-SubframeConfigList-r11</i> and <i>mbsfn-SubframeConfigList-v1430</i> are released.                                                                                                                                                                                                                                                                                          |
| <b>optionalSetOfFields</b>                   | If absent, the UE releases the configuration provided previously, if any, and applies the values from the serving cell configured on the same frequency. If the UE is configured with <i>qcl-Operation-v1530</i> , this field corresponds to codeword 0, see TS 36.213 [23], clause 7.1.10.                                                                                                                                                                                                          |
| <b>p-a</b>                                   | Parameter: $P_A$ , see TS 36.213 [23], clause 5.2. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.                                                                                                                                                                                                                                                                                                                                                                           |

|                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>p-b</b>                                                               | Parameter: $P_B$ , see TS 36.213 [23], clause Table 5.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>pdsch-maxNumRepetitionCEmodeA</b>                                     | Maximum value to indicate the set of PDSCH repetition numbers for CE mode A, see TS 36.211 [21] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pdsch-maxNumRepetitionCEmodeB</b>                                     | Maximum value to indicate the set of PDSCH repetition numbers for CE mode B, see TS 36.211 [21] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pdsch-Start</b>                                                       | The starting OFDM symbol of PDSCH for the concerned serving cell, see TS 36.213 [23], clause 7.1.6.4. Values 1, 2, 3 are applicable when <i>dl-Bandwidth</i> for the concerned serving cell is greater than 10 resource blocks, values 2, 3, 4 are applicable when <i>dl-Bandwidth</i> for the concerned serving cell is less than or equal to 10 resource blocks, see TS 36.211 [21], Table 6.7-1. Value <i>n1</i> corresponds to 1, value <i>n2</i> corresponds to 2 and so on. If the field <i>pdsch-Start-v1530</i> is also configured, E-UTRAN ensures that this value is the same as <i>pdsch-Start</i> (i.e., without suffix).                                                 |
| <b>qcl-CSI-RS-ConfigNZPId</b>                                            | Indicates the CSI-RS resource that is quasi co-located with the PDSCH antenna ports, see TS 36.213 [23], clause 7.1.9. E-UTRAN configures this field if and only if the UE is configured with <i>qcl-Operation</i> set to <i>typeB</i> or <i>qcl-Operation-v1530</i> set to <i>typeC</i> . If the UE is configured with <i>qcl-Operation-v1530</i> set to <i>typeC</i> , the field <i>qcl-CSI-RS-ConfigNZPId-r11</i> corresponds to codeword 0, and the field <i>qcl-CSI-RS-ConfigNZPId-v1530</i> corresponds to codeword 1, see TS 36.213 [23], clause 7.1.10..                                                                                                                      |
| <b>qcl-Operation</b>                                                     | Indicates the quasi co-location behaviour to be used by the UE, type A, type B, or type C, as described in TS 36.213 [23], clause 7.1.10. In case <i>qcl-Operation-v1530</i> is present, the UE shall ignore the field <i>qcl-Operation</i> (without suffix). E-UTRAN configures <i>qcl-Operation-v1530</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency and QCL type C is configured.                                                                                                                                                                                                                                                 |
| <b>referenceSignalPower</b>                                              | Parameter: Reference-signal power, which provides the downlink reference-signal EPRE, see TS 36.213 [23], clause 5.2. The actual value in dBm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>re-MappingQCLConfigToAddModList, re-MappingQCLConfigToReleaseList</b> | For a serving frequency E-UTRAN configures at least one <i>PDSCH-RE-MappingQCL-Config</i> when transmission mode 10 is configured for the serving cell on this carrier frequency. Otherwise it does not configure this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>tbsIndexAlt</b>                                                       | Indicates the applicability of the alternative TBS index for the $I_{TBS}$ 26 and 33 (see TS 36.213 [23], Table 7.1.7.2.1-1), to all subframes scheduled by DCI format 2C or 2D. Value <i>a26</i> refers to the alternative TBS index $I_{TBS}$ 26A, and value <i>a33</i> refers to the alternative TBS index $I_{TBS}$ 33A. If this field is not configured, the UE shall use $I_{TBS}$ 26 specified in Table 7.1.7.2.1-1 in TS 36.213 [23] for all subframes instead. If neither this field nor <i>tbsIndexAlt2</i> configures an alternative TBS index for $I_{TBS}$ 33, the UE shall use $I_{TBS}$ 33 specified in Table 7.1.7.2.1-1 in TS 36.213 [23] for all subframes instead. |
| <b>tbsIndexAlt2</b>                                                      | Indicates the applicability of the alternative TBS index for the $I_{TBS}$ 33 (see TS 36.213 [23], Table 7.1.7.2.1-1) to all subframes. Value <i>b33</i> refers to the alternative TBS index $I_{TBS}$ 33B. If neither this field nor <i>tbsIndexAlt</i> configures an alternative TBS index for $I_{TBS}$ 33, the UE shall use $I_{TBS}$ 33 specified in Table 7.1.7.2.1-1 in TS 36.213 [23] for all subframes instead.                                                                                                                                                                                                                                                              |
| <b>tbs-IndexAlt3</b>                                                     | Indicates the applicability of the alternative TBS index for the $I_{TBS}$ 37 (see TS 36.213 [23], Table 7.1.7.2.1-1) to all subframes. Value <i>a37</i> refers to the alternative TBS index $I_{TBS}$ 37A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Conditional presence | Explanation                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TypeC                | The field is optional, need ON when <i>qcl-Operation</i> is configured with <i>typeC</i> . Otherwise the field is not present and the UE shall delete any existing value for this field. |

## – *PDSCH-RE-MappingQCL-ConfigId*

The IE *PDSCH-RE-MappingQCL-ConfigId* is used to identify a set of PDSCH parameters related to resource element mapping and quasi co-location, as configured by the IE *PDSCH-RE-MappingQCL-Config*. The identity is unique within the scope of a carrier frequency.

### *PDSCH-RE-MappingQCL-ConfigId* information elements

|                                      |                                 |
|--------------------------------------|---------------------------------|
| -- ASN1START                         |                                 |
| PDSCH-RE-MappingQCL-ConfigId-r11 ::= | INTEGER (1 .. maxRE-MapQCL-r11) |
| -- ASN1STOP                          |                                 |

## – *PerCC-GapIndicationList*

The IE *PerCC-GapIndicationList* is used to specify the UE measurement gap preference.

### ***PerCC-GapIndication* information elements**

```
-- ASN1START
PerCC-GapIndicationList-r14 ::= SEQUENCE (SIZE (1..maxServCell-r13)) OF PerCC-GapIndication-r14

PerCC-GapIndication-r14 ::= SEQUENCE {
 servCellId-r14 ServCellIndex-r13,
 gapIndication-r14 ENUMERATED {gap, ncsg, nogap-noNcsg}
}

-- ASN1STOP
```

#### ***PerCC-GapIndication* field descriptions**

##### ***servCellId***

This field identifies the serving cell for which the measurement gap preference is provided.

##### ***gapIndication***

This field is used to indicate the measurement gap preference per component carrier (serving cell) by the UE both in non-CA and CA configurations. Value *gap* indicates that a measurement gap is needed for the associated *servCellId*, value *nogap-noNcsg* indicates that neither a measurement gap nor a ncsg is needed for the associated *servCellId*, value *ncsg* indicates that ncsg is needed for the associated *servCellId*. The UE shall indicate the per CC measurement gap preference consistently for the same non-CA or CA configuration and measurement configuration during the same RRC connection.

## – *PHICH-Config*

The IE *PHICH-Config* is used to specify the PHICH configuration.

### ***PHICH-Config* information element**

```
-- ASN1START
PHICH-Config ::= SEQUENCE {
 phich-Duration ENUMERATED {normal, extended},
 phich-Resource ENUMERATED {oneSixth, half, one, two}
}

-- ASN1STOP
```

#### ***PHICH-Config* field descriptions**

##### ***phich-Duration***

Parameter: *PHICH-Duration*, see TS 36.211 [21], Table 6.9.3-1.

##### ***phich-Resource***

Parameter: *Ng*, see TS 36.211 [21], clause 6.9. Value oneSixth corresponds to 1/6, half corresponds to 1/2 and so on.

## – *PhysicalConfigDedicated*

The IE *PhysicalConfigDedicated* is used to specify the UE specific physical channel configuration.

### ***PhysicalConfigDedicated* information element**

```
-- ASN1START
PhysicalConfigDedicated ::= SEQUENCE {
 pdsch-ConfigDedicated PDSCH-ConfigDedicated OPTIONAL, -- Need ON
 pucch-ConfigDedicated PUCCH-ConfigDedicated OPTIONAL, -- Need ON

| <b><i>absenceOfAnyOtherTechnology</i></b>                  | Presence of this field indicates absence on a long term basis (e.g. by level of regulation) of any other technology sharing the carrier; absence of this field indicates the potential presence of any other technology sharing the carrier, as specified in TS 37.213 [94].                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>additionalSpectrumEmissionPCell</i></b>              | E-UTRAN does not configure this field in this release of the specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>antennaInfo</i></b>                                  | A choice is used to indicate whether the <i>antennaInfo</i> is signalled explicitly or set to the default antenna configuration as specified in clause 9.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>blindSlotSubslotPDSCH-Repetitions</i></b>            | Enables HARQ-less/blind slot or subslot PDSCH repetitions for a UE in a given cell, i.e. back to back slot/subslot PDSCH transmissions for the same transport block. The number of slot/subslot PDSCH transmissions is indicated in the DCI.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>blindSubframePDSCH-Repetitions</i></b>               | Enables HARQ-less/blind subframe PDSCH repetitions for a UE in a given cell, i.e. back to back PDSCH transmissions for the same transport block. The number of PDSCH transmissions is indicated in the DCI.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>ce-CSI-RS-Feedback</i></b>                           | Indicates whether CSI-RS-based CSI feedback is enabled for non-BL UE in CE mode A, see TS 36.213 [23], clause 7.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>ce-Mode</i></b>                                      | Indicates the CE mode as specified in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
