| <b><i>cfi-SubframeNonMBSFN</i></b>                         | Indicates the semi-static control format indicator for subframe operation in non-MBSFN subframes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>cqi-ShortConfigSCell</i></b>                         | Indicates whether the CSI (CQI/PMI/RI/PTI/CRI) reporting resource configured by <i>cqi-ShortConfigSCell</i> is available upon receiving the SCell activation command for this SCell. E-UTRAN only configures this field when transmission mode 1-8 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                               |
| <b><i>csi-RS-Config</i></b>                                | For a serving frequency E-UTRAN does not configure <i>csi-RS-Config</i> (includes zeroTxPowerCSI-RS) when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>csi-RS-ConfigNZPToAddModList</i></b>                 | For a serving frequency E-UTRAN configures one or more <i>CSI-RS-ConfigNZP</i> only when transmission mode 9 or 10 is configured for the serving cell on this carrier frequency. For a serving frequency, EUTRAN configures a maximum number of <i>CSI-RS-ConfigNZP</i> in accordance with transmission mode (including CSI processes), eMIMO (including class) and associated UE capabilities (e.g. k-Max, n-MaxList).                                                                                                                                                                                                                        |
| <b><i>csi-RS-ConfigZP-ApList</i></b>                       | The aperiodic ZP CSI-RS for PDSCH rate matching. The field <i>subframeConfig</i> is applicable to semi-persistent CSI RS reporting. In other cases, the UE shall ignore field <i>subframeConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>csi-RS-ConfigZPToAddModList</i></b>                  | For a serving frequency E-UTRAN configures one or more <i>CSI-RS-ConfigZP</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>dl-STTI-Length, ul-STTI-Length</i></b>               | Indicates the DL and UL short TTI lengths. Value slot corresponds to 7 OFDM symbols and value subslot corresponds to 2 or 3 OFDM symbols. E-UTRAN configures the same value for all serving cells sending PUCCH feedback on the same cell. If one SCell is configured with short TTI in the group of cells configured to send PUCCH on the same cell, the cell carrying PUCCH shall be configured with short TTI. E-UTRAN can configure different value of <i>dl-STTI-Length</i> and <i>ul-STTI-Length</i> for serving cells sending PUCCH feedback on different cells. E-UTRAN does not configure the combination {slot,subslot} for {DL,UL}. |
| <b><i>dummy</i></b>                                        | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>eimta-MainConfigPCell, eimta-MainConfigSCell</i></b> | If E-UTRAN configures <i>eimta-MainConfigPCell</i> or <i>eimta-MainConfigSCell</i> for one serving cell in a frequency band, E-UTRAN configures <i>eimta-MainConfigPCell</i> or <i>eimta-MainConfigSCell</i> for all serving cells residing on the frequency band. E-UTRAN configures <i>eimta-MainConfigPCell</i> or <i>eimta-MainConfigSCell</i> only if <i>eimta-MainConfig</i> is configured.                                                                                                                                                                                                                                              |
| <b><i>energyDetectionThresholdOffset</i></b>               | Indicates the offset to the default maximum energy detection threshold value. Unit in dB. Value -13 corresponds to -13dB, value -12 corresponds to -12dB, and so on (i.e. in steps of 1dB) as specified in TS 37.213 [94].                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b><i>PhysicalConfigDedicated</i></b> field descriptions                      |                                                                                                                                                                                                                                                                                                                                                                         |

| <b><i>epdcch-Config</i></b>                                                   | indicates the <i>EPDCCH-Config</i> for the cell. E-UTRAN does not configure <i>EPDCCH-Config</i> for an SCell that is configured with value <i>other</i> for <i>schedulingCellInfo</i> in <i>CrossCarrierSchedulingConfig</i> .                                                                                                                                         |
| <b><i>k-max</i></b>                                                           | Indicates the maximum number of interfering spatial layers signaled in the assistance information for MUST. Value 1 corresponds to 1 layer, Value 3 corresponds to 3 layers.                                                                                                                                                                                            |
| <b><i>laa-PUSCH-Mode1</i>, <i>laa-PUSCH-Mode2</i>, <i>laa-PUSCH-Mode3</i></b> | Indicates whether LAA PUSCH mode 1, 2 and/or 3 is configured as specified in TS 36.212 [22], clause 5.3.3.1.                                                                                                                                                                                                                                                            |
| <b><i>laa-SCellSubframeConfig</i></b>                                         | A bit-map indicating LAA SCell subframe configuration, "1" denotes that the corresponding subframe is allocated as MBSFN subframe. The bitmap is interpreted as follows:<br>Starting from the first/leftmost bit in the bitmap, the allocation applies to subframes #1, #2, #3, #4, #6, #7, #8, and #9.                                                                 |
| <b><i>maxEnergyDetectionThreshold</i></b>                                     | Indicates the absolute maximum energy detection threshold value. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm) as specified in TS 36.213 [23]. If the field is not configured, the UE shall use a default maximum energy detection threshold value as specified in TS 37.213 [94].                 |
| <b><i>maxNumber-SlotSubslotPDSCH-Repetitions</i></b>                          | Indicates the maximum number of PDSCH transmissions for slot or subslot PDSCH repetitions.                                                                                                                                                                                                                                                                              |
| <b><i>maxNumber-SubframePDSCH-Repetitions</i></b>                             | Indicates the maximum number of PDSCH transmissions for subframe PDSCH repetitions.                                                                                                                                                                                                                                                                                     |
| <b><i>mcs-restrictionSlotSubslotPDSCH-Repetitions</i></b>                     | Indicates the MCS restriction in terms of number of non-addressable MSB in the MCS bit-field for slot or subslot PDSCH repetition applicable when k > 1.                                                                                                                                                                                                                |
| <b><i>mcs-restrictionSubframePDSCH-Repetitions</i></b>                        | Indicates MCS restriction in terms of number of non-addressable MSB in the MCS bit-field for subframe PDSCH repetition applicable when k > 1.                                                                                                                                                                                                                           |
| <b><i>numberOfProcesses-SlotSubslotPDSCH-Repetitions</i></b>                  | Indicates the number of HARQ processes for slot/subslot PDSCH repetition applicable when k > 1 configured per serving cell.                                                                                                                                                                                                                                             |
| <b><i>numberOfProcesses-SubframePDSCH-Repetitions</i></b>                     | Indicates the number of HARQ processes for subframe PDSCH repetition applicable when k > 1 configured per serving cell.                                                                                                                                                                                                                                                 |
| <b><i>p-a-must</i></b>                                                        | Parameter: $P_A$ , see TS 36.213 [23], clause 5.2. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.                                                                                                                                                                                                                                              |
| <b><i>pdsch-ConfigDedicated-v1130</i></b>                                     | For a serving frequency, E-UTRAN configures <i>pdsch-ConfigDedicated-v1130</i> only when transmission mode 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                             |
| <b><i>pdsch-ConfigDedicated-v1280</i></b>                                     | For a serving frequency, E-UTRAN configures <i>pdsch-ConfigDedicated-v1280</i> only when transmission mode 9 or 10 is configured for the serving cell on this carrier frequency.                                                                                                                                                                                        |
| <b><i>pucch-Cell</i></b>                                                      | If present, PUCCH feedback of this SCell is sent on the PUCCH SCell. If absent, PUCCH feedback of this SCell is sent on PCell or PSCell, or if the cell concerns the PUCCH SCell, on the concerned cell. If this field is not modified upon change of PUCCH SCell, the UE shall always send the PUCCH feedback of the concerned SCell using the configured PUCCH SCell. |
| <b><i>pucch-ConfigDedicated</i></b>                                           | E-UTRAN configures <i>pucch-ConfigDedicated-r13</i> only if <i>pucch-ConfigDedicated</i> (i.e., without suffix) is not configured. UE shall ignore <i>pucch-ConfigDedicated-v1020</i> when <i>pucch-ConfigDedicated-r13</i> is configured.                                                                                                                              |
| <b><i>pucch-SCell</i></b>                                                     | If present, the concerned SCell is the PUCCH SCell. E-UTRAN only configures this field upon SCell addition i.e. this field is only released when the SCell is released. The field is not applicable for an LAA SCell in this release.                                                                                                                                   |
| <b><i>pusch-ConfigDedicated-r13</i></b>                                       | E-UTRAN configures <i>pusch-ConfigDedicated-r13</i> only if <i>pusch-ConfigDedicated</i> is not configured.                                                                                                                                                                                                                                                             |
| <b><i>pusch-ConfigDedicated-v1250</i></b>                                     | E-UTRAN configures <i>pusch-ConfigDedicated-v1250</i> only if <i>tpc-SubframeSet</i> is configured.                                                                                                                                                                                                                                                                     |
| <b><i>pusch-EnhancementsConfig</i></b>                                        | Indicates that the UE shall transmit in the PUSCH enhancement mode if <i>pusch-EnhancementsConfig</i> is set to <i>setup</i> , see TS 36.211 [21] and TS 36.213 [23].                                                                                                                                                                                                   |
| <b><i>resourceReservationConfigDedicatedDL</i></b>                            | Indicates whether the DL resource reservation is enabled for the UE, e.g. for NR coexistence. If the field is set to <i>setup</i> and <i>resourceReservationConfigDedicatedDL</i> is not included, then <i>resourceReservationConfigCommonDL</i> in <i>SystemInformationBlockType29</i> applies.                                                                        |

| <b><i>PhysicalConfigDedicated</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                    |  |

| <b><i>srs-VirtualCellID-AllSRS</i></b>                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| Value TRUE indicates the configured virtual cell ID is applied to all SRS symbols. Value FALSE indicates the configured virtual cell ID is applied only to additional SRS symbols.                                                                                                                                                                                                                                                          |  |
| <b><i>subframeStartPosition</i></b>                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| Indicates possible starting positions of transmission in the first subframe of the DL transmission burst, see TS 36.211 [21]. Value s0 means the starting position is subframe boundary, s07 means the starting position is either subframe boundary or slot boundary.                                                                                                                                                                      |  |
| <b><i>tpc-PDCCH-ConfigPUCCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| PDCCH configuration for power control of PUCCH using format 3/3A, see TS 36.212 [22].                                                                                                                                                                                                                                                                                                                                                       |  |
| <b><i>tpc-PDCCH-ConfigPUSCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| PDCCH configuration for power control of PUSCH using format 3/3A, see TS 36.212 [22].                                                                                                                                                                                                                                                                                                                                                       |  |
| <b><i>typeA-SRS-TPC-PDCCH-Group</i></b>                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| Indicates Type A trigger configuration for SRS transmission on a PUSCH-less SCell. E-UTRAN configures the UE with either <i>typeA-SRS-TPC-PDCCH-Group</i> or <i>typeB-SRS-TPC-PDCCH-Group</i> , if any.                                                                                                                                                                                                                                     |  |
| <b><i>uplinkPowerControlDedicated</i></b>                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| E-UTRAN configures <i>uplinkPowerControlDedicated-v1130</i> only if <i>uplinkPowerControlDedicated</i> (without suffix) is configured.                                                                                                                                                                                                                                                                                                      |  |
| <b><i>uplinkPowerControlDedicatedSCell</i></b>                                                                                                                                                                                                                                                                                                                                                                                              |  |
| E-UTRAN configures <i>uplinkPowerControlDedicatedSCell-v1130</i> only if <i>uplinkPowerControlDedicatedSCell-r10</i> is configured for this serving cell.                                                                                                                                                                                                                                                                                   |  |
| <b><i>uplinkSegmentedPrecompensationGap</i></b>                                                                                                                                                                                                                                                                                                                                                                                             |  |
| Indicates the gap value between segments for PUSCH and PUCCH for TA pre-compensation. Value sym1 corresponds to 1 symbol, value sl1 corresponds to 1 slot, value sf1 corresponds to 1 subframe.                                                                                                                                                                                                                                             |  |

| <b><i>PhysicalConfigDedicated</i></b> field descriptions |                                                                                                                                                                |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>widebandPRG-SlotSubslot</i></b>                    | Indicates whether the precoding resource block group size is the whole scheduled bandwidth for slot or subslot PDSCH operation as specified in TS 36.213 [23]. |
| <b><i>widebandPRG-Subframe</i></b>                       | Indicates whether the precoding resource block group size is the whole scheduled bandwidth for subframe PDSCH operation as specified in TS 36.213 [23].        |

| Conditional presence          | Explanation                                                                                                                                                                                                                                                                                                 |

Otherwise the field is not present and the UE shall delete any existing value for this field.                                                                                                                            |
| <i>PeriodicSRSExt</i>         | If <i>soundingRS-UL-ConfigDedicatedUpPTsExt-r13</i> is absent, the field is optional, Need ON. Otherwise the field is not present and the UE shall delete any existing value for this field.                                                                                                                |
| <i>PUCCH-Format4or5</i>       | The field is mandatory present with <i>pucch-Format-v1370</i> set to <i>setup</i> if <i>pucch-ConfigDedicated-r13</i> is configured and <i>pucch-ConfigDedicated-r13</i> indicates PUCCH format 4 or PUCCH format 5; otherwise it is not present and the UE shall delete any existing value for this field. |
| <i>PUCCH-SCell1</i>           | The field is optionally present, need OR, for SCell not configured with <i>pucch-configDedicated-r13</i> . Otherwise it is not present.                                                                                                                                                                     |
| <i>PUSCH-SCell</i>            | The field is optionally present, need ON, if <i>pusch-ConfigDedicatedSCell-r10</i> and <i>pusch-ConfigDedicated-v1130</i> are absent. Otherwise the field is not present                                                                                                                                    |
| <i>PUSCH-SCell1</i>           | The field is optionally present, need ON, for SCell not configured with <i>pucch-configDedicated-r13</i> . Otherwise it is not present.                                                                                                                                                                     |
| <i>SCellAdd</i>               | The field is mandatory present if <i>cellIdentification</i> is present; otherwise it is optional, need ON.                                                                                                                                                                                                  |
| <i>SRS-Trigger-TypeA</i>      | The field is mandatory present if <i>typeA-SRS-TPC-PDCCH-Group-r14</i> is present. Otherwise the field is not present and the UE shall delete any existing value for this field.                                                                                                                            |

NOTE 1: During handover, the UE performs a MAC reset, which involves reverting to the default CQI/ SRS/ SR configuration in accordance with clause 5.3.13 and TS 36.321 [6], clauses 5.9 and 5.2. Hence, for these parts of the dedicated radio resource configuration, the default configuration (rather than the configuration used in the source PCell) is used as the basis for the delta signalling that is included in the message used to perform handover.

NOTE 2: Since delta signalling is not supported for the common SCell configuration, E-UTRAN can only add or release the uplink of an SCell by releasing and adding the concerned SCell.

## P-Max

The IE *P-Max* is used to limit the UE's uplink transmission power on a carrier frequency and is used to calculate the parameter *Pcompensation* defined in TS 36.304 [4]. Corresponds to parameter *P<sub>EMAX</sub>* or *P<sub>EMAX,c</sub>* in TS 36.101 [42]. The UE transmit power on one serving cell shall not exceed the configured maximum UE output power of the serving cell determined by this value as specified in TS 36.101 [42], clauses 6.2.5 or 6.2.5A, or, when transmitting sidelink discovery announcements within the coverage of the concerned cell, as specified in TS 36.101 [42], clause 6.2.5D.

### **P-Max information element**

```
-- ASN1START
P-Max ::= INTEGER (-30..33)
-- ASN1STOP
```

## PRACH-Config

The IE *PRACH-ConfigSIB* and IE *PRACH-Config* are used to specify the PRACH configuration in the system information and in the mobility control information, respectively.

### **PRACH-Config information elements**

```
-- ASN1START

| <b>PRACH-Config field descriptions</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>edt-PRACH-ParametersListCE</i></b>      | Configures PRACH parameters for each CE level applicable to a UE performing EDT. If included, the number of entries is same as number of entries in <i>prach-ParametersListCE</i> . The first entry in the list is the PRACH parameters for CE level 0, the second entry in the list is the PRACH parameters for CE level 1, and so on. The parameters <i>maxNumPreambleAttemptCE</i> , <i>numRepetitionPerPreambleAttempt</i> , <i>mpdcch-NumRepetition-RA</i> , <i>prach-HoppingConfig</i> included in <i>prach-ParametersListCE</i> for CE level X are also applicable for EDT. |
| <b><i>initial-CE-level</i></b>                | Indicates initial PRACH CE level at random access, see TS 36.321 [6]. If not configured, UE selects PRACH CE level based on measured RSRP level, see TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>highSpeedFlag</i></b>                   | Parameter: High-speed-flag, see TS 36.211 [21], clause 5.7.2]. TRUE corresponds to Restricted set and FALSE to Unrestricted set.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>maxNumPreambleAttemptCE</i></b>         | Maximum number of preamble transmission attempts per CE level. See TS 36.321 [6]. If the field is absent, the UE shall use the default value n3.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>mpdcch-NarrowbandsToMonitor</i></b>     | Narrowbands to monitor for MPDCCH for RAR, see TS 36.213 [23], clause 6.2. Field values (1.. <i>maxAvailNarrowBands-r13</i> ) correspond to narrowband indices (0.. <i>maxAvailNarrowBands-r13-1</i> ) as specified in TS 36.211 [21].                                                                                                                                                                                                                                                                                                                                             |
| <b><i>mpdcch-NumRepetition-RA</i></b>         | Maximum number of repetitions for MPDCCH common search space (CSS) for RAR, Msg3 and Msg4, see TS 36.211 [21].                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>mpdcch-startSF-CSS-RA</i></b>           | Starting subframe configuration for MPDCCH common search space (CSS), including RAR, Msg3 retransmission, PDSCH with contention resolution and PDSCH with CCCH MAC SDU, see TS 36.211 [21] and TS 36.213 [23]. Value v1 corresponds to 1, value v1dot5 corresponds to 1.5, and so on.                                                                                                                                                                                                                                                                                              |
| <b><i>numRepetitionPerPreambleAttempt</i></b> | Number of PRACH repetitions per attempt for each CE level, See TS 36.211 [21].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>prach-ConfigIndex</i></b>               | Parameter: <i>prach-ConfigurationIndex</i> , see TS 36.211 [21], clause 5.7.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>prach-ConfigIndexHighSpeed</i></b>      | Parameter: <i>prach-ConfigurationIndexHighSpeed</i> , see TS 36.211 [21], clause 5.7.1. If this field is present, the UE shall ignore <i>prach-ConfigIndex</i> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>prach-FreqOffset</i></b>                | Parameter: <i>prach-FrequencyOffset</i> , see TS 36.211 [21], clause 5.7.1. For TDD the value range is dependent on the value of <i>prach-ConfigIndex</i> .                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>prach-FreqOffsetHighSpeed</i></b>       | Parameter: <i>prach-FrequencyOffsetHighSpeed</i> , see TS 36.211 [21], clause 5.7.1. For TDD the value range is dependent on the value of <i>prach-ConfigIndexHighSpeed</i> . If this field is present, the UE shall ignore <i>prach-FreqOffset</i> .                                                                                                                                                                                                                                                                                                                              |
| <b><i>prach-HoppingConfig</i></b>             | Coverage level specific frequency hopping configuration for PRACH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>prach-HoppingOffset</i></b>             | Parameter: PRACH frequency hopping offset, expressed as a number of resource blocks, see TS 36.211 [21], clause 5.7.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>prach-ParametersListCE</i></b>          | Configures PRACH parameters for each CE level. The first entry in the list is the PRACH parameters of CE level 0, the second entry in the list is the PRACH parameters of CE level 1, and so on.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>prach-StartingSubframe</i></b>          | PRACH starting subframe periodicity, expressed in number of subframes available for preamble transmission (PRACH opportunities), see TS 36.211 [21]. Value sf2 corresponds to 2 subframes, sf4 corresponds to 4 subframes and so on. EUTRAN configures the PRACH starting subframe periodicity larger than or equal to the number of PRACH repetitions per attempt for each CE level ( <i>numRepetitionPerPreambleAttempt</i> ). If the field is absent, the value is determined implicitly in TS 36.211 [21], clause 5.7.1.                                                       |
| <b><i>prach-TxDuration</i></b>                | Duration of PRACH segment transmission in NTN transmission, see TS 36.213 [23]. Unit in duration of one preamble transmission including guard period (TCP+TSEQ+TGP). Value <i>n1</i> corresponds to the duration of 1 preamble transmission, value <i>n2</i> corresponds to the duration of 2 preambles transmission and so on.                                                                                                                                                                                                                                                    |
| <b><i>rootSequenceIndex</i></b>               | Parameter: <i>RACH_ROOT_SEQUENCE</i> , see TS 36.211 [21], clause 5.7.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>rootSequenceIndexHighSpeed</i></b>      | The field indicates starting logical root sequence index used to derive the 64 random access preambles based on restricted set type B in high speed scenario, see TS 36.211 [21], clause 5.7.2. If this field is present, the UE shall generate random access preambles based on restricted set type B and ignore <i>rootSequenceIndex</i> .                                                                                                                                                                                                                                       |

| <b>PRACH-Config field descriptions</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rsrp-ThresholdsPrachInfoList</b>       | The criterion for BL UEs and UEs in CE to select PRACH resource set. Up to 3 RSRP threshold values are signalled to determine the CE level for PRACH, see TS 36.213 [23]. The first element corresponds to RSRP threshold 1, the second element corresponds to RSRP threshold 2 and so on, see TS 36.321 [6]. The UE shall ignore this field if only one CE level, i.e. CE level 0, is configured in <i>prach-ParametersListCE</i> . The number of RSRP thresholds present in <i>rsrp-ThresholdsPrachInfoList</i> is equal to the number of CE levels configured in <i>prach-ParametersListCE</i> minus one. A UE that supports <i>powerClass-14dBm</i> shall correct the RSRP threshold values before applying them as follows: RSRP threshold = Signalled RSRP threshold - min{0, (14-min(23, P-Max))} where P-Max is the value of <i>p-Max</i> field in <i>SystemInformationBlockType1-BR</i> . |
| <b>zeroCorrelationZoneConfig</b>          | Parameter: Ncs configuration, see TS 36.211 [21], clause 5.7.2: table 5.7.2-2, for preamble format 0..3 and TS 36.211 [21], clause 5.7.2: table 5.7.2-3, for preamble format 4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>zeroCorrelationZoneConfigHighSpeed</b> | The field indicates Ncs configuration for the restricted set type B in high speed scenario, see TS 36.211 [21], clause 5.7.2. If this field is present, the UE shall generate random access preambles based on restricted set type B and ignore <i>zeroCorrelationZoneConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Conditional presence</b> | <b>Explanation</b>              |
|-----------------------------|---------------------------------|
| <i>MP</i>                   | The field is mandatory present. |

### – *PresenceAntennaPort1*

The IE *PresenceAntennaPort1* is used to indicate whether all the neighbouring cells use Antenna Port 1. When set to *TRUE*, the UE may assume that at least two cell-specific antenna ports are used in all neighbouring cells.

#### ***PresenceAntennaPort1* information element**

```
-- ASN1START
PresenceAntennaPort1 ::= BOOLEAN
-- ASN1STOP
```

### – *PUCCH-Config*

The IE *PUCCH-ConfigCommon* and IE *PUCCH-ConfigDedicated* are used to specify the common and the UE specific PUCCH configuration respectively.

#### ***PUCCH-Config* information elements**

```
-- ASN1START
PUCCH-ConfigCommon ::= SEQUENCE {
 deltaPUCCH-Shift ENUMERATED {ds1, ds2, ds3},

| <b>pucch-NumRepetitionCE-Format1</b> | Number of PUCCH repetitions for PUCCH format 1/1a, see TS 36.211 [21] and TS 36.213 [23]. When <i>pur-GrantInfo</i> is set to <i>ce-ModeA</i> , value n1 corresponds to 1 repetition, value n2 corresponds to 2 repetitions, and so on. When <i>pur-GrantInfo</i> is set to <i>ce-ModeB</i> , actual value corresponds to 4 * indicated value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>pusch-CyclicShift</b>             | Parameter: $n_{cs,A}$ . See TS 36.211 [21] clause 5.5.2.1.1. Value n0 corresponds to 0 and n6 corresponds to 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pusch-NB-MaxTBS</b>               | Activation of 2984 bits maximum PUSCH TBS in 1.4 MHz in CE mode A, see TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>pur-GrantInfo</b>                 | Indicates UL grant for transmission using PUR. Field set to <i>ce-ModeA</i> indicates the PUR grant is for CE Mode A and the field set to <i>ce-ModeB</i> indicates the PUR grant is for CE Mode B. <i>numRUs</i> indicates DCI field for PUSCH number of resource units, see TS 36.213 [23] clause 8.1.6. <i>prbAllocationInfo</i> indicates DCI field for PUSCH resource block assignment, see TS 36.212 [22], clause 5.3.3.1.10 (CE Mode A) and clause 5.3.3.1.11 (CE Mode B). <i>mcs</i> indicates DCI field for PUSCH modulation and coding scheme, see TS 36.213 [23] clause 8.6. <i>numRepetitions</i> indicates DCI field for PUSCH repetition number, see TS 36.213 [23] clause 8.0. For CE Mode A, <i>numRUs</i> set to '00' indicates use of full-PRB resource allocation, otherwise sub-PRB resource allocation as defined in TS 36.213 [23], clause 8.1.6. For CE Mode B, <i>subPRB-Allocation</i> indicates whether sub-PRB resource allocation is used. |
| <b>pur-ImplicitReleaseAfter</b>      | Number of consecutive PUR occasions that can be skipped before implicit release, as specified in 5.3.3.20. Value n2 corresponds to 2 PUR occasions, value n4 corresponds to 4 PUR occasions and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>pur-NumOccasions</b>              | Number of PUR occasions. Value one corresponds to 1 PUR occasion, and value <i>infinite</i> corresponds to an infinite number of PUR occasions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>pur-ResponseWindowTimer</b>       | PUR MPDCCH search space window duration. See TS 36.321 [6] and TS 36.213 [23]. Value in subframes. Value sf240 corresponds to 240 subframes, value sf480 corresponds to 480 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

***pur-RSRP-ChangeThreshold***

Indicates the threshold(s) of change in serving cell RSRP in dB for TA validation. Value dB4 corresponds to 4 dB, value dB6 corresponds to 6 dB and so on. When *pur-RSRP-ChangeThreshold* is set to *setup*, if *decreaseThresh* is absent the value of *increaseThresh* is also used for *decreaseThresh*.

***pur-TimeAlignmentTimer***

Indicates the idle mode TA timer in seconds for TA validation. Actual value = indicated value \* PUR periodicity.

| Conditional presence | Explanation                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SubPRB</i>        | This field is optionally present, need ON, if <i>subPRB-Allocation</i> is set to TRUE; otherwise the field is not present and UE shall delete any existing value for this field. |

### – *PUR-ConfigID*

The IE *PUR-ConfigID* is used to indicate the PUR configuration identity.

#### ***PUR-ConfigID* information element**

```
-- ASN1START
PUR-ConfigID-r16 ::= BIT STRING (SIZE(20))
-- ASN1STOP
```

### – *PUR-PeriodicityAndOffset*

The IE *PUR-PeriodicityAndOffset* is used to indicate H-SFN of the first PUR occasion and periodicity of the subsequent PUR occasions. The value of periodicity is in the unit of H-SFN duration (i.e., 10.24s). Value *periodicity8* corresponds to periodicity of 8 H-SFN, value *periodicity16* corresponds to periodicity of 16 H-SFN and so on. The value of offset is in the unit of H-SFN duration (i.e., 10.24s).

#### ***PUR-PeriodicityAndOffset* information element**

```
-- ASN1START
PUR-PeriodicityAndOffset-r16 ::= CHOICE {
 periodicity8 INTEGER (1..7),

| <b><i>betaOffset-ACK-Index, betaOffset2-ACK-Index, betaOffset-ACK-Index-MC, betaOffset2-ACK-Index-MC</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
| <p>Parameter: <math>I_{\text{offset}}^{\text{HARQ-ACK}}</math>, <math>I_{\text{offset},X}^{\text{HARQ-ACK}}</math>, <math>I_{\text{offset,M}}^{\text{HARQ-ACK}}</math> and <math>I_{\text{offset,MC,X}}^{\text{HARQ-ACK}}</math>, for single- and multiple-codeword respectively, see TS 36.213 [23], Table 8.6.3-1. <i>betaOffset-ACK-Index</i> and <i>betaOffset2-ACK-Index</i> are used for single-codeword and <i>betaOffset-ACK-Index-MC</i> and <i>betaOffset2-ACK-Index-MC</i> are used for multiple-codeword. If <i>betaOffset2-ACK-Index</i> is configured; <i>betaOffset-ACK-Index</i> is used when up to 22 HARQ-ACK bits are transmitted otherwise <i>betaOffset2-ACK-Index</i> is used. If <i>betaOffset-ACK2-Index-MC</i> is configured; <i>betaOffset-ACK-Index-MC</i> is used when up to 22 HARQ-ACK bits are transmitted otherwise <i>betaOffset2-ACK-Index-MC</i> is used. One value applies for all serving cells with an uplink in a cell group (MCG or SCG or the group of cells configured to send PUCCH on the same cell in case PUCCH SCell is configured) and not configured with uplink power control subframe sets. The same value also applies for subframe set 1 of all serving cells with an uplink in that cell group and configured with uplink power control subframe sets (the associated functionality is common i.e. not performed independently for each cell).</p>                  |  |
| <b><i>betaOffset-ACK-Index-SubframeSet2, betaOffset2-ACK-Index-SubframeSet2, betaOffset-ACK-Index-MC-SubframeSet2, betaOffset2-ACK-Index-MC-SubframeSet2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| <p>Parameter: <math>I_{\text{offset,sub2}}^{\text{HARQ-ACK}}</math>, <math>I_{\text{offset,sub2,X}}^{\text{HARQ-ACK}}</math>, <math>I_{\text{offset,MC,sub2}}^{\text{HARQ-ACK}}</math> and <math>I_{\text{offset,MC,sub2,X}}^{\text{HARQ-ACK}}</math> respectively, see TS 36.213 [23], Table 8.6.3-1. <i>betaOffset-ACK-Index-SubframeSet2</i> and <i>betaOffset2-ACK-Index-SubframeSet2</i> are used for single-codeword, <i>betaOffset-ACK-Index-MC-SubframeSet2</i>, <i>betaOffset2-ACK-Index-MC-SubframeSet2</i> are used for multiple-codeword. If <i>betaOffset2-ACK-Index-SubframeSet2</i> is configured; <i>betaOffset-ACK-Index-SubframeSet2</i> is used when up to 22 HARQ-ACK bits are transmitted otherwise <i>betaOffset2-ACK-Index-SubframeSet2</i> is used. If <i>betaOffset2-ACK-Index-MC-SubframeSet2</i> is configured; <i>betaOffset-ACK-Index-MC-SubframeSet2</i> is used when up to 22 HARQ-ACK bits are transmitted otherwise <i>betaOffset2-ACK-Index-MC-SubframeSet2</i> is used. One value applies for subframe set 2 of all serving cells with an uplink in a cell group (MCG or SCG or the group of cells configured to send PUCCH on the same cell in case PUCCH SCell is configured) and configured with uplink power control subframe sets (the associated functionality is common i.e. not performed independently for each cell configured with uplink power control subframe sets).</p> |  |

| <b>PUSCH-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ce-PUSCH-MaxBandwidth</b>           | Maximum PUSCH channel bandwidth in CE mode A, see TS 36.212 [22] and TS 36.213 [23]. Value bw5 corresponds to 5 MHz. If this field is not configured, the maximum PUSCH channel bandwidth in CE mode A set to 1.4 MHz. The maximum PUSCH channel bandwidth in CE mode B is 1.4 MHz regardless of the setting of this parameter.<br>Parameter: transmission bandwidth configuration, see TS 36.101 [42], table 5.6-1.                                                                                                                                                                                                                                                                                                                                                  |
| <b>ce-PUSCH-MultiTB-Config</b>         | Indicates whether UL multi-TB scheduling is enabled, i.e., a single DCI can schedule up to 8 PUSCH transport blocks in CE mode A and up to 4 PUSCH transport blocks in CE mode B. See TS 36.213 [23], clause 8.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ce-PUSCH-NB-MaxTBS</b>              | Activation of 2984 bits maximum PUSCH TBS in 1.4 MHz in CE mode A, see TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ce-PUSCH-SubPRB-Config</b>          | Activation of PUSCH sub-PRB allocation in CE mode A or B, see TS 36.211 [21], TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>cyclicShift</b>                     | Parameters: <i>cyclicShift</i> , see TS 36.211 [21], Table 5.5.2.1.1-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>dmrs-LessUpPTS-Config</b>           | Indicates the UE not to transmit DMRS for PUSCH in UpPTS, see TS 36.211 [21], clause 5.5.2.1.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>dmrs-WithOCC-Activated</b>          | Parameter: <i>Activate-DMRS-with OCC</i> , see TS 36.211 [21], clause 5.5.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>enable256QAM</b>                    | See TS 36.213 [23], clause 8.6.1. If <i>enable256QAM</i> is included and if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> , the field indicates (if set to TRUE) per uplink power control subframe set and DCI format 0/0A/0B and 4/4A/4B that 256QAM is allowed for UE UL categories as indicated in TS 36.306 [5], Table 4.1A-2, while FALSE indicates that 256 QAM is not allowed. If <i>enable256QAM</i> is included and if uplink power control subframe sets are not configured by <i>tpc-SubframeSet</i> , the field indicates (if set to TRUE) per DCI format 0/0A/0B and 4/4A/4B that 256QAM is allowed for UE UL categories as indicated in TS 36.306 [5], Table 4.1A-2, while FALSE indicates that 256 QAM is not allowed.   |
| <b>enable64QAM</b>                     | See TS 36.213 [23], clause 8.6.1. If <i>enable64QAM</i> (without suffix) is set to TRUE, it indicates that 64QAM is allowed for UE categories 5 and 8 indicated in <i>ue-Category</i> and UL categories indicated in <i>ue-Category/UL</i> which support UL 64QAM and can fallback to category 5 or 8, see TS 36.306 [5], Table 4.1A-2 and Table 4.1A-6, while FALSE indicates that 64QAM is not allowed. If <i>enable64QAM-v1270</i> is set to TRUE, it indicates that 64QAM is allowed for UL categories indicated in <i>ue-Category/UL</i> which support UL 64QAM but cannot fallback category 5 or 8, see TS 36.306 [5], Table 4.1A-2 and Table 4.1A-6. E-UTRAN configures <i>enable64QAM-v1270</i> only when <i>enable64QAM</i> (without suffix) is set to TRUE. |
| <b>interleaving</b>                    | Indicates whether interleaving for UL multi-TB scheduling is enabled, see TS 36.213 [23], clause 8.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>interval-ULHoppingPUSCH-Enh</b>     | Number of consecutive absolute subframes over which PUSCH stays at the same PRBs before hopping to other PRBs. For <i>interval-FDD-PUSCH-Enh</i> , int1 corresponds to 1 subframe, int2 corresponds to 2 subframes, and so on. For <i>interval-TDD-PUSCH-Enh</i> , int1 corresponds to 1 subframe, int5 corresponds to 5 subframes, and so on. | <b>pusch-hoppingOffset</b>             | Except for BL UEs and UEs in CE, parameter: $N_{RB}^{HO}$ , see TS 36.211 [21], clause 5.3.4. For BL UEs and UEs in CE, the <i>pusch-hoppingOffset-v1310</i> indicates the parameter $f_{NB,hop}^{PUSCH}$ , see TS 36.211 [21], clause 5.3.4.. In case <i>pusch-hoppingOffset-v1310</i> is signalled, the BL UEs and UEs in CE shall ignore <i>pusch-hoppingOffset</i> (i.e. without suffix).                                                                                                                                                                                                                                                                                                                                                                         |

| <b>PUSCH-Config field descriptions</b>          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>pusch-HoppingOffsetPUSCH-Enh</b>             | Indicates the frequency domain hopping offset between PRBs for PUSCH in frequency hopping, see TS 36.211 [21], clause 5.3.4. Value 1 corresponds to 1 PRB, value 2 corresponds to 2 PRBs, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pusch-maxNumRepetitionCEmodeA</b>            | Maximum value to indicate the set of PUSCH repetition numbers for CE mode A, see TS 36.211 [21] and TS 36.213 [23]. E-UTRAN does not configure value r8. If the field is not configured, the UE shall apply the default value as defined in TS 36.213 [23], clause 8.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>pusch-maxNumRepetitionCEmodeB</b>            | Maximum value to indicate the set of PUSCH repetition numbers for CE mode B, see TS 36.211 [21] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pusch-TxDuration</b>                         | Duration of PUSCH segment transmission in NTN transmission, see TS 36.213 [23]. Value in number of resource units. Value n2 corresponds to 2 resource units, value n4 corresponds to 4 resource units and so on. The signalled value corresponds to full-PRB allocation (unit: subframe). If PUSCH sub-PRB is configured, the signalled value is divided by 2, 4 and 8 for sub-PRB allocation of 6, 3 and 2-out-of-3 tones allocation and corresponds to the resource unit for 6 tones, 3 and 2-out-of-3 tones, respectively. If value n2 is signalled and PUSCH sub-PRB is configured, segment transmission is not applicable to 3 and 2-out-of-3 tones allocation. If value n4 is signalled and PUSCH sub-PRB is configured, segment transmission is not applicable to 2-out-of-3 tones allocation. |
| <b>sequenceHoppingEnabled</b>                   | Parameter: Sequence-hopping-enabled, see TS 36.211 [21], clause 5.5.1.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sixToneCyclicShift, threeToneCyclicShift</b> | Cyclic shift for PUSCH reference signal sequence of six/three subcarriers in CE mode A or B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>symPUSCH-UpPTS</b>                           | Indicates the number of data symbols that configured for PUSCH transmission in UpPTS. Values sym2, sym3, sym4, sym5 and sym6 can be used for normal cyclic prefix, if dmrsLess-UpPTS is set to true, otherwise, values sym2, sym3, sym4, sym5 can be used for normal cyclic prefix and values sym1, sym2, sym3 and sym4 can be used for extended cyclic prefix, see TS 36.213 [23], clause 8.6.2 and TS 36.211 [21], clause 5.3.4.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ul-DMRS-IFDMA</b>                            | Value TRUE indicates that the UE is configured with enhanced UL DMRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ul-ReferenceSignalsPUSCH</b>                 | Used to specify parameters needed for the transmission on PUSCH (or PUCCH).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>uplinkHARQ-Mode</b>                          | Used to set the HARQ mode per HARQ process ID, see TS 36.321 [6]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. A bit set to one identifies a HARQ process with HARQ mode A and a bit set to zero identifies a HARQ process with HARQ mode B.                                                                                                                                                                                                                                                                                                                                                                                                                |

| Conditional presence | Explanation                                                                                   |
|----------------------|-----------------------------------------------------------------------------------------------|
| <i>CE-ModeB</i>      | The field is optionally present, need ON, for CE Mode B. Otherwise, the field is not present. |

### RACH-ConfigCommon

The IE *RACH-ConfigCommon* is used to specify the generic random access parameters.

| RACH-ConfigCommon field descriptions         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connEstFailCount</b>                      | Number of times that the UE detects T300 expiry on the same cell before applying <i>connEstFailOffset</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>connEstFailOffset</b>                     | Parameter "Qoffset <sub>temp</sub> " in TS 36.304 [4]. If the field is not present the value of infinity shall be used for "Qoffset <sub>temp</sub> ".                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>connEstFailOffsetValidity</b>             | Amount of time that the UE applies <i>connEstFailOffset</i> before removing the offset from evaluation of the cell. Value s30 corresponds to 30 seconds, s60 corresponds to 60 seconds, and so on.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>edt-LastPreamble</b>                      | Provides the mapping of preambles to groups for each CE level for EDT, as specified in TS 36.321 [6]. For the concerned CE level, if PRACH resources configured by <i>edt-PRACH-ParametersCE-r15</i> are different from the PRACH resources configured by <i>PRACH-ParametersCE-r13</i> for all CE levels and <i>edt-PRACH-ParametersCE-r15</i> for all other CE levels, the preambles for EDT are the preambles <i>firstPreamble-r13</i> to <i>edt-LastPreamble-r15</i> , otherwise the preambles for EDT are the preambles <i>lastPreamble-r13+1</i> to <i>edt-LastPreamble-r15</i> . |
| <b>edt-SmallTBS-Enabled</b>                  | Value TRUE indicates UE performing EDT is allowed to select TBS smaller than <i>edt-TBS</i> for Msg3 in the corresponding CE level, as specified in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>edt-SmallTBS-Subset</b>                   | Presence indicates only two of the TBS values can be used according to <i>edt-TBS</i> corresponding to the CE level, as specified in TS 36.213 [23]. When the field is not present, any of the TBS values according to <i>edt-TBS</i> corresponding to the CE level can be used. This field is applicable for a CE level only when <i>edt-SmallTBS-Enabled</i> is included for the corresponding CE level.                                                                                                                                                                              |
| <b>edt-TBS</b>                               | Largest TBS for Msg3 for a CE level applicable to a UE performing EDT. Value in bits. Value b328 corresponds to 328 bits, b408 corresponds to 408 bits and so on. Additionally, value b1000 or 456 corresponds to 1000 bits for CE levels 0 and 1, and 456 bits for CE levels 2 and 3. See TS 36.213 [23].                                                                                                                                                                                                                                                                              |
| <b>mac-ContentionResolutionTimer</b>         | Timer for contention resolution in TS 36.321 [6]. Value in subframes. Value sf8 corresponds to 8 subframes, sf16 corresponds to 16 subframes and so on. <i>mac-ContentionResolutionTimer-r15</i> is only applicable for EDT. UE performing EDT shall use <i>mac-ContentionResolutionTimer-r15</i> , if present.                                                                                                                                                                                                                                                                         |
| <b>maxHARQ-Msg3Tx</b>                        | Maximum number of Msg3 HARQ transmissions in TS 36.321 [6], used for contention based random access. Value is an integer.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>messagePowerOffsetGroupB</b>              | Threshold for preamble selection in TS 36.321 [6]. Value in dB. Value minusinfinity corresponds to -infinity. Value dB0 corresponds to 0 dB, dB5 corresponds to 5 dB and so on.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>messageSizeGroupA</b>                     | Threshold for preamble selection in TS 36.321 [6]. Value in bits. Value b56 corresponds to 56 bits, b144 corresponds to 144 bits and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>numberOfRA-Preambles</b>                  | Number of non-dedicated random access preambles in TS 36.321 [6]. Value is an integer. Value n4 corresponds to 4, n8 corresponds to 8 and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>powerRampingStep</b>                      | Power ramping factor in TS 36.321 [6]. Value in dB. Value dB0 corresponds to 0 dB, dB2 corresponds to 2 dB and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>preambleInitialReceivedTargetPower</b>    | Initial preamble power in TS 36.321 [6]. Value in dBm. Value dBm-120 corresponds to -120 dBm, dBm-118 corresponds to -118 dBm and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>preambleMappingInfo</b>                   | Provides the mapping of preambles to groups for each CE level, except for EDT, as specified in TS 36.321 [6]. When random access preambles group B is used, <i>firstPreamble-r13</i> is set to 0 and <i>lastPreamble-r13</i> is set to <i>numberOfRA-Preambles-1</i> .                                                                                                                                                                                                                                                                                                                  |
| <b>preamblesGroupAConfig</b>                 | Provides the configuration for preamble grouping in TS 36.321 [6]. If the field is not signalled, the size of the random access preambles group A, as specified in TS 36.321 [6], is equal to <i>numberOfRA-Preambles</i> .                                                                                                                                                                                                                                                                                                                                                             |
| <b>preambleTransMax, preambleTransMax-CE</b> | Maximum number of preamble transmission in TS 36.321 [6]. Value is an integer. Value n3 corresponds to 3, n4 corresponds to 4 and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>rach-CE-LevelInfoList</b>                 | Provides RACH information for each coverage level. The first entry in the list contains RACH information of CE level 0, the second entry in the list contains RACH information of CE level 1, and so on. If E-UTRAN includes <i>rach-CE-LevelInfoList</i> , it includes the same number of entries as in <i>prach-ParametersListCE</i> .                                                                                                                                                                                                                                                |
| <b>ra-ResponseWindowSize</b>                 | Duration of the RA response window in TS 36.321 [6]. Value in subframes. Value sf2 corresponds to 2 subframes, sf3 corresponds to 3 subframes and so on. The same value applies for each serving cell (although the associated functionality is performed independently for each cell).                                                                                                                                                                                                                                                                                                 |

| <b>RACH-ConfigCommon field descriptions</b> |                                                                                                                                              |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connEstFailCount</b>                     | Number of times that the UE detects T300 expiry on the same cell before applying <i>connEstFailOffset</i> .                                  |
| <b>rar-HoppingConfig</b>                    | Frequency hopping activation/deactivation for RAR/Msg3/Msg4 for a CE level, see TS 36.211 [21].                                              |
| <b>sizeOfRA-PreamblesGroupA</b>             | Size of the random access preambles group A in TS 36.321 [6]. Value is an integer. Value n4 corresponds to 4, n8 corresponds to 8 and so on. |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                                                                          |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>EDT</i>                  | The field is mandatory present if <i>cp-EDT</i> or <i>up-EDT</i> in <i>SystemInformationBlockType2</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.            |
| <i>EDT-OR</i>               | The field is optionally present, Need OR, if <i>cp-EDT</i> or <i>up-EDT</i> in <i>SystemInformationBlockType2</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field. |

### – *RACH-ConfigDedicated*

The IE *RACH-ConfigDedicated* is used to specify the dedicated random access parameters.

#### ***RACH-ConfigDedicated* information element**

```
-- ASN1START
RACH-ConfigDedicated ::= SEQUENCE {
 ra-PreambleIndex INTEGER (0..63),
 ra-PRACH-MaskIndex INTEGER (0..15)
}
-- ASN1STOP
```

| <b>RACH-ConfigDedicated field descriptions</b> |                                                                                         |
|------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>ra-PRACH-MaskIndex</b>                      | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 36.321 [6].       |
| <b>ra-PreambleIndex</b>                        | Explicitly signalled Random Access Preamble for RA Resource selection in TS 36.321 [6]. |

### – *RadioResourceConfigCommon*

The IE *RadioResourceConfigCommonSIB* and IE *RadioResourceConfigCommon* are used to specify common radio resource configurations in the system information and in the mobility control information, respectively, e.g., the random access parameters and the static physical layer parameters.

#### ***RadioResourceConfigCommon* information element**

```
-- ASN1START
RadioResourceConfigCommonSIB ::= SEQUENCE {
 rach-ConfigCommon RACH-ConfigCommon,
 bcch-Config BCCH-Config,
 pcch-Config PCCH-Config,
 prach-Config PRACH-ConfigSIB,

| <b><i>RadioResourceConfigCommon</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>additionalSpectrumEmissionSCell</i></b>              | The UE requirements related to <i>additionalSpectrumEmissionSCell</i> are defined in TS 36.101 [42]. E-UTRAN configures the same value in <i>additionalSpectrumEmissionSCell</i> for all SCell(s) of the same band with UL configured. The <i>additionalSpectrumEmissionSCell</i> is applicable for all serving cells (including PCell) of the same band with UL configured.                                                           |
| <b><i>crs-ChEstMPDCCH-ConfigCommon</i></b>                 | Presence of this field indicates use of CRS for improving channel estimation on MPDCCH is enabled in RRC_IDLE and RRC_CONNECTED.                                                                                                                                                                                                                                                                                                       |
| <b><i>defaultPagingCycle</i></b>                           | Default paging cycle, used to derive 'T' in TS 36.304 [4]. Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on.                                                                                                                                                                                                                                                                                   |
| <b><i>dummy</i></b>                                        | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                |
| <b><i>harr-ReferenceConfig</i></b>                         | Indicates UL/ DL configuration used as the DL HARQ reference configuration for this serving cell. Value sa2 corresponds to Configuration2, sa4 to Configuration4 etc, as specified in TS 36.211 [21], table 4.2-2. E-UTRAN configures the same value for all serving cells residing on same frequency band.                                                                                                                            |
| <b><i>highSpeedEnhancedMeasFlag</i></b>                    | If the field is present, the UE shall apply the high speed (350 km/h) measurement enhancements as specified in TS 36.133 [16]. If <i>highSpeedEnhMeasFlag2</i> is present, the UE indicating <i>measurementEnhancements2</i> shall ignore this field.                                                                                                                                                                                  |
| <b><i>highSpeedEnhancedDemodulationFlag</i></b>            | If the field is present, the UE shall apply the advanced receiver in SFN scenario (350 km/h) as specified in TS 36.101 [42]. If this field is included in <i>HighSpeedConfig</i> and <i>highSpeedEnhDemodFlag2</i> is present, the UE indicating <i>demodulationEnhancements2</i> shall ignore this field in <i>HighSpeedConfig</i> .                                                                                                  |
| <b><i>highSpeedEnhDemodFlag2</i></b>                       | If the field is present, the UE shall apply the further enhanced receiver in HST-SFN scenario (500 km/h) as specified in TS 36.101 [42].                                                                                                                                                                                                                                                                                               |
| <b><i>highSpeedEnhMeasFlag2</i></b>                        | If the field is present, the UE shall apply the high speed (500 km/h) measurement enhancements as specified in TS 36.133 [16].                                                                                                                                                                                                                                                                                                         |
| <b><i>highSpeedEnhMeasFlagSCell</i></b>                    | If configured with value TRUE, the UE shall apply the high speed (350 km/h) SCell measurement enhancements as specified in TS 36.133 [16].                                                                                                                                                                                                                                                                                             |
| <b><i>highSpeedInterRAT-NR</i></b>                         | If the field is present, the UE shall apply the enhanced inter-RAT NR measurement requirements to support high speed up to 500 km/h as specified in TS 36.133 [16].                                                                                                                                                                                                                                                                    |
| <b><i>highSpeedMeasGapCE-ModeA</i></b>                     | If the field is present, the UE in CE mode A shall apply the measurement gap sharing table associated with high-velocity scenario for measurements, as specified in TS 36.133 [16].                                                                                                                                                                                                                                                    |
| <b><i>interval-DLHoppingConfigCommonModeX</i></b>          | Number of consecutive absolute subframes over which MPDCCH or PDSCH for CE mode X stays at the same narrowband before hopping to another narrowband. For interval-FDD, int1 corresponds to 1 subframe, int2 corresponds to 2 subframes, and so on. For interval-TDD, int1 corresponds to 1 subframe, int5 corresponds to 5 subframes, and so on.                                                                                       |
| <b><i>interval-ULHoppingConfigCommonModeX</i></b>          | Number of consecutive absolute subframes over which PUCCH or PUSCH for CE mode X stays at the same narrowband before hopping to another narrowband. For interval-FDD, int1 corresponds to 1 subframe, int2 corresponds to 2 subframes, and so on. For interval-TDD, int1 corresponds to 1 subframe, int5 corresponds to 5 subframes, and so on.                                                                                        |
| <b><i>modificationPeriodCoeff</i></b>                      | Actual modification period, expressed in number of radio frames= <i>modificationPeriodCoeff</i> * <i>defaultPagingCycle</i> . n2 corresponds to value 2, n4 corresponds to value 4, n8 corresponds to value 8, n16 corresponds to value 16, and n64 corresponds to value 64.                                                                                                                                                           |
| <b><i>mpdcch-NumRepetition-Paging</i></b>                  | Maximum number of repetitions for MPDCCH common search space (CSS) for paging, see TS 36.211 [21].                                                                                                                                                                                                                                                                                                                                     |
| <b><i>mpdcch-pdsch-HoppingOffset</i></b>                   | Parameter: $f_{NB, hop}^{DL}$ , see TS 36.211 [21], clause 6.4.1.                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>mpdcch-pdsch-HoppingNB</i></b>                       | The number of narrowbands for MPDCCH/PDSCH frequency hopping. Value nb2 corresponds to 2 narrowbands and value nb4 corresponds to 4 narrowbands.                                                                                                                                                                                                                                                                                       |
| <b><i>nB</i></b>                                           | Parameter: nB is used as one of parameters to derive the Paging Frame and Paging Occasion according to TS 36.304 [4]. Value in multiples of 'T' as defined in TS 36.304 [4]. A value of fourT corresponds to 4 * T, a value of twoT corresponds to 2 * T and so on. In case <i>nB-v1310</i> is signalled, the UE shall ignore <i>nB</i> (i.e. without suffix). EUTRAN configures <i>nB-v1310</i> only in the BR version of SI message. |

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>paging-narrowBands</b>        | Number of narrowbands used for paging, see TS 36.304 [4], TS 36.212 [22] and TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>p-Max</b>                     | Pmax to be used in the target cell. If absent, for the band used in the target cell, the UE applies the maximum power according to its capability as specified in 36.101 [42], clause 6.2.2. In case the UE is configured with uplink intra-band contiguous CA and the UE indicates ue-CA-PowerClass-N in that band combination, then the p-Max in RadioResourceConfigCommonSCell for that SCell, if present, also applies for that band combination whenever that SCell is activated. This field is ignored by IAB-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [107] |
| <b>prach-ConfigSCell</b>         | Indicates a PRACH configuration for an SCell. The field is not applicable for an LAA SCell in this release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>puncturedSubcarriersDL</b>    | Indicates number of punctured DL subcarriers and their locations, see TS 36.211 [31].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>rach-ConfigCommonSCell</b>    | Indicates a RACH configuration for an SCell. The field is not applicable for an LAA SCell in this release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ranPagingInIdlePO</b>         | Indicates that the network supports to send RAN paging in PO that corresponds to the i_s determined by UE in RRC_IDLE state, see TS 36.304 [4].                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>rss-MeasConfig</b>            | Indicates whether RSS-based measurement is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>rss-MeasNonNCL</b>            | Indicates RSS of neighbour cells not in the Neighbour Cell List may be used for measurements. When this field is included, the UE assumes for all neighbour cells not in the Neighbour Cell List the RSS power bias is same as used for the serving cell or the camped cell.                                                                                                                                                                                                                                                                                                                                        |
| <b>soundingRS-FlexibleTiming</b> | Indicates the SRS flexible timing (if configured) for aperiodic SRS triggered by DL grant. If the SRS transmission is collided with ACK/NACK, postpone once to the next configured SRS transmission opportunity.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ta-Report</b>                 | When this field is included in SystemInformationBlockType2, it indicates reporting of timing advance is enabled during Random Access due to RRC connection establishment, RRC connection resume or RRC connection reestablishment. When this field is included in MobilityControlInfo, it indicates TA reporting is enabled during Random Access due to handover, see TS 36.321 [6], clause 5.4.9.                                                                                                                                                                                                                  |
| <b>t318</b>                      | The value of timer T318. Value ms0 corresponds with 0 ms, ms50 corresponds with 50 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ul-Bandwidth</b>              | Parameter: transmission bandwidth configuration, NRB, in uplink, see TS 36.101 [42], table 5.6-1 and TS 36.108 [114], table 5.3A-1. Value n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on. If for FDD this parameter is absent, the uplink bandwidth is equal to the downlink bandwidth. For TDD this parameter is absent and it is equal to the downlink bandwidth.                                                                                                                                                                                                                       |
| <b>ul-CarrierFreq</b>            | For FDD: If absent, the (default) value determined from the default TX-RX frequency separation defined in TS 36.101 [42], table 5.7.3-1 and TS 36.108 [114], table 5.4A.2-1, applies.<br>For TDD: This parameter is absent and it is equal to the downlink frequency.                                                                                                                                                                                                                                                                                                                                               |
| <b>ul-CyclicPrefixLength</b>     | Parameter: Uplink cyclic prefix length see TS 36.211 [21], clause 5.2.1, where len1 corresponds to normal cyclic prefix and len2 corresponds to extended cyclic prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>crs-ChEstMPDCCH-ConfigDedicated</i></b>                   | Indicates whether use of CRS for improving channel estimation on MPDCCH is enabled in RRC_CONNECTED. If this field is not configured, the field <i>crs-ChEstMPDCCH-ConfigCommon</i> in <i>SystemInformationBlockType2</i> applies, if present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>crs-IntfMitigConfig</i></b>                               | <i>crs-IntfMitigEnabled-r15</i> indicates CRS interference mitigation is enabled for the cell, as specified in TS 36.133 [16], clause 3.6.1.1. For BL UEs supporting ce-CRS-IntfMitig, presence of this field indicates CRS interference mitigation is enabled in the cell, as specified in TS 36.133 [16], clauses 3.6.1.2 and 3.6.1.3, and the value <i>crs-IntfMitigNumPRBs</i> indicates number of PRBs, i.e. 6 or 24 PRBs, for CRS transmission in the central cell BW when CRS interference mitigation is enabled. For UEs not supporting this feature, the behaviour is undefined if this field is configured and the field <i>cellBarred</i> in <i>SystemInformationBlockType1</i> ( <i>SystemInformationBlockType1-BR</i> for BL UEs or UEs in CE) is set to <i>notbarred</i> . |
| <b><i>crs-PortsCount</i></b>                                    | Parameter represents the number of antenna ports for cell-specific reference signal used by the signaled neighboring cell where n1 corresponds to 1 antenna port, n2 to 2 antenna ports etc. see TS 36.211 [21], clause 6.10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>daps-HO</i></b>                                           | This field indicates that the handover, triggered in the same <i>RRCConnectionReconfiguration</i> message, shall be performed as a DAPS HO for the DRB. <i>daps-HO</i> is not configured if sidelink is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>drb-Identity</i></b>                                      | In case of DC, the DRB identity is unique within the scope of the UE i.e. an SCG DRB can not use the same value as used for an MCG or split DRB. For a split DRB the same identity is used for the MCG- and SCG parts of the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>drb-ToAddModList</i></b>                                  | When <i>drb-ToAddModList-r15</i> is configured, UE shall ignore the <i>drb-ToAddModList</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>drb-ToAddModListSCG</i></b>                               | When an SCG is configured, E-UTRAN configures at least one SCG or split DRB. When <i>drb-ToAddModListSCG-r15</i> is configured, UE shall ignore the <i>drb-ToAddModListSCG</i> (without suffix). When NE-DC is configured, this field indicates the SCG RLC bearers to be (re-)configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>drb-ToReleaseList</i></b>                                 | When <i>drb-ToReleaseList-r15</i> is configured, UE shall ignore the <i>drb-ToReleaseList</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>drb-ToReleaseListSCG</i></b>                              | When NE-DC is configured, this field indicates the SCG RLC bearers to be released.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>drb-Type</i></b>                                          | This field indicates whether the DRB is split or SCG DRB. E-UTRAN does not configure split and SCG DRBs simultaneously for the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>drb-TypeChange</i></b>                                    | Indicates that a split/SCG DRB is reconfigured to an MCG DRB (i.e. E-UTRAN only signals the field in case the DRB type changes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>drb-TypeLWA</i></b>                                       | Indicates whether a DRB is (re)configured as an LWA DRB or an LWA DRB is reconfigured not to use WLAN resources. NOTE 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b><i>Iwa-WLAN-AC</i></b>                                                           | For LWA bearers, indicates the corresponding WLAN access category for uplink. AC-BK (value <i>ac-bk</i> ) corresponds to Background access category, AC-BE (value <i>ac-be</i> ) corresponds to Best Effort access category, AC-VI (value <i>ac-vi</i> ) corresponds to Video access category and AC-VO (value <i>ac-vo</i> ) corresponds to Voice access category as defined by IEEE 802.11-2012 [67]. If <i>Iwa-WLAN-AC</i> is not configured, it is left up to UE to decide which IEEE 802.11 AC value to use when performing transmissions of packets for this DRB over WLAN in the uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>Iwip-DL-Aggregation, Iwip-UL-Aggregation</i></b>                              | Indicates whether LWIP is configured to utilize LWIP aggregation in DL or UL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>mac-MainConfig</i></b>                                                        | Although the ASN.1 includes a choice that is used to indicate whether the <i>mac-MainConfig</i> is signalled explicitly or set to the default MAC main configuration as specified in 9.2.2, EUTRAN does not apply " <i>defaultValue</i> ".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>mbsfn-SubframeConfig</i></b>                                                  | Defines the MBSFN subframe configuration used by the signaled neighboring cell. If absent, UE assumes no MBSFN configuration for the neighboring cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>measSubframePatternPCell</i></b>                                              | Time domain measurement resource restriction pattern for the PCell measurements (RSRP, RSRQ and the radio link monitoring).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>neighCellsCRS-Info, neighCellsCRS-InfoSCell, neighCellsCRS-InfoPSCell</i></b> | This field contains assistance information used by the UE to mitigate interference from CRS while performing RRM/RLM/CSI measurement or data demodulation or DL control channel demodulation. When the received CRS assistance information is for a cell with CRS non-colliding with that of the CRS of the cell to measure, the UE may use the CRS assistance information to mitigate CRS interference. When the received CRS assistance information is for a cell with CRS colliding with that of the CRS of the cell to measure, the UE may use the CRS assistance information to mitigate CRS interference RRM/RLM (as specified in TS 36.133 [16]) and for CSI (as specified in TS 36.101 [42]) on the subframes indicated by <i>measSubframePatternPCell</i> , <i>measSubframePatternConfigNeigh</i> , <i>csi-MeasSubframeSet1</i> if configured, and the CSI subframe set 1 if <i>csi-MeasSubframeSets-r12</i> is configured. The UE may use CRS assistance information to mitigate CRS interference from the cells in the <i>CRS-AssistanceInfoList</i> for the demodulation purpose or DL control channel demodulation as specified in TS 36.101 [42]. EUTRAN does not configure <i>neighCellsCRS-Info-r11</i> or <i>neighCellsCRS-Info-r13</i> if <i>eimta-MainConfigPCell-r12</i> is configured. |
| <b><i>neighCellsToAddModList</i></b>                                                | This field contains assistance information used by the UE to cancel and suppress interference of a neighbouring cell. If this field is present for a neighbouring cell, the UE assumes that the transmission parameters listed in the sub-fields are used by the neighbouring cell. If this field is present for a neighbouring cell, the UE assumes the neighbour cell is subframe and SFN synchronized to the serving cell, has the same system bandwidth, UL/DL and special subframe configuration, and cyclic prefix length as the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b><i>pdcp-verChange</i></b>                                                        | Indicates that the PDCP version of the SRB is changed from NR PDCP to E-UTRA PDCP. Network only configures this version change for during handover, resume and first reconfiguration after re-establishment. E-UTRAN does not include this field when <i>SRB-ToAddMod</i> is included in <i>srb-ToAddModListSCG</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>physicalConfigDedicated</i></b>                                               | The default dedicated physical configuration is specified in 9.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>resAllocGranularity</i></b>                                                   | Indicates the resource allocation and precoding granularity in PRB pair level of the signaled neighboring cell, see TS 36.213 [23], clause 7.1.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>rlc-BearerConfigSecondary</i></b>                                             | The configuration of a secondary RLC bearer within the same Cell Group as may e.g. be used in case of PDCP duplication using CA. The configuration comprises a (secondary) RLC entity, a logical channel identity and a logical channel configuration. E-UTRAN may configure this for SRB1, SRB2 and DRBs. For SRBs, E-UTRAN only configures the field for MCG (i.e. if included in <i>radioResourceConfigDedicated</i> ). E-UTRAN configures the same RLC mode (AM/UM) as used for the original RLC entity. The primary RLC entity is configured by <i>RLC-Config</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>rlc-Config</i></b>                                                            | For SRBs a choice is used to indicate whether the RLC configuration is signalled explicitly or set to the values defined in the default RLC configuration for SRB1 in 9.2.1.1 or for SRB2 in 9.2.1.2. RLC AM is the only applicable RLC mode for SRB1 and SRB2. E-UTRAN does not reconfigure the RLC mode of DRBs except when a full configuration option is used, and may reconfigure the RLC SN field size and the AM RLC LI field size only upon handover within E-UTRA or upon the first reconfiguration after RRC connection re-establishment or upon SCG Change for SCG and split DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>RadioResourceConfigDedicated</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b><i>servCell-p-a</i></b>                                    | Indicates the power offset for QPSK C-RNTI based PDSCH transmissions used by the serving cell, see TS 36.213 [23], clause 5.2. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>sps-Config</i></b>                                      | The default SPS configuration is specified in 9.2.3. Except for handover or releasing SPS for MCG, E-UTRAN does not reconfigure <i>sps-Config</i> for MCG when there is a configured downlink assignment or a configured uplink grant for MCG (see TS 36.321 [6]). Except for SCG change or releasing SPS for SCG, E-UTRAN does not reconfigure <i>sps-Config</i> for SCG when there is a configured downlink assignment or a configured uplink grant for SCG (see TS 36.321 [6]). In one serving cell, <i>sps-Config-v1530</i> is not present simultaneously with either <i>sps-Config</i> (without suffix) or <i>sps-Config-r12</i> .                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>srb-Identity</i></b>                                    | Value 1 is applicable for SRB1 only. Value 2 is applicable for SRB2 only. Value 4 is applicable for SRB4 only, if configured. For a split SRB the same identity is used for the MCG and NR SCG RLC bearer configurations. If <i>srb-Identity-v1530</i> is received, the UE shall ignore <i>srb-Identity</i> (i.e. without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>srb-Identity-v1530</i></b>                              | E-UTRAN does not include this field when <i>SRB-ToAddMod</i> is included in <i>srb-ToAddModListSCG</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>srb-ToAddModListExt</i></b>                             | The field is to configure SRB4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>srb-ToAddModList</i></b>                                | E-UTRAN configures the same RAT type (i.e. EUTRA or NR) for PDCP configuration of SRB1 and SRB2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>transmissionModeList</i></b>                            | Indicates a subset of transmission mode 1, 2, 3, 4, 6, 8, 9, 10, for the signaled neighboring cell for which <i>NeighCellsInfo</i> applies. When TM10 is signaled, other signaled transmission parameters in <i>NeighCellsInfo</i> are not applicable to up to 8 layer transmission scheme of TM10. E-UTRAN may indicate TM9 when TM10 with QCL type A and DMRS scrambling with $n_{ID}^{(i)} = N_{ID}^{\text{cell}}$ in TS 36.211 [21], clause 6.10.3.1, is used in the signalled neighbour cell and TM9 or TM10 with QCL type A and DMRS scrambling with $n_{ID}^{(i)} = N_{ID}^{\text{cell}}$ in TS 36.211 [21], clause 6.10.3.1, is used in the serving cell. UE behaviour with NAICS when TM10 is used is only defined when QCL type A and DMRS scrambling with $n_{ID}^{(i)} = N_{ID}^{\text{cell}}$ in TS 36.211 [21], clause 6.10.3.1, is used for the serving cell and all signalled neighbour cells. The first/ leftmost bit is for transmission mode 1, the second bit is for transmission mode 2, and so on. |
| <b><i>ul-TransmissionExtensionEnabled</i></b>                 | Presence of this field indicates that UL transmission extension after original GNSS validity duration expires is enabled by the network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>ul-TransmissionExtensionValue</i></b>                   | Indicates the duration after original GNSS validity duration expires within which UL transmission is allowed. Value in number of sub-frames, value sf500 corresponds to 500 sub-frames, sf750 corresponds to 750 sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

NOTE 1: It is up to eNB to ensure that the field indicating LWA bearer type is set to FALSE when LWA bearer is no longer used (e.g. during handover or re-establishment where LWA configuration is released).

| Conditional presence           | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### – *RCLWI-Configuration*

The IE *RCLWI-Configuration* is used to add, modify or release the RCLWI configuration.

```
-- ASN1START

RCLWI-Configuration-r13 ::= CHOICE {
 release
 setup
 rclwi-Config-r13
 }
}

RCLWI-Config-r13 ::= SEQUENCE {
 command
 steerToWLAN-r13

 },
 steerToLTE-r13
 NULL
}
```

```

}
-- ASN1STOP

```

### *ResourceReservationConfig*

The IE *ResourceReservationConfig* is used to specify the resource reservation, e.g. for coexistence with NR.

#### ***ResourceReservationConfig* information element**

| <b>periodicityStartPos</b>                          | Indicates periodicity and start offset of the reserved resources. Value set to <i>periodicity10ms</i> corresponds to periodicity 10 milliseconds and corresponding start position is 0, value set to <i>periodicity20ms</i> corresponds to periodicity 20 milliseconds and corresponding start position in milliseconds = indicated value * 10ms, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>resourceReservationFreq</b>                      | Downlink frequency domain resource reservation bitmap where each bit corresponds to a resource block group (RBG), see TS 36.213 [23]. Value <i>rbg-Bitmap1dot4</i> corresponds to 1.4 MHz system bandwidth, value <i>rbg-Bitmap3</i> corresponds to 3 MHz system bandwidth, and so on. If the field is absent, all RBGs in the system bandwidth are reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>slotBitmap</b>                                   | <p>Slot-level resource reservation configuration. Value <i>slotPattern10ms</i> corresponds to 10ms slot pattern and <i>slotPattern40ms</i> corresponds to 40ms slot pattern, see TS 36.213 [23] for DL and TS 36.211 [21] for UL.</p> <p>The first/leftmost 2-bits corresponds to the subframe #0 of the radio frame satisfying SFN mod periodicity = start position, as indicated by <i>periodicityStartPos</i>. Two bits for each subframe coded as:</p> <ul style="list-style-type: none"> <li>00: both slots are not reserved</li> <li>01: the first slot is not reserved, the second slot is reserved</li> <li>10: the first slot is reserved, the second slot is not reserved</li> <li>11: both slots are reserved.</li> </ul> <p>For a UE that supports subframe-level resource reservation but does not support slot/symbol-level resource reservation, two bits for each subframe are interpreted as:</p> <ul style="list-style-type: none"> <li>00: subframe is not reserved</li> <li>01: subframe is reserved. E-UTRAN does not set the field to this value when included in dedicated signalling.</li> <li>10: subframe is reserved. E-UTRAN does not set the field to this value when included in dedicated signalling.</li> <li>11: subframe is reserved.</li> </ul> <p>If the field is not included in UL configuration, the value of the field from DL configuration applies.</p> |
| <b>symbolBitmap1, symbolBitmap2</b>                 | <p>Provides the symbol-level resource reservation for one subframe. If <i>symbolBitmap1</i> is absent, value '01' in the <i>slotBitmap</i> corresponds to the whole 2nd slot being reserved. If <i>symbolBitmap2</i> is absent, value '10' in the <i>slotBitmap</i> corresponds to the whole 1st slot being reserved.</p> <p>A UE that supports subframe-level resource reservation but does not support slot/symbol-level resource reservation shall ignore <i>symbolBitmap1</i> and <i>symbolBitmap2</i>, if present.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Conditional presence | Explanation                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Bitmap1</i>       | The field is optionally present, need OR, if value of <i>slotBitmap</i> corresponding to at least one subframe is '01'; otherwise the field is not present. |
| <i>Bitmap2</i>       | The field is optionally present, need OR, if value of <i>slotBitmap</i> corresponding to at least one subframe is '10'; otherwise the field is not present. |
| <i>FDDandTDDnoDL</i> | The field is mandatory present for TDD when resource reservation for DL is not configured, and for FDD; otherwise the field is optionally present, need OP. |

## – RLC-Config

The IE *RLC-Config* is used to specify the RLC configuration of SRBs and DRBs.

### RLC-Config information element

| <b>RLC-Config field descriptions</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-extended-RLC-LI-Field, ul-extended-RLC-LI-Field</b> | Indicates the RLC LI field size. Value <i>TRUE</i> means that 15 bit LI length shall be used, otherwise 11 bit LI length shall be used; see TS 36.322 [7]. E-UTRAN enables this field only when <i>RLC-Config</i> (without suffix) is set to <i>am</i> .                                                                                                                                                                                          |
| <b>maxRetxThreshold</b>                                   | Parameter for RLC AM in TS 36.322 [7]. Value t1 corresponds to 1 retransmission, t2 to 2 retransmissions and so on.                                                                                                                                                                                                                                                                                                                               |
| <b>reestablishRLC</b>                                     | Indicates that RLC shall be re-established. For a UE configured with (NG)EN-DC, E-UTRAN may include this field for the (primary) RLC entity of an MCG RLC bearer of a DRB (used upon change from SN terminated split to MN terminated MCG RLC bearer). For a UE configured with NE-DC, E-UTRAN may include this field for the (primary) RLC entity of an SCG RLC bearer of a DRB or of an SRB (used upon key refresh for MN terminated split RB). |
| <b>pollByte</b>                                           | Parameter for RLC AM in TS 36.322 [7]. Value kB25 corresponds to 25 kBytes, kB50 to 50 kBytes and so on. kBInfinity corresponds to an infinite amount of kBytes. In case <i>pollByte-r14</i> is signalled, the UE shall ignore <i>pollByte</i> (i.e. without suffix).                                                                                                                                                                             |
| <b>pollPDU</b>                                            | Parameter for RLC AM in TS 36.322 [7]. Value p4 corresponds to 4 PDUs, p8 to 8 PDUs and so on. plnfinity corresponds to an infinite number of PDUs. In case <i>pollPDU-r13</i> is signalled, the UE shall ignore <i>pollPDU</i> (i.e. without suffix). E-UTRAN enables <i>pollPDU-v1310</i> field only when <i>RLC-Config</i> (without suffix) is set to <i>am</i> .                                                                              |
| <b>rlc-OutOfOrderDelivery</b>                             | Indicates that out-of-order delivery from RLC to PDCP is configured for this RLC entity as specified in TS 36.322 [7].                                                                                                                                                                                                                                                                                                                            |
| <b>sn-FieldLength</b>                                     | Indicates the UM RLC SN field size, see TS 36.322 [7], in bits. Value size5 means 5 bits, size10 means 10 bits.                                                                                                                                                                                                                                                                                                                                   |
| <b>t-PollRetransmit</b>                                   | Timer for RLC AM in TS 36.322 [7], in milliseconds. Value ms5 means 5ms, ms10 means 10ms and so on. EUTRAN configures values msX-v1310 (with suffix) only if UE supports CE.                                                                                                                                                                                                                                                                      |
| <b>t-Reordering</b>                                       | Timer for reordering in TS 36.322 [7], in milliseconds. Value ms0 means 0ms and behaviour as specified in 7.3.2 applies, ms5 means 5ms and so on.                                                                                                                                                                                                                                                                                                 |
| <b>t-ReorderingExt</b>                                    | Timer for reordering in TS 36.322 [7], in milliseconds. Value ms2200 corresponds to 2200 ms, value ms3200 corresponds to 3200 ms. The UE shall use the extended value <i>t-ReorderingExt-r17</i> , if present, and ignore the value signaled by <i>t-Reordering</i> or <i>t-Reordering-r15</i> .                                                                                                                                                  |
| <b>t-StatusProhibit</b>                                   | Timer for status reporting in TS 36.322 [7], in milliseconds. Value ms0 means 0ms and behaviour as specified in 7.3.2 applies, ms5 means 5ms and so on. EUTRAN configures values msX-v1310 (with suffix) only if UE supports operation in CE.                                                                                                                                                                                                     |
| <b>ul-extended-RLC-AM-SN, dl-extended-RLC-AM-SN</b>       | Indicates whether or not the UE shall use the extended SN and SO length for AM bearer. Value <i>TRUE</i> means that 16 bit SN length and 16 bit SO length shall be used, otherwise 10 bit SN length and 15 bit SO length shall be used; see TS 36.322 [7].                                                                                                                                                                                        |

### – *RLF-TimersAndConstants*

The IE *RLF-TimersAndConstants* contains UE specific timers and constants applicable for UEs in RRC\_CONNECTED.

#### ***RLF-TimersAndConstants* information element**

```

-- ASN1START

RLF-TimersAndConstants-r9 ::= CHOICE {

```

#### **RLF-TimersAndConstants field descriptions**

##### **n3xy**

Constants are described in clause 7.4. n1 corresponds with 1, n2 corresponds with 2 and so on.

##### **t3xy**

Timers are described in clause 7.3. Value ms0 corresponds with 0 ms, ms50 corresponds with 50 ms and so on. E-UTRAN configures *RLF-TimersAndConstants-r13* only if UE supports *ce-ModeB*. UE shall use the extended values *t3xy-v1310* and *t3xy-v1330*, if present, and ignore the values signaled by *t3xy-r9*.

## **RN-SubframeConfig**

The IE *RN-SubframeConfig* is used to specify the subframe configuration for an RN.

#### **RN-SubframeConfig information element**

```

-- ASN1START

RN-SubframeConfig-r10 ::= SEQUENCE {

| <b>RN-SubframeConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>demodulationRS</b>                       | Indicates which reference signals are used for R-PDCCH demodulation according to TS 36.216 [55], clause 7.4.1. Value interleaving corresponds to cross-interleaving and value noInterleaving corresponds to no cross-interleaving according to TS 36.216 [55], clauses 7.4.2 and 7.4.3.                                                                                                                                    |
| <b>n1PUCCH-AN-List</b>                      | Parameter: $n_{\text{PUCCH},t}^{(1)}$ , see TS 36.216, [55], clause 7.5.1. This parameter is only applicable for TDD. Configures PUCCH HARQ-ACK resources if the RN is configured to use HARQ-ACK channel selection, HARQ-ACK multiplexing or HARQ-ACK bundling.                                                                                                                                                           |
| <b>n1PUCCH-AN-P0, n1PUCCH-AN-P1</b>         | Parameter: $n_{\text{PUCCH}}^{(1,p)}$ , for antenna port P0 and for antenna port P1 respectively, see TS 36.216, [55], clause 7.5.1, for FDD and [55], clause 7.5.2 for TDD.                                                                                                                                                                                                                                               |
| <b>pdsch-Start</b>                          | Parameter: <i>DL-StartSymbol</i> , see TS 36.216 [55], Table 5.4-1.                                                                                                                                                                                                                                                                                                                                                        |
| <b>resourceAllocationType</b>               | Represents the resource allocation used: type 0, type 1 or type 2 according to TS 36.213 [23], clause 7.1.6. Value type0 corresponds to type 0, value type1 corresponds to type 1, value type2Localized corresponds to type 2 with localized virtual resource blocks and type2Distributed corresponds to type 2 with distributed virtual resource blocks.                                                                  |
| <b>resourceBlockAssignment</b>              | Indicates the resource block assignment bits according to TS 36.213 [23], clause 7.1.6. Value type01 corresponds to type 0 and type 1, and the value type2 corresponds to type 2. Value nrb6 corresponds to a downlink system bandwidth of 6 resource blocks, value nrb15 corresponds to a downlink system bandwidth of 15 resource blocks, and so on.                                                                     |
| <b>subframeConfigPatternFDD</b>             | Parameter: <i>SubframeConfigurationFDD</i> , see TS 36.216 [55], Table 5.2-1. Defines the DL subframe configuration for eNB-to-RN transmission, i.e. those subframes in which the eNB may indicate downlink assignments for the RN. The radio frame in which the pattern starts (i.e. the radio frame in which the first bit of the <i>subframeConfigPatternFDD</i> corresponds to subframe #0) occurs when SFN mod 4 = 0. |
| <b>subframeConfigPatternTDD</b>             | Parameter: <i>SubframeConfigurationTDD</i> , see TS 36.216 [55], Table 5.2-2. Defines the DL and UL subframe configuration for eNB-RN transmission.                                                                                                                                                                                                                                                                        |

## — RSS-Config

The IE *RSS-Config* is used to specify the RSS configuration, see TS 36.211 [21].

### **RSS-Config information element**

```
-- ASN1START
RSS-Config-r15 ::= SEQUENCE {

 timeOffset-r15 INTEGER (0..31)
}
-- ASN1STOP
```

| <b>RSS-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>duration</b>                      | Duration of RSS in subframes. Value sf8 corresponds to 8 subframes, value sf16 corresponds to 16 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>freqLocation</b>                  | Frequency location (lowest PRB number) of RSS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>periodicity</b>                   | Periodicity of RSS. Value ms160 corresponds to 160 ms, value ms320 corresponds to 320 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>powerBoost</b>                    | Power offset of RSS relative to CRS in dB. Value dB0 corresponds to 0 dB, value dB3 corresponds to 3 dB, value dB4dot8 corresponds to 4.8 dB and so on.                                                                                                                                                                                                                                                                                                                                                           |
| <b>timeOffset</b>                    | <p>Time offset of RSS in frames. The actual value of time offset is based on the value of <i>periodicity</i>, as follows:</p> <p>For <i>periodicity</i> 160 ms, only value range 0 to 15 are applicable. Actual value = <i>timeOffset</i> * 1 frame.</p> <p>For <i>periodicity</i> 320 ms, actual value = <i>timeOffset</i> * 1 frame.</p> <p>For <i>periodicity</i> 640 ms, actual value = <i>timeOffset</i> * 2 frames.</p> <p>For <i>periodicity</i> 1280 ms, actual value = <i>timeOffset</i> * 4 frames.</p> |

|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>altCQI-TableSTTI, altCQI-Table1024QAM-STTI</b>   | Indicates the applicability of the alternative CQI table (i.e. Table 7.2.3-2 and Table 7.2.3-4 in TS 36.213 [23]) for aperiodic CSI reporting for slot or subslot PDSCH for the concerned serving cell. Value <i>allSubframes</i> means the alternative CQI table applies to all the subframes and CSI processes, if configured, and value <i>csi-SubframeSet1</i> means the alternative CQI table applies to CSI subframe set1, and value <i>csi-SubframeSet2</i> means the alternative CQI table applies to CSI subframe set2. EUTRAN sets the value to <i>csi-SubframeSet1</i> or <i>csi-SubframeSet2</i> only if transmissionMode is set in range <i>tm1</i> to <i>tm9</i> and <i>csi-SubframePatternConfig-r10</i> is configured for the concerned serving cell and different CQI tables apply to the two CSI subframe sets; otherwise EUTRAN sets the value to <i>allSubframes</i> . EUTRAN does not configure the same value for altCQI-TableSTTI-r15 and altCQI-Table-1024QAM-STTI-r15 in SlotOrSubslotPDSCH-Config-r15. EUTRAN does not configure altCQI-Table-1024QAM-STTI-r15 if the value of altCQI-TableSTTI-r15 is set to <i>allSubframes</i> . EUTRAN does not configure altCQI-TableSTTI-r15 if the value of altCQI-Table-1024QAM-STTI-r15 is set to <i>allSubframes</i> . If both altCQI-TableSTTI-r15 and altCQI-Table-1024QAM-STTI-r15 are absent, the UE shall use Table 7.2.3-1 in TS 36.213 [23] for all subframes and CSI processes, if configured. |
| <b>resourceAllocation</b>                           | Parameter indicates resource allocation type for slot-PDSCH or subslot-PDSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>tbsIndexAlt-STTI</b>                             | Indicates the applicability of the alternative TBS index for the <i>l<sub>TBS</sub></i> 33 (see TS 36.213 [23], Table 7.1.7.2.1-1) to all slots/subslots scheduled by DCI format 7-1F and 7-1G. Value <i>a33</i> refers to the alternative TBS index <i>l<sub>TBS</sub></i> 33A. If neither this field nor <i>tbsIndexAlt2-STTI</i> configures an alternative TBS index for <i>l<sub>TBS</sub></i> 33, the UE shall use <i>l<sub>TBS</sub></i> 33 specified in Table 7.1.7.2.1-1 in TS 36.213 [23] for all slots/subslots instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>tbsIndexAlt2-STTI</b>                            | Indicates the applicability of the alternative TBS index for the <i>l<sub>TBS</sub></i> 33 (see TS 36.213 [23], Table 7.1.7.2.1-1) to all slots/subslots scheduled by DCI format 7-1B/7-1C/7-1D. Value <i>b33</i> refers to the alternative TBS index <i>l<sub>TBS</sub></i> 33B. If neither this field nor <i>tbsIndexAlt-STTI</i> configures an alternative TBS index for <i>l<sub>TBS</sub></i> 33, the UE shall use <i>l<sub>TBS</sub></i> 33 specified in Table 7.1.7.2.1-1 in TS 36.213 [23] for all slots/subslots instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>tbsIndexAlt3-STTI</b>                            | Indicates the applicability of the alternative TBS index for the <i>l<sub>TBS</sub></i> 37 (see TS 36.213 [23], Table 7.1.7.2.1-1) to all slots/subslots scheduled by DCI format 7-1F/7-1G. Value <i>a37</i> refers to the alternative TBS index <i>l<sub>TBS</sub></i> 37A. If this field does not configure an alternative TBS index for <i>l<sub>TBS</sub></i> 37, the UE shall use <i>l<sub>TBS</sub></i> 37 specified in TS 36.213 [23], Table 7.1.7.2.1-1 for all slots/subslots instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## – *SlotOrSubslotPUSCH-Config*

The IE *SlotOrSubslotPUSCH-Config* is used to specify the UE specific PUSCH configuration when sTTI is used.

### **SlotOrSubslotPUSCH-Config information element**

```

| <b><i>betaOffsetSlot-ACK-Index, betaOffsetSubslot-ACK-Index, betaOffset2Slot-ACK-Index, betaOffset2Subslot-ACK-Index</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| Parameter: $I_{\text{offset}}^{\text{HARQ-ACK}}$ and $I_{\text{offset},X}^{\text{HARQ-ACK}}$ for single-codeword, see TS 36.213 [23], Table 8.6.3-1. If <i>betaOffset2Slot-ACK-Index/betaOffset2Subslot-ACK-Index</i> is configured; <i>betaOffsetSlot-ACK-Index/betaOffsetSubslot-ACK-Index</i> is used when up to 22 HARQ-ACK bits are transmitted otherwise <i>betaOffset2Slot-ACK-Index/betaOffset2Subslot-ACK-Index</i> is used. The values apply for all serving cells with an uplink in a cell group (MCG or SCG or the group of cells configured to send SPUCH on the same cell in case SPUCH SCell is configured) and not configured with uplink power control subframe sets. It is indicated in DCI format 7-0A/7-0B which of the two values taken by <i>betaOffsetSubslot-ACK-Index-r15/betaOffset2Subslot-ACK-Index-r15/betaOffsetSubslot-RI-Index-r15</i> to use. The same value also applies for subframe set 1 of all serving cells with an uplink in that cell group and configured with uplink power control subframe sets (the associated functionality is common i.e. not performed independently for each cell). |  |
| <b><i>betaOffsetSlot-RI-Index, betaOffsetSubslot-RI-Index</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
| Parameter: $I_{\text{offset}}^{\text{RI}}$ , for single codeword, see TS 36.213 [23], Table 8.6.3-2. One value applies for subframe set 2 of all serving cells with an uplink in a cell group (MCG or SCG or the group of cells configured to send SPUCH on the same cell in case SPUCH SCell is configured) and configured with uplink power control subframe sets (the associated functionality is common i.e. not performed independently for each cell configured with uplink power control subframe sets).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
| <b><i>betaOffsetSlot-CQI-Index, betaOffsetSubslot-CQI-Index</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| Parameter: $I_{\text{offset}}^{\text{CQI}}$ , for single codeword, see TS 36.213 [23], Table 8.6.3-3. One value applies for all serving cells with an uplink in a cell group (MCG or SCG or the group of cells configured to send SPUCH on the same cell in case SPUCH SCell is configured) and not configured with uplink power control subframe sets. The same value also applies for subframe set 1 of all serving cells with an uplink in that cell group and configured with uplink power control subframe sets (the associated functionality is common i.e. not performed independently for each cell).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |
| <b><i>enable256QAM-SlotOrSubslot</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| Indicates that 256QAM for slot or subslot is enabled, see TS 36.213 [23], clause 8.6.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
| <b><i>resourceAllocationOffset</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| Indicates an RB resource allocation offset of 1 or 2 PRBs for slot-PUSCH or subslot-PUSCH. When the field is absent, the UE assumes no offset is used (i.e. offset = 0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |

| Value <i>TRUE</i> indicates that the UE is configured with enhanced UL DMRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |

## SoundingRS-UL-Config

The IE *SoundingRS-UL-Config* is used to specify the uplink Sounding RS configuration for periodic and aperiodic sounding.

### SoundingRS-UL-Config information element

```
-- ASN1START

SoundingRS-UL-ConfigCommon ::= CHOICE {
 release
 setup
 srs-BandwidthConfig
 srs-SubframeConfig
 ackNackSRS-SimultaneousTransmission BOOLEAN,
 srs-MaxUpPts
}
}

SoundingRS-UL-ConfigDedicated ::= CHOICE{
 release
 setup
 srs-Bandwidth
 srs-HoppingBandwidth
 freqDomainPosition
 duration
 srs-ConfigIndex
 transmissionComb
 cyclicShift
}
```

```

SoundingRS-UL-ConfigDedicated-v1020 ::= SEQUENCE {
 srs-AntennaPort-r10 SRS-AntennaPort
}

SoundingRS-UL-ConfigDedicated-v1310 ::= CHOICE{
 release NULL,
 setup SEQUENCE {
 transmissionComb-v1310 INTEGER (2..3) OPTIONAL, -- Need OR
 cyclicShift-v1310 ENUMERATED {cs8, cs9, cs10, cs11} OPTIONAL, -- Need
 }
 OR
 transmissionCombNum-r13 ENUMERATED {n2, n4} OPTIONAL -- Need OR
}
}

SoundingRS-UL-ConfigDedicatedUpPTsExt-r13 ::= CHOICE{
 release NULL,
 setup SEQUENCE {
 srs-UpPtsAdd-r13 ENUMERATED {sym2, sym4},
 srs-Bandwidth-r13 ENUMERATED {bw0, bw1, bw2, bw3},
 srs-HoppingBandwidth-r13 ENUMERATED {hbw0, hbw1, hbw2, hbw3},
 freqDomainPosition-r13 INTEGER (0..23),
 duration-r13 BOOLEAN,
 srs-ConfigIndex-r13 INTEGER (0..1023),
 transmissionComb-r13 INTEGER (0..3),
 cyclicShift-r13 ENUMERATED {cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7,
 cs8, cs9, cs10, cs11},
 srs-AntennaPort-r13 SRS-AntennaPort,
 transmissionCombNum-r13 ENUMERATED {n2, n4}
 }
}

SoundingRS-UL-ConfigDedicatedAperiodic-r10 ::= CHOICE{
 release NULL,
 setup SEQUENCE {
 srs-ConfigIndexAp-r10 INTEGER (0..31),

|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ackNackSRS-SimultaneousTransmission</b>                                              | Parameter: Simultaneous-AN-and-SRS, see TS 36.213 [23], clause 8.2. For SCells without PUCCH configured, this field is not applicable and the UE shall ignore the value.                                                                                                                                                                                                                                |
| <b>cyclicShift, cyclicShiftAp, srs-CyclicShiftAdd</b>                                   | Parameter: n_SRS for periodic, aperiodic and additional sounding reference signal transmission respectively except for an LAA SCell. See TS 36.211 [21], clause 5.5.3.1, where cs0 corresponds to 0 etc.                                                                                                                                                                                                |
| <b>duration</b>                                                                         | Parameter: Duration for periodic sounding reference signal transmission except for an LAA SCell. See TS 36.213 [21], clause 8.2. FALSE corresponds to "single" and value TRUE to "indefinite".                                                                                                                                                                                                          |
| <b>freqDomainPosition, freqDomainPositionAp, srs-FreqDomainPosAdd</b>                   | Parameter: $n_{RRC}$ for periodic, aperiodic and additional sounding reference signal transmission respectively, see TS 36.211 [21], clause 5.5.3.2.                                                                                                                                                                                                                                                    |
| <b>srs-AntennaPort, srs-AntennaPortAp, srs-AntennaPortAdd</b>                           | Indicates the number of antenna ports used for periodic, aperiodic and additional sounding reference signal transmission respectively, see TS 36.211 [21], clause 5.5.3. UE shall release srs-AntennaPort if SoundingRS-UL-ConfigDedicated is released.                                                                                                                                                 |
| <b>srs-Bandwidth, srs-BandwidthAp, srs-BandwidthAdd</b>                                 | Parameter: $B_{SRS}$ for periodic, aperiodic and additional sounding reference signal transmission respectively, see TS 36.211 [21], tables 5.5.3.2-1, 5.5.3.2-2, 5.5.3.2-3 and 5.5.3.2-4. For LAA SCell only bw0 is applied.                                                                                                                                                                           |
| <b>srs-BandwidthConfig</b>                                                              | Parameter: SRS Bandwidth Configuration. See TS 36.211, [21], tables 5.5.3.2-1, 5.5.3.2-2, 5.5.3.2-3 and 5.5.3.2-4. Actual configuration depends on UL bandwidth. bw0 corresponds to value 0, bw1 to value 1 and so on.                                                                                                                                                                                  |
| <b>srs-ConfigApDCI-Format0 / srs-ConfigApDCI-Format1a2b2c / srs-ConfigApDCI-Format4</b> | Parameters indicate the resource configurations for aperiodic sounding reference signal transmissions triggered by DCI formats 0, 1A, 2B, 2C, 4. See TS 36.213 [23], clause 8.2.                                                                                                                                                                                                                        |
| <b>srs-ConfigIndex, srs-ConfigIndexAp</b>                                               | Parameter: $I_{SRS}$ for periodic and aperiodic sounding reference signal transmission respectively except for an LAA SCell. See TS 36.213 [23], tables 8.2-1 and 8.2-2, for periodic and TS 36.213 [23], tables 8.2-4 an8.2-5, for aperiodic and additional SRS transmission. If both srs-ConfigIndexAp-r10 and srs-ConfigIndexAp-r16 are included, E-UTRAN configures the same value for both fields. |
| <b>srs-DurationAdd</b>                                                                  | Indicates the duration of the additional SRS including guard symbols within a UL subframe, see TS 36.211 [21], clause 5.5.3. E-UTRAN configures addSRS-StartPos and this field such that all the configured additional SRS occur within the same subframe.                                                                                                                                              |
| <b>srs-GuardSymbolAS-Add</b>                                                            | If enabled, there is a guard period of one symbol after antenna switching, see TS 36.211 [21], clause 5.5.3 and TS 36.213 [23] clause 8.2.                                                                                                                                                                                                                                                              |
| <b>srs-GuardSymbolFH-Add</b>                                                            | If enabled, there is a guard period of one symbol after frequency hopping, see TS 36.211 [21], clause 5.5.3 and TS 36.213 [23] clause 8.2.                                                                                                                                                                                                                                                              |
| <b>srs-HoppingBandwidth, srs-HoppingBandwidthAdd</b>                                    | Parameter: SRS hopping bandwidth $b_{hop} \in \{0,1,2,3\}$ for periodic and additional sounding reference signal transmission respectively except for an LAA SCell, see TS 36.211 [21], clause 5.5.3.2, where hbw0 corresponds to value 0, hbw1 to value 1 and so on.                                                                                                                                   |
| <b>srs-MaxUpPts</b>                                                                     | Parameter: srsMaxUpPts, see TS 36.211 [21], clause 5.5.3.2. If this field is present, reconfiguration of $m_{SRS,0}^{\max}$ applies for UpPts, otherwise reconfiguration does not apply.                                                                                                                                                                                                                |
| <b>srs-RepNumAdd</b>                                                                    | Parameter: R which indicates the number of the additional SRS repetitions, see TS 36.211 [21], clause 5.5.3.2 and TS 36.213 [23] clause 8.3.                                                                                                                                                                                                                                                            |
| <b>srs-StartPosAdd</b>                                                                  | Indicates the starting position of the additional SRS within a UL subframe excluding UpPTS, see TS 36.211 [21], clause 5.5.3.                                                                                                                                                                                                                                                                           |
| <b>srs-SubframeConfig</b>                                                               | Parameter: SRS SubframeConfiguration except for an LAA SCell. See TS 36.211, [21], table 5.5.3.3-1, applies for FDD whereas TS 36.211 [21], table 5.5.3.3-2, applies for TDD. sc0 corresponds to value 0, sc1 corresponds to value 1 and so on.                                                                                                                                                         |
| <b>srs-SubframeIndication</b>                                                           | Parameter: SRS subframe indication in SRS parameter set configuration for aperiodic sounding reference signal transmission on an LAA SCell configured with uplink, see TS 36.213 [23].                                                                                                                                                                                                                  |

| <b>SoundingRS-UL-Config field descriptions</b>                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>srs-UpPtsAdd</b>                                                  | The field only applies for TDD and frame structure type 3, see TS 36.211 [21]. If E-UTRAN configures both <i>soundingRS-UL-ConfigDedicatedUpPTsExt</i> and <i>soundingRS-UL-ConfigDedicatedAperiodicUpPTsExt</i> , <i>srs-UpPtsAdd</i> in both fields is set to the same value. If E-UTRAN configures <i>soundingRS-UL-PeriodicConfigDedicatedUpPTsExtList-r14</i> with a number of <i>soundingRS-UL-ConfigDedicatedUpPTsExt</i> and/or <i>soundingRS-UL-AperiodicConfigDedicatedList-r14</i> with a number of <i>soundingRS-UL-ConfigDedicatedAperiodicUpPTsExt</i> , <i>srs-UpPtsAdd</i> in all fields are set to the same value. |
| <b>transmissionComb, transmissionCombAp, srs-TransmissionCombAdd</b> | Parameter: $\bar{k}_{TC} \in \{0..3\}$ for periodic, aperiodic and additional sounding reference signal transmission respectively, see TS 36.211 [21], clause 5.5.3.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Conditional presence | Explanation                                                                                                                           |

| <b><i>al-StartingPointSPDCCH</i></b>           | Indicates the starting SCCE index for an aggregation level, see TS 36.213 [23], clause 9.1.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>dci7-Candidates</i></b>                  | Number of candidates in each aggregation level for DCI format 7. The number of PDCCH/SPDCCH candidate(s) M_DCI format $7^{\wedge}(L)$ at aggregation level L for monitoring DCI format 7 in PDCCH and SPDCCH region shall conform to the following restriction: <ul style="list-style-type: none"> <li>• less than or equal to 2 for aggregation level 4 and 8,</li> <li>• less than or equal to 6 for aggregation level 1 and 2</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>dci7-CandidatesPerAL-SPDCCH</i></b>      | SPDCCH candidates configured per aggregation level in SPDCCH region                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>dmrs-ScramblingSeqSPDCCH</i></b>         | The DMRS scrambling sequence initialization parameter $n_{ID,i}^{SPDCCH}$ defined in TS 36.211 [21], clause 6.10.3A.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>numberRB-InFreq-domain</i></b>           | Indicates the number of resource-blocks in the frequency domain used for the SPDCCH set. There is no restriction on the number of RBs in the frequency domain that can be configured to an SPDCCH resource set (up to 100), but at least two need to be configured to contain at least one SCCE. The granularity of resource block allocation in frequency domain for configuring an SPDCCH resource set is one in case spdcch-SetReferenceSig-r15 is set to crs. The granularity of resource block allocation for configuring an SPDCCH resource set is two in case sPDCCH-SetReferenceSig-r15 is set to dmrs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>rateMatchingMode</i></b>                 | Indicates, per resource-set, the mode of SPDCCH rate-matching operation <ul style="list-style-type: none"> <li>• Mode 1: UE rate-matches only around the DCI format 7 scheduling the slot or subslot PDSCH (if transmitted in the SPDCCH resource-set), otherwise no rate-matching is performed for the RB set.</li> <li>• Mode 2: UE rate-matches around the whole SPDCCH resource set</li> <li>• Mode 3: UE rate-matches around the whole SPDCCH resource set if DCI format 7 scheduling the slot or subslot PDSCH is found in the resource-set, otherwise no rate-matching is performed for the RB set.</li> <li>• Mode 4: UE rate-matches around the whole SPDCCH resource set if DCI format 7 scheduling the slot or subslot PDSCH is not found in the resource-set, otherwise UE rate-matches only around the DCI format 7 scheduling the slot or subslot PDSCH (if transmitted in the SPDCCH resource-set)</li> </ul> If the DCI format 7 scheduling the slot or subslot PDSCH is found on a candidate belonging to two SPDCCH resource sets, the DCI format 7 is assumed to be found in both resource sets. |
| <b><i>resourceBlockAssignment</i></b>          | Indicates the index to a specific combination of physical resource block in frequency for SPDCCH set, see TS 36.213 [23], clause 9.1.4.4. The value range is dependent on the combinatorial number defined in 36.213 [23], clause 9.1.4.4 with the assumption of no limitation in the number of RBs in frequency domain configured by the set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>spdcch-NoOfSymbols</i></b>               | Indicates the number of OFDM symbols that the CRS based SPDCCH is mapped over.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>spdcch-L1-ReuseIndication</i></b>        | For the up to two resource sets configured with the same <i>subframeType</i> applicability, the <i>SPDCCH-L1-ReuseIndication</i> defines the allowed combinations for the two resource sets: {1,1}, {2,0} or {0,2} corresponding to the values n0, n1 and n2 respectively. In case one resource set is configured, the allowed combinations are {2, 0} or {0,2} corresponding to n1 or n2. EUTRAN does not configure n0 in case one resource set is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>spdcch-SetConfigId</i></b>               | Indicates the ID of the SPDCCH set configured in <i>SPDCCH-Elements</i> . Maximum two sets can be configured for MBSFN and two for non-MBSFN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>spdcch-SetReferenceSig</i></b>           | Indicates CRS or DMRS based SPDCCH set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>subframeType</i></b>                     | Indicates applicable subframe type(s) for the SPDCCH set. CRS-based SPDCCH is only applied to non-MBSFN subframe.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>subslotApplicability</i></b>             | Indicates the set of subslots within the subframe where SPDCCH candidate set per aggregation levels applies, see <i>DCI7-CandidateSetsPerAL-SPDCCH</i> . The bitmap applies to the 5 DL subslot indices in a DL subframe. The first element in the sequence <i>DCI7-CandidateSetsPerAL-SPDCCH</i> applies to the indicated <i>subslotApplicability</i> . The second element in the sequence (if present) applies to the complement of the <i>subslotApplicability</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>transmissionType</i></b>                 | Indicates whether distributed or localized SPDCCH transmission mode is used as defined in TS 36.211 [21], clause 6.8A.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## – *SPS-Config*

The IE *SPS-Config* is used to specify the semi-persistent scheduling configuration.

This field is applicable for persistent scheduling, only. If choice setup is used and <i>p0-Persistent</i> is absent, apply the value of <i>p0-NominalPUSCH</i> for <i>p0-NominalPUSCH-Persistent</i> . If uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> , this field applies for uplink power control subframe set 1.                                                                              |
| <b><i>p0-NominalPUSCH-PersistentSubframeSet2, p0-NominalSPUSCH-PersistentSubframeSet2</i></b> | Parameter: $P_{\text{O\_NOMINAL\_PUSCH}}(0)$ . See TS 36.213 [23], clause 5.1.1.1, unit dBm step 1. This field is applicable for persistent scheduling, only. If <i>p0-PersistentSubframeSet2-r12</i> is not configured, apply the value of <i>p0-NominalPUSCH-SubframeSet2-r12</i> for <i>p0-NominalPUSCH-PersistentSubframeSet2</i> . E-UTRAN configures this field only if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> , in which case this field applies for uplink power control subframe set 2. |
| <b><i>p0-UE-PUSCH-Persistent</i></b>                                                          | Parameter: $P_{\text{O\_UE\_PUSCH}}(0)$ . See TS 36.213 [23], clause 5.1.1.1, unit dB. This field is applicable for persistent scheduling, only. If choice setup is used and <i>p0-Persistent</i> is absent, apply the value of <i>p0-UE-PUSCH</i> for <i>p0-UE-PUSCH-Persistent</i> . If uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> , this field applies for uplink power control subframe set 1.                                                                                                   |
| <b><i>p0-UE-PUSCH-PersistentSubframeSet2</i></b>                                              | Parameter: $P_{\text{O\_UE\_PUSCH}}(0)$ . See TS 36.213 [23], clause 5.1.1.1, unit dB. This field is applicable for persistent scheduling, only. If <i>p0-PersistentSubframeSet2-r12</i> is not configured, apply the value of <i>p0-UE-PUSCH-SubframeSet2</i> for <i>p0-UE-PUSCH-PersistentSubframeSet2</i> . E-UTRAN configures this field only if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> , in which case this field applies for uplink power control subframe set 2.                          |
| <b><i>rv-SPS-STTI-UL-Repetitions</i></b>                                                      | Indicates the RV sequence of slot or subslot PUSCH for slot or subslot UL SPS repetitions. Value <i>ulrvseq1</i> = {0, 0, 0, 0, 0} , value <i>ulrvseq2</i> = {0, 2, 3, 1, 0, 2} and value <i>ulrvseq3</i> = {0, 3, 0, 3, 0, 3}.                                                                                                                                                                                                                                                                                                       |
| <b><i>rv-SPS-UL-Repetitions</i></b>                                                           | Indicates the RV sequence of PUSCH for subframe UL SPS repetitions. Value <i>ulrvseq1</i> = {0, 0, 0, 0, 0, 0} , value <i>ulrvseq2</i> = {0, 2, 3, 1, 0, 2} and value <i>ulrvseq3</i> = {0, 3, 0, 3, 0, 3}.                                                                                                                                                                                                                                                                                                                           |
| <b><i>semiPersistSchedC-RNTI</i></b>                                                          | Semi-persistent Scheduling C-RNTI, see TS 36.321 [6]. If <i>sps-Config</i> is present for more than one cells in the same cell group, <i>semiPersistSchedC-RNTI</i> is present in only one <i>sps-Config</i> .                                                                                                                                                                                                                                                                                                                        |

| <b>SPS-Config field descriptions</b>                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>semiPersistSchedIntervalDL</b>                       | Semi-persistent scheduling interval in downlink, see TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. For TDD, the UE shall round this parameter down to the nearest integer (of 10 sub-frames), e.g. sf10 corresponds to 10 sub-frames, sf32 corresponds to 30 sub-frames, sf128 corresponds to 120 sub-frames.                                                                                                                                                                                                                                                                      |
| <b>semiPersistSchedIntervalDL-STTI</b>                  | Semi-persistent scheduling interval for sTTI in downlink, see TS 36.321 [6]. Value in number of sTTI. Value sTTI1 corresponds to a spacing of 1 sTTI interval, sTTI2 corresponds to 2 spacings of sTTI intervals and so on, e.g. sTTI1 equal to sub-slot of 2 symbols or 3 symbols when the type of 2OS sTTI is configured, or e.g. sTTI1 equal to slot of 7 symbols when type of 7OS sTTI is configured. SPS for sTTI is not supported for TDD.                                                                                                                                                                                                                         |
| <b>semiPersistSchedIntervalSL</b>                       | Semi-persistent scheduling interval in sidelink, see TS 36.321 [6]. Value in number of sub-frames. Value sf20 corresponds to 20 sub-frames, sf50 corresponds to 50 sub-frames and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>semiPersistSchedIntervalUL</b>                       | Semi-persistent scheduling interval in uplink, see TS 36.321 [6]. Value in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. For TDD, when the configured Semi-persistent scheduling interval is greater than or equal to 10 sub-frames, the UE shall round this parameter down to the nearest integer (of 10 sub-frames), e.g. sf10 corresponds to 10 sub-frames, sf32 corresponds to 30 sub-frames, sf128 corresponds to 120 sub-frames. If <i>semiPersistSchedIntervalUL-v1430</i> is configured, the UE only considers this extension (and ignores <i>semiPersistSchedIntervalUL</i> i.e. without suffix). |
| <b>semiPersistSchedIntervalUL-STTI</b>                  | Semi-persistent scheduling interval for sTTI in uplink, see TS 36.321 [6]. Value in number of sTTI. Value sTTI1 corresponds to a spacing of 1 sTTI interval, sTTI2 corresponds to 2 spacings of sTTI intervals and so on, e.g. sTTI1 equal to sub-slot of 2 symbols or 3 symbols when the type of 2OS sTTI is configured, or e.g. sTTI1 equal to slot of 7 symbols when type of 7OS sTTI is configured. SPS for sTTI is not supported for TDD.                                                                                                                                                                                                                           |
| <b>sl-SPS-V-RNTI</b>                                    | SL Semi-Persistent Scheduling V-RNTI for V2X sidelink communication, see TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sps-ConfigIndex</b>                                  | Indicates the index of one of multiple SL/UL SPS configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>sps-ConfigDL-STTI</b>                                | If <i>sps-ConfigDL-sTTI-r15</i> is signalled, the UE ignores <i>sps-ConfigDL</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>sps-ConfigSL-ToAddModList</b>                        | Indicates the SL SPS configurations to be added or modified, identified by <i>SPS-ConfigIndex</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>sTTI-StartTimeUL</b>                                 | Indicates the UL sTTI index start offset for SPS (re-)initialization, see TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>tbs-scalingFactorSubslotPUSCH-SPS-UL-Repetitions</b> | Indicates the TBS scaling factor of subslot PUSCH for UL SPS repetitions. Value n6 corresponds to 1/6 and value n12 corresponds to 1/12.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>totalNumberPUSCH-SPS-STTI-UL-Repetitions</b>         | Indicates the total number of UL transmissions for slot or subslot UL SPS repetitions. If the UE is configured with UL SPS and the configured number of SPS PUSCH transmissions k>1, simultaneous transmission of PUSCH and PUCCH is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>totalNumberPUSCH-SPS-UL-Repetitions</b>              | Indicates the total number of UL transmissions for subframe UL SPS repetitions. If the UE is configured with UL SPS and the configured number of SPS PUSCH transmissions k>1, simultaneous transmission of PUSCH and PUCCH is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>tpc-PDCCH-ConfigPUCCH-SPS</b>                        | PDCCH configuration for power control of slot/subslot-PUCCH using format 3/3A, see TS 36.212 [22], when <i>SPS-ConfigDL-STTI</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>SPS-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tpc-PDCCH-ConfigPUSCH-SPS</b>     | PDCCH configuration for power control of slot/subslot-PUSCH using format 3/3A, see TS 36.212 [22], when <i>SPS-ConfigUL-STI</i> is configured. If a UE is configured with multiple UL SPS configurations in a serving cell, the same TPC index for DCI format 3/3A applies to all the UL SPS configurations in the serving cell. |
| <b>twoIntervalsConfig</b>            | Trigger of two-intervals-Semi-Persistent Scheduling in uplink. See TS 36.321 [6], clause 5.10. If this field is present and the configured Semi-persistent scheduling interval greater than or equal to 10 sub-frames, two-intervals-SPS is enabled for uplink. Otherwise, two-intervals-SPS is disabled.                        |
| <b>ul-SPS-V-RNTI</b>                 | UL Semi-Persistent Scheduling V-RNTI for UEs capable of multiple uplink SPS configurations and which support V2X communication, see TS 36.321 [6].                                                                                                                                                                               |

### ***SPUCCH-Config field descriptions***

***dummy***

This field is not used in the specification. If received it shall be ignored by the UE.

***n1SlotSPUCCH-FH-AN-List***

Resource configuration for slot-SPUCCH format 1 when frequency hopping is enabled. Parameter:  $n_{\text{SPUCCH}}^{(1,p)}$  for antenna port P0 and for antenna port P1 respectively, see TS 36.213 [23], clause 10.1.

***n1SlotSPUCCH-NoFH-AN-List***

Resource configuration for slot-SPUCCH format 1 when frequency hopping is disabled. Parameter:  $n_{\text{SPUCCH}}^{(3,p)}$  for antenna port P0 and for antenna port P1 respectively, see TS 36.213 [23], clause 10.1.

***n1SubslotSPUCCH-AN-List***

Resource configuration for subslot-SPUCCH format 1. Parameter:  $n_{\text{SPUCCH}}^{(1,p)}$  for antenna port P0 and for antenna port P1 respectively, see TS 36.213 [23], clause 10.1.

***n3SPUCCH-AN-List***

Resource index for slot-SPUCCH format 3:  $n_{\text{SPUCCH}}^{(3,p)}$ , see TS 36.213 [23], clause 10.1.

***n4maxCoderateSlotPUCCH, n4maxCoderateSubslotPUCCH***

Indicates the maximum coding rate for slot-PUCCH and subslot-PUCCH format 4 transmission.

***n4maxCoderateMultiResourceSlotPUCCH, n4maxCoderateMultiResourceSubslotPUCCH***

Indicates the maximum coding rate for slot-PUCCH and subslot-PUCCH format 4 transmission in case of multiple resource configuration.

***n4numberOfPRB, n4numberOfPRBSubslot***

Parameter  $n_{\text{SPUCCH}}^{(4)}$  see TS 36.213 [23], Table 10.1.1-2 for determining SPUCCCH resource(s) of SPUCCCH format 4.

***n4startingPRB***

Parameter  $n_{\text{SPUCCH}}^{(4)}$  see TS 36.211 [21], clause 5.4A.3 for determining SPUCCCH resource(s) of SPUCCCH format 4.

***twoAntennaPortActivatedSPUCCH-Format1a1b***

Indicates whether two antenna ports are configured for SPUCCCH format 1a/1b for HARQ-ACK, see TS 36.213 [23], clause 10.1. The field also applies for SPUCCCH format 1a/1b transmission when *format3* is configured, see TS 36.213 [23], clauses 10.1.2.2.2 and 10.1.3.2.2.

***twoAntennaPortActivatedSPUCCH-Format3***

Indicates whether two antenna ports are configured for SPUCCCH format 3 for HARQ-ACK, see TS 36.213 [23], clause 10.1.

## — ***SRS-TPC-PDCCH-Config***

The IE ***SRS-TPC-PDCCH-Config*** is used to specify the RNTIs and indexes for A-SRS trigger and TPC according to TS 36.212 [22].

| <b>SRS-TPC-PDCCH-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cc-IndexInOneCC-Set</b>                     | Indicates the CC index in one CC set for Type A associated with the group DCI with SRS request field (optional) and TPC commands for a PUSCH-less SCell                                                                                                                                                                                                                                                                                                                                                  |
| <b>cc-SetIndex</b>                             | Indicates the CC set index for Type A associated with the group DCI with SRS request field (optional) and TPC commands for a PUSCH-less SCell.                                                                                                                                                                                                                                                                                                                                                           |
| <b>fieldTypeFormat3B</b>                       | The type of a field within the group DCI with SRS request fields (optional) and TPC commands for a PUSCH-less SCell, which indicates how many bits in the field are for SRS request (0 or 1/2) and how many bits in the field are for TPC (1 or 2). Note that for Type A, there is a common SRS request field for all SCells in the set, but each SCell has its own TPC command bits. See TS 36.212 [22], clause 5.3.3.1.7A. EUTRAN configures this field with the same value for all PUSCH-less SCells. |
| <b>srs-CC-SetIndexlist</b>                     | Indicates the index of the SRS-TPC-PDCCH-Config for Type A trigger by the group DCI with SRS request field (optional) and TPC commands for a PUSCH-less SCell. Each set may contain at most 8 CCs.                                                                                                                                                                                                                                                                                                       |
| <b>srs-TPC-RNTI</b>                            | RNTI for SRS trigger and power control using DCI format 3B, see TS 36.212 [22], clause 5.1.3.1.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>startingBitOfFormat3B</b>                   | The starting bit position of a block within the group DCI with SRS request fields (optional) and TPC commands for a PUSCH-less SCell.                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                               |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SRS-Trigger-TypeA</i>    | The field is mandatory present if <i>typeA-SRS-TPC-PDCCH-Group-r14</i> is present. Otherwise the field is not present and the UE shall delete any existing value for this field. |

|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>specialSubframePatterns</b>       | Indicates Configuration as in TS 36.211 [21], table 4.2-1, where <i>ssp0</i> points to Configuration 0, <i>ssp1</i> to Configuration 1 etc. Value <i>ssp7</i> points to Configuration 7 for extended cyclic prefix, value <i>ssp9</i> points to Configuration 9 for normal cyclic prefix and value <i>ssp10</i> points to Configuration 10 for normal cyclic prefix. Value <i>ssp10-CRS-LessDwPTS</i> corresponds to <i>ssp10</i> without CRS transmission on the 5th symbol of DwPTS. E-UTRAN signals <i>ssp7</i> only when setting <i>specialSubframePatterns</i> (without suffix i.e. the version defined in REL-8) to <i>ssp4</i> . E-UTRAN signals value <i>ssp9</i> only when setting <i>specialSubframePatterns</i> (without suffix) to <i>ssp5</i> . E-UTRAN signals value <i>ssp10</i> or <i>ssp10-CRS-LessDwPTS</i> only when setting <i>specialSubframePatterns</i> (without suffix) to <i>ssp0</i> or <i>ssp5</i> . If <i>specialSubframePatterns-v1130</i> , <i>specialSubframePatterns-v1430</i> , or <i>specialSubframePatterns-v1450</i> is present, the UE shall ignore <i>specialSubframePatterns</i> (without suffix). If <i>specialSubframePatterns-v1430</i> or <i>specialSubframePatterns-v1450</i> is present, the UE shall ignore <i>specialSubframePatterns-v1130</i> . E-UTRAN does not simultaneously configure <i>TDD-Config-v1430</i> and <i>TDD-Config-v1450</i> . |
| <b>subframeAssignment</b>            | Indicates DL/UL subframe configuration where <i>sa0</i> points to Configuration 0, <i>sa1</i> to Configuration 1 etc. as specified in TS 36.211 [21], table 4.2-2. E-UTRAN configures the same value for serving cells residing on same frequency band.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>subframeAssignmentSL</b>          | Indicates UL/ DL subframe configuration where <i>sa0</i> points to Configuration 0, <i>sa1</i> to Configuration 1 etc. as specified in TS 36.211 [21], table 4.2-2. The value <i>none</i> means that no TDD specific physical channel configuration is applicable (i.e. the carrier on which <i>MasterInformationBlock-SL</i> is transmitted is an FDD UL carrier or the carrier on which <i>MasterInformationBlock-SL-V2X</i> is transmitted is a carrier for V2X sidelink communication).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## — *TDM-PatternConfig*

The IE *TDM-PatternConfig* is used to specify the UL/DL reference configuration indicating the time during which a UE configured with (NG)EN-DC or NE-DC is allowed to transmit, as specified in TS 38.101-3 [101] and TS 38.213 [88].

### *TDM-PatternConfig* information element

```
-- ASN1START
TDM-PatternConfig-r15 ::= CHOICE {
 release
 setup
 subframeAssignment-r15
 harq-Offset-r15
 }
}
SubframeAssignment-r15 ::= ENUMERATED {sa0, sa1, sa2, sa3, sa4, sa5, sa6}
-- ASN1STOP
```

| <b>TDM-PatternConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>subframeAssignment</b>                   | Indicates DL/UL subframe configuration where <i>sa0</i> points to Configuration 0, <i>sa1</i> to Configuration 1 etc. as specified in TS 36.211 [21], table 4.2-2. When configured in EN-DC with LTE TDD PCell, the value range of this field is {sa2, sa4, sa5}.                                                       |
| <b>harq-Offset</b>                          | Indicates a HARQ subframe offset that is applied to the subframes designated as UL in the associated subframe assignment, see TS 36.213 [23]. When configured in EN-DC with LTE TDD PCell, the network ensures it does not violate the TDD configuration in SIB1, and the value range of this field is {0, 1, 2, 5, 6}. |

## — *TimeAlignmentTimer*

The IE *TimeAlignmentTimer* is used to control how long the UE considers the serving cells belonging to the associated TAG to be uplink time aligned. Corresponds to the Timer for time alignment in TS 36.321 [6]. Value in number of sub-frames. Value sf500 corresponds to 500 sub-frames, sf750 corresponds to 750 sub-frames and so on.

### *TimeAlignmentTimer* information element

```
-- ASN1START
TimeAlignmentTimer ::= ENUMERATED {
```

```
sf500, sf750, sf1280, sf1920, sf2560, sf5120,
sf10240, infinity}
```

```
-- ASN1STOP
```

## — *TimeReferenceInfo*

### *TimeReferenceInfo* information elements

```
-- ASN1START

TimeReferenceInfo-r15 ::= SEQUENCE {
 time-r15 ReferenceTime-r15,
 uncertainty-r15 INTEGER (0..12) OPTIONAL, -- Need OR
 timeInfoType-r15 ENUMERATED {localClock} OPTIONAL, -- Need OR
 referenceSFN-r15 INTEGER (0..1023) OPTIONAL -- Cond TimeRef
}

ReferenceTime-r15 ::= SEQUENCE {
 refDays-r15 INTEGER (0..72999),
 refSeconds-r15 INTEGER (0..86399),
 refMilliSeconds-r15 INTEGER (0..999),
 refQuarterMicroSeconds-r15 INTEGER (0..3999)
}

-- ASN1STOP
```

### *TimeReferenceInfo* field descriptions

#### **referenceSFN**

This field indicates the reference SFN for time reference information. The *time* field indicates the time at the ending boundary of the SFN indicated by *referenceSFN*. The UE considers the frame indicated by the *referenceSFN* nearest to the frame where the field is received.

If the *time* field is included in *SystemInformationBlockType16* and the *referenceSFN* field is not included, the *time* field indicates the time at the SFN boundary at or immediately after the ending boundary of the SI-window in which *SystemInformationBlockType16* is transmitted.

#### **time, timeInfoType**

This field indicates time reference with 0.25 us granularity. The indicated time is referenced at the network, i.e., without compensating for RF propagation delay. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the time at the UE. The indicated time in 0.25 us unit from the origin is *refDays*\*86400\*1000\*4000 + *refSeconds*\*1000\*4000 + *refMilliSeconds*\*4000 + *refQuarterMicroSeconds*. The *refDays* field specifies the sequential number of days (with day count starting at 0) from the origin of the *time* field. If *timeInfoType* is not included, the origin of the *time* field is 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time). If *timeInfoType* is set to *localClock*, the interpretation of the origin of the *time* is unspecified and left up to upper layers.

If *time* field is included in *SystemInformationBlockType16*, this field is excluded when estimating changes in system information, i.e. changes of *time* should neither result in system information change notifications nor in a modification of *systemInfoValueTag* in SIB1.

NOTE: The estimated time in an NTN-cell may be less accurate than the estimated time in a TN-cell.

#### **uncertainty**

This field indicates the number of LSBs which may be inaccurate in the *refQuarterMicroSeconds* field. If *uncertainty* is absent, the uncertainty of *refQuarterMicroSeconds* is not specified.

| Conditional presence | Explanation                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>TimeRef</i>       | The field is mandatory present if <i>TimeReferenceInfo</i> is included in <i>DLInformationTransfer</i> message; otherwise the field is not present. |

## — *TPC-PDCCH-Config*

The IE *TPC-PDCCH-Config* is used to specify the RNTIs and indexes for PUCCH and PUSCH power control according to TS 36.212 [22]. The power control function can either be setup or released with the IE.

### TPC-PDCCH-Config information element

```
-- ASN1START

TPC-PDCCH-Config ::= CHOICE {
 release
 setup
 TPC-RNTI
 tpc-Index
 }
}

TPC-PDCCH-ConfigSCell-r13 ::= CHOICE {
 release
 setup
 tpc-Index-PUCCH-SCell-r13
 }
}

TPC-Index ::= CHOICE {
 indexOfFormat3
 indexOfFormat3A
}
-- ASN1STOP
```

#### TPC-PDCCH-Config field descriptions

***IndexOfFormat3***

Index of N when DCI format 3 is used. See TS 36.212 [22], clause 5.3.3.1.6.

***IndexOfFormat3A***

Index of M when DCI format 3A is used. See TS 36.212 [22], clause 5.3.3.1.7.

***tpc-Index***

Index of N or M, see TS 36.212 [22], clauses 5.3.3.1.6 and 5.3.3.1.7, where N or M is dependent on the used DCI format (i.e. format 3 or 3a).

***tpc-Index-PUCCH-SCell***

Index of N or M, see TS 36.212 [22], clauses 5.3.3.1.6 and 5.3.3.1.7, where N or M is dependent on the used DCI format (i.e. format 3 or 3a).

***tpc-RNTI***

RNTI for power control using DCI format 3/3A, see TS 36.212 [22].

### *TunnelConfigLWIP*

The IE *TunnelConfigLWIP* is used to setup/release LWIP Tunnel.

```
-- ASN1START

TunnelConfigLWIP-r13 ::= SEQUENCE {
 ip-Address-r13 IP-Address-r13,
 ike-Identity-r13 IKE-Identity-r13,
 ...
 [[lwip-Counter-r13 INTEGER (0..65535) OPTIONAL -- Cond LWIP-Setup
]]
}

IKE-Identity-r13 ::= SEQUENCE {
 idI-r13 OCTET STRING
}

IP-Address-r13 ::= CHOICE {
 ipv4-r13 BIT STRING (SIZE (32)),
 ipv6-r13 BIT STRING (SIZE (128))
}
-- ASN1STOP
```

| <b>TunnelConfigLWIP field descriptions</b> |                                                                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-Address</b>                          | Parameter indicates the LWIP-SeGW IP Address to be used by the UE for initiating LWIP Tunnel establishment [32].                      |
| <b>ike-Identity</b>                        | Parameter indicates the IKE Identity elements (IDi) to be used in IKE Authentication Procedures [32].                                 |
| <b>lwig-Counter</b>                        | Indicates the parameter used by UE for computing the security keys used in LWIP tunnel establishment, as specified in TS 33.401 [32]. |

| Conditional presence | Explanation                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------|
| LWIP-Setup           | The field is mandatory present upon setup of LWIP tunnel. Otherwise the field is optional, Need ON. |

### — *UplinkPowerControl*

The IE *UplinkPowerControlCommon* and IE *UplinkPowerControlDedicated* are used to specify parameters for uplink power control in the system information and in the dedicated signalling, respectively.

#### *UplinkPowerControl* information elements

```
-- ASN1START

UplinkPowerControlCommon ::= SEQUENCE {

| <b><i>UplinkPowerControl field descriptions</i></b>                                         |                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>accumulationEnabled, accumulationEnabledSTI</i></b>                                   | Parameter: Accumulation-enabled, see TS 36.213 [23], clauses 5.1.1.1 and 5.1.3.1. TRUE corresponds to "enabled" whereas FALSE corresponds to "disabled".                                                                                                                                                                                                                                                   |
| <b><i>accumulationEnabledSRS-Add</i></b>                                                    | Parameter: accumulationEnabled-additionalSRS, see TS 36.213 [23], clauses 5.1.3.1. TRUE corresponds to "enabled" whereas FALSE corresponds to "disabled".                                                                                                                                                                                                                                                  |
| <b><i>alpha</i></b>                                                                         | Parameter: $\alpha$ See TS 36.213 [23], clause 5.1.1.1. This field applies for uplink power control subframe set 1 if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> .                                                                                                                                                                                                        |
| <b><i>alpha-SRS, alphaSRS-Add</i></b>                                                       | Parameter: $\alpha_{SRS}$ . See TS 36.213 [23], clause 5.1.3.1. <i>alpha-SRS</i> applies for SRS power control on a PUSCH-less SCell, <i>alphaSRS-Add</i> applies for SRS power control on the additional SRS symbols.                                                                                                                                                                                     |
| <b><i>alpha-SubframeSet2</i></b>                                                            | Parameter: $\alpha$ . See TS 36.213 [23], clause 5.1.1.1. This field applies for uplink power control subframe set 2 if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> .                                                                                                                                                                                                      |
| <b><i>alpha-UE</i></b>                                                                      | Parameter: $\alpha_{UE}$ See TS 36.213 [23], clause 5.1.1.1.                                                                                                                                                                                                                                                                                                                                               |
| <b><i>deltaF-PUCCH-FormatX</i></b>                                                          | Parameter: $\Delta_{F\_PUCCH}(F)$ for the PUCCH formats 1, 1b, 2, 2a, 2b, 3, 4, 5 and 1b with channel selection. See TS 36.213 [23], clause 5.1.2, where deltaF-2 corresponds to -2 dB, deltaF0 corresponds to 0 dB and so on.                                                                                                                                                                             |
| <b><i>deltaF-PUCCH-FormatX, deltaF-slotSPUCCH-FormatX, deltaF-subslotSPUCCH-FormatX</i></b> | Parameter: $\Delta_{F\_PUCCH}(F)$ for the SPUCCH formats 1, 1a, 1b, 3 and 4. See TS 36.213 [23], clause 5.1.2 where deltaF-2 corresponds to -2 dB, deltaF0 corresponds to 0 dB and so on. In case both an A and a B configuration exist, configuration A is used in case SPUCCH carries $\leq 22$ HARQ-ACK bits, and B otherwise.                                                                          |
| <b><i>deltaMCS-Enabled</i></b>                                                              | Parameter: $K_s$ See TS 36.213 [23], clause 5.1.1.1. en0 corresponds to value 0 corresponding to state "disabled". en1 corresponds to value 1.25 corresponding to "enabled".                                                                                                                                                                                                                               |
| <b><i>deltaPreambleMsg3</i></b>                                                             | Parameter: $\Delta_{PREAMBLE\_Msg3}$ see TS 36.213 [23], clause 5.1.1.1. Actual value = field value * 2 [dB].                                                                                                                                                                                                                                                                                              |
| <b><i>deltaTxD-OffsetPUCCH-FormatX</i></b>                                                  | Parameter: $\Delta_{TxD}(F')$ for the PUCCH formats 1, 1a/1b, 1b with channel selection, 2/2a/2b and 3 when two antenna ports are configured for PUCCH transmission. See TS 36.213 [23], clause 5.1.2.1, where dB0 corresponds to 0 dB, dB-1 corresponds to -1 dB, dB-2 corresponds to -2 dB. EUTRAN configures the field <i>deltaTxD-OffsetPUCCH-Format1bCS-r11</i> for the PCell and/or the PSCell only. |
| <b><i>deltaTxD-OffsetSPUCCH-FormatX</i></b>                                                 | Parameter: $\Delta_{TxD}(F')$ for the SPUCCH formats 1, 1a/1b, 1b with channel selection and 3 when two antenna ports are configured for SPUCCH transmission. See TS 36.213 [23], clause 5.1.2.1 where dB0 corresponds to 0 dB, dB-1 corresponds to -1 dB, dB-2 corresponds to -2 dB.                                                                                                                      |
| <b><i>fieldTypeFormat3B-SRS-Add</i></b>                                                     | Indicates the field width of power control field in DCI format 3B for additional SRS. See TS 36.212 [22], clause 5.3.3.1.7A.                                                                                                                                                                                                                                                                               |
| <b><i>filterCoefficient</i></b>                                                             | Specifies the filtering coefficient for RSRP measurements used to calculate path loss, as specified in TS 36.213 [23], clause 5.1.1.1. The same filtering mechanism applies as for <i>quantityConfig</i> described in 5.5.3.2.                                                                                                                                                                             |

| <b><i>p0-NominalSRS-Add</i></b>                     | Parameter: $P_{O\_NOMINAL\_SRS,c}(m)$ where $m=2$ . See TS 36.213 [23], clause 5.1.3.1, unit dBm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>p0-UE-SRS-Add</i></b>                         | Parameter: $P_{O\_UE\_SRS,c}(m)$ where $m=2$ . See TS 36.213 [23], clause 5.1.3.1, unit dB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>p0-UE-AperiodicSRS</i></b>                    | Parameter: $P_{O\_UE\_SRS,c}(m)$ where $m=1$ . See TS 36.213 [23], clause 5.1.3.1, unit dB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>p0-UE-PeriodicSRS</i></b>                     | Parameter: $P_{O\_UE\_SRS,c}(m)$ where $m=0$ . See TS 36.213 [23], clause 5.1.3.1, unit dB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>p0-UE-PUCCH</i></b>                           | Parameter: $P_{O\_UE\_PUCCH}$ See TS 36.213 [23], clause 5.1.2.1. Unit dB                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>p0-UE-PUSCH</i></b>                           | Parameter: $P_{O\_UE\_PUSCH}$ (1) See TS 36.213 [23], clause 5.1.1.1, unit dB. This field is applicable for non-persistent scheduling, only. This field applies for uplink power control subframe set 1 if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> . If <i>p0-UE-PUSCH-r15</i> is included, the UE ignores <i>p0-UE-PUSCH</i> (i.e., without suffix).                                                                                                                                                                                                               |
| <b><i>p0-UE-PUSCH-SubframeSet2</i></b>              | Parameter: $P_{O\_UE\_PUSCH}$ (1) See TS 36.213 [23], clause 5.1.1.1, unit dB. This field is applicable for non-persistent scheduling, only. This field applies for uplink power control subframe set 2 if uplink power control subframe sets are configured by <i>tpc-SubframeSet</i> .                                                                                                                                                                                                                                                                                                                |
| <b><i>pathlossReferenceLinking</i></b>              | Indicates whether the UE shall apply as pathloss reference either the downlink of the PCell or of the SCell that corresponds with this uplink (i.e. according to the <i>cellIdentification</i> within the field <i>sCellToAddMod</i> ). For SCells part of an STAG E-UTRAN sets the value to sCell.                                                                                                                                                                                                                                                                                                     |
| <b><i>pSRS-Offset, pSRS-OffsetAp</i></b>            | Parameter: <i>P<sub>SRS_OFFSET</sub></i> for periodic and aperiodic sounding reference signal transmission respectively. See TS 36.213 [23], clause 5.1.3.1. For <i>Ks</i> =1.25, the actual parameter value is <i>pSRS-Offset</i> value – 3. For <i>Ks</i> =0, the actual parameter value is -10.5 + 1.5* <i>pSRS-Offset</i> value.<br>If <i>pSRS-Offset-v1130</i> is included, the UE ignores <i>pSRS-Offset</i> (i.e., without suffix). Likewise, if <i>pSRS-OffsetAp-v1130</i> is included, the UE ignores <i>pSRS-OffsetAp-r10</i> . For <i>Ks</i> =0, E-UTRAN does not set values larger than 26. |
| <b><i>startingBitOfFormat3B-SRS-Add</i></b>         | Indicates the starting position of a block to trigger and TPC commands for the additional SRS symbols. See TS 36.212 [22], clause 5.3.3.1.7A.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>tpc-IndexSRS-Add</i></b>                      | Indicates the index to the TPC command for the SRS in additional symbols. See TS 36.212 [22], clause 5.3.3.1.6 and 5.3.3.1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>tpc-SubframeSet</i></b>                       | Indicates the uplink subframes (including UpPTS in special subframes) of the uplink power control subframe sets. Value 0 means the subframe belongs to uplink power control subframe set 1, and value 1 means the subframe belongs to uplink power control subframe set 2.                                                                                                                                                                                                                                                                                                                              |
| <b><i>uplinkPower-CSIPayload</i></b>                | TRUE indicates that the UE shall derive BPRE based on the actual value of O_CQI for slot/subslot-PUSCH, whereas FALSE indicates that the largest value of O_CQI across all RI values shall be used for the derivation of BPRE for slot/subslot-PUSCH.                                                                                                                                                                                                                                                                                                                                                   |

### — *WLAN-Id-List*

The IE *WLAN-Id-List* is used to list WLAN(s) for configuration of WLAN measurements and WLAN mobility set.

```
-- ASN1START
WLAN-Id-List-r13 ::= SEQUENCE (SIZE (1..maxWLAN-Id-r13)) OF WLAN-Identifiers-r12
-- ASN1STOP
```

### — *WLAN-MobilityConfig*

The IE *WLAN-MobilityConfig* is used for configuration of WLAN mobility set and WLAN Status Reporting. E-UTRAN configures at least one WLAN identifier in the *WLAN-MobilityConfig*.

```
-- ASN1START
WLAN-MobilityConfig-r13 ::= SEQUENCE {
 wlan-ToReleaseList-r13 OPTIONAL, -- Need ON
 wlan-ToAddList-r13 OPTIONAL, -- Need ON
 associationTimer-r13 ENUMERATED {s10, s30,
 s60, s120, s240} OPTIONAL, -- Need OR
 successReportRequested-r13 ENUMERATED {true} OPTIONAL, -- Need OR
 ...
 [wlan-SuspendConfig-r14 WLAN-SuspendConfig-r14 OPTIONAL, -- Need ON
]
}
-- ASN1STOP
```

#### ***WLAN-MobilityConfig* field descriptions**

***associationTimer***

Indicates the maximum time for connection to WLAN before connection failure reporting is initiated. Value s10 means 10 seconds, value s30 means 30 seconds and so on. E-UTRAN includes *associationTimer* only upon change in WLAN mobility set, *Iwa-WT-Counter* or *Iwip-Counter*.

***successReportRequested***

Indicates whether the UE shall report successful connection to WLAN. Applicable to LWA and LWIP.

***wlan-ToAddList***

Indicates the WLAN identifiers to be added to the WLAN mobility set.

***wlan-ToReleaseList***

Indicates the WLAN identifiers to be removed from the WLAN mobility set.

### — ***WUS-Config***

The IE *WUS-Config* is used to specify the WUS configuration. For the UEs supporting WUS, E-UTRAN uses WUS to indicate that the UE shall attempt to receive paging in that cell, see TS 36.304 [4].

#### ***WUS-Config* information element**

```
-- ASN1START
WUS-Config-r15 ::= SEQUENCE {
 maxDurationFactor-r15 ENUMERATED {one32th, one16th, one8th, one4th},
 numPOs-r15 ENUMERATED {n1, n2, n4, spare1} DEFAULT n1,
 freqLocation-r15 ENUMERATED {n0, n2, n4, spare1},
 timeOffsetDRX-r15 ENUMERATED {ms40, ms80, ms160, ms240},
 timeOffset-eDRX-Short-r15 ENUMERATED {ms40, ms80, ms160, ms240},
 timeOffset-eDRX-Long-r15 ENUMERATED {ms1000, ms2000} OPTIONAL, -- Need OP
}
WUS-Config-v1560 ::= SEQUENCE {

| <b>WUS-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>freqLocation</b>                  | Frequency location of WUS within paging narrowband for BL UEs and UEs in CE. Value <i>n0</i> corresponds to WUS in the 1st and 2nd PRB, value <i>n2</i> represents the 3rd and 4th PRB, and value <i>n4</i> represents the 5th and 6th PRB.                                                                                                                                                                                    |
| <b>maxDurationFactor</b>             | Maximum WUS duration, expressed as a ratio of Rmax associated with Type 1-CSS, see TS 36.211 [21]. Value <i>one32th</i> corresponds to Rmax * 1/32, value <i>one16th</i> corresponds to Rmax * 1/16 and so on. The value $L_{\text{MWUS}_{\text{max}}}$ in TS 36.213 [23] considered by the UE is : maxDuration = Max (signalled value * Rmax, 1) where Rmax is the value of <i>mpdch-NumRepetitionPaging</i> for the carrier. |
| <b>numDRX-CyclesRelaxed</b>          | Maximum number of consecutive DRX cycles during which the UE can use WUS for synchronisation and skip serving cell measurements, see TS 36.133 [16]. Value <i>n1</i> corresponds to 1 DRX cycle, value <i>n2</i> corresponds to 2 DRX cycles and so on.                                                                                                                                                                        |
| <b>numPOs</b>                        | Number of consecutive Paging Occasions (PO) mapped to one WUS, applicable to UEs configured to use extended DRX, see TS 36.304 [4]. Value <i>n1</i> corresponds to 1 PO, value <i>n2</i> corresponds to 2 POs and so on.                                                                                                                                                                                                       |
| <b>powerBoost</b>                    | Power offset of WUS relative to CRS in dB, see TS 36.213 [23] clause 5.2. Value <i>db0</i> corresponds to 0dB, value <i>db1dot8</i> corresponds to 1.8dB, and so on.                                                                                                                                                                                                                                                           |
| <b>timeOffsetDRX</b>                 | Minimum time gap in milliseconds from the end of the configured maximum WUS duration to the first associated PO, see TS 36.211 [21]. Value <i>ms40</i> corresponds to 40 ms, value <i>ms80</i> corresponds to 80 ms and so on.                                                                                                                                                                                                 |
| <b>timeOffset-eDRX-Short</b>         | When eDRX is used, the short non-zero gap in milliseconds from the end of the configured maximum WUS duration to the associated PO, see TS 36.211 [21]. Value <i>ms40</i> corresponds to 40 ms, value <i>ms80</i> corresponds to 80 ms and so on. E-UTRAN configures <i>timeOffset-eDRX-Short</i> to a value longer than or equal to <i>timeOffsetDRX</i> .                                                                    |
| <b>timeOffset-eDRX-Long</b>          | When eDRX is used, the long non-zero gap in milliseconds from the end of the configured maximum WUS duration to the associated PO, see TS 36.211 [21]. Value <i>ms1000</i> corresponds to 1000 ms and value <i>ms2000</i> corresponds to 2000 ms. If the field is absent, UE uses <i>timeOffset-eDRX-Short</i> for monitoring WUS.                                                                                             |

### 6.3.3 Security control information elements

- *NextHopChainingCount*

The IE *NextHopChainingCount* is used to update the K<sub>eNB</sub> key and corresponds to parameter NCC: See TS 33.401 [32], clause 7.2.8.4.

#### **NextHopChainingCount information element**

```
-- ASN1START
NextHopChainingCount ::= INTEGER (0..7)
-- ASN1STOP
```

- *SecurityAlgorithmConfig*

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm and AS ciphering algorithm for SRBs and DRBs. For RNs, the IE *SecurityAlgorithmConfig* is also used to configure AS integrity protection algorithm for DRBs between the RN and the E-UTRAN.

#### **SecurityAlgorithmConfig information element**

```
-- ASN1START
SecurityAlgorithmConfig ::= SEQUENCE {
 cipheringAlgorithm,
 integrityProtAlgorithm
}
 ENUMERATED {
 eia0-v920, eial, eia2, eia3-v1130, spare4, spare3,
 spare2, spare1, ...
}
```

```
CipheringAlgorithm-r12 ::= ENUMERATED {
 eea0, eea1, eea2, eea3-v1130, spare4, spare3,
 spare2, spare1, ...
}
-- ASN1STOP
```

#### ***SecurityAlgorithmConfig* field descriptions**

##### ***cipheringAlgorithm***

Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.401 [32], clause 5.1.3.2.

##### ***integrityProtAlgorithm***

Indicates the integrity protection algorithm to be used for SRBs, as specified in TS 33.401 [32], clause 5.1.4.2. For RNs, this field also indicates the integrity protection algorithm to be used for integrity protection-enabled DRB(s). For UEs capable of user plane integrity protection, this field also indicates the integrity protection algorithm to be used to derive the  $K_{UPint}$  key.

### ***ShortMAC-I***

The IE *ShortMAC-I* is used to identify and verify the UE at RRC connection re-establishment. The 16 least significant bits of the MAC-I calculated using the security configuration of the source PCell, as specified in 5.3.7.4.

#### ***ShortMAC-I* information element**

```
-- ASN1START
ShortMAC-I ::= BIT STRING (SIZE (16))
-- ASN1STOP
```

### **6.3.4 Mobility control information elements**

#### ***AdditionalSpectrumEmission***

If an extension is signalled using the extended value range (as defined by IE *AdditionalSpectrumEmission-v10I0*), the corresponding original field, using the value range as defined by IE *AdditionalSpectrumEmission* i.e. without suffix) shall be set to value 32, if signalled. UE supporting an LTE band assigned NS values larger than 32 as defined in TS 36.101 [42], clause 6.2.4 and TS 36.102 [113] clause 6.2A.3 for NTN capable UE, needs to support extension signaling (as defined by IE *AdditionalSpectrumEmission-v10I0*).

#### ***AdditionalSpectrumEmission* information element**

```
-- ASN1START
AdditionalSpectrumEmission ::= INTEGER (1..32)
AdditionalSpectrumEmission-v10I0 ::= INTEGER (33..288)
AdditionalSpectrumEmission-r18 ::= INTEGER (1..288)
-- ASN1STOP
```

#### ***AdditionalSpectrumEmissionNR***

The IE *AdditionalSpectrumEmissionNR* is used to indicate NR emission requirements to be fulfilled by the UE (see TS 38.101-1 [85], clause 6.2.3, and TS 38.101-2 [100], clause 6.2.3 and TS 38.101-3 [101], clause 6.5B.2). If an extension is signalled using the extended value range (as defined by the IE *AdditionalSpectrumEmissionNR-v1760*), the corresponding original field, using the value range as defined by the IE *AdditionalSpectrumEmissionNR* (with suffix -r15) shall be set to value 7.

#### ***AdditionalSpectrumEmissionNR* information element**

```
-- ASN1START
```

```

AdditionalSpectrumEmissionNR-r15 ::= INTEGER (0..7)
AdditionalSpectrumEmissionNR-v1760 ::= INTEGER (8..39)
AdditionalSpectrumEmissionNR-r18 ::= INTEGER (0..39)
-- ASN1STOP

```

### *ARFCN-ValueCDMA2000*

The IE *ARFCN-ValueCDMA2000* used to indicate the CDMA2000 carrier frequency within a CDMA2000 band, see C.S0002 [12].

#### ***ARFCN-ValueCDMA2000* information element**

```

-- ASN1START
ARFCN-ValueCDMA2000 ::= INTEGER (0..2047)
-- ASN1STOP

```

### *ARFCN-ValueEUTRA*

The IE *ARFCN-ValueEUTRA* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) E-UTRA carrier frequency, as defined in TS 36.101 [42] and TS 36.108 [114]. If an extension is signalled using the extended value range (as defined by IE *ARFCN-ValueEUTRA-v9e0*), the UE shall only consider this extension (and hence ignore the corresponding original field, using the value range as defined by IE *ARFCN-ValueEUTRA* i.e. without suffix, if signalled). In dedicated signalling, E-UTRAN only provides an EARFCN corresponding to an E-UTRA band supported by the UE.

#### ***ARFCN-ValueEUTRA* information element**

```

-- ASN1START
ARFCN-ValueEUTRA ::= INTEGER (0..maxEARFCN)
ARFCN-ValueEUTRA-v9e0 ::= INTEGER (maxEARFCN-Plus1..maxEARFCN2)
ARFCN-ValueEUTRA-r9 ::= INTEGER (0..maxEARFCN2)
-- ASN1STOP

```

NOTE: For fields using the original value range, as defined by IE *ARFCN-ValueEUTRA* i.e. without suffix, value *maxEARFCN* indicates that the E-UTRA carrier frequency is indicated by means of an extension. In such a case, UEs not supporting the extension consider the field to be set to a not supported value.

### *ARFCN-ValueGERAN*

The IE *ARFCN-ValueGERAN* is used to specify the ARFCN value applicable for a GERAN BCCH carrier frequency, see TS 45.005 [20].

#### ***ARFCN-ValueGERAN* information element**

```

-- ASN1START
ARFCN-ValueGERAN ::= INTEGER (0..1023)
-- ASN1STOP

```

## – *ARFCN-ValueNR*

The IE *ARFCN-ValueNR* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) NR carrier frequency, as defined in TS 38.101 [85].

### ***ARFCN-ValueNR* information element**

```
-- ASN1START
ARFCN-ValueNR-r15 ::= INTEGER (0.. 3279165)
-- ASN1STOP
```

## – *ARFCN-ValueUTRA*

The IE *ARFCN-ValueUTRA* is used to indicate the ARFCN applicable for a downlink (Nd, FDD) or bi-directional (Nt, TDD) UTRA carrier frequency, as defined in TS 25.331 [19].

### ***ARFCN-ValueUTRA* information element**

```
-- ASN1START
ARFCN-ValueUTRA ::= INTEGER (0..16383)
-- ASN1STOP
```

## – *BandclassCDMA2000*

The IE *BandclassCDMA2000* is used to define the CDMA2000 band in which the CDMA2000 carrier frequency can be found, as defined in C.S0057 [24], table 1.5-1.

### ***BandclassCDMA2000* information element**

```
-- ASN1START
BandclassCDMA2000 ::= ENUMERATED {
 bc0, bc1, bc2, bc3, bc4, bc5, bc6, bc7, bc8,
 bc9, bc10, bc11, bc12, bc13, bc14, bc15, bc16,
 bc17, bc18-v9a0, bc19-v9a0, bc20-v9a0, bc21-v9a0,
 spare10, spare9, spare8, spare7, spare6, spare5, spare4,
 spare3, spare2, spare1, ...
}
-- ASN1STOP
```

## – *BandIndicatorGERAN*

The IE *BandIndicatorGERAN* indicates how to interpret an associated GERAN carrier ARFCN, see TS 45.005 [20]. More specifically, the IE indicates the GERAN frequency band in case the ARFCN value can concern either a DCS 1800 or a PCS 1900 carrier frequency. For ARFCN values not associated with one of these bands, the indicator has no meaning.

### ***BandIndicatorGERAN* information element**

```
-- ASN1START
BandIndicatorGERAN ::= ENUMERATED {dcs1800, pcs1900}
-- ASN1STOP
```

## – *CarrierFreqCDMA2000*

The IE *CarrierFreqCDMA2000* used to provide the CDMA2000 carrier information.

### ***CarrierFreqCDMA2000* information element**

```
-- ASN1START

CarrierFreqCDMA2000 ::= SEQUENCE {
 bandClass
 arfcn
}
-- ASN1STOP
```

#### – *CarrierFreqGERAN*

The IE *CarrierFreqGERAN* is used to provide an unambiguous carrier frequency description of a GERAN cell.

### ***CarrierFreqGERAN* information element**

```
-- ASN1START

CarrierFreqGERAN ::= SEQUENCE {
 arfcn
 bandIndicator
}
-- ASN1STOP
```

#### ***CarrierFreqGERAN* field descriptions**

##### ***arfcn***

GERAN ARFCN of BCCH carrier.

##### ***bandIndicator***

Indicates how to interpret the ARFCN of the BCCH carrier.

#### – *CarrierFreqsGERAN*

The IE *CarrierFreqListGERAN* is used to provide one or more GERAN ARFCN values, as defined in TS 45.005 [43], which represents a list of GERAN BCCH carrier frequencies.

### ***CarrierFreqsGERAN* information element**

```
-- ASN1START

CarrierFreqsGERAN ::= SEQUENCE {
 startingARFCN
 bandIndicator
 followingARFCNs
 CHOICE {
 explicitListOfARFCNs
 OCTET STRING (SIZE (1..16))
 equallySpacedARFCNs
 SEQUENCE {
 arfcn-Spacing
 INTEGER (1..8),
 numberOfWorkingARFCNs
 INTEGER (0..31)
 },
 variableBitMapOfARFCNs
 }
}

ExplicitListOfARFCNs ::= SEQUENCE (SIZE (0..31)) OF ARFCN-ValueGERAN
-- ASN1STOP
```

| <b><i>CarrierFreqsGERAN</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>arfcn-Spacing</i></b>                        | Space, d, between a set of equally spaced ARFCN values.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>bandIndicator</i></b>                        | Indicates how to interpret the ARFCN of the BCCH carrier.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>explicitListOfARFCNs</i></b>                 | The remaining ARFCN values in the set are explicitly listed one by one.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>followingARFCNs</i></b>                      | Field containing a representation of the remaining ARFCN values in the set.                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>numberOfFollowingARFCNs</i></b>              | The number, n, of the remaining equally spaced ARFCN values in the set. The complete set of (n+1) ARFCN values is defined as: {s, ((s + d) mod 1024), ((s + 2*d) mod 1024) ... ((s + n*d) mod 1024)}.                                                                                                                                                                                                                                                                          |
| <b><i>startingARFCN</i></b>                        | The first ARFCN value, s, in the set.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>variableBitMapOfARFCNs</i></b>               | Bitmap field representing the remaining ARFCN values in the set. The leading bit of the first octet in the bitmap corresponds to the ARFCN = ((s + 1) mod 1024), the next bit to the ARFCN = ((s + 2) mod 1024), and so on. If the bitmap consists of N octets, the trailing bit of octet N corresponds to ARFCN = ((s + 8*N) mod 1024). The complete set of ARFCN values consists of ARFCN = s and the ARFCN values, where the corresponding bit in the bitmap is set to "1". |

### – ***CarrierFreqListMBMS***

The IE ***CarrierFreqListMBMS*** is used to indicate the E-UTRA ARFCN values of the one or more MBMS frequencies the UE is interested to receive.

#### ***CarrierFreqListMBMS*** information element

```
-- ASN1START
CarrierFreqListMBMS-r11 ::= SEQUENCE (SIZE (1..maxFreqMBMS-r11)) OF ARFCN-ValueEUTRA-r9
-- ASN1STOP
```

### – ***CDMA2000-Type***

The IE ***CDMA2000-Type*** is used to describe the type of CDMA2000 network.

#### ***CDMA2000-Type*** information element

```
-- ASN1START
CDMA2000-Type ::= ENUMERATED {type1XRTT, typeHRPD}
-- ASN1STOP
```

### – ***CellGlobalIdNR***

The IE ***CellGlobalIdNR*** specifies the Cell Global Identifier (CGI), the globally unique identity and the tracking area code (TAC) of a cell in NR.

#### ***CellGlobalIdNR*** information element

```
-- ASN1START
CellGlobalIdNR-r16 ::= SEQUENCE {
 plmn-Identity-r16 OPTIONAL,
 cellIdentity-r16 OPTIONAL,
 trackingAreaCode-r16 OPTIONAL
}
-- ASN1STOP
```

| CellGlobalIdNR field descriptions |                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity</b>               | Identity of the cell within the context of the PLMN.                                                                  |
| <b>plmn-Identity</b>              | Identifies the PLMN of the cell as given by the first PLMN entry in the <i>plmn-IdentityInfoList</i> in <i>SIB1</i> . |
| <b>trackingAreaCode</b>           | Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                        |

### – *CellIdentity*

The IE *CellIdentity* is used to unambiguously identify a cell within a PLMN.

#### ***CellIdentity* information element**

```
-- ASN1START
CellIdentity ::= BIT STRING (SIZE (28))
-- ASN1STOP
```

### – *CellIndexList*

The IE *CellIndexList* concerns a list of cell indices, which may be used for different purposes.

#### ***CellIndexList* information element**

```
-- ASN1START
CellIndexList ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CellIndex
CellIndex ::= INTEGER (1..maxCellMeas)
-- ASN1STOP
```

### – *CellReselectionPriority*

The IE *CellReselectionPriority* concerns the absolute priority of the concerned carrier frequency/ set of frequencies (GERAN)/ bandclass (CDMA2000), as used by the cell reselection procedure. Corresponds with parameter "priority" in TS 36.304 [4]. Value 0 means: lowest priority. The UE behaviour for the case the field is absent, if applicable, is specified in TS 36.304 [4].

#### ***CellReselectionPriority* information element**

```
-- ASN1START
CellReselectionPriority ::= INTEGER (0..7)
-- ASN1STOP
```

### – *CellSelectionInfoCE*

The IE *CellSelectionInfoCE* contains cell selection information for CE. The *q-RxLevMinCE* corresponds to parameter *Q\_rxlevmin\_CE* in TS 36.304 [4]. The *q-QualMinRSRQ-CE* corresponds to parameter *Q\_qualmin\_CE* in TS 36.304 [4]. If *q-QualMinRSRQ-CE* is not present, the UE applies the (default) value of negative infinity for *Q\_qualmin*.

#### ***CellSelectionInfoCE* information element**

```
-- ASN1START
CellSelectionInfoCE-r13 ::= SEQUENCE {
 q-RxLevMinCE-r13 OPTIONAL -- Need OR
 q-QualMinRSRQ-CE-r13 OPTIONAL -- Need OR
}
```

```

CellSelectionInfoCE-v1530 ::= SEQUENCE {
 powerClass14dBm-Offset-r15 ENUMERATED {dB-6, dB-3, dB3, dB6, dB9, dB12}
}
-- ASN1STOP

```

#### **CellSelectionInfoCE field descriptions**

##### **powerClass14dBm-Offset**

Parameter "Poffset" in TS 36.304 [4], only applicable for UE supporting *powerClass-14dBm*. Value in dB. Value dB-6 corresponds to -6 dB, dB-3 corresponds to -3 dB and so on. E-UTRAN configures this field only if *cellSelectionInfoCE-r13* is configured. If the field is absent, the UE applies the (default) value of 0 dB for "Poffset" in TS 36.304 [4].

### **CellSelectionInfoCE1**

The IE *CellSelectionInfoCE1* contains cell selection information for BL UEs or UEs in CE supporting CE Mode B. The *q-RxLevMinCE1* corresponds to parameter  $Q_{rxlevmin\_CE1}$  in TS 36.304 [4]. If *delta-RxLevMinCE1* is not included, actual value  $Q_{rxlevmin\_CE1} = q\text{-}RxLevMinCE1 * 2$  [dBm]. If *delta-RxLevMinCE1* is included, the actual value  $Q_{rxlevmin\_CE1} = (q\text{-}RxLevMinCE1 + delta\text{-}RxLevMinCE1) * 2$  [dBm]. The *q-QualMinRSRQ-CE1* corresponds to parameter  $Q_{qualmin\_CE1}$  in TS 36.304 [4]. If *q-QualMinRSRQ-CE1* is not present, the UE applies the (default) value of negative infinity for  $Q_{qualmin}$ .

#### **CellSelectionInfoCE1 information element**

```

-- ASN1START

CellSelectionInfoCE1-r13 ::= SEQUENCE {
 q-RxLevMinCE1-r13 Q-RxLevMin,
 q-QualMinRSRQ-CE1-r13 Q-QualMin-r9
} OPTIONAL -- Need OR

CellSelectionInfoCE1-v1360 ::= SEQUENCE {
 delta-RxLevMinCE1-v1360 INTEGER (-8..-1)
}

-- ASN1STOP

```

### **CellReselectionSubPriority**

The IE *CellReselectionSubPriority* indicates a fractional value to be added to the value of *cellReselectionPriority* to obtain the absolute priority of the concerned carrier frequency for E-UTRA and NR. Value oDot2 corresponds to 0.2, oDot4 corresponds to 0.4 and so on.

#### **CellReselectionSubPriority information element**

```

-- ASN1START

CellReselectionSubPriority-r13 ::= ENUMERATED {oDot2, oDot4, oDot6, oDot8}

-- ASN1STOP

```

### **CSFB-RegistrationParam1XRTT**

The IE *CSFB-RegistrationParam1XRTT* is used to indicate whether or not the UE shall perform a CDMA2000 1xRTT pre-registration if the UE does not have a valid / current pre-registration.

```

-- ASN1START

CSFB-RegistrationParam1XRTT ::= SEQUENCE {
 sid BIT STRING (SIZE (15)),
 nid BIT STRING (SIZE (16)),
 multipleSID BOOLEAN,
 multipleNID BOOLEAN,
 homeReg BOOLEAN,
 foreignSIDReg BOOLEAN,
 foreignNIDReg BOOLEAN,
}

```

```

parameterReg BOOLEAN,
powerUpReg BOOLEAN,
registrationPeriod BIT STRING (SIZE (7)),
registrationZone BIT STRING (SIZE (12)),
totalZone BIT STRING (SIZE (3)),
zoneTimer BIT STRING (SIZE (3))
}

CSFB-RegistrationParam1XRTT-v920 ::= SEQUENCE {
 powerDownReg-r9 ENUMERATED {true}
}

-- ASN1STOP

```

#### ***CSFB-RegistrationParam1XRTT field descriptions***

***foreignNIDReg***

The CDMA2000 1xRTT NID roamer registration indicator.

***foreignSIDReg***

The CDMA2000 1xRTT SID roamer registration indicator.

***homeReg***

The CDMA2000 1xRTT Home registration indicator.

***multipleNID***

The CDMA2000 1xRTT Multiple NID storage indicator.

***multipleSID***

The CDMA2000 1xRTT Multiple SID storage indicator.

***nid***

Used along with the *sid* as a pair to control when the UE should Register or Re-Register with the CDMA2000 1xRTT network.

***parameterReg***

The CDMA2000 1xRTT Parameter-change registration indicator.

***powerDownReg***

The CDMA2000 1xRTT Power-down registration indicator. If set to TRUE, the UE that has a valid / current CDMA2000 1xRTT pre-registration will perform a CDMA2000 1xRTT power down registration when it is switched off.

***powerUpReg***

The CDMA2000 1xRTT Power-up registration indicator.

***registrationPeriod***

The CDMA2000 1xRTT Registration period.

***registrationZone***

The CDMA2000 1xRTT Registration zone.

***sid***

Used along with the *nid* as a pair to control when the UE should Register or Re-Register with the CDMA2000 1xRTT network.

***totalZone***

The CDMA2000 1xRTT Number of registration zones to be retained.

***zoneTimer***

The CDMA2000 1xRTT Zone timer length.

#### ***CellGlobalIdEUTRA***

The IE ***CellGlobalIdEUTRA*** specifies the Evolved Cell Global Identifier (ECGI), the globally unique identity of a cell in E-UTRA.

#### ***CellGlobalIdEUTRA information element***

```

-- ASN1START

CellGlobalIdEUTRA ::= SEQUENCE {
 plmn-Identity,
 cellIdentity
}

-- ASN1STOP

```

| <b>CellGlobalIdEUTRA field descriptions</b> |                                                                                                                                          |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity</b>                         | Identity of the cell within the context of the PLMN.                                                                                     |
| <b>plmn-Identity</b>                        | Identifies the PLMN of the cell as given by the first PLMN entry in the <i>plmn-IdentityList</i> in <i>SystemInformationBlockType1</i> . |

### – *CellGlobalIdUTRA*

The IE *CellGlobalIdUTRA* specifies the global UTRAN Cell Identifier, the globally unique identity of a cell in UTRA.

#### **CellGlobalIdUTRA information element**

```
-- ASN1START

CellGlobalIdUTRA ::= SEQUENCE {
 plmn-Identity,
 cellIdentity
}

-- ASN1STOP
```

| <b>CellGlobalIdUTRA field descriptions</b> |                                                                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity</b>                        | UTRA Cell Identifier which is unique within the context of the identified PLMN as defined in TS 25.331 [19].    |
| <b>plmn-Identity</b>                       | Identifies the PLMN of the cell as given by the common PLMN broadcast in the MIB, as defined in TS 25.331 [19]. |

### – *CellGlobalIdGERAN*

The IE *CellGlobalIdGERAN* specifies the Cell Global Identification (CGI), the globally unique identity of a cell in GERAN.

#### **CellGlobalIdGERAN information element**

```
-- ASN1START

CellGlobalIdGERAN ::= SEQUENCE {
 plmn-Identity,
 locationAreaCode,
 cellIdentity
}

-- ASN1STOP
```

| <b>CellGlobalIdGERAN field descriptions</b> |                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity</b>                         | Cell Identifier which is unique within the context of the GERAN location area as defined in TS 23.003 [27]. |
| <b>locationAreaCode</b>                     | A fixed length code identifying the location area within a PLMN as defined in TS 23.003 [27].               |
| <b>plmn-Identity</b>                        | Identifies the PLMN of the cell, as defined in TS 23.003 [27].                                              |

### – *CellGlobalIdCDMA2000*

The IE *CellGlobalIdCDMA2000* specifies the Cell Global Identification (CGI), the globally unique identity of a cell in CDMA2000.

#### **CellGlobalIdCDMA2000 information element**

```
-- ASN1START
```

```

CellGlobalIdCDMA2000 ::= CHOICE {
 cellGlobalId1XRTT BIT STRING (SIZE (47)),
 cellGlobalIdHRPD BIT STRING (SIZE (128))
}
-- ASN1STOP

```

#### **CellGlobalIdCDMA2000 field descriptions**

***cellGlobalId1XRTT***

Unique identifier for a CDMA2000 1xRTT cell, corresponds to BASEID, SID and NID parameters (in that order) defined in C.S0005 [25].

***cellGlobalIdHRPD***

Unique identifier for a CDMA2000 HRPD cell, corresponds to SECTOR ID parameter defined in C.S0024 [26], clause 14.9.

### — *CellSelectionInfoNFreq*

The IE *CellSelectionInfoNFreq* includes the parameters used for cell selection on a neighbouring frequency, see TS 36.304 [4].

#### **CellSelectionInfoNFreq information element**

```

-- ASN1START
CellSelectionInfoNFreq-r13 ::= SEQUENCE {
 -- Cell selection information as in SIB1
 q-RxLevMin-r13 Q-RxLevMin,
 q-RxLevMinOffset INTEGER (1..8) OPTIONAL, -- Need OP
 -- Cell re-selection information as in SIB3
 q-Hyst-r13 ENUMERATED {
 dB0, dB1, dB2, dB3, dB4, dB5, dB6, dB8, dB10,
 dB12, dB14, dB16, dB18, dB20, dB22, dB24},
 q-RxLevMinReselection-r13 Q-RxLevMin,
 t-ReselectionEUTRA-r13 T-Reselection
}
-- ASN1STOP

```

### — *ConditionalReconfiguration*

The IE *ConditionalReconfiguration* is used to add, modify or release the configuration of a conditional handover, conditional PSCell addition or inter-SN conditional PSCell change per target candidate cell.

#### **ConditionalReconfiguration information element**

```

-- ASN1START
ConditionalReconfiguration-r16 ::= SEQUENCE {
 condReconfigurationToAddModList-r16 CondReconfigurationToAddModList-r16
 condReconfigurationToRemoveList-r16 CondReconfigurationToRemoveList-r16
 attemptCondReconf-r16 ENUMERATED {true} OPTIONAL, -- Need ON
 ...
}
CondReconfigurationToRemoveList-r16 ::= SEQUENCE (SIZE (1..maxCondConfig-r16)) OF
CondReconfigurationId-r16
-- ASN1STOP

```

| <b><i>ConditionalReconfiguration</i> field descriptions</b> |                                                                                                                                                                                    |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>attemptCondReconf</i></b>                             | If present, the UE shall perform conditional reconfiguration if selected cell is a target candidate cell and it is the first cell selection after failure as described in 5.3.7.3. |
| <b><i>condReconfigurationToAddModList</i></b>               | List of conditional reconfigurations (i.e. conditional handover, conditional PSCell addition or inter-SN conditional PSCell change) to add and/or modify.                          |
| <b><i>condReconfigurationToRemoveList</i></b>               | List of conditional reconfigurations (i.e. conditional handover, conditional PSCell addition or inter-SN conditional PSCell change) to remove.                                     |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                          |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| CHO                         | The field is optional present, Need OR, if the UE is configured with at least a candidate cell for CHO. Otherwise the field is not present. |

— ***ConditionalReconfigurationId***

The IE *ConditionalReconfigurationId* is used to identify a conditional reconfiguration (e.g. CHO, CPA or inter-SN CPC).

***ConditionalReconfigurationId* information element**

```
-- ASN1START
CondReconfigurationId-r16 ::= INTEGER (1.. maxCondConfig-r16)
-- ASN1STOP
```

— ***CondReconfigurationToAddModList***

The IE *CondReconfigurationToAddModList* concerns a list of conditional reconfigurations (i.e. conditional handover, conditional PSCell addition or inter-SN conditional PSCell change) to add or modify, for each entry the *measId* (associated to the triggering condition configuration) and the associated *RRConnectionReconfiguration*.

***CondReconfigurationToAddModList* information element**

```
-- ASN1START
CondReconfigurationToAddModList-r16 ::= SEQUENCE (SIZE (1.. maxCondConfig-r16)) OF
CondReconfigurationAddMod-r16

CondReconfigurationAddMod-r16 ::= SEQUENCE {
 condReconfigurationId-r16 CondReconfigurationId-r16,
 triggerCondition-r16 SEQUENCE (SIZE (1..2)) OF MeasId
 OPTIONAL, -- Need ON
 condReconfigurationToApply-r16 OCTET STRING (CONTAINING RRConnectionReconfiguration)
 OPTIONAL, -- Cond CondReconfigurationAdd
 ...
 [[
 triggerConditionSN-r17 OCTET STRING OPTIONAL -- Need ON
]]
}
-- ASN1STOP
```

| <b><i>CondReconfigurationToAddMod</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>condReconfigurationToApply</i></b>                     | The RCCConnectionReconfiguration message to be applied when the condition(s) are fulfilled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>triggerCondition</i></b>                               | The condition that needs to be fulfilled in order to trigger the execution of a conditional reconfiguration for CHO, CPA or MN initiated inter-SN CPC. When configuring two triggering events (MeasIds) for a candidate cell, the network ensures that both refer to the same <i>measObject</i> . For each <i>condReconfigurationId</i> , the network always configures either <i>triggerCondition</i> or <i>triggerConditionSN</i> (not both). For CHO in NTN, <i>condEventD1</i> or <i>condEventD2</i> or <i>condEventT1</i> can be configured independently for a candidate cell (i.e. without a second triggering event <i>condEventA3</i> , <i>condEventA4</i> or <i>condEventA5</i> for the same candidate cell), e.g. in hard satellite switching cases where the coverage gap between previous satellite and the incoming satellite is assumed to be zero or negligible. The network configures at most one from <i>condEventD1</i> , <i>condEventD2</i> or <i>condEventT1</i> for the same candidate cell. For CHO in terrestrial networks, the network does not indicate a <i>MeasId</i> associated with <i>condEventA4</i> . |
| <b><i>triggerConditionSN</i></b>                             | Includes the NR <i>CondReconfigExecCondSCG</i> as specified in TS 38.331 [82]. For each <i>condReconfigurationId</i> , the network always configures either <i>triggerCondition</i> or <i>triggerConditionSN</i> (not both). The field is applied to the case of SN initiated inter-SN CPC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Conditional presence</b>   | <b>Explanation</b>                                                                                                  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <i>CondReconfigurationAdd</i> | The field is mandatory present if a <i>condReconfigurationId</i> is being added. Otherwise it is optional, need ON. |

### – *CSG-Identity*

The IE *CSG-Identity* is used to identify a Closed Subscriber Group.

#### ***CSG-Identity* information element**

```
-- ASN1START
CSG-Identity ::= BIT STRING (SIZE (27))
-- ASN1STOP
```

### – *EphemerisOrbitalParameters*

The IE *EphemerisOrbitalParameters* provides satellite ephemeris in format of orbital parameters in ECI.

NOTE: The ECI and ECEF coincide at Epoch time (e.g. x,y,z axis in ECEF are aligned with x,y,z axis in ECI).

#### ***EphemerisOrbitalParameters* information element**

```
-- ASN1START
EphemerisOrbitalParameters-r17 ::= SEQUENCE {
 semiMajorAxis-r17 INTEGER (0..8589934591),
 eccentricity-r17 INTEGER (0..1048575),
 periapsis-r17 INTEGER (0..268435455),
 longitude-r17 INTEGER (0..268435455),
 inclination-r17 INTEGER (-67108864..67108863),
 anomaly-r17 INTEGER (0..268435455)
}
-- ASN1STOP
```

| <b>EphemerisOrbitalParameters field descriptions</b> |                                                                                                                                                                                   |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>anomaly</b>                                       | Mean anomaly M at epoch time, see NIMA TR 8350.2 [110]. Unit in radian.<br>Step of $2.341 \times 10^{-8}$ rad. Actual value = field value * $(2.341 \times 10^{-8})$ .            |
| <b>eccentricity</b>                                  | Eccentricity e, see NIMA TR 8350.2 [110].<br>Step $1.431 \times 10^{-8}$ . Actual value = field value * $(1.431 \times 10^{-8})$ .                                                |
| <b>inclination</b>                                   | Inclination i, see NIMA TR 8350.2 [110]. Unit in radian.<br>Step of $2.341 \times 10^{-8}$ rad. Actual value = field value * $(2.341 \times 10^{-8})$ .                           |
| <b>longitude</b>                                     | Longitude of ascending node $\Omega$ , see NIMA TR 8350.2 [110]. Unit in radian.<br>Step of $2.341 \times 10^{-8}$ rad. Actual value = field value * $(2.341 \times 10^{-8})$ .   |
| <b>periapsis</b>                                     | Argument of periapsis $\omega$ , see NIMA TR 8350.2 [110]. Unit in radian.<br>Step of $2.341 \times 10^{-8}$ rad. Actual value = field value * $(2.341 \times 10^{-8})$ .         |
| <b>semiMajorAxis</b>                                 | Semi major axis $a$ , see NIMA TR 8350.2 [110]. Unit in meter.<br>Step of $4.249 \times 10^{-3}$ m. Actual value = $6500000 + \text{field value} \times (4.249 \times 10^{-3})$ . |

## – *EphemerisStateVectors*

The IE *EphemerisStateVectors* provides satellite ephemeris in format of position and velocity state vectors in ECEF.

### ***EphemerisStateVectors* information element**

```
-- ASN1START

EphemerisStateVectors-r17 ::= SEQUENCE {
 positionX-r17 PositionStateVector-r17,
 positionY-r17 PositionStateVector-r17,
 positionZ-r17 PositionStateVector-r17,
 velocityVX-r17 VelocityStateVector-r17,
 velocityVY-r17 VelocityStateVector-r17,
 velocityVZ-r17 VelocityStateVector-r17
}

PositionStateVector-r17 ::= INTEGER (-33554432..33554431)

VelocityStateVector-r17 ::= INTEGER (-131072..131071)

-- ASN1STOP
```

| <b>EphemerisStateVectors field descriptions</b> |                                                                                                                                              |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionX, positionY, positionZ</b>          | X, Y, Z coordinate of satellite position state vector in ECEF. Unit in meter.<br>Step of 1.3 m. Actual value = field value * 1.3.            |
| <b>velocityVX, velocityVY, velocityVZ</b>       | X, Y, Z coordinate of satellite velocity state vector in ECEF. Unit in meter/second.<br>Step of 0.06 m/s. Actual value = field value * 0.06. |

## – *FreqBandIndicator*

The IE *FreqBandIndicator* indicates the E-UTRA operating band as defined in TS 36.101 [42], table 5.5-1 and TS 36.102 [113], table 5.2-1 for NTN capable UE. If an extension is signalled using the extended value range (as defined by IE *FreqBandIndicator-v9e0*), the UE shall only consider this extension (and hence ignore the corresponding original field, using the value range as defined by IE *FreqBandIndicator* i.e. without suffix, if signalled).

### ***FreqBandIndicator* information element**

```
-- ASN1START

FreqBandIndicator ::= INTEGER (1..maxFBI)
FreqBandIndicator-v9e0 ::= INTEGER (maxFBI-Plus1..maxFBI2)
```

```
FreqBandIndicator-r11 ::= INTEGER (1..maxFBI2)
-- ASN1STOP
```

NOTE: For fields using the original value range, as defined by IE *FreqBandIndicator* i.e. without suffix, value *maxFBI* indicates that the frequency band is indicated by means of an extension. In such a case, UEs not supporting the extension consider the field to be set to a not supported value.

### *FreqBandIndicatorNR*

The IE *FreqBandIndicatorNR* indicates the NR operating band as defined in TS 38.101 [85].

#### ***FreqBandIndicatorNR* information element**

```
-- ASN1START
FreqBandIndicatorNR-r15 ::= INTEGER (1.. maxFBI-NR-r15)
-- ASN1STOP
```

### *MobilityControlInfo*

The IE *MobilityControlInfo* includes parameters relevant for network controlled mobility to/within E-UTRA.

#### ***MobilityControlInfo* information element**

```
-- ASN1START

| <b><i>MobilityControlInfo</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>additionalSpectrumEmission</i></b>             | For a UE with no SCells configured for UL in the same band as the PCell, the UE shall apply the value for the PCell instead of the corresponding value from <i>SystemInformationBlockType2</i> or <i>SystemInformationBlockType1</i> . For a UE with SCell(s) configured for UL in the same band as the PCell, the UE shall, in case all SCells configured for UL in that band are released after handover completion, apply the value for the PCell instead of the corresponding value from <i>SystemInformationBlockType2</i> or <i>SystemInformationBlockType1</i> . The UE requirements related to IE <i>AdditionalSpectrumEmission</i> are defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE. |
| <b><i>carrierBandwidth</i></b>                       | Provides the parameters <i>Downlink bandwidth</i> , and <i>Uplink bandwidth</i> , see TS 36.101 [42].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>carrierFreq</i></b>                            | Provides the EARFCN to be used by the UE in the target cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>cbr-MobilityTxConfigList</i></b>               | Indicates the list of CBR ranges and the list of PSSCH transmission parameter configurations available to configure congestion control to the UE for V2X sidelink communication during handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>cipheringAlgorithmSCG</i></b>                  | Indicates the ciphering algorithm to be used for SCG DRBs. E-UTRAN includes the field upon SCG change when one or more SCG DRBs are configured. Otherwise E-UTRAN does not include the field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>dl-Bandwidth</i></b>                           | Parameter: <i>Downlink bandwidth</i> , see TS 36.101 [42].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>drb-ContinueROHC</i></b>                       | This field indicates whether to continue or reset, for this handover, the header compression protocol context for the RLC UM bearers configured with the header compression protocol. Presence of the field indicates that the header compression protocol context continues while absence indicates that the header compression protocol context is reset. E-UTRAN includes the field only in case of a handover within the same eNB. This field does not apply to any configured DAPS bearers.                                                                                                                                                                                                                                                                                                                                             |
| <b><i>gnss-PositionFixDurationReporting</i></b>      | If present, this field indicates that UEs are configured to include the time duration required to acquire a GNSS position in <i>RRCConnectionReconfigurationComplete</i> to the target cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>handoverWithoutWT-Change</i></b>               | Indicates whether UE performs handover where LWA configuration is retained with the same WT. If <i>sendEndMarker</i> is configured, the LWA end-marker for PDCP key change indication is used as defined in [8]. If value <i>keepLWA-Config</i> is configured, LWA end marker is not used and UE shall only retain the LWA configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>makeBeforeBreak</i></b>                        | Indicates that the UE shall continue uplink transmission/ downlink reception with the source cell(s) before performing the first transmission through PRACH to the target intra-frequency PCell, or performing initial PUSCH transmission to the target intra-frequency PCell while <i>rach-Skip</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>makeBeforeBreakSCG</i></b>                     | Indicates that the UE shall continue uplink transmission/ downlink reception with the source cell(s) before performing the first transmission through PRACH to the target intra-frequency PSCell, or performing initial PUSCH transmission to the target intra-frequency PSCell while <i>rach-SkipSCG</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>mib-RepetitionStatus</i></b>                   | Indicates whether additional MIB repetition is enabled in the target cell or not. Value TRUE indicates additional MIB repetition is enabled in the target cell. Value FALSE indicates additional MIB repetition is not enabled in the target cell. The absence of this field indicates additional MIB repetition may or may not be enabled in the target cell. See 5.2.1.2 and TS 36.211 [21], clause 6.4.1. This field is applicable to BL UE or UE in CE.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>mobilityControlInfoV2X</i></b>                 | Indicates the sidelink configurations of the target cell for V2X sidelink communication during handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>numberOfConfUL-Proceses</i></b>                | The number of configured HARQ processes for preallocated uplink grant, see TS 36.321 [6], clause 5.20. This field is applicable if a UE is configured with asynchronous HARQ, otherwise it shall be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>p-DAPS-Source</i></b>                          | Indicates the guaranteed power for the source PCell during a DAPS handover, as specified in TS 36.213 [23]. The value N corresponds to N-1 in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>p-DAPS-Target</i></b>                          | Indicates the guaranteed power for the target PCell during a DAPS handover as specified in TS 36.213 [23], Table 5.1.4.2-1. The value N corresponds to N-1 in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>powerControlMode</i></b>                       | Indicates the power control mode used in during a DAPS handover. Value 1 corresponds to DC power control mode 1 and value 2 indicates DC power control mode 2, as specified in TS 36.213 [23].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>rach-ConfigDedicated</i></b>                   | The dedicated random access parameters. If absent the UE applies contention based random access as specified in TS 36.321 [6].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>additionalSpectrumEmission</i></b>             | For a UE with no SCells configured for UL in the same band as the PCell, the UE shall apply the value for the PCell instead of the corresponding value from <i>SystemInformationBlockType2</i> or <i>SystemInformationBlockType1</i> . For a UE with SCell(s) configured for UL in the same band as the PCell, the UE shall, in case all SCells configured for UL in that band are released after handover completion, apply the value for the PCell instead of the corresponding value from <i>SystemInformationBlockType2</i> or <i>SystemInformationBlockType1</i> . The UE requirements related to IE <i>AdditionalSpectrumEmission</i> are defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE. |
| <b><i>rach-SkipSCG</i></b>                           | This field indicates whether random access procedure for the target PSCell is skipped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>sameSFN-Indication</i></b>                     | This field indicates that the target cell has the same SFN as the source cell and that the BL UE or UE in CE is not required to acquire <i>MasterInformationBlock</i> in the target PCell during handover to obtain the SFN of the target cell, as specified in clause 5.3.5.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>schedulingInfoSIB1-BR</i></b>                  | Indicates the index to the tables that define <i>SystemInformationBlockType1-BR</i> scheduling information. The tables are specified in TS 36.213 [23], Table 7.1.6-1 and Table 7.1.7.2.7-1. Value 0 means <i>SystemInformationBlockType1-BR</i> is not scheduled. If absent when <i>sameSFN-Indication</i> is present, UE assumes that <i>SystemInformationBlockType1-BR</i> scheduling information in target cell may be different from source cell.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>t304</i></b>                                   | Timer T304 as described in clause 7.3. ms50 corresponds with 50 ms, ms100 corresponds with 100 ms and so on. EUTRAN includes extended value <i>ms10000-v1310</i> only when UE supports CE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>t307</i></b>                                   | Timer T307 as described in clause 7.3. ms50 corresponds with 50 ms, ms100 corresponds with 100 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>targetTA</i></b>                               | This field refers to the timing adjustment indication, see TS 36.213 [23], indicating the $N_{TA}$ value which the UE shall use for the target PTAG of handover or the target PSTAG of SCG change. <i>ta0</i> corresponds to $N_{TA}=0$ . <i>mcg-PTAG</i> corresponds to the latest $N_{TA}$ value of the PTAG associated with MCG. <i>scg-PTAG</i> corresponds to the latest $N_{TA}$ value of the PTAG associated with SCG. <i>mcg-STAG</i> corresponds to the latest $N_{TA}$ value of a MCG STAG indicated by the STAG-Id. <i>scg-STAG</i> corresponds to the latest $N_{TA}$ value of a SCG STAG indicated by the STAG-Id.                                                                                                                                                                                                              |
| <b><i>ul-Bandwidth</i></b>                           | Parameter: <i>Uplink bandwidth</i> , see TS 36.101 [42], table 5.6-1. For TDD, the parameter is absent and it is equal to downlink bandwidth. If absent for FDD, apply the same value as applies for the downlink bandwidth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>ul-Grant</i></b>                               | Indicates the resources of the target PCell/PSCell to be used for the uplink transmission of PUSCH [23], clause 8.8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>ul-SchedInterval</i></b>                       | Indicates the scheduling interval in uplink, see TS 36.321 [6], clause 5.20. Value in number of sub-frames. Value sf2 corresponds to 2 subframes, sf5 corresponds to 5 subframes and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>ul-StartSubframe</i></b>                       | Indicates the subframe in which the UE may initiate the uplink transmission, see TS 36.321 [6], clause 5.20. Value 0 corresponds to subframe number 0, 1 corresponds to subframe number 1 and so on. The subframe indicating a valid uplink grant according to the calculation of UL grant configured by <i>ul-StartSubframe</i> and <i>ul-SchedInterval</i> , see TS 36.321 [6], clause 5.20, is the same across all radio frames.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>v2x-CommRxPool</i></b>                         | Indicates reception pools for receiving V2X sidelink communication during handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>v2x-CommSyncConfig</i></b>                     | Indicates synchronization configurations for performing V2X sidelink communication during handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>v2x-CommTxPoolExceptional</i></b>              | Indicates the transmission resources by which the UE is allowed to transmit V2X sidelink communication during handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Conditional presence   | Explanation                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD</i>             | The field is mandatory with default value (the default duplex distance defined for the concerned band, as specified in TS 36.101 [42]) in case of "FDD"; otherwise the field is not present.                   |
| <i>HO</i>              | This field is optionally present, need OP, in case of handover within E-UTRA when the <i>fullConfig</i> is not included; otherwise the field is not present.                                                   |
| <i>HO-SFNsynced</i>    | This field is optionally present, need OP, in case of source E-UTRA and target E-UTRA cells are SFN synchronised.                                                                                              |
| <i>HO-toEUTRA</i>      | The field is mandatory present in case of inter-RAT handover to E-UTRA; otherwise the field is optionally present, need ON.                                                                                    |
| <i>HO-toEUTRA2</i>     | The field is absent if <i>carrierFreq-v9e0</i> is present. Otherwise it is mandatory present in case of inter-RAT handover to E-UTRA and optionally present, need ON, in all other cases.                      |
| <i>NotFullConfigHO</i> | This field is optionally present, Need OR, in case of handover within E-UTRA when the <i>fullConfig</i> is not included in the <i>RRConnectionReconfiguration</i> message. Otherwise the field is not present. |
| <i>SCGEst</i>          | This field is mandatory present in case of SCG establishment; otherwise the field is optionally present, need ON.                                                                                              |

### – *MobilityParametersCDMA2000 (1xRTT)*

The *MobilityParametersCDMA2000* contains the parameters provided to the UE for handover and (enhanced) CSFB to 1xRTT support, as defined in C.S0097 [53].

#### ***MobilityParametersCDMA2000* information element**

```
-- ASN1START
MobilityParametersCDMA2000 ::= OCTET STRING
-- ASN1STOP
```

### – *MobilityStateParameters*

The IE *MobilityStateParameters* contains parameters to determine UE mobility state.

#### ***MobilityStateParameters* information element**

```
-- ASN1START
MobilityStateParameters ::= SEQUENCE {
 t-Evaluation ENUMERATED {
 s30, s60, s120, s180, s240, spare3, spare2, spare1},
 t-HystNormal ENUMERATED {
 s30, s60, s120, s180, s240, spare3, spare2, spare1},
 n-CellChangeMedium INTEGER (1..16),
 n-CellChangeHigh INTEGER (1..16)
}
-- ASN1STOP
```

| <b><i>MobilityStateParameters</i> field descriptions</b> |                                                                                                                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>n-CellChangeHigh</i></b>                           | The number of cell changes to enter high mobility state. Corresponds to <i>N<sub>CR_H</sub></i> in TS 36.304 [4].                                                                                  |
| <b><i>n-CellChangeMedium</i></b>                         | The number of cell changes to enter medium mobility state. Corresponds to <i>N<sub>CR_M</sub></i> in TS 36.304 [4].                                                                                |
| <b><i>t-Evaluation</i></b>                               | The duration for evaluating criteria to enter mobility states. Corresponds to <i>T<sub>CRmax</sub></i> in TS 36.304 [4]. Value in seconds, s30 corresponds to 30 s and so on.                      |
| <b><i>t-HystNormal</i></b>                               | The additional duration for evaluating criteria to enter normal mobility state. Corresponds to <i>T<sub>CRmaxHyst</sub></i> in TS 36.304 [4]. Value in seconds, s30 corresponds to 30 s and so on. |

## – *MultiBandInfoList*

### ***MultiBandInfoList* information element**

```
-- ASN1START

MultiBandInfoList ::= SEQUENCE (SIZE (1..maxMultiBands)) OF FreqBandIndicator

MultiBandInfoList-v9e0 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF MultiBandInfo-v9e0

MultiBandInfoList-v10j0 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF NS-PmaxList-r10

MultiBandInfoList-v10l0 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF NS-PmaxList-v10l0

MultiBandInfoList-r11 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF FreqBandIndicator-r11

MultiBandInfo-v9e0 ::= SEQUENCE {
 freqBandIndicator-v9e0 FreqBandIndicator-v9e0 OPTIONAL -- Need OP
}

MultiBandInfoListAerial-r18 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF NS-PmaxListAerial-r18

-- ASN1STOP
```

## – *MultiFrequencyBandListNR*

The IE *MultiFrequencyBandListNR* is used to configure a list of one or multiple NR frequency bands.

### ***MultiFrequencyBandListNR* information element**

```
-- ASN1START

MultiFrequencyBandListNR-r15 ::= SEQUENCE (SIZE (1.. maxMultiBandsNR-r15)) OF
FreqBandIndicatorNR-r15

-- ASN1STOP
```

## – *NS-PmaxList*

The IE *NS-PmaxList* concerns a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 36.101 [42], table 6.2.4-1, for UEs neither in CE nor BL UEs, TS 36.101 [42], table 6.2.4E-1, for UEs in CE or BL UEs and TS 36.102 [113], table 6.2A.3-1, for NTN capable UE, for a given frequency band. E-UTRAN does not include the same value of *additionalSpectrumEmission* in *SystemInformationBlockType2* within this list.

### ***NS-PmaxList* information element**

```
-- ASN1START

NS-PmaxList-r10 ::= SEQUENCE (SIZE (1..maxNS-Pmax-r10)) OF NS-PmaxValue-r10

NS-PmaxList-v10l0 ::= SEQUENCE (SIZE (1..maxNS-Pmax-r10)) OF NS-PmaxValue-v10l0

NS-PmaxListAerial-r18 ::= SEQUENCE (SIZE (1..maxNS-Pmax-r10)) OF NS-PmaxValueAerial-r18

NS-PmaxValue-r10 ::= SEQUENCE {
 additionalPmax-r10 P-Max OPTIONAL, -- Need OP
 additionalSpectrumEmission AdditionalSpectrumEmission
}

NS-PmaxValue-v10l0 ::= SEQUENCE {
 additionalSpectrumEmission-v10l0 AdditionalSpectrumEmission-v10l0 OPTIONAL -- Need OP
}

NS-PmaxValueAerial-r18 ::= SEQUENCE {
 additionalPmax-r18 P-Max OPTIONAL, -- Need OP
 additionalSpectrumEmission-r18 AdditionalSpectrumEmission-r18 OPTIONAL -- Need OP
}

-- ASN1STOP
```

## – *NS-PmaxListNR*

The IE *NS-PmaxListNR* concerns a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 38.101-1 [85], table 6.2.3.1-1A and TS 38.101-2 [100], table 6.2.3.1-2 for a given frequency band.

### ***NS-PmaxListNR* information element**

```
-- ASN1START

NS-PmaxListNR-r15 ::= SEQUENCE (SIZE (1..8)) OF NS-PmaxValueNR-r15

NS-PmaxValueNR-r15 ::= SEQUENCE {
 additionalPmaxNR-r15 P-MaxNR-r15 OPTIONAL, -- Need ON
 additionalSpectrumEmissionNR-r15 AdditionalSpectrumEmissionNR-r15
}

NS-PmaxListNR-v1760 ::= SEQUENCE (SIZE (1..8)) OF NS-PmaxValueNR-v1760

NS-PmaxValueNR-v1760 ::= SEQUENCE {
 additionalSpectrumEmissionNR-v1760 AdditionalSpectrumEmissionNR-v1760 OPTIONAL -- Need OR
}

NS-PmaxListNR-Aerial-r18 ::= SEQUENCE (SIZE (1..8)) OF NS-PmaxValueNR-Aerial-r18

NS-PmaxValueNR-Aerial-r18 ::= SEQUENCE {
 additionalSpectrumEmissionNR-r18 AdditionalSpectrumEmissionNR-r18 OPTIONAL -- Need OR
}

-- ASN1STOP
```

## – *PhysCellId*

The IE *PhysCellId* is used to indicate the physical layer identity of the cell, as defined in TS 36.211 [21].

### ***PhysCellId* information element**

```
-- ASN1START

PhysCellId ::= INTEGER (0..503)

-- ASN1STOP
```

## – *PhysCellIdCDMA2000*

The IE *PhysCellIdCDMA2000* identifies the PNOffset that represents the "Physical cell identity" in CDMA2000.

### ***PhysCellIdCDMA2000* information element**

```
-- ASN1START

PhysCellIdCDMA2000 ::= INTEGER (0..maxPNOffset)

-- ASN1STOP
```

## – *PhysCellIdGERAN*

The IE *PhysCellIdGERAN* contains the Base Station Identity Code (BSIC).

### ***PhysCellIdGERAN* information element**

```
-- ASN1START

PhysCellIdGERAN ::= SEQUENCE {
 networkColourCode BIT STRING (SIZE (3)),
 baseStationColourCode BIT STRING (SIZE (3))
}
```

-- ASN1STOP

***PhysCellIdGERAN* field descriptions*****baseStationColourCode***

Base station Colour Code as defined in TS 23.003 [27].

***networkColourCode***

Network Colour Code as defined in TS 23.003 [27].

— ***PhysCellIdNR***

The IE *PhysCellIdNR* indicates the physical layer identity (PCI) of an NR cell.

***PhysCellIdNR* information element**

-- ASN1START

PhysCellIdNR-r15 ::= INTEGER (0.. 1007)

-- ASN1STOP

— ***PhysCellIdRange***

The IE *PhysCellIdRange* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *PhysCellIdRange*, E-UTRAN may configure overlapping ranges of physical cell identities.

***PhysCellIdRange* information element**

-- ASN1START

```
PhysCellIdRange ::= SEQUENCE {
 start PhysCellId,
 range ENUMERATED {
 n4, n8, n12, n16, n24, n32, n48, n64, n84,
 n96, n128, n168, n252, n504, spare2,
 spare1} OPTIONAL -- Need OP
}
```

-- ASN1STOP

***PhysCellIdRange* field descriptions*****range***

Indicates the number of physical cell identities in the range (including *start*). Value n4 corresponds with 4, n8 corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical cell identity value indicated by *start* applies.

***start***

Indicates the lowest physical cell identity in the range.

— ***PhysCellIdRangeNR***

The IE *PhysCellIdRangeNR* is used to encode either a single or a range of physical layer identities of NR cells. The range is encoded by using a *start* value and by indicating the number of consecutive physical layer identities (including *start*) in the range. For fields comprising multiple occurrences of *PhysCellIdRangeNR*, E-UTRAN may configure overlapping ranges of physical layer identities.

***PhysCellIdRangeNR* information element**

-- ASN1START

```
PhysCellIdRangeNR-r16 ::= SEQUENCE {
 start PhysCellIdNR-r15,
```

```

range ENUMERATED {
 n4, n8, n12, n16, n24, n32, n48, n64, n84,
 n96, n128, n168, n252, n504, n1008,
 spare1} OPTIONAL -- Need OP
}

-- ASN1STOP

```

#### ***PhysCellIdRangeNR* field descriptions**

##### ***range***

Indicates the number of physical layer identities in the range (including *start*). Value n4 corresponds with 4, n8 corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical layer identity value indicated by *start* applies.

##### ***start***

Indicates the lowest physical layer identity in the range.

### ***PhysCellIdRangeUTRA-FDDList***

The IE *PhysCellIdRangeUTRA-FDDList* is used to encode one or more of *PhysCellIdRangeUTRA-FDD*. While the IE *PhysCellIdRangeUTRA-FDD* is used to encode either a single physical layer identity or a range of physical layer identities, i.e. primary scrambling codes. Each range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range.

#### ***PhysCellIdRangeUTRA-FDDList* information element**

```

-- ASN1START

PhysCellIdRangeUTRA-FDDList-r9 ::= SEQUENCE (SIZE (1..maxPhysCellIdRange-r9)) OF
PhysCellIdRangeUTRA-FDD-r9

PhysCellIdRangeUTRA-FDD-r9 ::= SEQUENCE {
 start-r9 OPTIONAL -- Need OP
 range-r9 INTEGER (2..512)
}

-- ASN1STOP

```

#### ***PhysCellIdRangeUTRA-FDDList* field descriptions**

##### ***range***

Indicates the number of primary scrambling codes in the range (including *start*). The UE shall apply value 1 in case the field is absent, in which case only the primary scrambling code value indicated by *start* applies.

##### ***start***

Indicates the lowest primary scrambling code in the range.

### ***PhysCellIdUTRA-FDD***

The IE *PhysCellIdUTRA-FDD* is used to indicate the physical layer identity of the cell, i.e. the primary scrambling code, as defined in TS 25.331 [19].

#### ***PhysCellIdUTRA-FDD* information element**

```

-- ASN1START

PhysCellIdUTRA-FDD ::= INTEGER (0..511)

-- ASN1STOP

```

### ***PhysCellIdUTRA-TDD***

The IE *PhysCellIdUTRA-TDD* is used to indicate the physical layer identity of the cell, i.e. the cell parameters ID (TDD), as specified in TS 25.331 [19]. Also corresponds to the Initial Cell Parameter Assignment in TS 25.223 [46].

### ***PhysCellIdUTRA-TDD* information element**

```
-- ASN1START
PhysCellIdUTRA-TDD ::= INTEGER (0..127)
-- ASN1STOP
```

#### ***PLMN-Identity***

The IE *PLMN-Identity* identifies a Public Land Mobile Network. Further information regarding how to set the IE are specified in TS 23.003 [27].

#### ***PLMN-Identity* information element**

```
-- ASN1START
PLMN-Identity ::= SEQUENCE {
 mcc OPTIONAL, -- Cond MCC
 mnc MNC
}
MCC ::= SEQUENCE (SIZE (3)) OF MCC-MNC-Digit
MNC ::= SEQUENCE (SIZE (2..3)) OF MCC-MNC-Digit
MCC-MNC-Digit ::= INTEGER (0..9)
-- ASN1STOP
```

#### ***PLMN-Identity* field descriptions**

##### ***mcc***

The first element contains the first MCC digit, the second element the second MCC digit and so on. If the field is absent, it takes the same value as the *mcc* of the immediately preceding IE *PLMN-Identity*. See TS 23.003 [27].

##### ***mnc***

The first element contains the first MNC digit, the second element the second MNC digit and so on. See TS 23.003 [27].

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCC                  | This IE is mandatory when <i>PLMN-Identity</i> is included in <i>CellGlobalIdEUTRA</i> , in <i>CellGlobalIdUTRA</i> , in <i>CellGlobalIdGERAN</i> or in <i>RegisteredMME</i> . This IE is also mandatory in the first occurrence of the IE <i>PLMN-Identity</i> within the IE <i>PLMN-IdentityList</i> . Otherwise it is optional, need OP. |

#### ***PLMN-IdentityList3***

Includes a list of PLMN identities.

#### ***PLMN-IdentityList3* information element**

```
-- ASN1START
PLMN-IdentityList3-r11 ::= SEQUENCE (SIZE (1..16)) OF PLMN-Identity
-- ASN1STOP
```

#### ***PmaxNR***

The IE *PmaxNR* concerns a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 38.101 [85], table 6.2.3-1 for a given frequency band.

### **PmaxNR information element**

```
-- ASN1START
P-MaxNR-r15 ::= INTEGER (-30..33)
-- ASN1STOP
```

#### — *PreRegistrationInfoHRPD*

```
-- ASN1START
PreRegistrationInfoHRPD ::= SEQUENCE {
 preRegistrationAllowed BOOLEAN,
 preRegistrationZoneId PreRegistrationZoneIdHRPD OPTIONAL, -- cond PreRegAllowed
 secondaryPreRegistrationZoneIdList SecondaryPreRegistrationZoneIdListHRPD OPTIONAL -- Need OR
}
SecondaryPreRegistrationZoneIdListHRPD ::= SEQUENCE (SIZE (1..2)) OF PreRegistrationZoneIdHRPD
PreRegistrationZoneIdHRPD ::= INTEGER (0..255)
-- ASN1STOP
```

#### **PreRegistrationInfoHRPD field descriptions**

##### **preRegistrationAllowed**

TRUE indicates that a UE shall perform a CDMA2000 HRPD pre-registration if the UE does not have a valid / current pre-registration. FALSE indicates that the UE is not allowed to perform CDMA2000 HRPD pre-registration in the current cell.

##### **preRegistrationZoneId**

ColorCode (see C.S0024 [26], C.S0087 [44]) of the CDMA2000 Reference Cell corresponding to the HRPD sector under the HRPD AN that is configured for this LTE cell. It is used to control when the UE should register or re-register.

##### **secondaryPreRegistrationZoneIdList**

List of SecondaryColorCodes (see C.S0024 [26], C.S0087 [44]) of the CDMA2000 Reference Cell corresponding to the HRPD sector under the HRPD AN that is configured for this LTE cell. They are used to control when the UE should re-register.

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                                     |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PreRegAllowed</i>        | The field is mandatory in case the <i>preRegistrationAllowed</i> is set to <i>true</i> . Otherwise the field is not present and the UE shall delete any existing value for this field. |

#### — *Q-QualMin*

The IE *Q-QualMin* is used to indicate for cell selection/ re-selection the required minimum received RSRQ level in the (E-UTRA) cell. Corresponds to parameter  $Q_{\text{qualmin}}$  in TS 36.304 [4]. Actual value  $Q_{\text{qualmin}} = \text{field value} [\text{dB}]$ .

### ***Q-QualMin* information element**

```
-- ASN1START
Q-QualMin-r9 ::= INTEGER (-34..-3)
-- ASN1STOP
```

#### — *Q-RxLevMin*

The IE *Q-RxLevMin* is used to indicate for cell selection/ re-selection the required minimum received RSRP level in the (E-UTRA) cell. Corresponds to parameter  $Q_{\text{rxlevmin}}$  in TS 36.304 [4]. Actual value  $Q_{\text{rxlevmin}} = \text{field value} * 2 [\text{dBm}]$ .

### ***Q-RxLevMin* information element**

```
-- ASN1START
```

```

Q-RxLevMin ::= INTEGER (-70..-22)
-- ASN1STOP

```

### *Q-OffsetRange*

The IE *Q-OffsetRange* is used to indicate a cell, CSI-RS resource or frequency specific offset to be applied when evaluating candidates for cell re-selection or when evaluating triggering conditions for measurement reporting. The value in dB. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.

#### ***Q-OffsetRange* information element**

```

-- ASN1START

Q-OffsetRange ::= ENUMERATED {
 dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
 dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
 dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
 dB6, dB8, dB10, dB12, dB14, dB16, dB18,
 dB20, dB22, dB24}

-- ASN1STOP

```

### *Q-OffsetRangeInterRAT*

The IE *Q-OffsetRangeInterRAT* is used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value in dB.

#### ***Q-OffsetRangeInterRAT* information element**

```

-- ASN1START

Q-OffsetRangeInterRAT ::= INTEGER (-15..15)

-- ASN1STOP

```

### *ReselectionThreshold*

The IE *ReselectionThreshold* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = field value \* 2 [dB].

#### ***ReselectionThreshold* information element**

```

-- ASN1START

ReselectionThreshold ::= INTEGER (0..31)

-- ASN1STOP

```

### *ReselectionThresholdQ*

The IE *ReselectionThresholdQ* is used to indicate a quality level threshold for cell reselection. Actual value of threshold = field value [dB].

#### ***ReselectionThresholdQ* information element**

```

-- ASN1START

ReselectionThresholdQ-r9 ::= INTEGER (0..31)

-- ASN1STOP

```

## – *RSS-ConfigCarrierInfo*

The IE *RSS-ConfigCarrierInfo* contains RSS configuration for a carrier.

### ***RSS-ConfigCarrierInfo* information element**

```
-- ASN1START

RSS-ConfigCarrierInfo-r16 ::= SEQUENCE {
 narrowbandIndex-r16 BIT STRING (SIZE (1..maxAvailNarrowBands-1-r16)),
 timeOffsetGranularity-r16 ENUMERATED {g1, g2, g4, g8, g16, g32, g64, g128}
}

-- ASN1STOP
```

#### ***RSS-ConfigCarrierInfo* field descriptions**

##### ***narrowbandIndex***

Bitmap containing narrowbands used for RSS deployment in the carrier. Narrowbands including central 6 PRBs are excluded from the bitmap. The RSS Cell Frequency Location of a specific cell is determined according to  $I_{RSS} = PCID \bmod (3N_{NB})$  where  $I_{RSS}$  is the index of possible RSS frequency locations starting with the lowest location and  $N_{NB}$  is the number of narrowbands, determined from *narrowbandIndex*, such that there are three non-overlapping RSS locations in each narrowband.

##### ***timeOffsetGranularity***

RSS Time Offset granularity ( $G_{RSS}$ ). Value  $g1$  corresponds to 1 frame, value  $g2$  corresponds to 2 frames, and so on. Only the following values of  $G_{RSS}$  are applicable depending on the serving cell RSS periodicity ( $P_{RSS}$ ) given by parameter *periodicity* in *ce-RSS-Config-r15*:

$G_{RSS} = \{1, 2, 4, 8, 16\}$  frames for  $P_{RSS} = 160$  ms

$G_{RSS} = \{1, 2, 4, 8, 16, 32\}$  frames for  $P_{RSS} = 320$  ms

$G_{RSS} = \{2, 4, 8, 16, 32, 64\}$  frames for  $P_{RSS} = 640$  ms

$G_{RSS} = \{4, 8, 16, 32, 64, 128\}$  frames for  $P_{RSS} = 1280$  ms.

The actual RSS time offset of a specific cell ( $O_{RSS}$ , see TS 36.211 [21] clause 6.11.3.2) in SFN radio frames is given by  $(X_{RSS} \times G_{RSS}) + \Delta_{RSS}$  where:

- RSS Time Offset of a specific cell ( $X_{RSS}$ ) is determined based on its PCID using  $X_{RSS} = \text{FLOOR}(PCID/(3N_{NB}))$  modulo  $M_{RSS}$ , and distributed across  $M_{RSS}$  time locations per  $P_{RSS}$  such that  $M_{RSS} = P_{RSS}/(10 \times G_{RSS})$ ; and
- $\Delta_{RSS}$  is calculated by using the serving cell  $X_{RSS}$  (i.e., based on serving cell PCID and parameters given in *ce-RSS-Config-r15*) such that serving cell  $O_{RSS} = (X_{RSS} \times G_{RSS}) + \Delta_{RSS}$ .

## – *RSS-MeasPowerBias*

The IE *RSS-MeasPowerBias* indicates power bias in dB relative to Qoffset of neighbour cell CRS. Value  $dB-6$  corresponds to -6 dB, value  $dB-3$  corresponds to -3 dB and so on. Value *rssNotUsed* indicates measurement based on RSS is not applicable for the corresponding neighbour cell.

### ***RSS-MeasPowerBias* information element**

```
-- ASN1START

RSS-MeasPowerBias-r16 ::= ENUMERATED {dB-6, dB-3, dB0, dB3, dB6, dB9, dB12, rssNotUsed}

-- ASN1STOP
```

## – *SCellIndex*

The IE *SCellIndex* concerns a short identity, used to identify an SCell.

### ***SCellIndex* information element**

```
-- ASN1START

SCellIndex-r10 ::= INTEGER (1..7)
SCellIndex-r13 ::= INTEGER (1..31)

-- ASN1STOP
```

## – *ServCellIndex*

The IE *ServCellIndex* concerns a short identity, used to identify a serving cell (i.e. the PCell or an SCell). Value 0 applies for the PCell, while the *SCellIndex* that has previously been assigned applies for SCells.

### **ServCellIndex information element**

```
-- ASN1START
ServCellIndex-r10 ::= INTEGER (0..7)
ServCellIndex-r13 ::= INTEGER (0..31)
-- ASN1STOP
```

## – *SpeedStateScaleFactors*

The IE *SpeedStateScaleFactors* concerns factors, to be applied when the UE is in medium or high speed state, used for scaling a mobility control related parameter.

### **SpeedStateScaleFactors information element**

```
-- ASN1START
SpeedStateScaleFactors ::= SEQUENCE {
 sf-Medium ENUMERATED {oDot25, oDot5, oDot75, 1Dot0},
 sf-High ENUMERATED {oDot25, oDot5, oDot75, 1Dot0}
}
-- ASN1STOP
```

#### **SpeedStateScaleFactors field descriptions**

##### ***sf-High***

The concerned mobility control related parameter is multiplied with this factor if the UE is in High Mobility state as defined in TS 36.304 [4]. Value oDot25 corresponds to 0.25, oDot5 corresponds to 0.5, oDot75 corresponds to 0.75 and so on.

##### ***sf-Medium***

The concerned mobility control related parameter is multiplied with this factor if the UE is in Medium Mobility state as defined in TS 36.304 [4]. Value oDot25 corresponds to 0.25, oDot5 corresponds to 0.5, oDot75 corresponds to 0.75 and so on.

## – *SystemInfoListGERAN*

The IE *SystemInfoListGERAN* contains system information of a GERAN cell.

### **SystemInfoListGERAN information element**

```
-- ASN1START
SystemInfoListGERAN ::= SEQUENCE (SIZE (1..maxGERAN-ST)) OF
 OCTET STRING (SIZE (1..23))
-- ASN1STOP
```

#### **SystemInfoListGERAN field descriptions**

##### ***SystemInfoListGERAN***

Each OCTET STRING contains one System Information (SI) message as defined in TS 44.018 [45], table 9.1.1, excluding the L2 Pseudo Length, the RR management Protocol Discriminator and the Skip Indicator or a complete Packet System Information (PSI) message as defined in TS 44.060 [36], table 11.2.1.

## – *SystemTimeInfoCDMA2000*

The IE *SystemTimeInfoCDMA2000* informs the UE about the absolute time in the current cell. The UE uses this absolute time knowledge to derive the CDMA2000 Physical cell identity, expressed as PNOFFSET, of neighbour CDMA2000 cells.

NOTE: The UE needs the CDMA2000 system time with a certain level of accuracy for performing measurements as well as for communicating with the CDMA2000 network (HRPD or 1xRTT).

### ***SystemTimeInfoCDMA2000* information element**

```
-- ASN1START

SystemTimeInfoCDMA2000 ::= SEQUENCE {
 cdma-EUTRA-Synchronisation BOOLEAN,
 cdma-SystemTime CHOICE {
 synchronousSystemTime BIT STRING (SIZE (39)),
 asynchronousSystemTime BIT STRING (SIZE (49))
 }
}

-- ASN1STOP
```

#### ***SystemTimeInfoCDMA2000* field descriptions**

##### ***asynchronousSystemTime***

The CDMA2000 system time corresponding to the SFN boundary at or after the ending boundary of the SI-Window in which *SystemInformationBlockType8* is transmitted. E-UTRAN includes this field if the E-UTRA frame boundary is not aligned to the start of CDMA2000 system time. This field size is 49 bits and the unit is 8 CDMA chips based on 1.2288 Mcps.

##### ***cdma-EUTRA-Synchronisation***

TRUE indicates that there is no drift in the timing between E-UTRA and CDMA2000. FALSE indicates that the timing between E-UTRA and CDMA2000 can drift. NOTE 1

##### ***synchronousSystemTime***

CDMA2000 system time corresponding to the SFN boundary at or after the ending boundary of the SI-window in which *SystemInformationBlockType8* is transmitted. E-UTRAN includes this field if the E-UTRA frame boundary is aligned to the start of CDMA2000 system time. This field size is 39 bits and the unit is 10 ms based on a 1.2288 Mcps chip rate.

NOTE 1: The following table shows the recommended combinations of the *cdma-EUTRA-Synchronisation* field and the choice of *cdma-SystemTime* included by E-UTRAN for FDD and TDD:

| FDD/TDD | <b><i>cdma-EUTRA-Synchronisation</i></b> | <b><i>synchronousSystemTime</i></b> | <b><i>asynchronousSystemTime</i></b> |
|---------|------------------------------------------|-------------------------------------|--------------------------------------|
| FDD     | FALSE                                    | Not Recommended                     | Recommended                          |
| FDD     | TRUE                                     | Recommended                         | Recommended                          |
| TDD     | FALSE                                    | Not Recommended                     | Recommended                          |
| TDD     | TRUE                                     | Recommended                         | Recommended                          |

## – *ThresholdNR*

The IE *ThresholdNR* and IE *ThresholdListNR* contain thresholds for NR related inter-RAT measurements.

### ***ThresholdNR* information element**

```
-- ASN1START

ThresholdNR-r15 ::= CHOICE {
 nr-RSRP-r15 RSRP-RangeNR-r15,
 nr-RSRQ-r15 RSRQ-RangeNR-r15,
 nr-SINR-r15 RS-SINR-RangeNR-r15
}

ThresholdListNR-r15 ::= SEQUENCE {
 nr-RSRP-r15 RSRP-RangeNR-r15
} OPTIONAL, -- Need OR
```

```

nr-RSRQ-r15 RSRQ-RangeNR-r15 OPTIONAL, -- Need OR
nr-SINR-r15 RS-SINR-RangeNR-r15 OPTIONAL, -- Need OR
}

-- ASN1STOP

```

## – *TLE-EphemerisParameters*

The IE *TLE-EphemerisParameters* provides satellite ephemeris parameters based on the CCSDS orbit mean-elements message (OMM) format, see [111]. The reference frame for SGP4 propagator and SGP4 parameter generation is TEME as per the NORAD Space Track standard.

### *TLE-EphemerisParameters* information element

```

-- ASN1START

TLE-EphemerisParameters-r17 ::= SEQUENCE {
 inclination-r17 INTEGER (0..2097151),
 argumentPerigee-r17 INTEGER (0..4194303),
 rightAscension-r17 INTEGER (0..4194303),
 meanAnomaly-r17 INTEGER (0..4194303),
 eccentricity-r17 INTEGER (0..16777215),
 meanMotion-r17 INTEGER (0..17179869183),
 bStarDecimal-r17 INTEGER (-99999..99999),
 bStarExponent-r17 INTEGER (-9..9),
 epochStar-r17 INTEGER (-1048575..1048575)
}
-- ASN1STOP

```

### *TLE-EphemerisParameters* field descriptions

#### **argumentPerigee**

Argument of perigee, see [111] Table 4-3: OMM Data. Unit in degree.  
Step of 360 / 4194303 degree. Actual value = field value \* (360 / 4194303).

#### **bStarDecimal**

Decimal part of B\*, see [111] Table 4-3: OMM Data. Unit in inverse Earth radii.  
Step of 0.00001 . Actual value = field value \* 0.00001.

#### **bStarExponent**

Exponent part of B\*, see [111] Table 4-3: OMM Data.

#### **eccentricity**

Eccentricity, see [111] Table 4-3: OMM Data.  
Step of 0.9999999 / 16777215. Actual value = field value \* (0.9999999 / 16777215).

#### **epochStar**

Time offset to the beginning of the current week (Monday 00:00:00 UTC) of the Epoch. Unit in second.

#### **inclination**

Inclination, see [111] Table 4-3: OMM Data. Unit in degree.  
Step of 180 / 2097151 degree. Actual value = field value \* (180 / 2097151).

#### **meanAnomaly**

Mean anomaly at epoch time, see [111] Table 4-3: OMM Data. Unit in degree.  
Step of 360 / 4194303 degree. Actual value = field value \* (360 / 4194303).

#### **meanMotion**

Mean motion at epoch time, see [111] Table 4-3: OMM Data]. Unit in revolution/day.  
Step of 99.99999999 / 17179869183 rev/day. Actual value = field value \* (99.99999999 / 17179869183).

#### **rightAscension**

Right ascension of ascending node, see [111] Table 4-3: OMM Data. Unit in degree.  
Step of 360 / 4194303 degree. Actual value = field value \* (360 / 4194303).

## – *TrackingAreaCode*

The IE *TrackingAreaCode* is used to identify a tracking area within the scope of a PLMN, see TS 24.301 [35].

### *TrackingAreaCode* information element

```

-- ASN1START

TrackingAreaCode ::= BIT STRING (SIZE (16))
TrackingAreaCode-5GC-r15 ::= BIT STRING (SIZE (24))

```

```
-- ASN1STOP
```

### — *T-Reselection*

The IE *T-Reselection* concerns the cell reselection timer  $T_{\text{Reselection}_{\text{RAT}}}$  for E-UTRA, UTRA, GERAN or CDMA2000. Value in seconds. For value 0, behaviour as specified in 7.3.2 applies.

#### ***T-Reselection* information element**

```
-- ASN1START
T-Reselection ::= INTEGER (0..7)
-- ASN1STOP
```

### — *T-ReselectionEUTRA-CE*

The IE *T-ReselectionEUTRA-CE* concerns the cell reselection timer  $T_{\text{Reselection}_{\text{EUTRA\_CE}}}$  as specified in TS 36.304 [4]. Value in seconds. For value 0, behaviour as specified in 7.3.2 applies.

#### ***T-ReselectionEUTRA-CE* information element**

```
-- ASN1START
T-ReselectionEUTRA-CE-r13 ::= INTEGER (0..15)
-- ASN1STOP
```

### 6.3.5 Measurement information elements

#### — *AllowedMeasBandwidth*

The IE *AllowedMeasBandwidth* is used to indicate the maximum allowed measurement bandwidth on a carrier frequency as defined by the parameter Transmission Bandwidth Configuration "N<sub>RB</sub>" TS 36.104 [47]. The values mbw6, mbw15, mbw25, mbw50, mbw75, mbw100 indicate 6, 15, 25, 50, 75 and 100 resource blocks respectively.

#### ***AllowedMeasBandwidth* information element**

```
-- ASN1START
AllowedMeasBandwidth ::= ENUMERATED {mbw6, mbw15, mbw25, mbw50, mbw75, mbw100}
-- ASN1STOP
```

#### — *BT-NameList*

The IE *BT-NameList* is used to indicate the names of the Bluetooth beacon which the UE is configured to measure.

#### ***BT-NameList* information element**

```
-- ASN1START
BT-NameListConfig-r15 ::= CHOICE{
 release,
 setup,
 BT-NameList-r15
}
BT-NameList-r15 ::= SEQUENCE (SIZE (1..maxBT-Name-r15)) OF BT-Name-r15
BT-Name-r15 ::= OCTET STRING (SIZE (1..248))
-- ASN1STOP
```

### ***BT-NameList* field descriptions**

#### ***bt-Name***

If configured, the UE only performs Bluetooth measurements according to the names identified. For each name, it refers to LOCAL NAME defined in Bluetooth specification [93].

- ***CSI-RSRP-Range***

The IE *CSI-RSRP-Range* specifies the value range used in CSI-RSRP measurements and thresholds. Integer value for CSI-RSRP measurements according to mapping table in TS 36.133 [16].

#### ***CSI-RSRP-Range* information element**

```
-- ASN1START
CSI-RSRP-Range-r12 ::= INTEGER(0..97)
-- ASN1STOP
```

- ***Hysteresis***

The IE *Hysteresis* is a parameter used within the entry and leave condition of an event triggered reporting condition. The actual value is field value \* 0.5 dB, except if included in *reportConfigEUTRA* and associated to *eventV1* or *eventV2*. If included in *reportConfigEUTRA* and associated to *eventV1* or *eventV2*, the actual value is field value divided by 100.

#### ***Hysteresis* information element**

```
-- ASN1START
Hysteresis ::= INTEGER (0..30)
-- ASN1STOP
```

- ***HysteresisLocation***

The IE *HysteresisLocation* is a parameter used within entry and leave condition of a location based conditional event. The actual value is field value \* 10 meters.

#### ***HysteresisLocation* information element**

```
-- ASN1START
HysteresisLocation-r18 ::= INTEGER (0..32767)
-- ASN1STOP
```

- ***LocationInfo***

The IE *LocationInfo* is used to transfer detailed location information available at the UE to correlate measurements and UE position information.

#### ***LocationInfo* information element**

```
-- ASN1START
LocationInfo-r10 ::= SEQUENCE {
 locationCoordinates-r10 CHOICE {
 ellipsoid-Point-r10 OCTET STRING,
 ellipsoidPointWithAltitude-r10 OCTET STRING,
 ...
 ellipsoidPointWithUncertaintyCircle-r11 OCTET STRING,
```

```

ellipsoidPointWithUncertaintyEllipse-r11 OCTET STRING,
ellipsoidPointWithAltitudeAndUncertaintyEllipsoid-r11 OCTET STRING,
ellipsoidArc-r11 OCTET STRING,
polygon-r11 OCTET STRING

},
horizontalVelocity-r10 OCTET STRING OPTIONAL,
gnss-TOD-msec-r10 OCTET STRING OPTIONAL,
...
[[verticalVelocityInfo-r15 CHOICE {
 verticalVelocity-r15 OCTET STRING,
 verticalVelocityAndUncertainty-r15 OCTET STRING
}
OPTIONAL
]]
}

-- ASN1STOP

```

#### ***LocationInfo field descriptions***

***ellipsoidArc***

Parameter *EllipsoidArc* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***ellipsoid-Point***

Parameter *Ellipsoid-Point* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***ellipsoidPointWithAltitude***

Parameter *EllipsoidPointWithAltitude* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***ellipsoidPointWithAltitudeAndUncertaintyEllipsoid***

Parameter *EllipsoidPointWithAltitudeAndUncertaintyEllipsoid* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***ellipsoidPointWithUncertaintyCircle***

Parameter *EllipsoidPointWithUncertaintyCircle* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***ellipsoidPointWithUncertaintyEllipse***

Parameter *EllipsoidPointWithUncertaintyEllipse* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***gnss-TOD-msec***

Parameter *Gnss-TOD-msec* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***horizontalVelocity***

Parameter *HorizontalVelocity* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***polygon***

Parameter *Polygon* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***verticalVelocityAndUncertainty***

Parameter *verticalVelocityAndUncertainty* corresponds to *horizontalWithVerticalVelocityAndUncertainty* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

***verticalVelocity***

Parameter *verticalVelocity* corresponds to *horizontalWithVerticalVelocity* defined in TS 36.355 [54]. The first/leftmost bit of the first octet contains the most significant bit.

#### ***LogMeasResultListBT***

The IE *LogMeasResultListBT* covers measured results for Bluetooth.

#### ***LogMeasResultListBT information element***

```

-- ASN1START

LogMeasResultListBT-r15 ::= SEQUENCE (SIZE (1..maxBT-IdReport-r15)) OF LogMeasResultBT-r15

LogMeasResultBT-r15 ::= SEQUENCE {
 bt-Addr-r15 BIT STRING (SIZE (48)),
 rssi-BT-r15 INTEGER (-128..127) OPTIONAL,
 ...
}

-- ASN1STOP

```

### ***LogMeasResultListBT* field descriptions**

***bt-Addr***

This field indicates the Bluetooth public address of the Bluetooth beacon as defined in TS 36.355 [54].

***rssi-BT***

This field provides the beacon received signal strength indicator (RSSI) in dBm as defined in TS 36.355 [54].

## – ***LogMeasResultListWLAN***

The IE *LogMeasResultListWLAN* covers measured results for WLAN.

### ***LogMeasResultListWLAN* information element**

```
-- ASN1START

LogMeasResultListWLAN-r15 ::= SEQUENCE (SIZE (1..maxWLAN-Id-Report-r14)) OF LogMeasResultWLAN-
r15

LogMeasResultWLAN-r15 ::= SEQUENCE {
 wlan-Identifiers-r15 WLAN-Identifiers-r12,
 rssiWLAN-r15 WLAN-RSSI-Range-r13 OPTIONAL,
 rtt-WLAN-r15 WLAN-RTT-r15 OPTIONAL,
 ...
}

-- ASN1STOP
```

### ***LogMeasResultListWLAN* field descriptions**

***rssiWLAN***

Measured WLAN RSSI result in dBm.

***rtt-WLAN***

This field provides the measured round trip time between the target device and WLAN AP and optionally the accuracy expressed as the standard deviation of the delay. Units for each of these are 1000ns, 100ns, 10ns, 1ns, and 0.1ns as defined in TS 36.355 [54].

***wlan-Identifiers***

Indicates the WLAN parameters used for identification of the WLAN for which the measurement results are applicable.

## – ***MaxRS-IndexCellQualNR***

The IE *MaxRS-IndexCellQualNR* indicates the maximum number of RS indices to be considered/ averaged to derive the cell quality for RRM.

### ***MaxRS-IndexCellQualNR* information element**

```
-- ASN1START

MaxRS-IndexCellQualNR-r15 ::= INTEGER (1..maxRS-IndexCellQual-r15)

-- ASN1STOP
```

## – ***MBSFN-RSRQ-Range***

The IE *MBSFN-RSRQ-Range* specifies the value range used in MBSFN RSRQ measurements. Integer value for MBSFN RSRQ measurements according to mapping table in TS 36.133 [16].

### ***MBSFN-RSRQ-Range* information element**

```
-- ASN1START

MBSFN-RSRQ-Range-r12 ::= INTEGER(0..31)

-- ASN1STOP
```

## — MeasConfig

The IE *MeasConfig* specifies measurements to be performed by the UE, and covers intra-frequency, inter-frequency and inter-RAT mobility as well as configuration of measurement gaps.

### MeasConfig information element

```
-- ASN1START

MeasConfig ::= SEQUENCE {

| <b>MeasConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>allowInterruptions</b>            | Value TRUE indicates that the UE is allowed to cause interruptions to serving cells when performing measurements of deactivated SCell carriers for <i>measCycleSCell</i> of less than 640ms, as specified in TS 36.133 [16]. E-UTRAN enables this field only when an SCell is configured.                                                                                                                                                                                                                                                                                      |
| <b>fr1-Gap</b>                       | Indicates whether the gap is only applicable for measurements on FR1. E-UTRAN sets this field to <i>TRUE</i> only when the UE is configured with (NG)EN-DC.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>heightThreshRef</b>               | Reference height threshold for <i>eventH1</i> and <i>eventH2</i> in <i>reportConfig</i> . Value 0 refers to -420m, value 1 refers to -120m, and so on until value 30 refers to 8880m. The actual value is height in meters relative to sea level. Value 31 is reserved.                                                                                                                                                                                                                                                                                                        |
| <b>measGapConfig</b>                 | Used to setup and release measurement gaps. E-UTRAN includes either <i>measGapConfig</i> or <i>measGapConfigPerCC-List</i> , if any.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measGapConfigDensePRS</b>         | Used to setup and release additional measurement gap pattern with dense PRS configuration as specified in TS 36.133 [16], Table 8.1.2.1-3. E-UTRAN configures this field only when UE indicates the preference of measurement gap configuration for dense PRS, i.e., <i>measPRS-Offset-r15</i> .                                                                                                                                                                                                                                                                               |
| <b>measGapConfigPerCC-List</b>       | Used to setup and release serving cell specific measurement gaps. E-UTRAN includes either <i>measGapConfig</i> or <i>measGapConfigPerCC-List</i> , if any.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>measGapSharingConfig</b>          | Used to setup and release measurement gap sharing for intra- and inter-frequency measurement as specified in TS 36.133 [16].                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>measIdToAddModList</b>            | List of measurement identities. Field <i>measIdToAddModListExt</i> includes additional measurement identities i.e. extends the size of the measurement identity list using the general principles specified in 5.1.2. If E-UTRAN includes <i>measIdToAddModList-v1310</i> it includes the same number of entries, and listed in the same order, as in <i>measIdToAddModList</i> (i.e. without suffix). If E-UTRAN includes <i>measIdToAddModListExt-v1310</i> , it includes the same number of entries, and listed in the same order, as in <i>measIdToAddModListExt-r12</i> . |
| <b>measIdToRemoveList</b>            | List of measurement identities to remove. Field <i>measIdToRemoveListExt</i> includes additional measurement identities i.e. extends the size of the measurement identity list using the general principles specified in 5.1.2.                                                                                                                                                                                                                                                                                                                                                |
| <b>measObjectToAddModList</b>        | If E-UTRAN includes <i>measObjectToAddModList-v9e0</i> it includes the same number of entries, and listed in the same order, as in <i>measObjectToAddModList</i> (i.e. without suffix). Field <i>measObjectToAddModListExt</i> includes additional measurement object identities i.e. extends the size of the measurement object identity list using the general principles specified in 5.1.2.                                                                                                                                                                                |
| <b>measObjectToRemoveList</b>        | List of measurement objects to remove. Field <i>measObjectToRemoveListExt</i> includes additional measurement object identities i.e. extends the size of the measurement object identity list using the general principles specified in 5.1.2.                                                                                                                                                                                                                                                                                                                                 |
| <b>measRSRQ-OnAllSymbols</b>         | Value <i>TRUE</i> indicates that the UE shall, when performing RSRQ measurements, perform RSRQ measurement on all OFDM symbols in accordance with TS 36.214 [48]. If <i>widebandRSRQ-Meas</i> is enabled for the frequency in <i>MeasObjectEUTRA</i> , the UE shall, when performing RSRQ measurements, perform RSRQ measurement on all OFDM symbols with wider bandwidth for concerned frequency in accordance with TS 36.214 [48].                                                                                                                                           |
| <b>measScaleFactor</b>               | Even if <i>reducedMeasPerformance</i> is not included in any <i>measObjectEUTRA</i> or <i>measObjectUTRA</i> , E-UTRAN may configure this field. The UE behavior is specified in TS 36.133 [16].                                                                                                                                                                                                                                                                                                                                                                               |
| <b>mgta</b>                          | Indicates whether a timing advance value of 0.5 ms is applicable to the measurement gap configuration provided by E-UTRAN according to TS 38.133 [84]. E-UTRAN sets <i>mgta</i> to <i>TRUE</i> only when the UE is configured to perform NR measurements.                                                                                                                                                                                                                                                                                                                      |
| <b>preRegistrationInfoHRPD</b>       | The CDMA2000 HRPD Pre-Registration Information tells the UE if it should pre-register with the CDMA2000 HRPD network and identifies the Pre-registration zone to the UE.                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>MeasConfig field descriptions</b> |                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>locationMeasConfig</b>            | Presence of this field indicates that UE shall perform location-based measurement initiation. If this field is configured, s-Measure is also configured.                                                                                         |
| <b>reportConfigToRemoveList</b>      | List of measurement reporting configurations to remove.                                                                                                                                                                                          |
| <b>s-Measure</b>                     | PCell (or PSCell, if the UE is in NE-DC) quality threshold controlling whether or not the UE is required to perform measurements of intra-frequency, inter-frequency and inter-RAT neighbouring cells. Value "0" indicates to disable s-Measure. |
| <b>timeMeasConfig</b>                | Presence of this field indicates that UE shall perform time-based measurement initiation. If this field is configured, s-Measure is also configured.                                                                                             |
| <b>timeToTrigger-SF</b>              | The timeToTrigger in ReportConfigEUTRA and in ReportConfigInterRAT are multiplied with the scaling factor applicable for the UE's speed state.                                                                                                   |

## – MeasDS-Config

The IE *MeasDS-Config* specifies information applicable for discovery signals measurement.

### MeasDS-Config information elements

```
-- ASN1START

| <b>MeasDS-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-RS-IndividualOffset</b>          | CSI-RS individual offset applicable to a specific CSI-RS resource. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.                                                                                                                                                                                                                                                           |
| <b>dmtc-PeriodOffset</b>                | Indicates the discovery signals measurement timing configuration (DMTC) periodicity ( <i>dmtc-Periodicity</i> ) and offset ( <i>dmtc-Offset</i> ) for this frequency. For DMTC periodicity, value ms40 corresponds to 40ms, ms80 corresponds to 80ms and so on. The value of DMTC offset is in number of subframe(s). The duration of a DMTC occasion is 6ms.                                          |
| <b>ds-OccasionDuration</b>              | Indicates the duration of discovery signal occasion for this frequency. Discovery signal occasion duration is common for all cells transmitting discovery signals on one frequency. If the <i>carrierFreq</i> in the measurement object is on an unlicensed band as specified in [42], the UE shall ignore the field <i>ds-OccasionDuration</i> for the carrier frequency and apply a value 1 instead. |
| <b>measCSI-RS-ToAddModList</b>          | List of CSI-RS resources to add/ modify in the CSI-RS resource list for discovery signals measurement.                                                                                                                                                                                                                                                                                                 |
| <b>measCSI-RS-ToRemoveList</b>          | List of CSI-RS resources to remove from the CSI-RS resource list for discovery signals measurement.                                                                                                                                                                                                                                                                                                    |
| <b>physCellId</b>                       | Indicates the physical cell identity where UE may assume that the CSI-RS and the PSS/SSS/CRS corresponding to the indicated physical cell identity are quasi co-located with respect to average delay and doppler shift.                                                                                                                                                                               |
| <b>resourceConfig</b>                   | Parameter: CSI reference signal configuration, see TS 36.211 [21], tables 6.10.5.2-1 and 6.10.5.2-2. If the <i>carrierFreq</i> in the measurement object is on an unlicensed band as specified in TS 36.101 [42], E-UTRAN does not configure the values {0, 4, 5, 9, 10, 11, 18, 19}.                                                                                                                  |
| <b>scramblingIdentity</b>               | Parameter: Pseudo-random sequence generator parameter, $n_{ID}$ , see TS 36.213 [23], clause 7.2.5.                                                                                                                                                                                                                                                                                                    |
| <b>subframeOffset</b>                   | Indicates the subframe offset between SSS of the cell indicated by <i>physCellId</i> and the CSI-RS resource in a discovery signal occasion. The field <i>subframeOffset</i> is set to values 0 if the <i>carrierFreq</i> in the measurement object is on an unlicensed band as specified in TS 36.101 [42].                                                                                           |

## – MeasGapConfig

The IE *MeasGapConfig* specifies the measurement gap configuration and controls setup/ release of measurement gaps.

### MeasGapConfig information element

```
-- ASN1START

MeasGapConfig ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 gapOffset CHOICE {
 gp0 INTEGER (0..39),
 gp1 INTEGER (0..79),
 ...
 gp2-r14 INTEGER (0..39),

 }
 }
}
```

-- ASN1STOP

***MeasGapConfig* field descriptions*****gapOffset***

Value *gapOffset* of *gp0* corresponds to gap offset of Gap Pattern Id "0" with MGRP = 40ms, *gapOffset* of *gp1* corresponds to gap offset of Gap Pattern Id "1" with MGRP = 80ms, *gapOffset* of *gp2* corresponds to gap offset of Gap Pattern Id "2" with MGRP = 40ms and MGL = 3ms, *gapOffset* of *gp3* Gap Pattern Id "3" with MGRP = 80ms and MGL = 3ms, *gapOffset* of *gp-ncsg0* corresponds to gap offset of NCSG Pattern Id "0" with VIRP = 40ms and ML = 4ms, *gapOffset* of *gp-ncsg1* corresponds to gap offset of NCSG Pattern Id "1" with VIRP = 80ms and ML = 4ms, *gapOffset* of *gp-ncsg2* corresponds to gap offset of NCSG Pattern Id "2" with VIRP = 40ms and ML = 3ms, *gapOffset* of *gp-ncsg3* corresponds to gap offset of NCSG Pattern Id "3" with VIRP = 80ms and ML = 3ms. *gapOffset* of *gp-nonUniform1* corresponds to gap offset of non uniform gap pattern Id "1" with LMGRP = 1280ms, *gapOffset* of *gp-nonUniform2* corresponds to gap offset of non uniform gap pattern Id "2" with LMGRP = 2560ms, *gapOffset* of *gp-nonUniform3* corresponds to gap offset of non uniform gap pattern Id "3" with LMGRP = 5120ms, *gapOffset* of *gp-nonUniform4* corresponds to gap offset of non uniform gap pattern Id "4" with LMGRP = 10240ms. Also used to specify the measurement gap pattern to be applied, as defined in TS 36.133 [16]. For Gap Patterns (including non-uniform gap patterns, but excluding NCSG patterns), E-UTRAN includes the same *gapOffset* value (gap pattern id and gap offset) for all serving cells that are configured with a Gap Pattern. For NCSG Patterns, E-UTRAN includes *gapOffset* value indicating VIRP and gap offset consistent with the Gap Pattern configuration (MGRP and gap offset). Value *gapOffset* of *gp4*, *gp5*, ..., *gp11* are corresponding to gap pattern with Gap Pattern ID 4, 5,..11 respectively, see TS 38.133 [84], Table 9.1.2-1. Value *gp4*, *gp5*, ..., *gp11* can be applied for (NG)EN-DC, see TS 38.133 [84], Table 9.1.2-2.

***servCellId***

Identifies the serving cell for which measurement gap configuration is provided (setup) or deleted (release).

***MeasGapConfigDensePRS***

The IE *MeasGapConfigDensePRS* specifies the additional measurement gap pattern configuration for RSTD measurements with dense PRS configuration, see TS 36.133 [16], Table 8.1.2.1-3. Measurement gaps are configured according to applicability rules specified in 36.133 [16], Table 8.1.2.1-3.

***MeasGapConfigDensePRS* information element**

-- ASN1START

```

MeasGapConfigDensePRS-r15 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 gapOffsetDensePRS-r15 CHOICE {

```

| <b>MeasGapConfigDensePRS field descriptions</b> |
|-------------------------------------------------|
|-------------------------------------------------|

**gapOffsetDensePRS**

Indicates the gap offset for performing RSTD measurements with dense PRS configurations as specified in 5.5.2.9a corresponding to measurement gap pattern ID specified in TS 36.133 [16].

- **MeasGapConfigPerCC-List**

The IE *MeasGapConfigPerCC-List* specifies the measurement gap configuration and controls setup/ release of measurement gaps.

**MeasGapConfigPerCC-List information element**

```
-- ASN1START

MeasGapConfigPerCC-List-r14 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 measGapConfigToRemoveList-r14 MeasGapConfigToRemoveList-r14 OPTIONAL, -- Need ON
 measGapConfigToAddModList-r14 MeasGapConfigToAddModList-r14 OPTIONAL, -- Need ON
 }
}

MeasGapConfigToRemoveList-r14 ::= SEQUENCE (SIZE (1..maxServCell-r13)) OF ServCellIndex-r13

MeasGapConfigToAddModList-r14 ::= SEQUENCE (SIZE (1..maxServCell-r13)) OF MeasGapConfigPerCC-r14

MeasGapConfigPerCC-r14 ::= SEQUENCE {
 servCellId-r14 ServCellIndex-r13,
 measGapConfigCC-r14 MeasGapConfig
}

-- ASN1STOP
```

| <b>MeasGapConfigPerCC-List field descriptions</b> |
|---------------------------------------------------|
|---------------------------------------------------|

**measGapConfigToAddModList**

List of serving cells and corresponding serving cell specific measurement gap configuration to add /modify.

**measGapConfigToRemoveList**

List of serving cells for which measurement gap configuration is removed.

- **MeasGapSharingConfig**

The IE *MeasGapSharingConfig* specifies the measurement gap sharing scheme and controls setup/ release of measurement gap sharing.

**MeasGapSharingConfig information element**

```
-- ASN1START

MeasGapSharingConfig-r14 ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 measGapSharingScheme-r14 ENUMERATED {scheme00, scheme01, scheme10, scheme11}
 }
}

-- ASN1STOP
```

| <b>MeasGapSharingConfig field descriptions</b> |
|------------------------------------------------|
|------------------------------------------------|

**measGapSharingScheme**

Indicates the measurement gaps sharing scheme for BL UEs in CE mode A and CE mode B and for (NG)EN-DC (for the measurement gap configured by E-UTRAN). For BL UEs, see TS 36.133 [16], Table 8.13.2.1.1-2 and Table 8.13.3.1.1-3. For (NG)EN-DC, see TS 36.133 [16], Table 8.17.1.1-1. Value *scheme00* corresponds to "00", value *scheme01* corresponds to "01", and so on.

## — MeasId

The IE *MeasId* is used to identify a measurement configuration, i.e., linking of a measurement object and a reporting configuration.

### **MeasId information element**

```
-- ASN1START

MeasId ::= INTEGER (1..maxMeasId)
MeasId-v1250 ::= INTEGER (maxMeasId-Plus1..maxMeasId-r12)

-- ASN1STOP
```

## — MeasIdleConfig

The IE *MeasIdleConfig* is used to convey information to UE about measurements requested to be done while in RRC\_IDLE or RRC\_INACTIVE.

### **MeasIdleConfig information element**

```
-- ASN1START

MeasIdleConfigSIB-r15 ::= SEQUENCE {

| <b>MeasIdleConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>allowedMeasBandwidth</b>              | If absent, the value corresponding to the downlink bandwidth indicated by the <i>dl-Bandwidth</i> included in <i>MasterInformationBlock</i> of serving cell applies.                                                                                                                                                                                                                 |
| <b>beamMeasConfigIdle</b>                | Indicates the beam level measurement configuration.                                                                                                                                                                                                                                                                                                                                  |
| <b>carrierFreq</b>                       | Indicates the E-UTRA carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                  |
| <b>carrierFreqNR</b>                     | Indicates the NR carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                      |
| <b>frequencyBandList</b>                 | Indicates the list of frequency bands for which the NR idle/inactive measurement parameters apply. The UE shall select the first listed band which it supports in the frequencyBandList field to represent the NR neighbour carrier frequency.                                                                                                                                       |
| <b>deriveSSB-IndexFromCell</b>           | The field indicates whether the UE may use, to derive the SSB index of a cell on the indicated SSB frequency and subcarrier spacing, the timing of any detected cell with the same SSB frequency and subcarrier spacing. If this field is set to TRUE, the UE assumes SFN and frame boundary alignment across cells on the same NR carrier frequency as specified in TS 36.133 [16]. |
| <b>maxReportRS-Index</b>                 | Max number of beam indices to include in the idle/inactive measurement result.                                                                                                                                                                                                                                                                                                       |
| <b>maxRS-IndexCellQual</b>               | Number of SS blocks to average for cell measurement derivation. Corresponds to the parameter <i>nrofSS-BlocksToAverage</i> in TS 38.304 [92].                                                                                                                                                                                                                                        |
| <b>measCellList</b>                      | Indicates the list of E-UTRA cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                   |
| <b>measCellListNR</b>                    | Indicates the list of NR cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                       |
| <b>measIdleCarrierListEUTRA</b>          | Indicates the E-UTRA carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                        |
| <b>measIdleCarrierListNR</b>             | Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                            |
| <b>measIdleDuration</b>                  | Indicates the duration for performing measurements during RRC_IDLE or RRC_INACTIVE for measurements assigned via <i>RRCConnectionRelease</i> . Value sec10 correspond to 10 seconds, value sec30 to 30 seconds and so on.                                                                                                                                                            |
| <b>measTimingConfig</b>                  | Used to configure the NR measurement timing configurations, i.e., timing occasions at which the UE measures SSBs. If the field is absent in <i>VarMeasConfig</i> , the UE assumes that SSB periodicity is 5ms in this frequency.                                                                                                                                                     |
| <b>qualityThreshold</b>                  | Indicates the quality thresholds for reporting the measured cells for idle/inactive E-UTRA measurements.                                                                                                                                                                                                                                                                             |
| <b>qualityThresholdNR</b>                | Indicates the quality thresholds for reporting the measured cells for idle/inactive NR measurements.                                                                                                                                                                                                                                                                                 |
| <b>reportQuantities</b>                  | Indicates which E-UTRA measurement quantities the UE is requested to report in the idle/inactive measurement report. In this version of the specification, E-UTRAN always configures the value 'both'.                                                                                                                                                                               |
| <b>reportQuantitiesNR</b>                | Indicates which NR measurement quantities the UE is requested to report in the idle/inactive measurement report.                                                                                                                                                                                                                                                                     |
| <b>reportQuantityRS-IndexNR</b>          | Indicates which measurement information per beam index the UE shall include in the NR idle/inactive measurement results.                                                                                                                                                                                                                                                             |
| <b>reportRS-IndexResultsNR</b>           | Indicates whether or not the UE shall include beam measurements in the NR idle/inactive measurement results.                                                                                                                                                                                                                                                                         |
| <b>ss-RSSI-Measurement</b>               | Indicates the SSB-based RSSI measurement configuration. If the field is absent in <i>VarMeasConfig</i> , the UE behaviour is defined in TS 38.215 [89], clause 5.1.3.                                                                                                                                                                                                                |
| <b>ssb-ToMeasure</b>                     | The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [89]). When the field is absent in <i>VarMeasConfig</i> , the UE measures on all SS-blocks.                                                                                                                                                                                                  |
| <b>subcarrierSpacingSSB</b>              | Indicates subcarrier spacing of SSB of NR frequency. If <i>subcarrierSpacingSSB-r17</i> is present, the UE shall ignore <i>subcarrierSpacingSSB-r16</i> .                                                                                                                                                                                                                            |
| <b>threshRS-Index</b>                    | List of thresholds for consolidation of L1 measurements per RS index. Corresponds to the parameter <i>absThreshSS-BlocksConsolidation</i> in TS 38.304 [92].                                                                                                                                                                                                                         |

| <b>MeasIdleConfig field descriptions</b> |
|------------------------------------------|
|------------------------------------------|

**validityArea**

Indicates the list of cells within which UE is requested to do measurements during RRC\_IDLE or RRC\_INACTIVE. If the UE reselects to a cell whose physical cell identity does not match any entry in *validityArea* for the corresponding carrier frequency, the measurements are no longer required. E-UTRAN configures this field only in *RRCConnectionRelease*.

**validityAreaList**

Indicates the list of frequencies and optionally, for each frequency, a list of cells within which the UE is required to perform measurements during RRC\_IDLE or RRC\_INACTIVE. E-UTRAN configures this field only in *RRCConnectionRelease*. A UE can be configured either with *validityArea* or *validityAreaList*, but not both.

### — MeasIdToAddModList

The IE *MeasIdToAddModList* concerns a list of measurement identities to add or modify, with for each entry the *measId*, the associated *measObjectId* and the associated *reportConfigId*. Field *measIdToAddModListExt* includes additional measurement identities i.e. extends the size of the measurement identity list using the general principles specified in 5.1.2.

#### **MeasIdToAddModList information element**

```
-- ASN1START

MeasIdToAddModList ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasIdToAddMod
MeasIdToAddModList-v1310 ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasIdToAddMod-v1310
MeasIdToAddModListExt-r12 ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasIdToAddModExt-r12
MeasIdToAddModListExt-v1310 ::= SEQUENCE (SIZE (1..maxMeasId)) OF MeasIdToAddMod-v1310

MeasIdToAddMod ::= SEQUENCE {
 measId MeasId,
 measObjectId MeasObjectId,
 reportConfigId ReportConfigId
}

MeasIdToAddModExt-r12 ::= SEQUENCE {
 measId-v1250 MeasId-v1250,
 measObjectId-r12 MeasObjectId,
 reportConfigId-r12 ReportConfigId
}

MeasIdToAddMod-v1310 ::= SEQUENCE {
 measObjectId-v1310 MeasObjectId-v1310 OPTIONAL
}

-- ASN1STOP
```

| <b>MeasIdToAddModList field descriptions</b> |
|----------------------------------------------|
|----------------------------------------------|

**measObjectId**

If the *measObjectId-v1310* is included, the *measObjectId* or *measObjectId-r12* is ignored by the UE.

### — MeasObjectCDMA2000

The IE *MeasObjectCDMA2000* specifies information applicable for inter-RAT CDMA2000 neighbouring cells.

#### **MeasObjectCDMA2000 information element**

```
-- ASN1START

MeasObjectCDMA2000 ::= SEQUENCE {
 cdma2000-Type CDMA2000-Type,
 carrierFreq CarrierFreqCDMA2000,
 searchWindowSize INTEGER (0..15) OPTIONAL, -- Need ON
 offsetFreq Q-OffsetRangeInterRAT DEFAULT 0,
 cellsToRemoveList CellIndexList OPTIONAL, -- Need ON
 cellsToAddModList CellsToAddModListCDMA2000 OPTIONAL, -- Need ON
```

```

cellForWhichToReportCGI PhysCellIdCDMA2000 OPTIONAL, -- Need ON
...
}

CellsToAddModListCDMA2000 ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CellsToAddModCDMA2000

CellsToAddModCDMA2000 ::= SEQUENCE {
 cellIndex INTEGER (1..maxCellMeas),
 physCellId PhysCellIdCDMA2000
}
-- ASN1STOP

```

#### ***MeasObjectCDMA2000* field descriptions**

##### ***carrierInfo***

Identifies CDMA2000 carrier frequency for which this configuration is valid.

##### ***cdma2000-Type***

The type of CDMA2000 network: CDMA2000 1xRTT or CDMA2000 HRPD.

##### ***cellIndex***

Entry index in the neighbouring cell list.

##### ***cellsToAddModList***

List of cells to add/ modify in the neighbouring cell list.

##### ***cellsToRemoveList***

List of cells to remove from the neighbouring cell list.

##### ***physCellId***

CDMA2000 Physical cell identity of a cell in neighbouring cell list expressed as PNOffset.

##### ***searchWindowSize***

Provides the search window size to be used by the UE for the neighbouring pilot, see C.S0005 [25].

### ***MeasObjectEUTRA***

The IE *MeasObjectEUTRA* specifies information applicable for intra-frequency or inter-frequency E-UTRA cells.

#### ***MeasObjectEUTRA* information element**

```

-- ASN1START

MeasObjectEUTRA ::= SEQUENCE {

| <b><i>altTTT-CellsToAddModList</i></b>           | List of cells to add/ modify in the cell list for which the alternative time to trigger specified by <i>alternativeTimeToTrigger</i> in <i>reportConfigEUTRA</i> , if configured, applies.                                                                                                                                                                                                                                                                                                         |
| <b><i>altTTT-CellsToRemoveList</i></b>           | List of cells to remove from the list of cells for alternative time to trigger.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>carrierFreq</i></b>                        | Identifies E-UTRA carrier frequency for which this configuration is valid. E-UTRAN does not configure more than one measurement object for the same physical frequency regardless of the E-ARFCN used to indicate this. CarrierFreq-r13 is included only when the extension list <i>measObjectToAddModListExt-r13</i> is used. If <i>carrierFreq-r13</i> is present, <i>carrierFreq</i> (i.e., without suffix) shall be set to value <i>maxEARFCN</i> .                                            |
| <b><i>cellIndex</i></b>                          | Entry index in the cell list. An entry may concern a range of cells, in which case this value applies to the entire range.                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>cellIndividualOffset</i></b>               | Cell individual offset applicable to a specific cell. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>cellsToAddModList</i></b>                  | List of cells to add/ modify in the cell list. <i>cellsToAddModList-v1610</i> indicates list of RSS assistance information which is used for the corresponding <i>physCellId</i> . If E-UTRAN includes <i>cellsToAddModList-v1610</i> , it includes the same number of entries, and listed in the same order, as in <i>cellsToAddModList</i> (i.e. without suffix).                                                                                                                                |
| <b><i>cellsToRemoveList</i></b>                  | List of cells to remove from the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>epochTime</i></b>                          | Epoch time of the satellite ephemeris data and reference location configured in the associated <i>ReportConfigEUTRA</i> for earth moving cells. This field is based on the timing of the serving cell, i.e. the <i>startSFN</i> and <i>startSubFrame</i> number indicated in this field refers to the SFN and sub-frame of the serving cell, and <i>startSFN</i> indicates the current SFN or the next upcoming SFN after the frame where the message indicating the <i>epochTime</i> is received. |
| <b><i>excludedCellsToAddModList</i></b>          | List of cells to add/ modify in the list of exclude-listed cells.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>excludedCellsToRemoveList</i></b>          | List of cells to remove from the list of exclude-listed cells.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>fembms-MixedCarrier</i></b>                | If this field is set to <i>TRUE</i> , the cells on the carrier frequency indicated by the <i>measObject</i> are FeMBMS/Unicast-mixed cells.                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>measCycleSCell</i></b>                     | The parameter is used only when an SCell is configured on the frequency indicated by the <i>measObject</i> and is in deactivated state, see TS 36.133 [16], clause 8.3.3. E-UTRAN configures the parameter whenever an SCell is configured on the frequency indicated by the <i>measObject</i> , but the field may also be signalled when an SCell is not configured. Value <i>sf160</i> corresponds to 160 sub-frames, <i>sf256</i> corresponds to 256 sub-frames and so on.                      |
| <b><i>measDS-Config</i></b>                      | Parameters applicable to discovery signals measurement on the carrier frequency indicated by <i>carrierFreq</i> .                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>measDuration</i></b>                       | Number of consecutive symbols for which the Physical Layer reports samples of RSSI, see TS 36.214 [48]. Value <i>sym1</i> corresponds to one symbol, <i>sym14</i> corresponds to 14 symbols, and so on.                                                                                                                                                                                                                                                                                            |
| <b><i>measRSS-DedicatedConfig</i></b>            | The field indicates whether measurements based on RSS in RRC_CONNECTED is enabled and provides neighbour cell RSS information.                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>measSubframeCellList</i></b>               | List of cells for which <i>measSubframePatternNeigh</i> is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>measSubframePatternNeigh</i></b>           | Time domain measurement resource restriction pattern applicable to neighbour cell RSRP and RSRQ measurements on the carrier frequency indicated by <i>carrierFreq</i> . For cells in <i>measSubframeCellList</i> the UE shall assume that the subframes indicated by <i>measSubframePatternNeigh</i> are non-MBSFN subframes, and have the same special subframe configuration as PCell.                                                                                                           |
| <b><i>offsetFreq</i></b>                         | Offset value applicable to the carrier frequency. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>physCellId</i></b>                         | Physical cell identity of a cell in the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>physCellIdRange</i></b>                    | Physical cell identity or a range of physical cell identities.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b><i>MeasObjectEUTRA</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>reducedMeasPerformance</i></b>             | If set to <i>TRUE</i> , the EUTRA carrier frequency is configured for reduced measurement performance, otherwise it is configured for normal measurement performance, see TS 36.133 [16].                                                                                                                                                                                                                                                                                                                   |
| <b><i>rmtc-Config</i></b>                        | Parameters applicable to RSSI and channel occupancy measurement on the carrier frequency indicated by <i>carrierFreq</i> .                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>rmtc-Period</i></b>                        | Indicates the RSSI measurement timing configuration (RMTC) periodicity for this frequency. Value <i>ms40</i> corresponds to 40 ms periodicity, <i>ms80</i> corresponds to 80 ms periodicity and so on, see TS 36.214 [48].                                                                                                                                                                                                                                                                                  |
| <b><i>rmtc-SubframeOffset</i></b>                | Indicates the RSSI measurement timing configuration (RMTC) subframe offset for this frequency. The value of <i>rmtc-SubframeOffset</i> should be smaller than the value of <i>rmtc-Period</i> , see TS 36.214 [48]. For inter-frequency measurements, this field is optional present and if it is not configured, the UE chooses a random value as <i>rmtc-SubframeOffset</i> for <i>measDuration</i> which shall be selected to be between 0 and the configured <i>rmtc-Period</i> with equal probability. |
| <b><i>rss-ConfigCarrierInfo</i></b>              | RSS configurations for this carrier frequency. If absent, RSS is collocated (time and frequency domain) in all cells.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>t312</i></b>                               | The value of timer T312. Value <i>ms0</i> represents 0 ms, <i>ms50</i> represents 50 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>tx-ResourcePoolToAddList</i></b>           | List of transmission pools identities to be added to the list of pools configured for CBR measurements and for which <i>poolReportId</i> is included in <i>SL-V2X-ConfigDedicated</i> , <i>SystemInformationBlockType21</i> or <i>SystemInformationBlockType26</i> .                                                                                                                                                                                                                                        |
| <b><i>tx-ResourcePoolToRemoveList</i></b>        | List of transmission resource pools identities to be removed from the list of pools configured for CBR measurements and for which <i>poolReportId</i> is included in <i>SL-V2X-ConfigDedicated</i> , <i>SystemInformationBlockType21</i> or <i>SystemInformationBlockType26</i> .                                                                                                                                                                                                                           |
| <b><i>widebandRSRQ-Meas</i></b>                  | If this field is set to <i>TRUE</i> , the UE shall, when performing RSRQ measurements, use a wider bandwidth in accordance with TS 36.133 [16].                                                                                                                                                                                                                                                                                                                                                             |

| Conditional presence | Explanation                                                                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>always</i>        | The field is mandatory present.                                                                                                                                                                                                                        |
| <i>Moving</i>        | The field is mandatory present if one of the associated <i>reportConfigEUTRA</i> contains <i>EventD2</i> or <i>condEventD2</i> . Otherwise it is optionally present, need ON.                                                                          |
| <i>WB-RSRQ</i>       | The field is optionally present, need ON, if the measurement bandwidth indicated by <i>allowedMeasBandwidth</i> is 50 resource blocks or larger; otherwise it is not present and the UE shall delete any existing value for this field, if configured. |

## – *MeasObjectGERAN*

The IE *MeasObjectGERAN* specifies information applicable for inter-RAT GERAN neighbouring frequencies.

### ***MeasObjectGERAN*** information element

```

| <b><i>MeasObjectNR</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bandNR</i></b>                          | Indicates the frequency band of the NR carrier frequency configured in this <i>MeasObjectNR</i> . This field is always set to setup when the network configures measurements with this <i>MeasObjectNR</i> .                                                                                                                                                                       |
| <b><i>carrierFreq</i></b>                     | Identifies the SSB frequency to be measured. E-UTRAN does not configure more than one measurement object for the same SSB frequency.                                                                                                                                                                                                                                               |
| <b><i>cellIndividualOffset</i></b>            | Cell individual offset applicable to a specific cell.                                                                                                                                                                                                                                                                                                                              |
| <b><i>deriveSSB-IndexFromCell</i></b>         | The field indicates whether the UE may use, to derive the SSB index of a cell on the indicated SSB frequency and subcarrier spacing, the timing of the NR serving cell with the same SSB frequency and subcarrier spacing if configured. Otherwise, the field indicates whether the UE may use the timing of any detected cell with the same SSB frequency and subcarrier spacing. |
| <b><i>measDurationNR</i></b>                  | Number of consecutive symbols for which the Physical Layer reports samples of RSSI (see TS 38.215 [89]). Value <i>sym1</i> corresponds to one symbol, <i>sym14or12</i> corresponds to 14 symbols of the reference numerology for NCP and 12 symbols for ECP, and so on. If <i>measDurationNR-r17</i> is present, the UE shall ignore <i>measDurationNR-r16</i> .                   |
| <b><i>quantityConfigSet</i></b>               | Indicates the n-th element of <i>quantityConfigNRLList</i> provided in <i>MeasConfig</i> .                                                                                                                                                                                                                                                                                         |
| <b><i>refSCS-CP-NR</i></b>                    | Indicates a reference subcarrier spacing and cyclic prefix to be used for RSSI measurements (see TS 38.215 [89]).                                                                                                                                                                                                                                                                  |
| <b><i>rmtc-FrequencyNR</i></b>                | Indicates the center frequency of the measured bandwidth (see TS 38.215 [89]).                                                                                                                                                                                                                                                                                                     |
| <b><i>rmtc-PeriodicityNR</i></b>              | Indicates the RSSI measurement timing configuration (RMTC) periodicity (see TS 38.215 [89]). Value <i>ms40</i> corresponds to 40 ms periodicity, <i>ms80</i> corresponds to 80 ms periodicity, and so on.                                                                                                                                                                          |
| <b><i>rmtc-SubframeOffsetNR</i></b>           | Indicates the RSSI measurement timing configuration (RMTC) subframe offset (see TS 38.215 [89]). If not configured, the UE chooses a random value as <i>rmtc-SubframeOffsetNR</i> for <i>measDurationNR</i> which shall be selected to be between 0 and the configured <i>rmtc-PeriodicityNR</i> with equal probability.                                                           |
| <b><i>rs-ConfigSSB</i></b>                    | Indicates the SSB configuration for measuring the set of SS blocks within the SMT measurement duration.                                                                                                                                                                                                                                                                            |
| <b><i>ssb-PositionQCL-NR</i></b>              | Indicates the QCL relationship between SS/PBCH blocks for a specific neighbor cell as specified in TS 38.213 [88], clause 4.1. If provided, the cell specific value overwrites the common value signalled by <i>ssb-PositionQCL-CommonNR</i> in <i>MeasObjectNR</i> for the indicated cell.                                                                                        |
| <b><i>ssb-PositionQCL-CommonNR</i></b>        | Indicates the QCL relationship between SS/PBCH blocks for NR neighbor cells as specified in TS 38.213 [88], clause 4.1. If <i>ssb-PositionQCL-CommonNR-r17</i> is present, the UE shall ignore <i>ssb-PositionQCL-CommonNR-r16</i> .                                                                                                                                               |
| <b><i>subcarrierSpacingSSB</i></b>            | Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                               |
| <b><i>rmtc-BandwidthNR</i></b>                | Indicates the bandwidth for the RSSI measurement.                                                                                                                                                                                                                                                                                                                                  |
| <b><i>threshRS-Index</i></b>                  | List of thresholds for consolidation of L1 measurements per RS index.                                                                                                                                                                                                                                                                                                              |

}

CSG-AllowedReportingCells-r9 ::= SEQUENCE {
 physCellIdRangeUTRA-FDDList-r9 OPTIONAL -- Need OR
}
-- ASN1STOP

```

#### *MeasObjectUTRA* field descriptions

***carrierFreq***

Identifies UTRA carrier frequency for which this configuration is valid. E-UTRAN does not configure more than one measurement object for the same physical frequency regardless of the ARFCN used to indicate this.

***cellIndex***

Entry index in the neighbouring cell list.

***cellsToAddModListUTRA-FDD***

List of UTRA FDD cells to add/ modify in the neighbouring cell list.

***cellsToAddModListUTRA-TDD***

List of UTRA TDD cells to add/modify in the neighbouring cell list.

***cellsToRemoveList***

List of cells to remove from the neighbouring cell list.

***csg-allowedReportingCells***

One or more ranges of physical cell identities for which UTRA-FDD reporting is allowed.

***reducedMeasPerformance***

If set to *TRUE* the UTRA carrier frequency is configured for reduced measurement performance, otherwise it is configured for normal measurement performance, see TS 36.133 [16].

#### — *MeasObjectWLAN*

The IE *MeasObjectWLAN* specifies information applicable for inter-RAT WLAN measurements. E-UTRAN configures at least one WLAN identifier in the *MeasObjectWLAN*.

```

-- ASN1START

MeasObjectWLAN-r13 ::= SEQUENCE {
 carrierFreq-r13 CHOICE {
 bandIndicatorListWLAN-r13 SEQUENCE (SIZE (1..maxWLAN-Bands-r13)) OF WLAN-
 BandIndicator-r13,

| <b>MeasResults field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>availableAdmissionCapacityWLAN</b> | Indicates the available admission capacity of WLAN as defined in IEEE 802.11-2012 [67].                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>averageDelay</b>                   | Indicates average delay for the packets during the reporting period, as specified in TS 38.314 [103]. Value 0 corresponds to 0 millisecond, value 1 corresponds to 0.1 millisecond, value 2 corresponds to 0.2 millisecond, and so on.                                                                                                                                                                                                                                                                                       |
| <b>backhaulDL-BandwidthWLAN</b>       | Indicates the backhaul available downlink bandwidth of WLAN, equal to Downlink Speed times Downlink Load defined in Wi-Fi Alliance Hotspot 2.0 [76].                                                                                                                                                                                                                                                                                                                                                                         |
| <b>backhaulUL-BandwidthWLAN</b>       | Indicates the backhaul available uplink bandwidth of WLAN, equal to Uplink Speed times Uplink Load defined in Wi-Fi Alliance Hotspot 2.0 [76].                                                                                                                                                                                                                                                                                                                                                                               |
| <b>bandWLAN</b>                       | Indicates the WLAN band.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>carrierFreq</b>                    | Indicates the E-UTRA carrier frequency. Within <i>MeasResultIdleListEUTRA-r15</i> , UE only includes measurements with the same carrier frequency.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>carrierFreqNR</b>                  | Indicates the NR carrier frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>carrierInfoWLAN</b>                | Indicates the WLAN channel information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>cbr-PSSCH</b>                      | Indicates the CBR measurement results on the PSSCH of the pool indicated by <i>poolIdentity</i> . If <i>adjacencyPSCCH-PSSCH</i> is set to <i>TRUE</i> for the pool indicated by <i>poolIdentity</i> , this field indicates the CBR measurement of both the PSSCH and PSCCH resources which are measured together.                                                                                                                                                                                                           |
| <b>cbr-PSCCH</b>                      | Indicates the CBR measurement results on the PSCCH of the pool indicated by <i>poolIdentity</i> . This field is only included if <i>adjacencyPSCCH-PSSCH</i> is set to <i>FALSE</i> for the pool indicated by <i>poolIdentity</i> .                                                                                                                                                                                                                                                                                          |
| <b>channelOccupancy</b>               | Indicates the percentage of samples when the RSSI was above the configured <i>channelOccupancyThreshold</i> for the associated <i>reportConfig</i> .                                                                                                                                                                                                                                                                                                                                                                         |
| <b>channelUtilizationWLAN</b>         | Indicates WLAN channel utilization as defined in IEEE 802.11-2012 [67].                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>coarseLocationInfo</b>             | This field indicates the coarse location information reported by the UE. This field is coded as the Ellipsoid-Point IE defined in TS 37.355 [109]. The first/leftmost bit of the first octet contains the most significant bit. The least significant bits of <i>degreesLatitude</i> and <i>degreesLongitude</i> are set to 0 to meet the accuracy requirement which corresponds to a granularity of approximately 2 km.<br>It is up to UE implementation as to how many LSBs are set to 0 to meet the accuracy requirement. |
| <b>connectedWLAN</b>                  | Indicates whether the UE is connected to the WLAN for which the measurement results are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>csg-MemberStatus</b>               | Indicates whether or not the UE is a member of the CSG of the neighbour cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>currentSFN</b>                     | Indicates the current system frame number when receiving the UE Rx-Tx time difference measurement results from lower layer.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>drb-Id</b>                         | Indicates the identity of DRB for which UL PDCP Packet Delay value is provided, according to TS 38.314 [103].                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>excessDelay</b>                    | Indicates excess queueing delay ratio in UL, according to excess delay ratio measurement report mapping table, as defined in TS 36.314 [71], Table 4.2.1.1-1.                                                                                                                                                                                                                                                                                                                                                                |
| <b>gNB-ID-Length</b>                  | Indicates the length of the gNB ID corresponding to the associated entry in the <i>PLMN-IdentityInfoNR</i> .                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>heightUE</b>                       | Indicates height of the UE in meters relative to the sea level. Value 0 corresponds to sea level (i.e., negative value indicates depth of the UE below sea level). Value -400 corresponds to -400 m, value -399 corresponds to -399 m and so on.                                                                                                                                                                                                                                                                             |
| <b>locationAreaCode</b>               | A fixed length code identifying the location area within a PLMN, as defined in TS 23.003 [27].                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>measId</b>                         | Identifies the measurement identity for which the reporting is being performed. If the <i>measId-v1250</i> is included, the <i>measId</i> (i.e. without a suffix) is ignored by eNB.                                                                                                                                                                                                                                                                                                                                         |
| <b>measIdleResultNR</b>               | Idle/inactive measurement results for an NR cell (optionally including beam level measurements).                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>MeasResults field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>measResult</b>                     | Measured result of an E-UTRA cell;<br>Measured result of a UTRA cell;<br>Measured result of a GERAN cell or frequency;<br>Measured result of a CDMA2000 cell;<br>Measured result of a WLAN;<br>Measured result of UE Rx-Tx time difference;<br>Measured result of UE SFN, radio frame and subframe timing difference; or<br>Measured result of RSSI and channel occupancy.                                                                                                                 |
| <b>measResultCSI-RS-List</b>          | Measured results of the CSI-RS resources in discovery signals measurement.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>measResultListCDMA2000</b>         | List of measured results for the maximum number of reported best cells for a CDMA2000 measurement identity.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>measResultListEUTRA</b>            | List of measured results for the maximum number of reported best cells for an E-UTRA measurement identity. For UE supporting CE Mode B, when CE mode B is not restricted by upper layers, <i>measResult-v1360</i> is reported if the measured RSRP is less than -140 dBm.                                                                                                                                                                                                                  |
| <b>measResultListGERAN</b>            | List of measured results for the maximum number of reported best cells or frequencies for a GERAN measurement identity.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>measResultListIdle</b>             | List of measured results for E-UTRA idle/inactive measurements.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>measResultListIdleNR</b>           | List of measured results for NR idle/inactive measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>measResultListSFTD</b>             | List of measured SFTD results for the reported cells for a NR measurement identity.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>measResultListUTRA</b>             | List of measured results for the maximum number of reported best cells for a UTRA measurement identity.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>measResultListWLAN</b>             | List of measured results for the maximum number of reported best WLAN outside the WLAN mobility set and connected WLAN, if any, for a WLAN measurement identity.                                                                                                                                                                                                                                                                                                                           |
| <b>measResultPCell</b>                | Measured result of the PCell. For BL UEs or UEs in CE, when operating in CE Mode B, <i>measResultPCell-v1360</i> is reported if the measured RSRP is less than -140 dBm. If sending of the MeasurementReport message is triggered by a measurement configured by the field <i>sl-ConfigDedicatedEUTRA</i> that was received within an NR RRCReconfiguration message (i.e. CBR measurements), <i>measResultPCell</i> is not applicable, its contents is invalid and ignored by the network. |
| <b>measResultsCDMA2000</b>            | Contains the CDMA2000 HRPD pre-registration status and the list of CDMA2000 measurements.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>measResultServFreqList</b>         | Measured results of the serving frequencies: the measurement result of each SCell, if any, and of the best neighbouring cell on each serving frequency. For UE supporting CE Mode B, when CE mode B is not restricted by upper layers, <i>measResultBestNeighCell-v1360</i> is reported if the measured RSRP is less than -140 dBm.                                                                                                                                                        |
| <b>measResultServingCell</b>          | Measured results of the serving cell (i.e., PCell) from idle/inactive measurements.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>measResultsPerCellListIdleNR</b>   | List of idle/inactive measured results for the maximum number of reported best cells for a given NR carrier.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>noSIB1</b>                         | Contains <i>ssb-SubcarrierOffset</i> and <i>pdcch-ConfigSIB1</i> fields acquired by the UE from MIB of the cell for which report CGI procedure was requested by the network in case SIB1 was not broadcast by the cell.                                                                                                                                                                                                                                                                    |
| <b>pilotPnPhase</b>                   | Indicates the arrival time of a CDMA2000 pilot, measured relative to the UE's time reference in units of PN chips, see C.S0005 [25]. This information is used in either SRVCC handover or enhanced 1xRTT CS fallback procedure to CDMA2000 1xRTT.                                                                                                                                                                                                                                          |
| <b>pilotStrength</b>                  | CDMA2000 Pilot Strength, the ratio of pilot power to total power in the signal bandwidth of a CDMA2000 Forward Channel. See C.S0005 [25] for CDMA2000 1xRTT and C.S0024 [26] for CDMA2000 HRPD.                                                                                                                                                                                                                                                                                            |
| <b>poolIdentity</b>                   | The identity of the transmission resource pool which is corresponding to the <i>poolReportId</i> configured in a resource pool for V2X sidelink communication.                                                                                                                                                                                                                                                                                                                             |
| <b>plmn-IdentityList</b>              | The list of PLMN Identity read from broadcast information when the multiple PLMN Identities are broadcast.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>preRegistrationStatusHRPD</b>      | Set to TRUE if the UE is currently pre-registered with CDMA2000 HRPD. Otherwise set to FALSE. This can be ignored by the eNB for CDMA2000 1xRTT.                                                                                                                                                                                                                                                                                                                                           |

| <b>MeasResults field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>qci-Id</i></b>                  | Indicates QCI value for which <i>excessDelay</i> is provided, according to TS 36.314 [71].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>resourceIndex</i></b>           | Indicates the available resource candidates within the [T1, T2] window as specified in TS 36.213 [23], clause 14.1.1.6. Value 1 indicates the resource candidate on the subframe indicated by <i>sl-SubframeRef</i> , from subchannel 0 to <i>sensingSubchannelNumber</i> -1. Value 2 indicates the resource candidate on the first subframe following the subframe indicated by <i>sl-SubframeRef</i> , from subchannel 0 to <i>sensingSubchannelNumber</i> -1 (Value 101 indicates the resource candidate on the subframe indicated by <i>sl-SubframeRef</i> , from subchannel 1 to <i>sensingSubchannelNumber</i> , if the <i>numSubchannel</i> of the resource pool is larger than <i>sensingSubchannelNumber</i> ) and so on. |
| <b><i>resultRS-IndexList</i></b>      | Beam level measurement results (indexes and optionally, beam measurements).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>routingAreaCode</i></b>         | The RAC identity read from broadcast information, as defined in TS 23.003 [27].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b><i>rssi</i></b>                    | GERAN Carrier RSSI. RXLEV is mapped to a value between 0 and 63, TS 45.008 [28]. When mapping the RXLEV value to the RSSI bit string, the first/leftmost bit of the bit string contains the most significant bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>rs-sinr-Result</i></b>          | Measured RS-SINR result of an E-UTRA or NR cell. The <i>rs-sinr-Result</i> is only reported if configured by the eNB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>rssiWLAN</i></b>                | Measured WLAN RSSI result in dBm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>sl-SubframeRef</i></b>          | Indicates the subframe corresponding to n+T1 used to obtain the sensing measurement results (see TS 36.213 [23]). Specifically, the value indicates the timing offset with respect to subframe#0 of DFN#0 in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>stationCountWLAN</i></b>        | Indicates the total number stations currently associated with this WLAN as defined in IEEE 802.11-2012 [67].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>ue-RxTxTimeDiffResult</i></b>   | UE Rx-Tx time difference measurement result of the PCell, provided by lower layers. If <i>ue-RxTxTimeDiffPeriodicalTDD-r13</i> is set to <i>TRUE</i> , the measurement mapping is according to EUTRAN TDD UE Rx-Tx time difference report mapping in TS 36.133 [16] and measurement result includes <i>NtAoffset</i> , else the measurement mapping is according to EUTRAN FDD UE Rx-Tx time difference report mapping in TS 36.133 [16].                                                                                                                                                                                                                                                                                          |
| <b><i>uncomBarPreMeasResult</i></b>   | This field provides barometric pressure measurements as <i>Sensor-MeasurementInformation</i> defined in TS 37.355 [109]. The first/leftmost bit of the first octet contains the most significant bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>utra-EcNo</i></b>               | According to CPICH_Ec/No in TS 25.133 [29] for FDD. Fourteen spare values. The field is not present for TDD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>utra-RSCP</i></b>               | According to CPICH_RSCP in TS 25.133 [29] for FDD and P-CCPCH_RSCP in TS 25.123 [30] for TDD. Thirty-one spare values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>wlan-Identifiers</i></b>        | Indicates the WLAN parameters used for identification of the WLAN for which the measurement results are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### – MeasResultCellSFTD

The IE *MeasResultCellSFTD* consists of SFN and radio frame boundary difference between the PCell and an NR cell as specified in TS 38.215 [89] and TS 38.133 [84].

#### MeasResultCellSFTD information element

-- ASN1START

```

MeasResultCellListSFTD-r15 ::= SEQUENCE (SIZE (1..maxCellsSFTD)) OF MeasResultCellsSFTD-r15
MeasResultCellsSFTD-r15 ::= SEQUENCE {
 physCellId-r15
 sfn-OffsetResult-r15
 frameBoundaryOffsetResult-r15
 rsrpResult-r15
}
} OPTIONAL
-- ASN1STOP

```

#### **MeasResultCellSFTD field descriptions**

##### **physCellId**

Indicates the physical layer identity (PCI) of an NR cell.

##### **sfn-OffsetResult**

Indicates the SFN difference between the PCell and the NR cell as an integer value according to TS 38.215 [89].

##### **frameBoundaryOffsetResult**

Indicates the frame boundary difference between the PCell and the NR cell as an integer value according to TS 38.215 [89].

##### **rsrpResult**

Measured RSRP result of an NR cell.

### **MeasResultSCG-FailureMRDC**

The IE *MeasResultSCG-FailureMRDC* is used to provide measurement information concerning E-UTRA measurements upon SCG failure detected by a UE configured with NE-DC.

#### **MeasResultSCG-FailureMRDC information element**

```

-- ASN1START
MeasResultSCG-FailureMRDC-r15 ::= SEQUENCE {
 measResultFreqListEUTRA-r15 MeasResultList3EUTRA-r15,
 ...
 [[locationInfo-r16 LocationInfo-r10
 logMeasResultListBT-r16 LogMeasResultListBT-r15
 logMeasResultListWLAN-r16 LogMeasResultListWLAN-r15
]]
}
MeasResultList3EUTRA-r15 ::= SEQUENCE (SIZE (1..maxFreq)) OF MeasResult3EUTRA-r15
MeasResult3EUTRA-r15 ::= SEQUENCE {
 carrierFreq-r15
 measResultServingCell-r15
 measResultNeighCellList-r15
 ...
}
-- ASN1STOP

```

### **MeasResultSSTD**

The IE *MeasResultSSTD* consists of SFN, radio frame and subframe boundary difference between the PCell and the PSCell as specified in TS 36.214 [48] and TS 36.133 [16].

#### **MeasResultSSTD information element**

```

-- ASN1START
MeasResultSSTD-r13 ::= SEQUENCE {
 sfn-OffsetResult-r13
 frameBoundaryOffsetResult-r13
 subframeBoundaryOffsetResult-r13
}
-- ASN1STOP

```

| <b>MeasResultSSTD field descriptions</b> |                                                                                                                                                   |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sfn-OffsetResult</b>                  | Indicates the SFN difference between the PCell and the PSCell as an integer value according to TS 36.214 [48].                                    |
| <b>frameBoundaryOffsetResult</b>         | Indicates the frame boundary difference between the PCell and the PSCell as an integer value according to TS 36.214 [48].                         |
| <b>subframeBoundaryOffsetResult</b>      | Indicates the subframe boundary difference between the PCell and the PSCell as an integer value according to the mapping table in TS 36.133 [16]. |

## – *MeasScaleFactor*

The IE *MeasScaleFactor* specifies the factor for scaling the measurement performance requirements in TS 36.133 [16].

### **MeasScaleFactor information element**

```
-- ASN1START
MeasScaleFactor-r12 ::= ENUMERATED {sf-EUTRA-cf1, sf-EUTRA-cf2}
-- ASN1STOP
```

NOTE: If the *reducedMeasPerformance* is not included in any *measObjectEUTRA* or *measObjectUTRA* and the *measScaleFactor* is included in the *measConfig*, E-UTRAN can configure any of the values for the *measScaleFactor* as specified in TS 36.133 [16].

## – *MeasSensing-Config*

The IE *MeasSensing-Config* specifies the input factors for sensing measurement as specified in TS 36.213 [23].

### **MeasSensing-Config information element**

```
-- ASN1START
MeasSensing-Config-r15 ::= SEQUENCE {
 sensingSubchannelNumber-r15 INTEGER (1..20),
 sensingPeriodicity-r15 ENUMERATED {ms20, ms50, ms100, ms200,
 ms300, ms400, ms500, ms600,
 ms700, ms800, ms900, ms1000},
 sensingReselectionCounter-r15 INTEGER (5..75),
 sensingPriority-r15 INTEGER (1..8)
}
-- ASN1STOP
```

| <b>MeasSensing-Config field descriptions</b> |                                                                                                                                               |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sensingReselectionCounter</b>             | Indicate the value of SL_RESOURCE_RESELECTION_COUNTER, which is used to derive $C_{resel}$ , as specified in TS 36.213 [23], clause 14.1.1.6. |
| <b>sensingSubchannelNumber</b>               | Indicate the number of sub-channels, i.e., parameter $L_{subCH}$ , as specified in TS 36.213 [23], clause 14.1.1.6.                           |
| <b>sensingPeriodicity</b>                    | Indicate the resource reservation interval, i.e., parameter $P_{rsvp\_TX}$ , as specified in TS 36.213 [23], clause 14.1.1.6.                 |
| <b>sensingPriority</b>                       | Indicate the priority, i.e., parameter $prio_{TX}$ as specified in TS 36.213 [23], clause 14.1.1.6.                                           |

## MTC-SSB-NR

The IE *MTC-SSB-NR* specifies the SS/PBCH block measurement timing configuration (SMTC) applicable for SSB based NR measurements i.e. the time occasions for performing these measurements, see 5.5.2.13.

### ***MTC-SSB-NR* information elements**

```
-- ASN1START

MTC-SSB-NR-r15 ::= SEQUENCE {
 periodicityAndOffset-r15 CHOICE {
 sf5-r15 INTEGER (0..4),
 sf10-r15 INTEGER (0..9),
 sf20-r15 INTEGER (0..19),
 sf40-r15 INTEGER (0..39),
 sf80-r15 INTEGER (0..79),
 sf160-r15 INTEGER (0..159)
 },
 ssb-Duration-r15 ENUMERATED {sf1, sf2, sf3, sf4, sf5 }
}

MTC-SSB2-LP-NR-r16 ::= SEQUENCE {
 pci-List-r16 SEQUENCE (SIZE (1..maxNrofPCI-PerSMTC-r16)) OF PhysCellIdNR-r15
 OPTIONAL, -- Need OR
 periodicity-r16 ENUMERATED {sf10, sf20, sf40, sf80, sf160, spare3, spare2, spare1}
}

-- ASN1STOP
```

### ***MTC-SSB-NR* field descriptions**

#### ***pci-List***

PCIs that are known to follow this SMTC.

## QuantityConfig

The IE *QuantityConfig* specifies the measurement quantities and layer 3 filtering coefficients for E-UTRA and inter-RAT measurements.

### ***QuantityConfig* information element**

```
-- ASN1START

QuantityConfig ::= SEQUENCE {
 quantityConfigEUTRA QuantityConfigEUTRA OPTIONAL, -- Need ON
 quantityConfigUTRA QuantityConfigUTRA OPTIONAL, -- Need ON
 quantityConfigGERAN QuantityConfigGERAN OPTIONAL, -- Need ON
 quantityConfigCDMA2000 QuantityConfigCDMA2000 OPTIONAL, -- Need ON
 ...
 [[quantityConfigUTRA-v1020 QuantityConfigUTRA-v1020 OPTIONAL -- Need ON
]],
 [[quantityConfigEUTRA-v1250 QuantityConfigEUTRA-v1250 OPTIONAL -- Need ON
]],
 [[quantityConfigEUTRA-v1310 QuantityConfigEUTRA-v1310 OPTIONAL, -- Need ON
 quantityConfigWLAN-r13 QuantityConfigWLAN-r13 OPTIONAL -- Need ON
]],
 [[quantityConfigNRList-r15 QuantityConfigNRList-r15 OPTIONAL -- Need ON
]]
```

```
}

QuantityConfigEUTRA ::= SEQUENCE {
 filterCoefficientRSRP FilterCoefficient DEFAULT fc4,
 filterCoefficientRSRQ FilterCoefficient DEFAULT fc4
}

QuantityConfigEUTRA-v1250 ::= SEQUENCE {
 filterCoefficientCSI-RSRP-r12 FilterCoefficient OPTIONAL -- Need
OR
}

QuantityConfigEUTRA-v1310 ::= SEQUENCE {

```

```

}

QuantityConfigUTRA ::= SEQUENCE {
 measQuantityUTRA-FDD ENUMERATED {cpich-RSCP, cpich-EcN0},
 measQuantityUTRA-TDD ENUMERATED {pccpch-RSCP},
 filterCoefficient FilterCoefficient DEFAULT fc4
}

QuantityConfigUTRA-v1020 ::= SEQUENCE {
 filterCoefficient2-FDD-r10 FilterCoefficient DEFAULT fc4
}

QuantityConfigGERAN ::= SEQUENCE {
 measQuantityGERAN ENUMERATED {rssい},
 filterCoefficient FilterCoefficient DEFAULT fc2
}

QuantityConfigCDMA2000 ::= SEQUENCE {
 measQuantityCDMA2000 ENUMERATED {pilotStrength, pilotPnPhaseAndPilotStrength}
}

QuantityConfigNRList-r15 ::= SEQUENCE (SIZE (1..maxQuantSetsNR-r15)) OF QuantityConfigNR-r15

QuantityConfigNR-r15 ::= SEQUENCE {
 measQuantityCellNR-r15 QuantityConfigRS-NR-r15,
 measQuantityRS-IndexNR-r15 QuantityConfigRS-NR-r15 OPTIONAL
}

QuantityConfigRS-NR-r15 ::= SEQUENCE {
 filterCoeff-RSRP-r15 FilterCoefficient DEFAULT fc4,
 filterCoeff-RSRQ-r15 FilterCoefficient DEFAULT fc4,
 filterCoefficient-SINR-r13 FilterCoefficient DEFAULT fc4
}

QuantityConfigWLAN-r13 ::= SEQUENCE {
 measQuantityWLAN-r13 ENUMERATED {rssいWLAN},
 filterCoefficient-r13 FilterCoefficient DEFAULT fc4
}

-- ASN1STOP

```

| <b>QuantityConfig field descriptions</b> |                                                                                                                                                                                                                        |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>filterCoefficient2-FDD</b>            | Specifies the filtering coefficient used for the UTRAN FDD measurement quantity, which is not included in <i>measQuantityUTRA-FDD</i> , when <i>reportQuantityUTRA-FDD</i> is present in <i>ReportConfigInterRAT</i> . |
| <b>filterCoefficientCSI-RSRP</b>         | Specifies the filtering coefficient used for CSI-RSRP.                                                                                                                                                                 |
| <b>filterCoefficientRSRP</b>             | Specifies the filtering coefficient used for RSRP.                                                                                                                                                                     |
| <b>filterCoefficientRSRQ</b>             | Specifies the filtering coefficient used for RSRQ.                                                                                                                                                                     |
| <b>filterCoefficientRS-SINR</b>          | Specifies the filtering coefficient used for RS-SINR.                                                                                                                                                                  |
| <b>measQuantityCDMA2000</b>              | Measurement quantity used for CDMA2000 measurements. <i>pilotPnPhaseAndPilotStrength</i> is only applicable for <i>MeasObjectCDMA2000</i> of <i>cdma2000-Type = type1XRTT</i> .                                        |
| <b>measQuantityRS-IndexNR</b>            | Specifies L3 filter configurations for measurement results of an NR RS index for a particular RS Type (e.g. SS/PBCH block) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).                     |
| <b>measQuantityGERAN</b>                 | Measurement quantity used for GERAN measurements.                                                                                                                                                                      |
| <b>measQuantityCell/NR</b>               | Specifies L3 filter configurations for measurement results of an NR cell for a particular RS Type (e.g. SS/PBCH block) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).                         |
| <b>measQuantityUTRA</b>                  | Measurement quantity used for UTRA measurements.                                                                                                                                                                       |
| <b>measQuantityWLAN</b>                  | Measurement quantity used for WLAN measurements.                                                                                                                                                                       |
| <b>quantityConfigCDMA2000</b>            | Specifies quantity configurations for CDMA2000 measurements.                                                                                                                                                           |
| <b>quantityConfigEUTRA</b>               | Specifies filter configurations for E-UTRA measurements.                                                                                                                                                               |
| <b>quantityConfigGERAN</b>               | Specifies quantity and filter configurations for GERAN measurements.                                                                                                                                                   |
| <b>quantityConfigUTRA</b>                | Specifies quantity and filter configurations for UTRA measurements. Field <i>quantityConfigUTRA-v1020</i> is applicable only when <i>reportQuantityUTRA-FDD</i> is configured.                                         |
| <b>quantityConfigWLAN</b>                | Specifies quantity and filter configurations for WLAN measurements.                                                                                                                                                    |

### – *ReferenceLocation*

The IE *ReferenceLocation* contains location information used as a reference location. The value of the field is same as *Ellipsoid-Point* defined in TS 37.355 [109]. The first/leftmost bit of the first octet contains the most significant bit.

#### **ReferenceLocation** information element

```
-- ASN1START
ReferenceLocation-r18 ::= OCTET STRING
-- ASN1STOP
```

### – *ReportConfigEUTRA*

The IE *ReportConfigEUTRA* specifies criteria for triggering of an E-UTRA measurement reporting or conditional reconfiguration (i.e. conditional handover) event. The E-UTRA measurement reporting events concerning CRS are labelled AN with N equal to 1, 2 and so on.

- Event A1: Serving becomes better than absolute threshold;
- Event A2: Serving becomes worse than absolute threshold;
- Event A3: Neighbour becomes amount of offset better than PCell/ PSCell;
- Event A4: Neighbour becomes better than absolute threshold;
- Event A5: PCell/ PSCell becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2;
- Event A6: Neighbour becomes amount of offset better than SCell;
- Event D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* becomes shorter than configured threshold *distanceThreshFromReference2*;
- Event D2: Distance between UE and a moving reference location based on *movingReferenceLocation* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location based on *referenceLocation2* becomes shorter than configured threshold *distanceThreshFromReference2*.

The E-UTRA measurement reporting events concerning CRS for conditional reconfigurations are labelled AN with *N* equal to 3, 4 or 5. The E-UTRA measurement reporting event concerning distance(s) between UE and reference location(s) for conditional reconfiguration is labelled CondEvent D1 or CondEvent D2. The E-UTRA measurement reporting event concerning measured time for conditional reconfiguration is labelled with CondEvent T1.

- CondEvent A3: Conditional reconfiguration candidate becomes amount of offset better than PCell;
- CondEvent A4: Conditional reconfiguration candidate becomes better than absolute threshold;
- CondEvent A5: PCell becomes worse than absolute threshold1 AND conditional reconfiguration candidate becomes better than another absolute threshold2;
- CondEvent D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* of conditional reconfiguration candidate becomes shorter than configured threshold *distanceThreshFromReference2*;
- CondEvent D2: Distance between UE and a moving reference location based on *movingReferenceLocation* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location based on *referenceLocation2* of conditional reconfiguration candidate becomes shorter than configured threshold *distanceThreshFromReference2*;
- CondEvent T1: Time measured at UE becomes more than configured threshold *t1-Threshold* but is less than *t1-Threshold + duration*;

The E-UTRA measurement reporting events concerning CSI-RS are labelled CN with *N* equal to 1 and 2.

- Event C1: CSI-RS resource becomes better than absolute threshold;
- Event C2: CSI-RS resource becomes amount of offset better than reference CSI-RS resource.

The E-UTRA measurement reporting events concerning CBR are labelled VN with *N* equal to 1 and 2.

- Event V1: CBR becomes larger than absolute threshold;
- Event V2: CBR becomes smaller than absolute threshold.

The E-UTRA reporting events concerning Aerial UE height are labelled HN with *N* equal to 1 and 2.

Event H1: Aerial UE height becomes higher than absolute threshold;

Event H2: Aerial UE height becomes lower than absolute threshold.

```

| <i>ReportConfigEUTRA</i> field descriptions | |
|--|---|
| <i>a3-Offset/ a6-Offset/ c2-Offset</i> | Offset value to be used in EUTRA measurement report triggering condition for event a3/ a6/ c2, or to be used in conditional reconfiguration trigger condition for cond event a3. The actual value is field value * 0.5 dB. |
| <i>a5-Threshold1/ a5-Threshold2</i> | Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) to be used in conditional reconfiguration trigger condition for cond event a5. In the same <i>condEventA5</i> , the network configures the same quantity for the <i>TriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> . |
| <i>alternativeTimeToTrigger</i> | Indicates the time to trigger applicable for cells specified in <i>altTTT-CellsToAddModList</i> of the associated measurement object, if configured |
| <i>aN-ThresholdM/ cN-ThresholdM</i> | Threshold to be used in EUTRA measurement report triggering condition for event number aN/ cN. If multiple thresholds are defined for event number aN/ cN, the thresholds are differentiated by M. E-UTRAN configures <i>aN-Threshold1</i> only for events A1, A2, A4, A5 and <i>a5-Threshold2</i> only for event A5. |
| <i>c1-ReportOnLeave/ c2-ReportOnLeave</i> | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a CSI-RS resource in <i>csi-RS-TriggeredList</i> , as specified in 5.5.4.1. |
| <i>c2-RefCSI-RS</i> | Identity of the CSI-RS resource from the <i>measCSI-RS-ToAddModList</i> of the associated <i>measObject</i> , to be used as the reference CSI-RS resource in EUTRA measurement report triggering condition for event c2. |
| <i>channelOccupancyThreshold</i> | RSSI threshold which is used for channel occupancy evaluation. |
| <i>coarseLocationReq</i> | If this field is set to <i>true</i> , the UE shall report coarse location information if available. |
| <i>condEventId</i> | Choice of conditional reconfiguration event triggered criteria. |
| <i>condReconfigurationTriggerEUTRA</i> | Event configured for conditional reconfiguration. If this field is configured, the UE shall ignore the configuration of <i>triggerType</i> , <i>reportQuantity</i> , <i>maxReportCells</i> , <i>reportInterval</i> , and <i>reportAmount</i> . |
| <i>distanceThreshFromReference1, distanceThreshFromReference2</i> | Distance from a fixed reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> in <i>eventD1</i> or <i>condEventD1</i> , or distance from a moving reference location determined based on <i>movingReferenceLocation</i> broadcast in <i>SystemInformationBlockType31</i> or <i>referenceLocation2</i> in <i>eventD2</i> or <i>condEventD2</i> . Each step represents 50m. |
| <i>duration</i> | This field is used for defining the leaving condition T1-2 for conditional HO event <i>condEventT1</i> . Each step represents 100ms. |
| <i>eventId</i> | Choice of E-UTRA event triggered reporting criteria. EUTRAN may set this field to <i>eventC1</i> or <i>eventC2</i> only if <i>measDS-Config</i> is configured in the associated <i>measObject</i> with one or more CSI-RS resources. The <i>eventC1</i> and <i>eventC2</i> are not applicable for the <i>eventId</i> if RS-SINR is configured as <i>triggerQuantity</i> or <i>reportQuantity</i> . |
| <i>h1-Hysteresis, h2-Hysteresis</i> | This parameter is used within the entry and leave condition of an event triggered reporting condition for event H1 and event H2. The actual value is field value. If this field is configured UE shall ignore parameter <i>hysteresis</i> . |
| <i>h1-ThresholdOffset, h2-ThresholdOffset</i> | An offset value to <i>heightThreshRef</i> to obtain the threshold to be used in EUTRA height report triggering condition for event H1 and event H2. The value for h1-ThresholdOffset and h2-ThresholdOffset is expressed in meters such that granularity is 2meters. Value 0 corresponds to offset value 0m, value 1 corresponds to offset value 2m, value 2 correspond to offset value 4m, and so on. |
| <i>includeMultiBandInfo</i> | If this field is present, the UE shall acquire and include multi band information in the measurement report. |
| <i>maxReportCells</i> | Max number of cells, excluding the serving cell, to include in the measurement report concerning CRS, and max number of CSI-RS resources to include in the measurement report concerning CSI-RS. |
| <i>measRSSI-ReportConfig</i> | If this field is present, the UE shall perform measurement reporting for RSSI and channel occupancy and ignore the <i>triggerQuantity</i> , <i>reportQuantity</i> and <i>maxReportCells</i> fields. E-UTRAN sets this field to <i>true</i> only when setting <i>triggerType</i> to <i>periodical</i> and <i>purpose</i> to <i>reportStrongestCells</i> . |
| <i>numberOfTriggeringCells</i> | Indicates the number of cells detected that are required to fulfill an event for a measurement report to be triggered. This field is set only for the events concerning neighbor cells, i.e. <i>eventA3</i> , <i>eventA4</i> , <i>eventA5</i> . |
| <i>referenceLocation1, referenceLocation2</i> | For <i>eventD1</i> or <i>condEventD1</i> , the <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to candidate target cell. For <i>eventD2</i> , the <i>referenceLocation2</i> is associated to neighbour cell. For <i>condEventD2</i> , the <i>referenceLocation2</i> is associated to candidate target cell. |

| ReportConfigEUTRA field descriptions | |
|---|---|
| reportAmount | Number of measurement reports applicable for <i>triggerType event</i> as well as for <i>triggerType periodical</i> . In case <i>purpose</i> is set to <i>reportCGI</i> or <i>reportSSTD-Meas</i> is set to <i>true</i> , only value 1 applies. |
| reportCRS-Meas | If this field is set to <i>TRUE</i> the UE shall include rsrp, rsrq together with csi-rsrp in the measurement report, if possible. |
| reportOnLeave/ a6-ReportOnLeave/ a4-a5-ReportOnLeave | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in <i>cellsTriggeredList</i> , as specified in 5.5.4.1. |
| reportQuantity | The quantities to be included in the measurement report. The value both means that both the rsrp and rsrq quantities are to be included in the measurement report. The value <i>rsrpANDsinr</i> and <i>rsrqANDsinr</i> mean that both <i>rsrp</i> and <i>rs-sinr</i> quantities, and both <i>rsrq</i> and <i>rs-sinr</i> quantities are to be included respectively in the measurement report. The value <i>all</i> means that <i>rsrp</i> , <i>rsrq</i> and <i>rs-sinr</i> are to be included in the measurement report. In case <i>triggerQuantityCSI-RS</i> is set to <i>TRUE</i> , only value <i>sameAsTriggerQuantity</i> applies. If <i>reportQuantity-v1310</i> is configured, the UE only considers this extension (and ignores <i>reportQuantity</i> i.e. without suffix). |
| reportSSTD-Meas | If this field is set to <i>true</i> , the UE shall measure SSTD between the PCell and the PSCell as specified in TS 36.214 [48] and ignore the <i>triggerQuantity</i> , <i>reportQuantity</i> and <i>maxReportCells</i> fields. E-UTRAN sets this field to <i>true</i> only when setting <i>triggerType</i> to <i>periodical</i> and <i>purpose</i> to <i>reportStrongestCells</i> . |
| reportStrongestCSI-RS | Indicates that periodical CSI-RS measurement report is performed. EUTRAN configures value <i>TRUE</i> only if <i>measDS-Config</i> is configured in the associated <i>measObject</i> with one or more CSI-RS resources. |
| si-RequestForHO | The field applies to the <i>reportCGI</i> functionality, and when the field is included, the UE is allowed to use autonomous gaps in acquiring system information from the neighbour cell, applies a different value for T321, and includes different fields in the measurement report. |
| ThresholdEUTRA | For RSRP: RSRP based threshold for event evaluation. The actual value is field value – 140 dBm.
For RSRQ: RSRQ based threshold for event evaluation. The actual value is (field value – 40)/2 dB.
For RS-SINR: RS-SINR based threshold for event evaluation. The actual value is (field value -46)/2 dB.
For CSI-RSRP: CSI-RSRP based threshold for event evaluation. The actual value is field value – 140 dBm.
EUTRAN configures the same threshold quantity for all the thresholds of an event. |
| timeToTrigger | Time during which specific criteria for the event needs to be met in order to trigger a measurement report, or to execute the conditional reconfiguration evaluation. |
| triggerQuantity | The quantity used to evaluate the triggering condition for the event concerning CRS. EUTRAN sets the value according to the quantity of the <i>ThresholdEUTRA</i> for this event. The values <i>rsrp</i> , <i>rsrq</i> and <i>sinr</i> correspond to Reference Signal Received Power (RSRP), Reference Signal Received Quality (RSRQ) and Reference Signal Signal to Noise and Interference Ratio (RS-SINR), see TS 36.214 [48]. If <i>triggerQuantity-v1310</i> is configured, the UE only considers this extension (and ignores <i>triggerQuantity</i> i.e. without suffix). |
| triggerQuantityCSI-RS | The quantity used to evaluate the triggering condition for the event concerning CSI-RS. The value <i>TRUE</i> corresponds to CSI Reference Signal Received Power (CSI-RSRP), see TS 36.214 [48]. E-UTRAN configures value <i>TRUE</i> if and only if the measurement reporting event concerns CSI-RS. |
| ue-RxTxTimeDiffPeriodical | If this field is present, the UE shall perform UE Rx-Tx time difference measurement reporting and ignore the fields <i>triggerQuantity</i> , <i>reportQuantity</i> and <i>maxReportCells</i> . If the field is present, the only applicable values for the corresponding <i>triggerType</i> and <i>purpose</i> are <i>periodical</i> and <i>reportStrongestCells</i> respectively. |
| ue-RxTxTimeDiffPeriodicalTDD | If this field is set to <i>TRUE</i> , the UE shall perform UE Rx-Tx time difference measurement reporting according to EUTRAN TDD UE Rx-Tx time difference report mapping in TS 36.133 [16]. If the field is configured, the <i>ue-RxTxTimeDiffPeriodical</i> shall be configured. The field is applicable for TDD only. |
| useAllowedCellList | Indicates whether only the cells included in the list of allow-listed cells of the associated <i>measObject</i> are applicable as specified in 5.5.4.1. E-UTRAN does not configure the field for events A1, A2, C1 and C2. |
| usePSCell | If this field is set to <i>TRUE</i> the UE shall use the PSCell instead of the PCell. E-UTRAN configures value <i>TRUE</i> only for events A3 and A5, see 5.5.4.4 and 5.5.4.6. |
| useT312 | If value <i>TRUE</i> is configured, the UE shall use the timer T312 with the value <i>t312</i> as specified in the corresponding <i>measObject</i> . If the corresponding <i>measObject</i> does not include the timer T312 then the timer T312 is considered as not configured. E-UTRAN configures value <i>TRUE</i> only if <i>triggerType</i> is set to <i>event</i> . |

| <i>ReportConfigEUTRA</i> field descriptions | |
|--|---|
| <i>ul-DelayConfig</i> | If the field is present, E-UTRAN configures UL PDCP Packet Delay per QCI measurement and the UE shall ignore the fields <i>triggerQuantity</i> and <i>maxReportCells</i> . The applicable values for the corresponding <i>triggerType</i> and <i>reportInterval</i> are <i>periodical</i> and (one of the) ms1024, ms2048, ms5120 or ms10240 respectively. The <i>reportInterval</i> indicates the periodicity for performing and reporting of UL PDCP Delay per QCI measurement as specified in TS 36.314 [71]. |
| <i>ul-DelayValueConfig</i> | If the field is present, the UE shall perform the UL PDCP Packet Delay measurement per DRB as specified in TS 38.314 [103] and the UE shall ignore the fields <i>reportQuantityCell</i> and <i>maxReportCells</i> . The applicable values for the corresponding <i>reportInterval</i> are (one of the) { ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, min1, min6, min12, min30, min60}. The <i>reportInterval</i> indicates the periodicity for performing and reporting of UL PDCP Packet Delay per DRB measurement as specified in TS 38.314 [103]. |

| Conditional presence | Explanation |
|----------------------|---|
| <i>reportCGI</i> | The field is optional, need OR, in case <i>purpose</i> is included and set to <i>reportCGI</i> ; otherwise the field is not present and the UE shall delete any existing value for this field. |
| <i>a3a4a5</i> | This field is optional, need OR, in case <i>eventId</i> is set to eventA3 or eventA4 or eventA5; otherwise, this field is not present and the UE shall delete any existing value of this field. |
| <i>a4a5</i> | This field is optional, need OR, in case <i>eventId</i> is set to eventA4 or eventA5; otherwise, this field is not present and the UE shall delete any existing value of this field. |

— *ReportConfigId*

The IE *ReportConfigId* is used to identify a measurement reporting configuration.

ReportConfigId information element

```
-- ASN1START
ReportConfigId ::= INTEGER (1..maxReportConfigId)
-- ASN1STOP
```

— *ReportConfigInterRAT*

The IE *ReportConfigInterRAT* specifies criteria for triggering of an inter-RAT measurement reporting event or of a CPA or MN initiated inter-SN CPC event. The inter-RAT measurement reporting events for NR, UTRAN, GERAN and CDMA2000 are labelled BN with N equal to 1, 2 and so on. The inter-RAT measurement reporting events for WLAN are labelled WN with N equal to 1, 2 and so on.

- Event B1: Neighbour becomes better than absolute threshold;
- Event B2: PCell becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2.
- Event W1: WLAN becomes better than a threshold;
- Event W2: All WLAN inside WLAN mobility set become worse than a threshold1 and a WLAN outside WLAN mobility set becomes better than a threshold2;
- Event W3: All WLAN inside WLAN mobility set become worse than a threshold.

CondEvent B1: Conditional reconfiguration candidate becomes better than absolute threshold.

The b1 and b2 event thresholds for CDMA2000 are the CDMA2000 pilot detection thresholds are expressed as an unsigned binary number equal to $[-2 \times 10 \log 10 E_c/I_o]$ in units of 0.5dB, see C.S0005 [25] for details.

| ReportConfigInterRAT field descriptions | |
|--|---|
| availableAdmissionCapacityRequestWLAN | The value true indicates that the UE shall include, if available, WLAN Available Admission Capacity in measurement reports. |
| backhaulDL-BandwidthRequestWLAN | The value true indicates that the UE shall include, if available, WLAN Backhaul Downlink Bandwidth in measurement reports. |
| backhaulUL-BandwidthRequestWLAN | The value true indicates that the UE shall include, if available, WLAN Backhaul Uplink Bandwidth in measurement reports. |
| bandRequestWLAN | The value true indicates that the UE shall include WLAN band in measurement reports. |
| bN-ThresholdM | Threshold to be used in inter RAT measurement report triggering condition for event number bN. If multiple thresholds are defined for event number bN, the thresholds are differentiated by M. |
| carrierInfoRequestWLAN | The value true indicates that the UE shall include, if available, WLAN Carrier Information in measurement reports. |
| channelUtilizationRequest-WLAN | The value true indicates that the UE shall include, if available, WLAN Channel Utilization in measurement reports. |
| condReconfigurationTriggerNR | The conditional reconfiguration trigger event that is used for CPA or MN initiated inter-SN CPC. If this field is configured, the UE shall ignore the configuration of <i>triggerType</i> , <i>maxReportCells</i> , <i>reportInterval</i> , and <i>reportAmount</i> . |
| condEventId | Choice of conditional reconfiguration event triggered criteria. |
| eventId | Choice of inter-RAT event triggered reporting criteria. |
| maxReportCells | Max number of cells, excluding the serving cell, to include in the measurement report. In case <i>purpose</i> is set to <i>reportStrongestCellsForSON</i> only value 1 applies. For inter-RAT WLAN, it is the maximum number of WLANs to include in the measurement report. |
| maxReportRS-Index | Max number of RS indices to include in the measurement report. E-UTRAN configures value 0 only if it sets <i>reportRS-IndexResultsNR</i> to <i>FALSE</i> . |
| measRSSI-ReportConfigNR | If this field is present, the UE shall perform measurement reporting for RSSI and channel occupancy and ignore the <i>triggerQuantity</i> , <i>reportQuantity</i> and <i>maxReportCells</i> fields. E-UTRAN sets this field to <i>true</i> only when setting <i>triggerType</i> to <i>periodical</i> and <i>purpose</i> to <i>reportStrongestCells</i> . |
| Purpose | <i>reportStrongestCellsForSON</i> applies only in case <i>reportConfig</i> is linked to a <i>measObject</i> set to <i>measObjectUTRA</i> or <i>measObjectCDMA2000</i> . |
| reportAmount | Number of measurement reports applicable for <i>triggerType event</i> as well as for <i>triggerType periodical</i> . In case <i>purpose</i> is set to <i>reportCGI</i> or <i>reportStrongestCellsForSON</i> only value 1 applies. In case <i>reportSFTD-Meas</i> is configured, only value 1 applies. |
| reportAnyWLAN | Indicates UE to report any WLAN AP meeting the triggering requirements, even if it is not included in the corresponding <i>MeasObjectWLAN</i> . |
| reportOnLeave | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in <i>cellsTriggeredList</i> , as specified in 5.5.4.1. |
| reportQuantityUTRA-FDD | The quantities to be included in the UTRA measurement report. The value <i>both</i> means that both the cpich RSCP and cpich EcNo quantities are to be included in the measurement report. |
| reportRS-IndexResultsNR | Indicates whether or not the UE shall report beam measurement result of NR in the measurement report. |
| reportSFTD-Meas | If this field is set to <i>pSCell</i> , the UE shall measure SFTD between the PCell and the PSCell as specified in TS 38.215 [89], in this case, the frequency of PSCell is configured in the corresponding <i>measObjectNR</i> . If the field is set to <i>neighborCells</i> , the UE shall measure SFTD between the PCell and the NR cells included in <i>cellsForWhichToReportSFTD</i> (if configured in the corresponding <i>measObjectNR</i>) or between the PCell and up to 3 strongest detected NR cells (if <i>cellsForWhichToReportSFTD</i> is not configured in the corresponding <i>measObjectNR</i>), as specified in TS 38.215 [89]. E-UTRAN only includes this field when setting <i>triggerType</i> to <i>periodical</i> and <i>purpose</i> to <i>reportStrongestCells</i> . If included, the UE shall ignore the <i>maxReportCells</i> field. |

| <i>ReportConfigInterRAT</i> field descriptions | |
|--|--|
| <i>availableAdmissionCapacityRequestWLAN</i> | |
| The value true indicates that the UE shall include, if available, WLAN Available Admission Capacity in measurement reports. | |
| <i>backhaulDL-BandwidthRequestWLAN</i> | |
| The value true indicates that the UE shall include, if available, WLAN Backhaul Downlink Bandwidth in measurement reports. | |
| <i>backhaulUL-BandwidthRequestWLAN</i> | |
| The value true indicates that the UE shall include, if available, WLAN Backhaul Uplink Bandwidth in measurement reports. | |
| <i>bandRequestWLAN</i> | |
| The value true indicates that the UE shall include WLAN band in measurement reports. | |
| <i>si-RequestForHO</i> | |
| The field applies to the <i>reportCGI</i> functionality, and when the field is included, the UE is allowed to use autonomous gaps in acquiring system information from the neighbour cell, applies a different value for T321, and includes different fields in the measurement report. EUTRAN does not configure the field if <i>reportConfig</i> is linked to a <i>measObject</i> set to <i>measObjectNR</i> . | |
| <i>ss-rsrp</i> | |
| Indicates whether or not the UE shall report SS-RSRP quantity of NR. | |
| <i>ss-rsrq</i> | |
| Indicates whether or not the UE shall report SS-RSRQ quantity of NR. | |
| <i>ss-sinr</i> | |
| Indicates whether or not the UE shall report SS-SINR quantity of NR. | |
| <i>stationCountRequestWLAN</i> | |
| The value true indicates that the UE shall include, if available, WLAN Station Count in measurement reports. | |
| <i>b1-ThresholdGERAN, b2-Threshold2GERAN</i> | |
| The actual value is field value – 110 dBm. | |
| <i>b1-ThresholdUTRA, b2-Threshold2UTRA</i> | |
| utra-RSCP corresponds to CPICH_RSCP in TS 25.133 [29] for FDD and P-CCPCH_RSCP in TS 25.123 [30] for TDD. utra-EcNo corresponds to CPICH_Ec/No in TS 25.133 [29] for FDD, and is not applicable for TDD. For <i>utra-RSCP</i> : The actual value is field value – 115 dBm. For <i>utra-EcNo</i> : The actual value is (field value – 49)/2 dB. | |
| <i>timeToTrigger</i> | |
| Time during which specific criteria for the event needs to be met in order to trigger a measurement report or to execute the conditional reconfiguration evaluation. | |
| <i>triggerType</i> | |
| E-UTRAN does not configure the value <i>periodical</i> in case <i>reportConfig</i> is linked to a <i>measObject</i> set to <i>measObjectWLAN</i> . | |
| <i>useAutonomousGapsNR</i> | |
| The field applies to the <i>reportCGI</i> functionality, and when the field is included, the UE is allowed to use autonomous gaps in acquiring system information from the NR neighbour cell, applies the corresponding value for T321, EUTRAN can configure the field only if <i>reportConfig</i> is linked to a <i>measObject</i> set to <i>measObjectNR</i> . | |

| Conditional presence | Explanation |
|-----------------------------|--|
| <i>reportCGI</i> | The field is optional, need OR, in case <i>purpose</i> is included and set to <i>reportCGI</i> ; otherwise the field is not present and the UE shall delete any existing value for this field. |
| <i>reportCGI-NR</i> | The field is optional, need OR, in case <i>purpose</i> is included and set to <i>reportCGI</i> , and <i>reportConfig</i> is linked to a <i>measObject</i> set to <i>measObjectNR</i> , otherwise the field is not present and the UE shall delete any existing value for this field. |

– *ReportConfigToAddModList*

The IE *ReportConfigToAddModList* concerns a list of reporting configurations to add or modify

***ReportConfigToAddModList* information element**

```
-- ASN1START
ReportConfigToAddModList ::= SEQUENCE (SIZE (1..maxReportConfigId)) OF ReportConfigToAddMod
ReportConfigToAddMod ::= SEQUENCE {
    reportConfigId           ReportConfigId,
    reportConfig              CHOICE {
        reportConfigEUTRA      ReportConfigEUTRA,
        reportConfigInterRAT    ReportConfigInterRAT
    }
}
```

```
}
```

-- ASN1STOP

ReportInterval

The *ReportInterval* indicates the interval between periodical reports. The *ReportInterval* is applicable if the UE performs periodical reporting (i.e. when *reportAmount* exceeds 1), for *triggerType event* as well as for *triggerType periodical*. Value ms120 corresponds with 120 ms, ms240 corresponds with 240 ms and so on, while value min1 corresponds with 1 min, min6 corresponds with 6 min and so on.

ReportInterval information element

```
-- ASN1START
```

```
ReportInterval ::= ENUMERATED {
    ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240,
    min1, min6, min12, min30, min60, spare3, spare2, spare1}
```

-- ASN1STOP

RS-IndexNR

The IE *RS-IndexNR* is used to identify an NR Reference Signal.

RS-IndexNR information element

```
-- ASN1START
```

```
RS-IndexNR-r15 ::= INTEGER (0.. maxRS-Index-1-r15)
```

-- ASN1STOP

RSRP-Range

The IE *RSRP-Range* specifies the value range used in RSRP measurements and thresholds. Integer value for RSRP measurements according to mapping table in TS 36.133 [16]. A given field using *RSRP-Range-v1360* shall only be signalled if the corresponding original field (using *RSRP-Range* i.e. without suffix) is set to value 0.

RSRP-Range information element

```
-- ASN1START
```

```
RSRP-Range ::= INTEGER(0..97)
```

```
RSRP-Range-v1360 ::= INTEGER(-17..-1)
```

```
RSRP-RangeSL-r12 ::= INTEGER(0..13)
```

```
RSRP-RangeSL2-r12 ::= INTEGER(0..7)
```

```
RSRP-RangeSL3-r12 ::= INTEGER(0..11)
```

```
RSRP-RangeSL4-r13 ::= INTEGER(0..49)
```

-- ASN1STOP

| <i>RSRP-Range field descriptions</i> |
|--|
| <i>RSRP-Range</i> |
| For UE supporting CE Mode B, when CE mode B is not restricted by upper layers, <i>RSRP-Range-v1360</i> (i.e., with suffix) is reported if the measured RSRP is less than -140 dBm. |
| <i>RSRP-RangeSL</i> |
| Value 0 corresponds to -infinity, value 1 to -115dBm, value 2 to -110dBm, and so on (i.e. in steps of 5dBm) until value 12, which corresponds to -60dBm, while value 13 corresponds to +infinity. |
| <i>RSRP-RangeSL2</i> |
| Value 0 corresponds to -infinity, value 1 to -110dBm, value 2 to -100dBm, and so on (i.e. in steps of 10dBm) until value 6, which corresponds to -60dBm, while value 7 corresponds to +infinity. |
| <i>RSRP-RangeSL3</i> |
| Value 0 corresponds to -110dBm, value 1 to -105dBm, value 2 to -100dBm, and so on (i.e. in steps of 5dBm) until value 10, which corresponds to -60dBm, while value 11 corresponds to +infinity. |
| <i>RSRP-RangeSL4</i> |
| Indicates the range for SD-RSRP. Value 0 corresponds to -130dBm, value 1 to -128dBm, value 2 to -126dBm, and so on (i.e. in steps of 2dBm) until value 48, which corresponds to -34dBm, while value 49 corresponds to +infinity. |

— ***RSRP-RangeNR***

The IE *RSRP-RangeNR* specifies the value range used in RSRP measurements and thresholds. For RSRP measurements, integer value is according to mapping table in TS 38.133 [84]. For thresholds, the actual value is (field value – 156) dBm, except for field value 127, in which case the actual value is infinity.

RSRP-RangeNR information element

```
-- ASN1START
RSRP-RangeNR-r15 ::= INTEGER (0..127)
-- ASN1STOP
```

— ***RSRQ-Range***

The IE *RSRQ-Range* specifies the value range used in RSRQ measurements and thresholds. Integer value for RSRQ measurements is according to mapping table in TS 36.133 [16]. A given field using *RSRQ-Range-v1250* shall only be signalled if the corresponding original field (using *RSRQ-Range* i.e. without suffix) is set to value 0 or 34. Only a UE indicating support of *extendedRSRQ-LowerRange-r12* or *rsrq-OnAllSymbols-r12* may report *RSRQ-Range-v1250*, and this may be done without explicit configuration from the E-UTRAN. If received, the UE shall use the value indicated by the *RSRQ-Range-v1250* and ignore the value signalled by *RSRQ-Range* (without the suffix). *RSRQ-Range-r13* covers the original range and extended *RSRQ-Range-v1250*. *RSRQ-Range-r13* may be signalled without the corresponding original field and without any requirements for indicated support of *extendedRSRQ-LowerRange-r12* or *rsrq-OnAllSymbols-r12*.

RSRQ-Range information element

```
-- ASN1START
RSRQ-Range ::= INTEGER(0..34)
RSRQ-Range-v1250 ::= INTEGER(-30..46)
RSRQ-Range-r13 ::= INTEGER(-30..46)
-- ASN1STOP
```

— ***RSRQ-RangeNR***

The IE *RSRQ-RangeNR* specifies the value range used in RSRQ measurements and thresholds. For RSRQ measurements, integer value is according to mapping table in TS 38.133 [84]. For thresholds, the actual value is (field value – 87) / 2 dB.

***RSRQ-RangeNR* information element**

```
-- ASN1START
RSRQ-RangeNR-r15 ::= INTEGER (0..127)
-- ASN1STOP
```

RSRQ-Type

The IE *RSRQ-Type* specifies the RSRQ value type used in RSRQ measurements, see TS 36.214 [48].

***RSRQ-Type* information element**

```
-- ASN1START
RSRQ-Type-r12 ::= SEQUENCE {
    allSymbols-r12      BOOLEAN,
    wideBand-r12        BOOLEAN
}
-- ASN1STOP
```

***RSRQ-Type* field descriptions**

allSymbols

Value TRUE indicates use of all OFDM symbols when performing RSRQ measurements.

wideBand

Value TRUE indicates use of a wider bandwidth when performing RSRQ measurements.

RS-SINR-Range

The IE *RS-SINR-Range* specifies the value range used in RS-SINR measurements and thresholds. Integer value for RS-SINR measurements is according to mapping table in TS 36.133 [16].

***RS-SINR-Range* information element**

```
-- ASN1START
RS-SINR-Range-r13 ::= INTEGER(0..127)
-- ASN1STOP
```

RS-SINR-RangeNR

The IE *RS-SINR-RangeNR* specifies the value range used in RS-SINR measurements and thresholds. For RS-SINR measurements, integer value is according to mapping table in TS 38.133 [84]. For thresholds, the actual value is (field value – 46) / 2 dB.

***RS-SINR-RangeNR* information element**

```
-- ASN1START
RS-SINR-RangeNR-r15 ::= INTEGER (0..127)
-- ASN1STOP
```

RSSI-Range-r13

The IE *RSSI-Range* specifies the value range used in RSSI measurements and thresholds. Integer value for RSSI measurements is according to mapping table in TS 36.133 [16].

RSSI-Range information element

```
-- ASN1START
RSSI-Range-r13 ::= INTEGER(0..76)
-- ASN1STOP
```

– SS-RSSI-Measurement

The IE *SS-RSSI-Measurement* specifies the configuration of NR SSB based RSSI measurements.

SS-RSSI-Measurement information element

```
-- ASN1START
SS-RSSI-Measurement-r15 ::= SEQUENCE {
    measurementSlots-r15      BIT STRING (SIZE(1..80)),
    endSymbol-r15              INTEGER(0..3)
}
-- ASN1STOP
```

SS-RSSI-Measurement field descriptions

endSymbol

Within a slot that is configured for RSSI measurements (see *measurementSlots*) the UE measures the RSSI from symbol 0 to symbol *endSymbol*. This field identifies the entry in Table 5.1.33-1 in TS 36.214 which determines the actual end symbol.

measurementSlots

Indicates the slots in which the UE can perform NR RSSI measurements. The length of the *BIT STRING* is equal to the number of slots in the configured SMTC window (determined by the *ssb-duration* and by the *subcarrierSpacingSSB*). The first (left-most / most significant) bit in the bitmap corresponds to the first slot in the SMTC window, the second bit in the bitmap corresponds to the second slot in the SMTC window, and so on. The UE measures in slots for which the corresponding bit in the bitmap is set to 1.

– SSB-PositionQCL-RelationNR

The IE *SSB-PositionQCL-RelationNR* is used to indicate the QCL relationship between SSB positions on the indicated frequency or cell (see TS 38.213 [88], clause 4.1) for NR operation with shared spectrum channel access. Value n1 corresponds to 1, value n2 corresponds to 2 and so on.

SSB-PositionQCL-RelationNR information element

```
-- ASN1START
SSB-PositionQCL-RelationNR-r16 ::= ENUMERATED {n1, n2, n4, n8}
SSB-PositionQCL-RelationNR-r17 ::= ENUMERATED {n32, n64}
-- ASN1STOP
```

– SSB-ToMeasure

The IE *SSB-ToMeasure* is used to configure a pattern of SSBs. For operation with shared spectrum channel access, only *mediumBitmap* is used.

SSB-ToMeasure information element

```
-- ASN1START
```

```

SSB-ToMeasure-r15 ::= CHOICE {
    shortBitmap-r15      BIT STRING (SIZE (4)),
    mediumBitmap-r15     BIT STRING (SIZE (8)),
    longBitmap-r15       BIT STRING (SIZE (64))
}

-- ASN1STOP

```

| SSB-ToMeasure field descriptions | |
|---|---|
| longBitmap | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [88], clause 4.1. |
| mediumBitmap | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [88], clause 4.1. For operation with shared spectrum channel access, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMTC measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k - 1 may be transmitted; if the k-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k > ssb-PositionQCL-CommonNR and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. If ssb-PositionQCL-NR is configured with a value smaller than ssb-PositionQCL-CommonNR, only the leftmost K bits (K = ssb-PositionQCL-NR) are applicable for the corresponding cell. |
| shortBitmap | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [88], clause 4.1. |

— *TimeToTrigger*

The IE *TimeToTrigger* specifies the value range used for time to trigger parameter, which concerns the time during which specific criteria for the event needs to be met in order to trigger a measurement report. Value ms0 corresponds to 0 ms and behaviour as specified in 7.3.2 applies, ms40 corresponds to 40 ms, and so on.

TimeToTrigger information element

```

-- ASN1START

TimeToTrigger ::= ENUMERATED {
    ms0, ms40, ms64, ms80, ms100, ms128, ms160, ms256,
    ms320, ms480, ms512, ms640, ms1024, ms1280, ms2560,
    ms5120
}

-- ASN1STOP

```

— *UL-DelayConfig*

The IE *UL-DelayConfig* IE specifies the configuration of the UL PDCP Packet Delay per QCI measurement specified in TS 36.314 [71].

UL-DelayConfig information element

```

-- ASN1START

UL-DelayConfig-r13 ::= CHOICE {
    release           NULL,
    setup             SEQUENCE {
        delayThreshold-r13 ENUMERATED {
            ms30, ms40, ms50, ms60, ms70, ms80,
            ms90, ms100, ms150, ms300, ms500, ms750, spare4,
            spare3, spare2, spare1
        }
    }
}

-- ASN1STOP

```

| UL-DelayConfig field descriptions |
|--|
|--|

delayThreshold

Indicates the delay threshold value used by UE to provide results of UL PDCP Packet Delay per QCI measurement as specified in TS 36.314 [71]. Value in milliseconds. Value ms30 means 30 ms and so on.

- **UL-DelayValueConfig**

The IE *UL-DelayValueConfig* specifies the configuration of the UL PDCP Packet Delay value per DRB measurements specified in TS 38.314 [103].

UL-DelayValueConfig information element

```
-- ASN1START
UL-DelayValueConfig-r16 ::= CHOICE {
    release           NULL,
    setup             SEQUENCE {
        delay-DRBlist-r16   SEQUENCE (SIZE(1..maxDRB)) OF DRB-Identity
    }
}
-- ASN1STOP
```

| UL-DelayValueConfig field descriptions |
|---|
|---|

delay-DRBlist

Indicates the DRB IDs used by UE to provide results of UL PDCP Packet Delay value per DRB measurement as specified in TS 38.314 [103].

- **WLAN-CarrierInfo**

The IE *WLAN-CarrierInfo* is used to identify the WLAN frequency band information, as specified in Annex E in [67].

WLAN-CarrierInfo information element

```
-- ASN1START
WLAN-CarrierInfo-r13 ::= SEQUENCE {
    operatingClass-r13      INTEGER (0..255)          OPTIONAL, -- Need ON
    countryCode-r13         ENUMERATED {unitedStates, europe, japan, global, ...} OPTIONAL, -- Need ON
    channelNumbers-r13       WLAN-ChannelList-r13     OPTIONAL, -- Need ON
    ...
}
WLAN-ChannelList-r13 ::= SEQUENCE (SIZE (1..maxWLAN-Channels-r13)) OF WLAN-Channel-r13
WLAN-Channel-r13 ::= INTEGER(0..255)
-- ASN1STOP
```

| WLAN-CarrierInfo field descriptions |
|--|
|--|

channelNumbers

Indicates the WLAN channels as defined in IEEE 802.11-2012 [67]. Value 0 is not used.

countryCode

Indicates the country code of WLAN as defined in IEEE 802.11-2012 [67].

operatingClass

Indicates the Operating Class of WLAN as defined in IEEE 802.11-2012 [67].

- **WLAN-NameList**

The IE *WLAN-NameList* is used to indicate the names of the WLAN AP for which the UE is configured to measure.

***WLAN-NameList* information element**

```
-- ASN1START

WLAN-NameListConfig-r15 ::= CHOICE{
  release,
  NULL,
  setup,
  WLAN-NameList-r15
}

WLAN-NameList-r15 ::= SEQUENCE (SIZE (1..maxWLAN-Name-r15)) OF WLAN-Name-r15

WLAN-Name-r15 ::= OCTET STRING (SIZE (1..32))

-- ASN1STOP
```

***WLAN-NameList* field descriptions**

WLAN-Name

If configured, the UE only performs WLAN measurements according to the names identified. For each name, it refers to Service Set Identifier (SSID) defined in IEEE 802.11-2012 [67].

WLAN-RSSI-Range

The IE *WLAN-RSSI-Range* specifies the value range used in WLAN RSSI measurements and thresholds. Integer value for WLAN RSSI measurements is according to mapping table in TS 36.133 [16]. Value 0 corresponds to -infinity, value 1 to -100dBm, value 2 to -99dBm, and so on (i.e. in steps of 1dBm) until value 140, which corresponds to 39dBm, while value 141 corresponds to +infinity.

***WLAN-RSSI-Range* information element**

```
-- ASN1START

WLAN-RSSI-Range-r13 ::= INTEGER(0..141)

-- ASN1STOP
```

WLAN-RTT

The IE *WLAN-RTT* covers the measured round trip time between the target device and WLAN AP and optionally the accuracy expressed as the standard deviation of the delay.

***WLAN-RTT* information element**

```
-- ASN1START

WLAN-RTT-r15 ::= SEQUENCE {
  rttValue-r15           INTEGER (0..16777215),
  rttUnits-r15           ENUMERATED { microseconds,
                                         hundredsofnanoseconds,
                                         tensofnanoseconds,
                                         nanoseconds,
                                         tenthsofnanoseconds,
                                         ... },
  rttAccuracy-r15        INTEGER (0..255)          OPTIONAL,
  ...
}

-- ASN1STOP
```

| <i>WLAN-RTT field descriptions</i> | |
|---|--|
| <i>rttValue</i> | This field specifies the Round Trip Time (RTT) measurement between the target device and WLAN AP in units given by the field rttUnits as defined in TS 36.355 [54]. |
| <i>rttUnits</i> | This field specifies the Units for the fields rttValue and rttAccuracy. The available Units are 1000ns, 100ns, 10ns, 1ns, and 0.1ns as defined in TS 36.355 [54]. |
| <i>rttAccuracy</i> | This field provides the estimated accuracy of the provided rttValue expressed as the standard deviation in units given by the field rttUnits as defined in TS 36.355 [54]. |

— *WLAN-Status*

The IE *WLAN-Status* indicates the current status of WLAN connection. The values are set as described in clause 5.6.15.2 and 5.6.15.4.

WLAN-Status information element

```
-- ASN1START
WLAN-Status-r13 ::= ENUMERATED {successfulAssociation, failureWlanRadioLink,
failureWlanUnavailable, failureTimeout}
WLAN-Status-v1430 ::= ENUMERATED {suspended, resumed}
-- ASN1STOP
```

— *WLAN-SuspendConfig*

The IE *WLAN-SuspendConfig* is used for configuration of WLAN suspend/resume functionality.

```
-- ASN1START
WLAN-SuspendConfig-r14 ::= SEQUENCE {
    wlan-SuspendResumeAllowed-r14           BOOLEAN      OPTIONAL,   -- Need ON
    wlan-SuspendTriggersStatusReport-r14     BOOLEAN      OPTIONAL,   -- Need ON
}
-- ASN1STOP
```

| <i>WLAN-SuspendConfig field descriptions</i> | | | |
|--|--|--|--|
| <i>wlan-SuspendResumeAllowed</i> | | | |
| Indicates whether the UE is allowed to use suspend-resume mechanism, i.e., to indicate WLAN being temporarily unavailable and WLAN being available again after temporary unavailability. | | | |
| <i>wlan-SuspendTriggersStatusReport</i> | | | |
| Indicates whether the UE shall trigger PDCP status report as defined in TS 36.323 [8] when WLAN is temporarily unavailable and UE reports this status. | | | |

6.3.6 Other information elements

— *AbsoluteTimeInfo*

The IE *AbsoluteTimeInfo* indicates an absolute time in a format YY-MM-DD HH:MM:SS and using BCD encoding. The first/ leftmost bit of the bit string contains the most significant bit of the most significant digit of the year and so on.

AbsoluteTimeInfo information element

```
-- ASN1START
AbsoluteTimeInfo-r10 ::= BIT STRING (SIZE (48))
-- ASN1STOP
```

AMF-Identifier

The IE *AMF-Identifier* (AMFI) comprises of an AMF Region ID, an AMF Set ID and an AMF Pointer as specified in 23.003 [27], clause 2.10.1.

AMF-Identifier information element

```
-- ASN1START
AMF-Identifier-r15 ::= BIT STRING (SIZE (24))
-- ASN1STOP
```

AreaConfiguration

The *AreaConfiguration* indicates area for which UE is requested to perform measurement logging. If not configured, measurement logging is not restricted to specific cells or tracking areas but applies as long as the RPLMN is contained in *plmn-IdentityList* stored in *VarLogMeasReport*.

AreaConfiguration information element

```
-- ASN1START
AreaConfiguration-r10 ::= CHOICE {
    cellGlobalIdList-r10           CellGlobalIdList-r10,
    trackingAreaCodeList-r10        TrackingAreaCodeList-r10
}
AreaConfiguration-v1130 ::= SEQUENCE {
    trackingAreaCodeList-v1130     TrackingAreaCodeList-v1130
}
CellGlobalIdList-r10 ::= SEQUENCE (SIZE (1..32)) OF CellGlobalIdEUTRA
TrackingAreaCodeList-r10 ::= SEQUENCE (SIZE (1..8)) OF TrackingAreaCode
TrackingAreaCodeList-v1130 ::= SEQUENCE {
    plmn-Identity-perTAC-List-r11   SEQUENCE (SIZE (1..8)) OF PLMN-Identity
}
-- ASN1STOP
```

AreaConfiguration field descriptions

plmn-Identity-perTAC-List

Includes the PLMN identity for each of the TA codes included in *trackingAreaCodeList*. The PLMN identity listed first in *plmn-Identity-perTAC-List* corresponds with the TA code listed first in *trackingAreaCodeList* and so on.

BandCombinationList

The IE *BandCombinationList* contains a list of CA band combinations.

BandCombinationList information element

```
-- ASN1START
BandCombinationList-r14 ::= SEQUENCE (SIZE (1..maxBandComb-r13)) OF BandCombination-r14
BandCombination-r14 ::= SEQUENCE (SIZE (1..maxSimultaneousBands-r10)) OF BandIndication-r14
BandIndication-r14 ::= SEQUENCE {
    bandEUTRA-r14                FreqBandIndicator-r11,
    ca-BandwidthClassDL-r14       CA-BandwidthClass-r10,
    ca-BandwidthClassUL-r14       CA-BandwidthClass-r10
}                                                               OPTIONAL
-- ASN1STOP
```

C-RNTI

The IE *C-RNTI* identifies a UE having a RRC connection within a cell.

***C-RNTI* information element**

```
-- ASN1START
C-RNTI ::= BIT STRING (SIZE (16))
-- ASN1STOP
```

DedicatedInfoCDMA2000

The *DedicatedInfoCDMA2000* is used to transfer UE specific CDMA2000 information between the network and the UE. The RRC layer is transparent for this information.

***DedicatedInfoCDMA2000* information element**

```
-- ASN1START
DedicatedInfoCDMA2000 ::= OCTET STRING
-- ASN1STOP
```

DedicatedInfoF1c

The IE *DedicatedInfoF1c* is used to transfer IAB-DU specific F1-C related information between the network and the IAB-node. The carried information consists of F1AP message encapsulated in SCTP/IP or F1-C related IP packet with or without SCTP encapsulation, see TS 38.472 [105] and TS 36.423 [108]. The RRC layer is transparent for this information.

***DedicatedInfoF1c* information element**

```
-- ASN1START
DedicatedInfoF1c-r16 ::= OCTET STRING
-- ASN1STOP
```

DedicatedInfoNAS

The IE *DedicatedInfoNAS* is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for this information.

***DedicatedInfoNAS* information element**

```
-- ASN1START
DedicatedInfoNAS ::= OCTET STRING
-- ASN1STOP
```

FilterCoefficient

The IE *FilterCoefficient* specifies the measurement filtering coefficient. Value *fc0* corresponds to k = 0, *fc1* corresponds to k = 1, and so on.

***FilterCoefficient* information element**

```
-- ASN1START
FilterCoefficient ::= ENUMERATED {
    fc0, fc1, fc2, fc3, fc4, fc5,
```

```
fc6, fc7, fc8, fc9, fc11, fc13,
fc15, fc17, fc19, spare1, ...}
```

```
-- ASN1STOP
```

FlightPathInfoReportConfig

The IE *FlightPathInfoReportConfig* specifies flight path information report configuration.

***FlightPathInfoReportConfig* information element**

```
-- ASN1START
FlightPathInfoReportConfig-r15 ::= SEQUENCE {
    maxWayPointNumber-r15           INTEGER (1..maxWayPoint-r15),
    includeTimeStamp-r15            ENUMERATED {true}                      OPTIONAL
}
-- ASN1STOP
```

***FlightPathInfoReportConfig* field descriptions**

maxWayPointNumber

Indicates the maximum number of way points UE can include in the flight path information report if this information is available at the UE.

includeTimeStamp

Indicates whether time stamp of each way point can be reported in the flight path information report if time stamp information is available at the UE.

GNSS-ID

The IE *GNSS-ID* is used to indicate a specific GNSS (see also TS 36.355 [54]).

***GNSS-ID* information element**

```
-- ASN1START
GNSS-ID-r15 ::= SEQUENCE {
    gnss-id-r15          ENUMERATED{gps, sbas, qzss, galileo, glonass, bds, ..., navic-v1610},
    ...
}
-- ASN1STOP
```

GNSS-PositionFixDuration

The IE *GNSS-PositionFixDuration* indicates the time duration required for the UE to acquire a GNSS position. Value s1 corresponds to 1 second, s2 corresponds to 2 seconds and so on.

***GNSS-PositionFixDuration* information element**

```
-- ASN1START
GNSS-PositionFixDuration-r18 ::= ENUMERATED{
    s1, s2, s3, s4, s5, s6, s7, s13, s19, s25, s31
}
-- ASN1STOP
```

GNSS-ValidityDuration

The IE *GNSS-ValidityDuration* indicates the remaining GNSS validity duration in the UE. Value s10 corresponds to 10 seconds, s20 corresponds to 20 seconds and so on. Value min5 corresponds to 5 minutes, value min10 corresponds to 10 minutes and so on.

***GNSS-ValidityDuration* information element**

```
-- ASN1START

GNSS-ValidityDuration-r17 ::= ENUMERATED{
    s10, s20, s30, s40, s50, s60, min5, min10,
    min15, min20, min25, min30, min50, min90, min120, infinity}

-- ASN1STOP
```

I-RNTI

The *I-RNTI* IE is used to identify the suspended UE context of a UE in RRC_INACTIVE and for User plane CIoT 5GS optimisation.

***I-RNTI* information element**

```
-- ASN1START

I-RNTI-r15 ::= BIT STRING (SIZE(40))

-- ASN1STOP
```

LoggingDuration

The *LoggingDuration* indicates the duration for which UE is requested to perform measurement logging. Value min10 corresponds to 10 minutes, value min20 corresponds to 20 minutes and so on.

***LoggingDuration* information element**

```
-- ASN1START

LoggingDuration-r10 ::= ENUMERATED {
    min10, min20, min40, min60, min90, min120, spare2, spare1}

-- ASN1STOP
```

LoggingInterval

The *LoggingInterval* indicates the periodicity for logging measurement results. Value ms1280 corresponds to 1.28s, value ms2560 corresponds to 2.56s and so on.

***LoggingInterval* information element**

```
-- ASN1START

LoggingInterval-r10 ::= ENUMERATED {
    ms1280, ms2560, ms5120, ms10240, ms20480,
    ms30720, ms40960, ms61440}

-- ASN1STOP
```

MeasSubframePattern

The IE *MeasSubframePattern* is used to specify a subframe pattern. The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod x = 0, where SFN is that of PCell and x is the size of the bit string divided by 10. "1" denotes that the corresponding subframe is used.

***MeasSubframePattern* information element**

```
-- ASN1START

MeasSubframePattern-r10 ::= CHOICE {
    subframePatternFDD-r10           BIT STRING (SIZE (40)),
```

```

subframePatternTDD-r10          CHOICE {
    subframeConfig1-5-r10        BIT STRING (SIZE (20)),
    subframeConfig0-r10          BIT STRING (SIZE (70)),
    subframeConfig6-r10          BIT STRING (SIZE (60)),
    ...
},
...
}

-- ASN1STOP

```

MMEC

The IE *MMEC* identifies an MME within the scope of an MME Group within a PLMN, see TS 23.003 [27].

***MMEC* information element**

```

-- ASN1START

MMEC ::=           BIT STRING (SIZE (8))

-- ASN1STOP

```

NeighCellConfig

The IE *NeighCellConfig* is used to provide the information related to MBSFN and TDD UL/DL configuration of neighbour cells.

***NeighCellConfig* information element**

```

-- ASN1START

NeighCellConfig ::=      BIT STRING (SIZE (2))

-- ASN1STOP

```

***NeighCellConfig* field descriptions**

neighCellConfig

Provides information related to MBSFN and TDD UL/DL configuration of neighbour cells of this frequency
 00: Not all neighbour cells have the same MBSFN subframe allocation as the serving cell on this frequency, if configured, and as the PCell otherwise
 10: The MBSFN subframe allocations of all neighbour cells are identical to or subsets of that in the serving cell on this frequency, if configured, and of that in the PCell otherwise
 01: No MBSFN subframes are present in all neighbour cells
 11: Different UL/DL allocation in neighbouring cells for TDD compared to the serving cell on this frequency, if configured, and compared to the PCell otherwise
 For TDD, 00, 10 and 01 are only used for same UL/DL allocation in neighbouring cells compared to the serving cell on this frequency, if configured, and compared to the PCell otherwise.

NG-5G-S-TMSI

The IE *NG-5G-S-TMSI* contains a 5G S-Temporary Mobile Subscriber Identity, a temporary UE identity provided by the AMF which uniquely identifies the UE within the tracking area, see TS 23.003 [27].

***NG-5G-S-TMSI* information element**

```

-- ASN1START

NG-5G-S-TMSI-r15 ::=      BIT STRING (SIZE (48))

-- ASN1STOP

```

— *OtherConfig*

The IE *OtherConfig* contains configuration related to other configuration.

OtherConfig information element

```
-- ASN1START

OtherConfig-r9 ::= SEQUENCE {
    reportProximityConfig-r9          ReportProximityConfig-r9           OPTIONAL,   -- Need ON
    ...,
    [ [ idc-Config-r11                IDC-Config-r11                  OPTIONAL,   -- Need ON

```

| <i>OtherConfig</i> field descriptions | |
|--|--|
| <i>ailc-BitConfig</i> | Indicates whether the UE is allowed to provide assistance information bit for local cache. If configured, the UE shall only apply to a DRB configured with 12-bit PDCP SN format as specified in TS 36.323 [8]. |
| <i>autonomousDenialSubframes</i> | Indicates the maximum number of the UL subframes for which the UE is allowed to deny any UL transmission. Value n2 corresponds to 2 subframes, n5 to 5 subframes and so on. E-UTRAN does not configure autonomous denial for frequencies on which SCG cells are configured. |
| <i>autonomousDenialValidity</i> | Indicates the validity period over which the UL autonomous denial subframes shall be counted. Value sf200 corresponds to 200 subframes, sf500 corresponds to 500 subframes and so on. |
| <i>bt-NameListConfig</i> | Configuration for the UE to report measurements from specific Bluetooth beacons. E-UTRAN configures the field only if <i>includeBT-Meas</i> is configured for one or more measurements. |
| <i>bw-PreferenceIndicationTimer</i> | Prohibit timer for bandwidth preference indication reporting. Value in seconds. Value s0 means prohibit timer is set to 0 second, value s0dot5 means prohibit timer is set to 0.5 second, value s1 means prohibit timer is set to 1 second and so on. |
| <i>CandidateServingFreqListNR</i> | Indicates for each candidate NR serving cells, the center frequency around which UE is requested to report IDC issues for MR-DC. |
| <i>delayBudgetReportingProhibitTimer</i> | Prohibit timer for delay budget reporting. Value in seconds. Value s0 means prohibit timer is set to 0 second, value s0dot4 means prohibit timer is set to 0.4 second, and so on. |
| <i>idc-HardwareSharingIndication</i> | The field is used to indicate whether the UE is allowed indicate in <i>InDeviceCoexIndication</i> that the cause of the problems are due to hardware sharing, and whether the UE is allowed to omit the TDM assistance information. |
| <i>idc-Indication</i> | The field is used to indicate whether the UE is configured to initiate transmission of the <i>InDeviceCoexIndication</i> message to the network. |
| <i>idc-Indication-MRDC</i> | The field is used to indicate whether the UE is configured to provide IDC indications for MR-DC using the <i>InDeviceCoexIndication</i> message. |
| <i>idc-Indication-UL-CA</i> | The field is used to indicate whether the UE is configured to provide IDC indications for UL CA using the <i>InDeviceCoexIndication</i> message. |
| <i>measConfigAppLayerContainer</i> | The field contains configuration of application layer measurements, see Annex L (normative) in TS 26.247 [90] and clause 16.5 in TS 26.114 [99]. The maximum number of configurations of application layer measurements that a UE supports is one regardless of <i>serviceType</i> . |
| <i>serviceType</i> | Indicates the type of application layer measurement. Value qoe indicates Quality of Experience Measurement Collection for streaming services, value qoemtsi indicates Enhanced Quality of Experience Measurement Collection for MTSI. |
| <i>obtainLocation</i> | Requests the UE to attempt to have detailed location information available using GNSS. E-UTRAN configures the field only if <i>includeLocationInfo</i> is configured for one or more measurements. |
| <i>overheatingAssistanceConfig</i> | Configuration for the UE to report assistance information to inform the eNB about UE detected internal overheating. |
| <i>overheatingAssistanceConfigForSCG</i> | The field is used to indicate whether the UE is configured to provide overheating assistance information for NR SCG. E-UTRAN configures value <i>TRUE</i> only when the UE is configured with an NR SCG. |
| <i>overheatingIndicationProhibitTimer</i> | Prohibit timer for overheating assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 second, value s1 means prohibit timer is set to 1 second and so on. |
| <i>powerPrefIndicationTimer</i> | Prohibit timer for Power Preference Indication reporting. Value in seconds. Value s0 means prohibit timer is set to 0 second, value s0dot5 means prohibit timer is set to 0.5 second, value s1 means prohibit timer is set to 1 second and so on. |
| <i>reportProximityConfig</i> | Indicates, for each of the applicable RATs (EUTRA, UTRA), whether or not proximity indication is enabled for CSG member cell(s) of the concerned RAT. Note. |
| <i>rImReportTimer</i> | Prohibit timer for RLM event reporting, i.e. "early-out-of-sync" and "early-in-sync" event reporting, as specified in clause 5.6.10. Value in seconds. Value s0 means prohibit timer is set to 0 second, value s0dot5 means prohibit timer is set to 0.5 second, value s1 means prohibit timer is set to 1 second and so on. |

| <i>OtherConfig</i> field descriptions | |
|--|---|
| <i>ailc-BitConfig</i> | Indicates whether the UE is allowed to provide assistance information bit for local cache. If configured, the UE shall only apply to a DRB configured with 12-bit PDCP SN format as specified in TS 36.323 [8]. |
| <i>autonomousDenialSubframes</i> | Indicates the maximum number of the UL subframes for which the UE is allowed to deny any UL transmission. Value n2 corresponds to 2 subframes, n5 to 5 subframes and so on. E-UTRAN does not configure autonomous denial for frequencies on which SCG cells are configured. |
| <i>autonomousDenialValidity</i> | Indicates the validity period over which the UL autonomous denial subframes shall be counted. Value sf200 corresponds to 200 subframes, sf500 corresponds to 500 subframes and so on. |
| <i>bt-NameListConfig</i> | Configuration for the UE to report measurements from specific Bluetooth beacons. E-UTRAN configures the field only if <i>includeBT-Meas</i> is configured for one or more measurements. |
| <i>r1mReportRep-MPDCCH</i> | The field is used to indicate whether the UE is configured to report excess repetitions on MPDCCH. |
| <i>sps-AssistanceInfoReport</i> | Value TRUE indicates that the UE is allowed to report SPS-AssistanceInformation. If the <i>sl-V2X-SPS-Config</i> is provided by an E-UTRA <i>RRCConnectionReconfiguration</i> message embedded within an NR <i>RRCReconfiguration</i> for V2X sidelink communication (i.e. <i>sl-ConfigDedicatedEUTRA</i>) as in TS 38.331 [82], the network should configure the <i>otherConfig</i> and set this field to TRUE. |
| <i>wlan-NameListConfig</i> | Configuration for the UE to report measurements from specific WLAN APs. E-UTRAN configures the field only if <i>includeWLAN-Meas</i> is configured for one or more measurements. |

NOTE: Enabling/ disabling of proximity indication includes enabling/ disabling of the related functionality e.g. autonomous search in connected mode.

| Conditional presence | Explanation |
|-----------------------------|---|
| <i>idc-Ind</i> | The field is optionally present if <i>idc-Indication</i> is present, need OR. Otherwise the field is not present. |
| <i>overheating</i> | The field is optionally present, need ON, if the UE is configured with <i>overheatingAssistanceConfig</i> ; if <i>overheatingAssistanceConfig</i> is included and set to <i>release</i> , the UE shall delete any existing value for this field; otherwise, the field is not present. |

RAN-AreaCode

The *RAN-AreaCode* IE indicates RAN area code of the cell.

RAN-AreaCode information element

```
-- ASN1START
RAN-AreaCode-r15 ::= INTEGER (0..255)
-- ASN1STOP
```

RAND-CDMA2000 (1xRTT)

The *RAND-CDMA2000* concerns a random value, generated by the eNB, to be passed to the CDMA2000 upper layers.

RAND-CDMA2000 information element

```
-- ASN1START
RAND-CDMA2000 ::= BIT STRING (SIZE (32))
-- ASN1STOP
```

– *RAT-Type*

The IE *RAT-Type* is used to indicate the radio access technology (RAT), including E-UTRA, of the requested/transferred UE capabilities. A separate value applies for some EUTRA-NR capabilities that are transferred by a separate UE capability container, used in case of MR-DC.

***RAT-Type* information element**

```
-- ASN1START
RAT-Type ::= ENUMERATED {
    eutra, utra, geran-cs, geran-ps, cdma2000-1XRTT,
    nr, eutra-nr, sparel, ...}
-- ASN1STOP
```

– *Resumelidentity*

The IE *Resumelidentity* is used to identify the suspended UE context

***Resumelidentity* information element**

```
-- ASN1START
Resumelidentity-r13 ::= BIT STRING (SIZE(40))
-- ASN1STOP
```

– *RRC-TransactionIdentifier*

The IE *RRC-TransactionIdentifier* is used, together with the message type, for the identification of an RRC procedure (transaction).

***RRC-TransactionIdentifier* information element**

```
-- ASN1START
RRC-TransactionIdentifier ::= INTEGER (0..3)
-- ASN1STOP
```

– *SatelliteId*

The IE *SatelliteId* is used to identify the satellite assistance information of the serving or neighbour satellites.

***SatelliteId* information element**

```
-- ASN1START
SatelliteId-r18 ::= INTEGER (0..255)
-- ASN1STOP
```

– *SBAS-ID*

The IE *SBAS-ID* is used to indicate a specific SBAS (see also TS 36.355 [54]).

***SBAS-ID* information element**

```
-- ASN1START
SBAS-ID-r15 ::= SEQUENCE {
    sbas-id-r15      ENUMERATED {waas, egnos, msas, gagan, ...},
```

```

}
-- ASN1STOP

```

ShortI-RNTI

The *ShortI-RNTI* IE is used to identify the suspended UE context of a UE in RRC_INACTIVE using fewer bits compared to *I-RNTI*.

***ShortI-RNTI* information element**

```

-- ASN1START
ShortI-RNTI-r15 ::=           BIT STRING (SIZE(24))
-- ASN1STOP

```

S-NSSAI

The IE *S-NSSAI* identifies a Network Slice end to end and comprises a slice/service type and a slice differentiator, see TS 23.003 [27].

***S-NSSAI* information element**

```

-- ASN1START
S-NSSAI-r15 ::=           CHOICE {
    sst             BIT STRING (SIZE (8)),
    sst-SD          BIT STRING (SIZE (32))
}
-- ASN1STOP

```

***S-NSSAI* field descriptions**

sst

Indicates the *S-NSSAI* consists of Slice/Service Type, see TS 23.003 [27].

sst-SD

Indicates the *S-NSSAI* consists of Slice/Service Type and Slice Differentiator, see TS 23.003 [27].

S-TMSI

The IE *S-TMSI* contains an S-Temporary Mobile Subscriber Identity, a temporary UE identity provided by the EPC which uniquely identifies the UE within the tracking area, see TS 23.003 [27].

***S-TMSI* information element**

```

-- ASN1START
S-TMSI ::=           SEQUENCE {
    mmec            MMEC,
    m-TMSI          BIT STRING (SIZE (32))
}
-- ASN1STOP

```

***S-TMSI* field descriptions**

m-TMSI

The first/leftmost bit of the bit string contains the most significant bit of the M-TMSI.

- ***TimeOffsetUTC***

The IE *TimeOffsetUTC* provides the time offset to the beginning of week (Monday 00:00:00 UTC). Units in seconds.

***TimeOffsetUTC* information element**

```
-- ASN1START
TimeOffsetUTC-r17 ::= INTEGER (0..1048575)
-- ASN1STOP
```

- ***TraceReference***

The *TraceReference* contains parameter Trace Reference as defined in TS 32.422 [58].

***TraceReference* information element**

```
-- ASN1START
TraceReference-r10 ::= SEQUENCE {
    plmn-Identity-r10
    traceId-r10
}
-- ASN1STOP
```

- ***UE-CapabilityRAT-ContainerList***

The IE *UE-CapabilityRAT-ContainerList* contains list of containers, one for each RAT for which UE capabilities are transferred, if any.

***UE-CapabilityRAT-ContainerList* information element**

```
-- ASN1START
UE-CapabilityRAT-ContainerList ::=SEQUENCE (SIZE (0..maxRAT-Capabilities)) OF UE-CapabilityRAT-
Container
UE-CapabilityRAT-Container ::= SEQUENCE {
    rat-Type
    ueCapabilityRAT-Container
}
-- ASN1STOP
```

***UECapabilityRAT-ContainerList* field descriptions**

ueCapabilityRAT-Container

Container for the UE capabilities of the indicated RAT. The encoding is defined in the specification of each RAT:
For E-UTRA: the encoding of UE capabilities is defined in IE *UE-EUTRA-Capability*.

For UTRA: the octet string contains the INTER RAT HANDOVER INFO message defined in TS 25.331 [19].

For GERAN CS: the octet string contains the concatenated string of the Mobile Station Classmark 2 and Mobile Station Classmark 3. The first 5 octets correspond to Mobile Station Classmark 2 and the following octets correspond to Mobile Station Classmark 3. The Mobile Station Classmark 2 is formatted as 'TLV' and is coded in the same way as the *Mobile Station Classmark 2* information element in TS 24.008 [49]. The first octet is the *Mobile station classmark 2 IEI* and its value shall be set to 33H. The second octet is the *Length of mobile station classmark 2* and its value shall be set to 3. The octet 3 contains the first octet of the value part of the *Mobile Station Classmark 2* information element, the octet 4 contains the second octet of the value part of the *Mobile Station Classmark 2* information element and so on. For each of these octets, the first/ leftmost/ most significant bit of the octet contains b8 of the corresponding octet of the Mobile Station Classmark 2. The Mobile Station Classmark 3 is formatted as 'V' and is coded in the same way as the value part in the *Mobile station classmark 3* information element in TS 24.008 [49]. The sixth octet of this octet string contains octet 1 of the value part of *Mobile station classmark 3*, the seventh of octet of this octet string contains octet 2 of the value part of *Mobile station classmark 3* and so on. Note.

For GERAN PS: the encoding of UE capabilities is formatted as 'V' and is coded in the same way as the value part in the *MS Radio Access Capability* information element in TS 24.008 [49].

For CDMA2000-1XRTT: the octet string contains the A21 Mobile Subscription Information and the encoding of this is defined in A.S0008 [33]. The A21 Mobile Subscription Information contains the supported CDMA2000 1xRTT band class and band sub-class information.

For NR: The octet string contains the IE *UE-NR-Capability* as defined in TS 38.331 [82].

For EUTRA-NR: The octet string contains the IE *UE-MRDC-Capability* as defined in TS 38.331 [82]

NOTE: The value part is specified by means of CSN.1, which encoding results in a bit string, to which final padding may be appended up to the next octet boundary TS 24.008 [49]. The first/ leftmost bit of the CSN.1 bit string is placed in the first/ leftmost/ most significant bit of the first octet. This continues until the last bit of the CSN.1 bit string, which is placed in the last/ rightmost/ least significant bit of the last octet.

UE-EUTRA-Capability

The IE *UE-EUTRA-Capability* is used to convey the E-UTRA UE Radio Access Capability Parameters, see TS 36.306 [5], and the Feature Group Indicators for mandatory features (defined in Annexes B.1 and C.1) to the network. The IE *UE-EUTRA-Capability* is transferred in E-UTRA or in another RAT.

NOTE 0: For (UE capability specific) guidelines on the use of keyword OPTIONAL, see Annex A.3.5.

***UE-EUTRA-Capability* information element**

```
-- ASN1START

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| accessStratumRelease
Set to rel17 in this version of the specification. NOTE 7. | - |
| additionalRx-Tx-PerformanceReq
Indicates whether the UE supports the additional Rx and Tx performance requirement for a given band combination as specified in TS 36.101 [42]. | - |
| addSRS
Presence of this field indicates the UE supports the additional SRS symbol(s) within the normal UL subframes in TDD as described in TS 36.213 [23]. | - |
| addSRS-1T2R
Indicates whether the UE supports selecting one antenna among two antennas to transmit additional SRS symbol(s) for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| addSRS-1T4R
Indicates whether the UE supports selecting one antenna among four antennas to transmit additional SRS symbol(s) for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| addSRS-2T4R-2Pairs
Indicates whether the UE supports selecting one antenna pair between two antenna pairs to transmit additional SRS symbol(s) simultaneously for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| addSRS-2T4R-3Pairs
Indicates whether the UE supports selecting one antenna pair among three antenna pairs to transmit additional SRS symbol(s) simultaneously for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| addSRS-AntennaSwitching (in addSRS)
Value <i>useBasic</i> indicates the antenna switching capabilities for additional SRS symbol(s) for a band of band combination for which the capability is not signalled in <i>bandParameterList-v1610</i> is the same as indicated by <i>bandParameterList-v1380</i> and/or <i>bandParameterList-v1530</i> for the concerned band of band combination. | - |
| addSRS-AntennaSwitching (in bandParameterList-v1610)
If signalled, the field indicates the antenna switching capabilities for additional SRS symbol(s) for the concerned band of band combination. | - |
| addSRS-CarrierSwitching (in addSRS)
Indicates whether carrier switching is supported for additional SRS symbol(s) for all band pairs of band combinations for which UE supports SRS carrier switching. This field is included only if <i>srs-CapabilityPerBandPairList-r14</i> is included. If this field is included, <i>addSRS-CarrierSwitching (in bandParameterList-v1610)</i> is not included. | - |
| addSRS-CarrierSwitching (in bandParameterList-v1610)
Indicates whether carrier switching is supported for additional SRS symbol(s) for the concerned band pair of band combination. This field is included only if <i>srs-CapabilityPerBandPairList-r14</i> is included. If this field is included, <i>addSRS-CarrierSwitching (in addSRS)</i> is not included. | - |
| addSRS-FrequencyHopping (in addSRS)
Indicates whether frequency hopping is supported for additional SRS symbol(s) for all bands of band combinations for which the capability is not signalled in <i>bandParameterList-v1610</i> . | - |
| addSRS-FrequencyHopping (in bandParameterList-v1610)
If signalled, the field indicates whether frequency hopping is supported for additional SRS symbol(s) for the concerned band of band combination. | - |
| allowedCellList
Indicates whether the UE supports EUTRA allowed-cell listing to limit the set of cells applicable for measurements. | - |
| alternativeTBS-Indices
Indicates whether the UE supports alternative TBS indices I_{TBS} 26A and 33A as specified in TS 36.213 [23]. | - |
| alternativeTBS-Index
Indicates whether the UE supports alternative TBS index I_{TBS} 33B as specified in TS 36.213 [23]. | No |
| alternativeTimeToTrigger
Indicates whether the UE supports alternativeTimeToTrigger. | No |
| altFreqPriority
Indicates whether the UE supports alternative cell reselection priority. | No |
| altMCS-Table
Indicates whether the UE supports the 6-bit MCS table as specified in TS 36.212 [22] and TS 36.213 [23]. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| aperiodicCSI-Reporting
Indicates whether the UE supports aperiodic CSI reporting with 3 bits of the CSI request field size as specified in TS 36.213 [23], clause 7.2.1 and/or aperiodic CSI reporting mode 1-0 and mode 1-1 as specified in TS 36.213 [23], clause 7.2.1. The first bit is set to "1" if the UE supports the aperiodic CSI reporting with 3 bits of the CSI request field size. The second bit is set to "1" if the UE supports the aperiodic CSI reporting mode 1-0 and mode 1-1. | No |
| aperiodicCsi-ReportingSTTI
Indicates whether the UE supports aperiodic CSI reporting for short TTI as specified in TS 36.213 [23], clause 7.2.1. | Yes |
| appliedCapabilityFilterCommon
Contains the filter, applied by the UE, common for all MR-DC related capability containers that are requested and as defined by <i>UE-CapabilityRequestFilterCommon</i> IE in TS 38.331 [82]. | - |
| assistInfoBitForLC
Indicates whether the UE supports assistance information bit for local cache. | - |
| aul
Indicates whether the UE supports AUL as specified in TS 36.321 [6]. | - |
| bandCombinationListEUTRA
One entry corresponding to each supported band combination listed in the same order as in <i>supportedBandCombination</i> . | - |
| BandCombinationParameters-v1090, BandCombinationParameters-v10i0, BandCombinationParameters-v1270
If included, the UE shall include the same number of entries, and listed in the same order, as in <i>BandCombinationParameters-r10</i> . | - |
| BandCombinationParameters-v1130
The field is applicable to each supported CA bandwidth class combination (i.e. CA configuration in TS 36.101 [42], clause 5.6A.1) indicated in the corresponding band combination. If included, the UE shall include the same number of entries, and listed in the same order, as in <i>BandCombinationParameters-r10</i> . | - |
| bandEUTRA
E-UTRA band as defined in TS 36.101 [42] and TS 36.102 [113] for NTN capable UE. In case the UE includes <i>bandEUTRA-v9e0</i> or <i>bandEUTRA-v1090</i> , the UE shall set the corresponding entry of <i>bandEUTRA</i> (i.e. without suffix) or <i>bandEUTRA-r10</i> respectively to <i>maxFBI</i> . | - |
| bandInfoNR-v1610, bandInfoNR-v1800
One entry corresponding to each supported E-UTRA band listed in the same order as in <i>supportedBandListEUTRA</i> . If <i>bandInfoNR-v1610</i> is absent, network assumes gap is required when measurement is performed on any NR bands while UE is served by cell(s) belongs to a E-UTRA band listed in <i>supportedBandListEUTRA</i> except for the FR2 inter-RAT measurement which depends on the support of <i>independentGapConfig</i> . | - |
| bandListEUTRA
One entry corresponding to each supported E-UTRA band listed in the same order as in <i>supportedBandListEUTRA</i> . | - |
| bandParameterList-v1380
If included, the UE shall include the same number of entries listed in the same order as the band entries in the corresponding band combination. | - |
| bandParametersUL, bandParametersDL
Indicates the supported parameters for the band. Each of <i>CA-MIMO-ParametersUL</i> and <i>CA-MIMO-ParametersDL</i> can be included only once for one band in a single band combination entry. | - |
| beamformed (in MIMO-CA-ParametersPerBoBCPerTM)
If signalled, the field indicates for a particular transmission mode, the UE capabilities concerning beamformed EBF/ FD-MIMO operation (class B) applicable for the concerned band combination. | - |
| beamformed (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode, the UE capabilities concerning beamformed EBF/ FD-MIMO operation (class B) applicable for band combinations for which the concerned capabilities are not signalled. | Yes |
| benefitsFromInterruption
Indicates whether the UE power consumption would benefit from being allowed to cause interruptions to serving cells when performing measurements of deactivated SCell carriers for <i>measCycleSCell</i> of less than 640ms, as specified in TS 36.133 [16]. | No |
| bwPrefInd
Indicates whether the UE supports maximum PDSCH/PUSCH bandwidth preference indication. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| ca-BandwidthClass
The CA bandwidth class supported by the UE as defined in TS 36.101 [42], Table 5.6A-1. The UE explicitly includes all the supported CA bandwidth class combinations in the band combination signalling. Support for one CA bandwidth class does not implicitly indicate support for another CA bandwidth class. | - |
| ca-IdleModeMeasurements
Indicates whether UE supports reporting measurements performed during RRC_IDLE. | - |
| ca-IdleModeValidityArea
Indicates whether UE supports validity area for IDLE measurements during RRC_IDLE. | - |
| cch-IM-RefRecTypeA-OneRX-Port
This field defines whether the DL Category 1bis or the DL Category M2 UE supports Type A downlink control channel interference mitigation (CCH-IM) receiver "LMMSE-IRC + CRS-IC" for PDCCH/PCFICH/PHICH/EPDCCH receive processing (Enhanced downlink control channel performance requirements Type A in TS 36.101 [6]). | No |
| cch-InterfMitigation-RefRecTypeA, cch-InterfMitigation-RefRecTypeB, cch-InterfMitigation-MaxNumCCs
The field <i>cch-InterfMitigation-RefRecTypeA</i> defines whether the UE supports Type A downlink control channel interference mitigation (CCH-IM) receiver "LMMSE-IRC + CRS-IC" for PDCCH/PCFICH/PHICH/EPDCCH receive processing (Enhanced downlink control channel performance requirements Type A in the TS 36.101 [6]). The field <i>cch-InterfMitigation-RefRecTypeB</i> defines whether the UE supports Type B downlink CCH-IM receiver "E-LMMSE-IRC + CRS-IC" for PDCCH/PCFICH/PHICH receive processing in synchronous networks (Enhanced downlink control channel performance requirements Type B in the TS 36.101 [6]). The UE supporting the capability defined by <i>cch-InterfMitigation-RefRecTypeB-r13</i> shall also support the capability defined by <i>cch-InterfMitigation-RefRecTypeA-r13</i> .

If the UE sets one or more of the fields <i>cch-InterfMitigation-RefRecTypeA</i> and <i>cch-InterfMitigation-RefRecTypeB</i> to "supported", the UE shall include the parameter <i>cch-InterfMitigation-MaxNumCCs</i> to indicate that the UE supports CCH-IM on at least one arbitrary downlink CC for up to <i>cch-InterfMitigation-MaxNumCCs</i> downlink CC CA configuration. The UE shall not include the parameter <i>cch-InterfMitigation-MaxNumCCs</i> if neither <i>cch-InterfMitigation-RefRecTypeA</i> nor <i>cch-InterfMitigation-RefRecTypeB</i> is present. The UE may not perform CCH-IM on more than 1 DL CCs. For example, the UE sets " <i>cch-InterfMitigation-MaxNumCCs = 3</i> " to indicate that UE supports CCH-IM on at least one DL CC for supported non-CA, 2DL CA and 3DL CA configurations. For CA scenarios, the CCH-IM is guaranteed to be supported on at least one arbitrary component carrier. | - |
| cdma2000-NW-Sharing
Indicates whether the UE supports network sharing for CDMA2000. | - |
| ce-ClosedLoopTxAntennaSelection
Indicates whether the UE supports UL closed-loop Tx antenna selection in CE mode A, as specified in TS 36.212 [22]. | Yes |
| ce-CQI-AlternativeTable
Indicates whether the UE supports alternative CQI table in CE mode A. See TS 36.213 [22]. | Yes |
| ce-CRS-IntfMitig
Indicates whether UE supports CRS interference mitigation, i.e., value <i>supported</i> indicates UE does not rely on the CRS outside certain PRBs and subframes as defined in TS 36.133 [16], clauses 3.6.1.2 and 3.6.1.3, and TS 36.213 [23] when operating in coverage enhancement mode. | Yes |
| ce-CSI-RS-Feedback
Indicates whether the UE supports CSI-RS based feedback when the UE is operating in CE mode A, as specified in TS 36.213 [23]. | Yes |
| ce-CSI-RS-FeedbackCodebookRestriction
Indicates whether the UE supports CSI-RS based feedback with codebook subset restriction when the UE in CE is operating in CE mode A, as specified in TS 36.213 [23]. | Yes |
| ce-DL-ChannelQualityReporting
Indicates whether UE operating in CE mode supports aperiodic DL channel quality reporting in RRC_CONNECTED. | Yes |
| ce-EUTRA-5GC
Indicates whether the UE operating in CE mode A or B supports E-UTRA/5GC. | Yes |
| ce-EUTRA-5GC-HO-ToNR-FDD-FR1
Indicates whether the UE operating in CE mode A or B supports handover from E-UTRA/5GC to NR FDD FR1. | Yes |
| ce-EUTRA-5GC-HO-ToNR-TDD-FR1
Indicates whether the UE operating in CE mode A or B supports handover from E-UTRA/5GC to NR TDD FR1. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| ce-EUTRA-5GC-HO-ToNR-FDD-FR2
Indicates whether the UE operating in CE mode A or B supports handover from E-UTRA/5GC to NR FDD FR2. | Yes |
| ce-EUTRA-5GC-HO-ToNR-TDD-FR2
Indicates whether the UE operating in CE mode A or B supports handover from E-UTRA/5GC to NR TDD FR2-1. | Yes |
| ce-EUTRA-5GC-HO-ToNR-TDD-FR2-2
Indicates whether the UE operating in CE mode A or B supports handover from E-UTRA/5GC to NR TDD FR2-2. | - |
| ce-HARQ-AckBundling
Indicates whether the UE supports HARQ-ACK bundling in half duplex FDD in CE mode A, as specified in TS 36.212 [22] and TS 36.213 [23]. | - |
| ce-InactiveState
Indicates whether UE operating in CE mode supports RRC_INACTIVE when connected to 5GC. A UE including this field also supports short eDRX cycles in RRC_INACTIVE when connected to 5GC. | No |
| ce-MeasRSS-Dedicated, ce-MeasRSS-DedicatedSameRBs
Indicates whether the UE operating in CE mode A/B supports receiving neighbour cell RSS information in dedicated signalling and performing serving cell and neighbour cell measurements based on RSS in RRC_CONNECTED as specified in TS 36.306 [5] and TS 36.133 [16]. | Yes |
| ce-ModeA, ce-ModeB
Indicates whether the UE supports operation in CE mode A and/or B, as specified in TS 36.211 [21] and TS 36.213 [23]. | - |
| crs-ChEstMPDCCH-CE-ModeA, crs-ChEstMPDCCH-CE-ModeB
Indicates whether UE operating in CE mode A/B supports using CRS for improving MPDCCH channel estimation. | Yes |
| crs-ChEstMPDCCH-CSI
Indicates whether UE operating in CE mode A supports CSI-based mapping for improving MPDCCH channel estimation. | Yes |
| crs-ChEstMPDCCH-ReciprocityTDD
Indicates whether UE operating in CE mode A supports using CRS for improving MPDCCH channel estimation with reciprocity-based candidates in TDD. | No |
| ceMeasurements
Indicates whether the UE supports intra-frequency RSRQ measurements and inter-frequency RSRP and RSRQ measurements in RRC_CONNECTED, as specified in TS 36.133 [16] and TS 36.304 [4]. | - |
| ce-MultiTB-64QAM
Indicates whether the UE supports downlink 64QAM for multiple TB scheduling in connected mode for PDSCH when operating in CE mode A, as specified in TS 36.211 [21] and TS 36.213 [23]. This field can be included only if <i>ce-PUSCH-SubPRB-Allocation</i> is included. | Yes |
| ce-MultiTB-EarlyTermination
Indicates whether the UE supports early termination of PUSCH transmission for multiple TB scheduling in connected mode, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| ce-MultiTB-FrequencyHopping
Indicates whether the UE supports frequency hopping for multiple TB scheduling for PDSCH/PUSCH in connected mode, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| ce-MultiTB-HARQ-AckBundling
Indicates whether the UE supports downlink HARQ-ACK bundling for multiple TB scheduling in connected mode when operating in CE mode A, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| ce-MultiTB-Interleaving
Indicates whether the UE supports TB interleaving for multiple TB scheduling in connected mode for PDSCH/PUSCH when operating in CE mode A or B, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| ce-MultiTB-SubPRB
Indicates whether the UE supports sub-PRB allocation for multiple TB scheduling for PUSCH in connected mode, as specified in TS 36.211 [21] and TS 36.213 [23]. This field can be included only if <i>ce-PUSCH-SubPRB-Allocation</i> is included. | Yes |
| ce-PDSCH-14HARQProcesses, ce-PDSCH-14HARQProcesses-Alt2
Indicates whether the UE supports 14-HARQ processes, as specified in TS 36.212 [22]. | - |
| ce-PDSCH-64QAM
Indicates whether the UE supports 64QAM for non-repeated unicast PDSCH in CE mode A. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| ce-PDSCH-FlexibleStartPRB-CE-ModeA, ce-PDSCH-FlexibleStartPRB-CE-ModeB, ce-PUSCH-FlexibleStartPRB-CE-ModeA, ce-PUSCH-FlexibleStartPRB-CE-ModeB
This field indicates whether UE supports flexible starting PRB for PDSCH/PUSCH when operating in coverage enhancement mode A/B, as specified in TS 36.211 [21] and TS 36.213 [22]. | Yes |
| ce-PDSCH-MaxTBS
Indicates whether the UE supports downlink TBS of 1736 bits, as specified in TS 36.212 [22]. | - |
| ce-PDSCH-PUSCH-Enhancement
Indicates whether the UE supports new numbers of repetitions for PUSCH and modulation restrictions for PDSCH/PUSCH in CE mode A as specified in TS 36.212 [22] and TS 36.213 [23]. | No |
| ce-PDSCH-PUSCH-MaxBandwidth
Indicates the maximum supported PDSCH/PUSCH channel bandwidth in CE mode A and B, as specified in TS 36.212 [22] and TS 36.213 [23]. Value bw5 corresponds to 5 MHz and value bw20 corresponds to 20 MHz. If the field is absent the maximum PDSCH/PUSCH channel bandwidth in CE mode A and B is 1.4 MHz. If the setting of this parameter is 20 MHz, the max supported PUSCH channel bandwidth in CE mode A is 5 MHz. The maximum PUSCH channel bandwidth in CE mode B is 1.4 MHz regardless of the setting of this parameter. Parameter: transmission bandwidth configuration, see TS 36.101 [42], table 5.6-1. | Yes |
| ce-PDSCH-TenProcesses
Indicates whether the UE supports 10 DL HARQ processes in FDD in CE mode A. | Yes |
| ce-PUCCH-Enhancement
Indicates whether the UE supports repetition levels 64 and 128 for PUCCH in CE Mode B, as specified in TS 36.211 [21] and in TS 36.213 [23]. | No |
| ce-PUSCH-NB-MaxTBS
Indicates whether the UE supports 2984 bits max UL TBS in 1.4 MHz in CE mode A operation, as specified in TS 36.212 [22] and TS 36.213 [23]. | Yes |
| ce-PUSCH-SubPRB-Allocation
Indicates whether the UE supports sub-PRB resource allocation for PUSCH in CE mode A or B, as specified in TS 36.211 [21], TS 36.212 [22] and TS 36.213 [23]. | Yes |
| ce-ReturningSymbols
Indicates the number of retuning symbols in CE mode A and B as specified in TS 36.211 [21]. Value n0 corresponds to 0 retuning symbols and value n1 corresponds to 1 retuning symbol. If the field is absent the number of retuning symbols in CE mode A and B is 2. | No |
| ce-SchedulingEnhancement
Indicates whether the UE supports dynamic HARQ-ACK delay for HD-FDD in CE mode A as specified in TS 36.212 [22] and TS 36.213 [23]. | No |
| ce-SRS-Enhancement
Indicates whether the UE supports SRS coverage enhancement in TDD with support of SRS combs 2 and 4 as specified in TS 36.213 [23]. This field can be included only if ce-SRS-EnhancementWithoutComb4 is not included. | Yes |
| ce-SRS-EnhancementWithoutComb4
Indicates whether the UE supports SRS coverage enhancement in TDD with support of SRS comb 2 but without support of SRS comb 4 as specified in TS 36.213 [23]. This field can be included only if ce-SRS-Enhancement is not included. | - |
| ce-SwitchWithoutHO
Indicates whether the UE supports switching between normal mode and enhanced coverage mode without handover. | - |
| ce-UL-HARQ-ACK-Feedback
This field indicates whether UE supports uplink HARQ ACK feedback when operating in coverage enhancement, as specified in TS36.213 [22]. | Yes |
| channelMeasRestriction
Indicates for a particular transmission mode whether the UE supports channel measurement restriction. | Yes |
| cho
Indicates whether the UE supports conditional handover including execution condition, candidate cell configuration and maximum 8 candidate cells. | Yes |
| cho-Failure
Indicates whether the UE supports conditional handover during re-establishment procedure when the selected cell is configured as candidate cell for condition handover. | Yes |
| cho-FDD-TDD
Indicates whether the UE supports conditional handover between FDD and TDD cells. | No |
| cho-TwoTriggerEvents
Indicates whether the UE supports 2 trigger events for same execution condition. It is mandatory supported if the UE supports cho. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| codebook-HARQ-ACK
Indicates whether the UE supports determining HARQ ACK codebook size based on the DAI-based solution and/or the number of configured CCs. The first bit is set to "1" if the UE supports the DAI-based codebook size determination. The second bit is set to "1" if the UE supports the codebook determination based on the number of configured CCs. | No |
| commMultipleTx
Indicates whether the UE supports multiple transmissions of sidelink communication to different destinations in one SC period. If <i>commMultipleTx-r13</i> is set to supported then the UE support 8 transmitting sidelink processes. | - |
| commSimultaneousTx
Indicates whether the UE supports simultaneous transmission of EUTRA and sidelink communication (on different carriers) in all bands for which the UE indicated sidelink support in a band combination (using <i>commSupportedBandsPerBC</i>). | - |
| commSupportedBands
Indicates the bands on which the UE supports sidelink communication, by an independent list of bands i.e. separate from the list of supported E-UTRA band, as indicated in <i>supportedBandListEUTRA</i> . | - |
| commSupportedBandsPerBC
Indicates, for a particular band combination, the bands on which the UE supports simultaneous reception of EUTRA and sidelink communication. If the UE indicates support simultaneous transmission (using <i>commSimultaneousTx</i>), it also indicates, for a particular band combination, the bands on which the UE supports simultaneous transmission of EUTRA and sidelink communication. The first bit refers to the first band included in <i>commSupportedBands</i> , with value 1 indicating sidelink is supported. | - |
| configN (in MIMO-CA-ParametersPerBoBCPerTM)
If signalled, the field indicates for a particular transmission mode whether the UE supports non-precoded EBF/ FD-MIMO (class A) related configuration N for the concerned band combination. | - |
| configN (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode whether the UE supports non-precoded EBF/ FD-MIMO (class A) related configuration N for band combinations for which the concerned capabilities are not signalled. | Yes |
| continueEHC-Context
Indicates that the UE supports EHC context continuation operation where the UE keeps the established EHC context(s) upon PDCP re-establishment, as specified in TS 36.323 [8]. | No |
| crossCarrierScheduling | Yes |
| crossCarrierScheduling-B5C
Indicates whether the UE supports cross carrier scheduling beyond 5 DL CCs. | No |
| crossCarrierSchedulingLAA-DL
Indicates whether the UE supports cross-carrier scheduling from a licensed carrier for LAA cell(s) for downlink. This field can be included only if <i>downlinkLAA</i> is included. | - |
| crossCarrierSchedulingLAA-UL
Indicates whether the UE supports cross-carrier scheduling from a licensed carrier for LAA cell(s) for uplink. This field can be included only if <i>uplinkLAA</i> is included. | - |
| crs-DiscoverySignalsMeas
Indicates whether the UE supports CRS based discovery signals measurement, and PDSCH/EPDCCH RE mapping with zero power CSI-RS configured for discovery signals. | Yes |
| crs-IM-TM1-toTM9-OneRX-Port
Indicates whether the DL Category 1bis UE or the DL Category M2 UE supports CRS interference mitigation (IM) while operating in the following transmission modes (TM): TM 1, TM 2, ..., TM 8 and TM 9. | No |
| crs-InterfHandl
Indicates whether the UE supports CRS interference handling. | Yes |
| crs-InterfMitigationTM10
The field defines whether the UE supports CRS interference mitigation in transmission mode 10. The UE supporting the <i>crs-InterfMitigationTM10</i> capability shall also support the <i>crs-InterfHandl</i> capability. | No |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| crs-InterfMitigationTM1toTM9
Indicates whether the UE supports CRS interference mitigation (IM) while operating in the following transmission modes (TM): TM 1, TM 2, ..., TM 8 and TM 9. The UE shall not include the field if it does not support CRS IM in TMs 1-9. If the field is present, the UE supports CRS-IM on at least one arbitrary downlink CC for up to <i>crs-InterfMitigationTM1toTM9-r13</i> downlink CC CA configuration. The UE signals <i>crs-InterfMitigationTM1toTM9-r13</i> value to indicate the maximum <i>crs-InterfMitigationTM1toTM9-r13</i> downlink CC CA configuration where UE may apply CRS IM. For example, the UE sets " <i>crs-InterfMitigationTM1toTM9-r13 = 3</i> " to indicate that the UE supports CRS-IM on at least one DL CC for supported non-CA, 2DL CA and 3DL CA configurations. The UE supporting the <i>crs-InterfMitigationTM1toTM9-r13</i> capability shall also support the <i>crs-InterfHandl-r11</i> capability. | - |
| crs-IntfMitig
Indicate whether the UE supports CRS interference mitigation as specified in TS 36.133 [16], clause 3.6.1.1. | Yes |
| crs-LessDwPTS
Indicates whether the UE supports TDD special subframe configuration 10 without CRS transmission on the 5th symbol of DwPTS, i.e. <i>ssp10-CRS-LessDwPTS</i> , as specified in TS 36.211 [17]. | - |
| csi-ReportingAdvanced, csi-ReportingAdvancedMaxPorts (in MIMO-CA-ParametersPerBoBCPerTM)
If signalled, the field indicates that for a particular transmission mode, the maximum number of CSI-RS ports supported by the UE for advanced CSI reporting is different in the concerned band or band combination than the value indicated by the field <i>csi-ReportingAdvanced</i> or <i>csi-ReportingAdvancedMaxPorts</i> in <i>MIMO-UE-ParametersPerTM</i> . The UE shall not include both <i>csi-ReportingAdvanced</i> and <i>csi-ReportingAdvancedMaxPorts</i> for a particular transmission mode in the concerned band or band combination. | - |
| csi-ReportingAdvanced (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode the maximum number of CSI-RS ports supported by the UE for advanced CSI reporting. The field <i>csi-ReportingAdvanced</i> indicates 32 CSI-RS ports. The UE shall not include both <i>csi-ReportingAdvanced</i> and <i>csi-ReportingAdvancedMaxPorts</i> for a particular transmission mode. | Yes |
| csi-ReportingAdvancedMaxPorts (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode the maximum number of CSI-RS ports supported by the UE for advanced CSI reporting. The field <i>csi-ReportingAdvancedMaxPorts</i> indicates 8, 12, 16, 20, 24 or 28 CSI-RS ports. The UE shall not include both <i>csi-ReportingAdvanced</i> and <i>csi-ReportingAdvancedMaxPorts</i> for a particular transmission mode. | - |
| csi-ReportingNP (in MIMO-CA-ParametersPerBoBCPerTM)
If signalled, value <i>different</i> indicates that for a particular transmission mode, the CSI reporting on non-precoded CSI-RS with 20, 24, 28 or 32 antenna ports for the concerned band or band combination is different than the value indicated by field <i>csi-ReportingNP</i> in <i>MIMO-UE-ParametersPerTM</i> . | - |
| csi-ReportingNP (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode whether the UE supports CSI reporting on non-precoded CSI-RS with 20, 24, 28, or 32 antenna ports for band combinations for which the concerned capabilities are not signalled in <i>MIMO-CA-ParametersPerBoBCPerTM</i> , and the FD-MIMO processing capability condition as described in NOTE 8 is satisfied. | Yes |
| csi-RS-DiscoverySignalsMeas
Indicates whether the UE supports CSI-RS based discovery signals measurement. If this field is included, the UE shall also include <i>crs-DiscoverySignalsMeas</i> . | Yes |
| csi-RS-DRS-RRM-MeasurementsLAA
Indicates whether the UE supports performing RRM measurements on LAA cell(s) based on CSI-RS-based DRS. This field can be included only if <i>downlinkLAA</i> is included. | - |
| csi-RS-EnhancementsTDD
Indicates for a particular transmission mode whether the UE supports CSI-RS enhancements applicable for TDD. | Yes |
| csi-SubframeSet
Indicates whether the UE supports REL-12 DL CSI subframe set configuration, REL-12 DL CSI subframe set dependent CSI measurement/feedback, configuration of up to 2 CSI-IM resources for a CSI process with no more than 4 CSI-IM resources for all CSI processes of one frequency if the UE supports tm10, configuration of two ZP-CSI-RS for tm1 to tm9, PDSCH RE mapping with two ZP-CSI-RS configurations, and EPDCCH RE mapping with two ZP-CSI-RS configurations if the UE supports EPDCCH. This field is only applicable for UEs supporting TDD. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| csi-SubframeSet2ForDormantSCell
Indicates whether the UE supports second CSI subframe set for periodic CSI reporting for dormant serving cells. A UE that indicates support of this field shall also indicate support for <i>dormantSCellState-r15</i> . This field is only applicable for UEs supporting TDD. | - |
| dataInactMon
Indicates whether the UE supports the data inactivity monitoring as specified in TS 36.321 [6]. | - |
| dc-Support
Including this field indicates that the UE supports synchronous DC and power control mode 1. Including this field for a band combination entry comprising of single band entry indicates that the UE supports intra-band contiguous DC. Including this field for a band combination entry comprising of two or more band entries, indicates that the UE supports DC for these bands and that the serving cells corresponding to a band entry shall belong to one cell group (i.e. MCG or SCG). Including field <i>asynchronous</i> indicates that the UE supports asynchronous DC and power control mode 2. Including this field for a TDD/FDD band combination indicates that the UE supports TDD/FDD DC for this band combination. | - |
| delayBudgetReporting
Indicates whether the UE supports delay budget reporting. | No |
| demodulationEnhancements
This field defines whether the UE supports advanced receiver in SFN scenario (350 km/h) as specified in TS 36.101 [42]. | - |
| demodulationEnhancements2
This field defines whether the UE supports further enhanced receiver in HST-SFN scenario (up to 500 km/h velocity) as specified in TS 36.101 [42]. | - |
| densityReductionNP, densityReductionBF
Indicates whether the UE supports CSI-RS density reduction with values 1, 1/2 and 1/3 for non-precoded CSI-RS and beamformed CSI-RS respectively. | Yes |
| deviceType
UE may set the value to " <i>noBenFromBatConsumpOpt</i> " when it does not foresee to particularly benefit from NW-based battery consumption optimisation. Absence of this value means that the device does benefit from NW-based battery consumption optimisation. | - |
| diffFallbackCombReport
Indicates that the UE supports reporting of UE radio access capabilities for the CA band combinations asked by the eNB as well as, if any, reporting of different UE radio access capabilities for their fallback band combination as specified in TS 36.306 [5]. The UE does not report fallback combinations if their UE radio access capabilities are the same as the ones for the CA band combination asked by the eNB. | - |
| differentFallbackSupported
Indicates that the UE supports different capabilities for at least one fallback case of this band combination. | - |
| directMCG-SCellActivationResume
Indicates whether the UE supports having an E-UTRA MCG SCell configured in activated SCell state. | - |
| directSCellActivation
Indicates whether the UE supports having an E-UTRA SCell configured in activated SCell state in the <i>RRCConnectionReconfiguration</i> message. This field is applicable to both LTE standalone and LTE-DC. | - |
| directSCellHibernation
Indicates whether the UE supports having an SCell configured in dormant SCell state. | - |
| directSCG-SCellActivationNEDC
Indicates whether the UE supports having an E-UTRA SCG SCell configured in activated SCell state in the <i>RRCConnectionReconfiguration</i> message contained in the NR <i>RRCReconfiguration</i> message, as defined in TS 36.321 [6] and TS 38.331 [82].
If the UE indicates support of <i>directSCG-SCellActivationNEDC-r16</i> , the UE shall also indicate support of <i>ne-dc</i> as specified in TS 38.331 [82]. | - |
| directSCG-SCellActivationResume
Indicates whether the UE supports having an E-UTRA SCG SCell configured in activated SCell state. | - |
| disInterFreqTx
Indicates whether the UE support sidelink discovery announcements either a) on the primary frequency only or b) on other frequencies also, regardless of the UE configuration (e.g. CA, DC). The UE may set <i>disInterFreqTx</i> to supported when having a separate transmitter or if it can request sidelink discovery transmission gaps. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| discoverySignalsInDeactSCell
Indicates whether the UE supports the behaviour on DL signals and physical channels when SCell is deactivated and discovery signals measurement is configured as specified in TS 36.211 [21], clause 6.11A. This field is included only if UE supports carrier aggregation and includes <i>crs-DiscoverySignalsMeas</i> . | Yes |
| discPeriodicSLSS
Indicates whether the UE supports periodic (i.e. not just one time before sidelink discovery announcement) Sidelink Synchronization Signal (SLSS) transmission and reception for sidelink discovery. | - |
| discScheduledResourceAlloc
Indicates whether the UE supports transmission of discovery announcements based on network scheduled resource allocation. | - |
| disc-UE-SelectedResourceAlloc
Indicates whether the UE supports transmission of discovery announcements based on UE autonomous resource selection. | - |
| disc-SLSS
Indicates whether the UE supports Sidelink Synchronization Signal (SLSS) transmission and reception for sidelink discovery. | - |
| discSupportedBands
Indicates the bands on which the UE supports sidelink discovery. One entry corresponding to each supported E-UTRA band, listed in the same order as in <i>supportedBandListEUTRA</i> . | - |
| discSupportedProc
Indicates the number of processes supported by the UE for sidelink discovery. | - |
| discSysInfoReporting
Indicates whether the UE supports reporting of system information for inter-frequency/PLMN sidelink discovery. | - |
| dl-256QAM
Indicates whether the UE supports 256QAM in DL on the band. | - |
| dl-1024QAM
Indicates whether the UE supports 1024QAM in DL on the band or on the band within the band combination. When <i>dl-1024QAM-ScalingFactor</i> and <i>dl-1024QAM-TotalWeightedLayers</i> are included, the UE supports 1024QAM in a set of CCs in a band combination if the CCs belong to bands indicated to support 1024QAM in that band combination and the 1024QAM processing capability condition as specified in equation 4.3.5.31-1 in TS 36.306 [5] is satisfied. | - |
| dl-1024QAM-ScalingFactor
Indicates scaling factor for processing a CC configured with 1024QAM with respect to a CC not configured with 1024QAM as described in 4.3.5.31 in TS 36.306 [5]. Value v1 indicates 1, value v1dot2 indicates 1.2 and value v1dot25 indicates 1.25. | - |
| dl-1024QAM-TotalWeightedLayers
Indicates total number of weighted layers the UE can process for 1024QAM as described in 4.3.5.31 in TS 36.306 [5]. Actual value = (10 + indicated value x 2), i.e., value 0 indicates 10 layers, value 1 indicates 12 layers and so on. | - |
| dl-1024QAM-Slot
Indicates whether the UE supports 1024QAM in DL on the band for slot TTI operation. | - |
| dl-1024QAM-SubslotTA-1
Indicates whether the UE supports 1024QAM in DL on the band for subslot TTI operation with TA set 1. | - |
| dl-1024QAM-SubslotTA-2
Indicates whether the UE supports 1024QAM in DL on the band for subslot TTI operation with TA set 2, dmrsBasedSPDCCH-nonMBSFN | - |
| dl-DedicatedMessageSegmentation
Indicates whether the UE supports reception of segmented DL RRC messages. | - |
| dmrs-BasedSPDCCH-MBSFN
Indicates whether the UE supports sDCI monitoring in DMRS based SPDCCH for MBSFN subframe. If UE supports this, it also provides the corresponding DMRS based SPDCCH capability in <i>min-Proc-TimelineSubslot</i> . | Yes |
| dmrs-BasedSPDCCH-nonMBSFN
Indicates whether the UE supports sDCI monitoring in DMRS based SPDCCH for non-MBSFN subframe. If UE supports this, it also provides the corresponding DMRS based SPDCCH capability in <i>min-Proc-TimelineSubslot</i> . | Yes |
| dmrs-Enhancements (in MIMO-CA-ParametersPerBoBCPerTM)
If signalled, the field indicates for a particular transmission mode, that for the concerned band combination the DMRS enhancements are different than the value indicated by field <i>dmrs-Enhancements</i> in <i>MIMO-UE-ParametersPerTM</i> . | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| dmrs-Enhancements (in MIMO-UE-ParametersPerTM)
Indicates for a particular transmission mode whether the UE supports DMRS enhancements for the indicated transmission mode. | Yes |
| dmrs-LessUpPTS
Indicates whether the UE supports not to transmit DMRS for PUSCH in UpPTS. | No |
| dmrs-OverheadReduction
Indicates whether the UE supports OCC4 for rank 3 and 4 transmission as specified in clause 5.3.3.1.5C of TS 36.212 [22]. | Yes |
| dmrs-PositionPattern
Indicates whether the UE supports uplink DMRS position pattern 'D D D' in subslot #5 with application of the 1/6 as the TBS scaling factor. | Yes |
| dmrs-RepetitionSubslotPDSCH
Indicates whether the UE supports back-to-back 3/4-layer DMRS reception in two consecutive subslots across subframe boundary for subslot-PDSCH. | Yes |
| dmrs-SharingSubslotPDSCH
Indicates whether the UE supports DMRS sharing in two consecutive subslots across subframe boundary for subslot-PDSCH. | Yes |
| dormantSCellState
Indicates whether UE supports Dormant SCell state (i.e. SCell state with CQI and RRM measurement reporting but no PDCCH monitoring). | - |
| downlinkLAA
Presence of the field indicates that the UE supports downlink LAA operation including identification of downlink transmissions on LAA cell(s) for full downlink subframes, decoding of common downlink control signalling on LAA cell(s), CSI feedback for LAA cell(s), RRM measurements on LAA cell(s) based on CRS-based DRS. | - |
| drb-TypeSCG
Indicates whether the UE supports SCG bearer. | - |
| drb-TypeSplit
Indicates whether the UE supports split bearer except for PDCP data transfer in UL. | - |
| dtm
Indicates whether the UE supports DTM in GERAN. | - |
| dummy
This field is not used in the specification. It shall not be sent by the UE. | - |
| earlyData-UP
Indicates whether the UE supports UP-EDT when connected to EPC. | - |
| earlyData-UP-5GC
Indicates whether the UE supports UP-EDT when connected to 5GC. | - |
| earlySecurityReactivation
Indicates whether the UE supports early security reactivation when resuming a suspended RRC connection. | - |
| e-CSFB-1XRTT
Indicates whether the UE supports enhanced CS fallback to CDMA2000 1xRTT or not. | Yes |
| e-CSFB-ConcPS-Mob1XRTT
Indicates whether the UE supports concurrent enhanced CS fallback to CDMA2000 1xRTT and PS handover/ redirection to CDMA2000 HRPD. | Yes |
| e-CSFB-dual-1XRTT
Indicates whether the UE supports enhanced CS fallback to CDMA2000 1xRTT for dual Rx/Tx configuration. This bit can only be set to supported if <i>tx-Config1XRTT</i> and <i>rx-Config1XRTT</i> are both set to dual. | Yes |
| e-HARQ-Pattern-FDD
Indicates whether the UE supports enhanced HARQ pattern for TTI bundling operation for FDD. | Yes |
| ehc
Indicates that the UE supports Ethernet header compression and decompression using EHC protocol, as specified in TS 36.323 [8] and in Annex A of TS 38.323 [83]. The UE indicating this capability and indicating support for at least one ROHC profile, shall support simultaneous configuration of EHC and ROHC on different DRBs. | No |
| eLCID-Support
Indicates whether the UE supports LCID "10000" and MAC PDU subheader containing the eLCID field as described in TS 36.321 [6]. | - |
| emptyUnicastRegion
Indicates whether the UE supports unicast reception in subframes with empty unicast control region as described in TS 36.213 [23] clause 12. This field can be included only if <i>unicast-fembmsMixedSCell</i> and <i>crossCarrierScheduling</i> are included. | No |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| en-DC
Indicates whether the UE supports EN-DC. | - |
| endingDwPTS
Indicates whether the UE supports reception ending with a subframe occupied for a DwPTS-duration as described in TS 36.211 [21] and TS 36.213 [23]. This field can be included only if <i>downlinkLAA</i> is included. | - |
| Enhanced-4TxCodebook
Indicates whether the UE supports enhanced 4Tx codebook. | No |
| enhancedDualLayerTDD
Indicates whether the UE supports enhanced dual layer (PDSCH transmission mode 8) for TDD or not. | - |
| ePDCCH
Indicates whether the UE can receive DCI on UE specific search space on Enhanced PDCCH. | Yes |
| epdcch-SPT-differentCells
Indicates whether the UE supports EPDCCH and short processing time on different serving cells. | Yes |
| epdcch-STTI-differentCells
Indicates whether the UE supports EPDCCH and sTTI on different serving cells. | Yes |
| e-RedirectionUTRA | Yes |
| e-RedirectionUTRA-TDD
Indicates whether the UE supports enhanced redirection to UTRA TDD to multiple carrier frequencies both with and without using related SIB provided by <i>RRCConnectionRelease</i> or not. | Yes |
| etws-CMAS-RxInConnCE-ModeA, etws-CMAS-RxInConn
Indicates whether the UE operating in CE mode A/B supports reception of ETWS/CMAS indication in RRC_CONNECTED mode as specified in TS 36.212 [22]. | - |
| eutra-5GC
Indicates whether the UE supports E-UTRA/5GC. | Yes |
| eutra-5GC-HO-ToNR-FDD-FR1
Indicates whether the UE supports handover from E-UTRA/5GC to NR FDD FR1. | Yes |
| eutra-5GC-HO-ToNR-TDD-FR1
Indicates whether the UE supports handover from E-UTRA/5GC to NR TDD FR1. | Yes |
| eutra-5GC-HO-ToNR-FDD-FR2
Indicates whether the UE supports handover from E-UTRA/5GC to NR FDD FR2. | Yes |
| eutra-5GC-HO-ToNR-TDD-FR2
Indicates whether the UE supports handover from E-UTRA/5GC to NR TDD FR2-1. | Yes |
| eutra-5GC-HO-ToNR-TDD-FR2-2
Indicates whether the UE supports handover from E-UTRA/5GC to NR TDD FR2-2. | - |
| eutra-CGI-Reporting-ENDC
Indicates whether the UE supports Intra-RAT report CGI procedure when it is configured with (NG) EN-DC wherein either MN and SN have different DRX cycles, or on-duration configured by MN does not contain on-duration configured by SN if their DRX cycles are same. | Yes |
| eutra-CGI-Reporting-NEDC
Indicates whether the UE supports acquisition of relevant information from a neighbouring E-UTRA cell by reading the SI of the neighbouring cell and reporting the acquired information to the network when the NE-DC is configured. | Yes |
| eutra-EPC-HO-ToNR-FDD-FR1
Indicates whether the UE supports handover from E-UTRA/EPC to NR FDD FR1. | Yes |
| eutra-EPC-HO-ToNR-TDD-FR1
Indicates whether the UE supports handover from E-UTRA/EPC to NR TDD FR1. | Yes |
| eutra-EPC-HO-ToNR-FDD-FR2
Indicates whether the UE supports handover from E-UTRA/EPC to NR FDD FR2. | Yes |
| eutra-EPC-HO-ToNR-TDD-FR2
Indicates whether the UE supports handover from E-UTRA/EPC to NR TDD FR2-1. | Yes |
| eutra-EPC-HO-ToNR-TDD-FR2-2
Indicates whether the UE supports handover from E-UTRA/EPC to NR TDD FR2-2. | - |
| eutra-EPC-HO-EUTRA-5GC
Indicates whether the UE supports handover between E-UTRA/EPC and E-UTRA/5GC. | Yes |
| eutra-IdleInactiveMeasurements
Indicates whether UE supports reporting measurements performed during RRC_IDLE or RRC_INACTIVE. | No |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|---------------------|
| eutra-SI-AcquisitionForHO-ENDC
Indicates whether the UE supports, upon configuration of <i>si-RequestForHO</i> by the network, acquisition of relevant information from a neighbouring E-UTRA cell by reading the SI of the neighbouring cell using autonomous gaps and reporting the acquired information to the network. | Yes |
| eventB2
Indicates whether the UE supports event B2. A UE supporting NR SA operation shall set this bit to <i>supported</i> . | - |
| eventD1-MeasReportTrigger
This field indicates whether the UE supports location-based measurement report triggering in RRC_CONNECTED in earth fixed cell (i.e. event D1). | - |
| eventD2-MeasReportTrigger
This field indicates whether the UE supports location-based measurement report triggering in RRC_CONNECTED in earth moving cell (i.e. event D2). | - |
| extendedBand-n77
This field is only applicable for UEs that indicate support for band n77. If present, the UE supports the restriction to 3450 - 3550 MHz and 3700 - 3980 MHz ranges of band n77 in the USA as specified in Note 12 of Table 5.2-1 in TS 38.101-1 [85]. If absent, the UE supports only restriction to the 3700 - 3980 MHz range of band n77 in the USA. A UE that indicates this field shall support NS value 55 as specified in TS 38.101-1 [85]. | - |
| extendedBand-n77-2
This field is only applicable for UEs that indicate support for band n77. If present, the UE supports the restriction to 3450 - 3650 MHz and 3650 - 3980 ranges of band n77 in Canada as specified in Note 12 of Table 5.2-1 in TS 38.101-1 [85]. If absent, the UE supports only restriction to the 3450 - 3650 MHz range of band n77 in Canada. A UE that indicates this field shall also support NS value 57 as specified in TS 38.101-1 [85]. | - |
| extendedFreqPriorities
Indicates whether the UE supports extended E-UTRA frequency priorities indicated by <i>cellReselectionSubPriority</i> field. A UE supporting NR SA operation shall set this bit to <i>supported</i> . | - |
| extendedLCID-Duplication
Indicates whether the UE supports use of extended LCIDs 32-38 for PDCP duplication. | - |
| extendedLongDRX
Indicates whether the UE supports extended long DRX cycle values of 5.12s and 10.24s in RRC_CONNECTED. | - |
| extendedMAC-LengthField
Indicates whether the UE supports the MAC header with L field of size 16 bits as specified in TS 36.321 [6], clause 6.2.1. | - |
| extendedMaxMeasId
Indicates whether the UE supports extended number of measurement identities as defined by <i>maxMeasId-r12</i> . | No |
| extendedMaxObjectId
Indicates whether the UE supports extended number of measurement object identities as defined by <i>maxObjectId-r13</i> . | No |
| extendedNumberOfDRBs
Indicates whether the UE supports up to 15 DRBs. The UE shall support any combination of RLC AM and RLC UM entities for the configured DRBs. | - |
| extendedPollByte
Indicates whether the UE supports extended pollByte values as defined by <i>pollByte-r14</i> . | - |
| extended-RLC-LI-Field
Indicates whether the UE supports 15 bit RLC length indicator. | - |
| extendedRLC-SN-SO-Field
Indicates whether the UE supports 16 bits of RLC sequence number and segmentation offset. | - |
| extendedRSRQ-LowerRange
Indicates whether the UE supports the extended RSRQ lower value range from -34dB to -19.5dB in measurement configuration and reporting as specified in TS 36.133 [16]. | No |
| fdd-HARQ-TimingTDD
Indicates whether UE supports FDD HARQ timing for TDD SCell when configured with TDD PCell. | Yes |
| featureGroupIndicators, featureGroupIndRel9Add, featureGroupIndRel10
The definitions of the bits in the bit string are described in Annex B.1 (for <i>featureGroupIndicators</i> and <i>featureGroupIndRel9Add</i>) and in Annex C.1 (for <i>featureGroupIndRel10</i>). | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| featureSetsDL-PerCC
In MR-DC, indicates a set of features that the UE supports on one component carrier in a bandwidth class for a band in a given band combination. The UE shall hence include at least as many <i>FeatureSetDL-PerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-bandwidthClassDL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetDownlinkPerCC-Id</i> in the feature set. The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetDL-PerCC-Id</i> in this list. | - |
| FeatureSetDL-PerCC-Id
In MR-DC, indicates the index position of the <i>FeatureSetDL-PerCC-r15</i> in the <i>featureSetsDL-PerCC-r15</i> list. Value 0 corresponds to the first element in the list, value 1 corresponds to the second element in the list, and so on. Value 32 is not used. | - |
| featureSetsUL-PerCC
In MR-DC, indicates a set of features that the UE supports on one component carrier in a bandwidth class for a band in a given band combination. The UE shall hence include at least as many <i>FeatureSetUL-PerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-bandwidthClassUL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetDownlinkPerCC-Id</i> in the feature set. The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetUL-PerCC-Id</i> in this list. | - |
| FeatureSetUL-PerCC-Id
In MR-DC, indicates the index position of the <i>FeatureSetUL-PerCC-r15</i> in the <i>featureSetsUL-PerCC-r15</i> list. Value 0 corresponds to the first element in the list, value 1 corresponds to the second element in the list, and so on. Value 32 is not used. | - |
| fembmsMixedCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception with 15 kHz subcarrier spacings via MBSFN from FeMBMS/Unicast mixed cells on a frequency indicated in an <i>MBMSInterestIndication</i> message. | |
| fembmsDedicatedCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception with 15 kHz subcarrier spacings via MBSFN from MBMS-dedicated cells on a frequency indicated in an <i>MBMSInterestIndication</i> message. | |
| flexibleUM-AM-Combinations
Indicates whether the UE supports any combination of RLC UM and RLC AM bearers as long as the total number of bearers is at most 8, regardless of what FGI20 indicates. | - |
| flightPathPlan
Indicates whether UE supports reporting of flight path plan information. | - |
| fourLayerTM3-TM4
Indicates whether the UE supports 4-layer spatial multiplexing for TM3 and TM4. | - |
| fourLayerTM3-TM4 (in FeatureSetDL-PerCC)
Indicates whether the UE supports 4-layer spatial multiplexing for TM3 and TM4 for MR-DC within the indicated feature set. If this field is absent, UE supports two layer MIMO for TM3/TM4. | - |
| fourLayerTM3-TM4-perCC
Indicates whether the UE supports 4-layer spatial multiplexing for TM3 and TM4 for the component carrier. | - |
| frameStructureType-SPT
This field indicates the supported FS-type(s) for short processing time. The UE capability is reported per band combination. The reported FS-type(s) apply to the reported <i>maxNumberCCs-SPT-r15</i> for the given band combination. | - |
| freqBandPriorityAdjustment
Indicates whether the UE supports the prioritization of frequency bands in <i>multiBandInfoList</i> over the band in <i>freqBandIndicator</i> as defined by <i>freqBandIndicatorPriority-r12</i> . | - |
| freqBandRetrieval
Indicates whether the UE supports reception of <i>requestedFrequencyBands</i> . | - |
| gaplessMeas-FR2-maxCC
Indicates whether the UE supports inter-RAT NR FR2 measurement without measurement gap as specified in clause 9.1.2 of TS 38.133 [84] while the number of configured serving cells is less than or equal to the indicated number. This field is applicable when only E-UTRA serving cells are configured. The UE reporting this field and supporting (NG)EN-DC shall not indicate support of <i>independentGapConfig</i> in <i>MeasAndMobParametersMRDC</i> (defined in TS 38.306 [87]). | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| gNB-ID-Length-Reporting-NR-EN-DC
Indicates whether the UE supports Inter-RAT gNB ID length reporting towards NR cell when it is configured with (NG)EN-DC. If the UE supports <i>reportCGI-NR-EN-DC-r15</i> , the UE shall support the <i>gNB-ID-Length-Reporting-NR-EN-DC-r17</i> . | - |
| gNB-ID-Length-Reporting-NR-NoEN-DC
Indicates whether the UE supports Inter-RAT gNB ID length reporting towards cell when it is not configured with (NG)EN-DC. If the UE supports <i>reportCGI-NR-NoEN-DC-r15</i> , the UE shall support <i>gNB-ID-Length-Reporting-NR-NoEN-DC-r17</i> . | - |
| halfDuplex
If <i>halfDuplex</i> is set to true, only half duplex operation is supported for the band, otherwise full duplex operation is supported. | - |
| heightMeas
Indicates whether UE supports the measurement events H1/H2. | - |
| ho-EUTRA-5GC-FDD-TDD
Indicates whether the UE supports handover between E-UTRA/5GC FDD and E-UTRA/5GC TDD. | No |
| ho-InterfreqEUTRA-5GC
Indicates whether the UE supports inter frequency handover within E-UTRA/5GC. | Yes |
| hybridCSI
Indicates whether the UE supports hybrid CSI transmission as described in TS 36.213 [23]. | Yes |
| idleInactiveValidityAreaList
Indicates whether the UE supports list of validity areas for measurements during RRC_IDLE and RRC_INACTIVE. | No |
| immMeasBT
Indicates whether the UE supports Bluetooth measurements in RRC connected mode. | - |
| immMeasUnComBarPre
Indicates whether the UE supports uncompensated barometric pressure measurements in RRC connected mode. | - |
| immMeasWLAN
Indicates whether the UE supports WLAN measurements in RRC connected mode. | - |
| ims-VoiceOverMCG-BearerEUTRA-5GC
Indicates whether the UE supports IMS voice over NR PDCP for MCG bearer for E-UTRA/5GC. | No |
| ims-VoiceOverNR-FR1
Indicates whether the UE supports IMS voice over NR FR1. | No |
| ims-VoiceOverNR-FR2
Indicates whether the UE supports IMS voice over NR FR2-1. | No |
| ims-VoiceOverNR-FR2-2
Indicates whether the UE supports IMS voice over NR FR2-2. | - |
| ims-VoiceOverNR-PDCP-MCG-Bearer
Indicates whether the UE supports IMS voice over NR PDCP with only MCG RLC bearer. | Yes |
| ims-VoiceOverNR-PDCP-SCG-Bearer
Indicates whether the UE supports IMS voice over NR PDCP with only SCG RLC bearer when configured with EN-DC. | Yes |
| ims-VoNR-PDCP-SCG-NGENDC
Indicates whether the UE supports IMS voice over NR PDCP with only SCG RLC bearer when configured with NGEN-DC. | Yes |
| inactiveState
Indicates whether the UE supports RRC_INACTIVE. | No |
| incMonEUTRA
Indicates whether the UE supports increased number of E-UTRA carrier monitoring in RRC_IDLE and RRC_CONNECTED, as specified in TS 36.133 [16]. | No |
| incMonUTRA
Indicates whether the UE supports increased number of UTRA carrier monitoring in RRC_IDLE and RRC_CONNECTED, as specified in TS 36.133 [16]. | No |
| inDeviceCoexInd
Indicates whether the UE supports in-device coexistence indication as well as autonomous denial functionality. | Yes |
| inDeviceCoexInd-ENDC
Indicates whether the UE supports in-device coexistence indication for (NG)EN-DC operation. This field can be included only if <i>inDeviceCoexInd</i> is included. The UE supports <i>inDeviceCoexInd-ENDC</i> in the same duplexing modes as it supports <i>inDeviceCoexInd</i> . | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| <i>inDeviceCoexInd-HardwareSharingInd</i>
Indicates whether the UE supports indicating hardware sharing problems when sending the <i>InDeviceCoexIndication</i> , as well as omitting the TDM assistance information. A UE that supports hardware sharing indication shall also indicate support of LAA operation. | - |
| <i>inDeviceCoexInd-UL-CA</i>
Indicates whether the UE supports UL CA related in-device coexistence indication. This field can be included only if <i>inDeviceCoexInd</i> is included. The UE supports <i>inDeviceCoexInd-UL-CA</i> in the same duplexing modes as it supports <i>inDeviceCoexInd</i> . | - |
| <i>interBandTDD-CA-WithDifferentConfig</i>
Indicates whether the UE supports inter-band TDD carrier aggregation with different UL/DL configuration combinations. The first bit indicates UE supports the configuration combination of SCell DL subframes are a subset of PCell and PSCell by SIB1 configuration and the configuration combination of SCell DL subframes are a superset of PCell and PSCell by SIB1 configuration; the second bit indicates UE supports the configuration combination of SCell DL subframes are neither superset nor subset of PCell and PSCell by SIB1 configuration. This field is included only if UE supports inter-band TDD carrier aggregation. | - |
| <i>interBandPowerSharingAsyncDAPS</i>
Indicates whether the UE supports power sharing for asynchronous inter-band DAPS handovers. | - |
| <i>interBandPowerSharingSyncDAPS</i>
Indicates whether the UE supports power sharing for synchronous inter-band DAPS handovers. | - |
| <i>interferenceMeasRestriction</i>
Indicates whether the UE supports interference measurement restriction. | Yes |
| <i>interFreqAsyncDAPS</i>
Indicates whether the UE supports asynchronous DAPS handover in source PCell and inter-frequency target PCell. | - |
| <i>interFreqBandList</i>
One entry corresponding to each supported E-UTRA band listed in the same order as in <i>supportedBandListEUTRA</i> . | - |
| <i>interFreqDAPS</i>
Indicates whether the UE supports DAPS handover in source PCell and inter-frequency target PCell, i.e. support of simultaneous DL reception of PDCCH and PDSCH from source and target cell. For a BC, the capability applies to every carrier pair for source and target. A UE indicating this capability shall also support synchronous DAPS handover, and single UL transmission for inter-frequency DAPS handover. | - |
| <i>interFreqMultiUL-TransmissionDAPS</i>
Indicates that the UE supports simultaneous UL transmission in source PCell and inter-frequency target PCell. | - |
| <i>interFreqNeedForGaps</i>
Indicates need for measurement gaps when operating on the E-UTRA band given by the entry in <i>bandListEUTRA</i> or on the E-UTRA band combination given by the entry in <i>bandCombinationListEUTRA</i> and measuring on the E-UTRA band given by the entry in <i>interFreqBandList</i> . | - |
| <i>interFreqProximityIndication</i>
Indicates whether the UE supports proximity indication for inter-frequency E-UTRAN CSG member cells. | - |
| <i>interFreqRSTD-Measurement</i>
Indicates whether the UE supports inter-frequency RSTD measurements for OTDOA positioning, as specified in TS 36.355 [54]. | Yes |
| <i>interFreqSI-AcquisitionForHO</i>
Indicates whether the UE supports, upon configuration of si-RequestForHO by the network, acquisition and reporting of relevant information using autonomous gaps by reading the SI from a neighbouring inter-frequency cell. | Yes |
| <i>interRAT-BandList</i>
One entry corresponding to each supported band of another RAT listed in the same order as in the <i>interRAT-Parameters</i> . The NR bands reported in <i>SupportedBandListNR</i> are excluded from this list. | - |
| <i>interRAT-BandListNR-EN-DC</i>
One entry corresponding to each supported NR band listed in the same order as in the <i>supportedBandListEN-DC-r15</i> . If both <i>interRAT-BandListNR-EN-DC</i> and <i>interRAT-BandListNR-SA</i> are included, the UE shall set the same <i>interRAT-NeedForGapsNR</i> value and same <i>interRAT-NeedForInterruptionNR</i> value (if any) for the same NR band. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| interRAT-BandListNR-SA
One entry corresponding to each supported NR band listed in the same order as in the <i>supportedBandListNR-SA</i> . If both <i>interRAT-BandListNR-EN-DC</i> and <i>interRAT-BandListNR-SA</i> are included, the UE shall set the same <i>interRAT-NeedForGapsNR</i> value and same <i>interRAT-NeedForInterruptionNR</i> value (if any) for the same NR band. | - |
| interRAT-enhancementNR
Indicates whether the UE supports enhanced inter-RAT NR measurement requirements to support high speed up to 500 km/h as specified in TS 36.133 [16], when EN-DC is not configured and when EN-DC is configured. | - |
| interRAT-NeedForGaps
Indicates need for DL measurement gaps when operating on the E-UTRA band given by the entry in <i>bandListEUTRA</i> or on the E-UTRA band combination given by the entry in <i>bandCombinationListEUTRA</i> and measuring on the inter-RAT band given by the entry in the <i>interRAT-BandList</i> . | - |
| interRAT-NeedForGapsNR
Indicates need for measurement gaps when operating on the E-UTRA band given by the entry in <i>supportedBandListEUTRA</i> or on the E-UTRA band combination given by the entry in <i>supportedBandCombination-r10</i> or <i>supportedBandCombinationAdd-r11</i> or <i>supportedBandCombinationReduced-r13</i> and measuring on the NR band given by the entry in the <i>InterRAT-BandListNR</i> . | - |
| interRAT-NeedForInterruptionNR
Indicates need for interruption when operating on the E-UTRA band given by the entry in <i>supportedBandListEUTRA</i> or on the E-UTRA band combination given by the entry in <i>supportedBandCombination-r10</i> or <i>supportedBandCombinationAdd-r11</i> or <i>supportedBandCombinationReduced-r13</i> and measuring without measurement gaps on the NR band given by the entry in the <i>InterRAT-BandListNR</i> . | - |
| interRAT-ParametersWLAN
Indicates whether the UE supports WLAN measurements configured by <i>MeasObjectWLAN</i> with corresponding quantity and report configuration in the supported WLAN bands. | - |
| interRAT-PS-HO-ToGERAN
Indicates whether the UE supports inter-RAT PS handover to GERAN or not. | Yes |
| intraBandContiguousCC-InfoList
Indicates, per serving carrier of which the corresponding bandwidth class includes multiple serving carriers (i.e. bandwidth class B, C, D and so on), the maximum number of supported layers for spatial multiplexing in DL and the maximum number of CSI processes supported. The number of entries is equal to the number of component carriers in the corresponding bandwidth class. The UE shall support the setting indicated in each entry of the list regardless of the order of entries in the list. The UE shall include the field only if it supports 4-layer spatial multiplexing in transmission mode3/4 for a subset of component carriers in the corresponding bandwidth class, or if the maximum number of supported layers for at least one component carrier is higher than <i>supportedMIMO-CapabilityDL-r10</i> in the corresponding bandwidth class, or if the number of CSI processes for at least one component carrier is higher than <i>supportedCSI-Proc-r11</i> in the corresponding band.
This field may also be included for bandwidth class A but in such a case without including any sub-fields in <i>IntraBandContiguousCC-Info-r12</i> (see NOTE 6). | - |
| intraFreqA3-CE-ModeA
Indicates whether the UE when operating in CE Mode A supports <i>eventA3</i> for intra-frequency neighbouring cells. | - |
| intraFreqA3-CE-ModeB
Indicates whether the UE when operating in CE Mode B supports <i>eventA3</i> for intra-frequency neighbouring cells. | - |
| intraFreq-CE-NeedForGaps
Indicates need for measurement gaps when operating in CE on the E-UTRA band given by the entry in <i>supportedBandListEUTRA</i> . | - |
| intraFreqAsyncDAPS
Indicates whether the UE supports asynchronous DAPS handover in source PCell and intra-frequency target PCell. | - |
| intraFreqDAPS
Indicates whether UE supports DAPS handover in source PCell and intra-frequency target PCell, i.e. support of simultaneous DL reception of PDCCH and PDSCH from source and target cell. A UE indicating this capability shall also support synchronous DAPS handover, and single UL transmission for intra-frequency DAPS handover. | - |
| intraFreqHO-CE-ModeA
Indicates whether the UE when operating in CE Mode A supports intra-frequency handover. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| <i>intraFreqHO-CE-ModeB</i>
Indicates whether the UE when operating in CE Mode B supports intra-frequency handover. | - |
| <i>intraFreqProximityIndication</i>
Indicates whether the UE supports proximity indication for intra-frequency E-UTRAN CSG member cells. | - |
| <i>intraFreqSI-AcquisitionForHO</i>
Indicates whether the UE supports, upon configuration of si-RequestForHO by the network, acquisition and reporting of relevant information using autonomous gaps by reading the SI from a neighbouring intra-frequency cell. | Yes |
| <i>intraFreqTwoTAGs-DAPS</i>
Indicates whether the UE supports different timing advance groups in source PCell and intra-frequency target PCell. It is mandatory for <i>intraFreqDAPS</i> capable UE. | - |
| <i>jointEHC-ROHC-Config</i>
Indicates whether the UE supports simultaneous configuration of EHC and ROHC protocols for the same DRB. | No |
| <i>k-Max (in MIMO-CA-ParametersPerBoBCPerTM)</i>
If signalled, the field indicates for a particular transmission mode the maximum number of NZP CSI RS resource configurations supported within a CSI process applicable for the concerned band combination. | No |
| <i>k-Max (in MIMO-UE-ParametersPerTM)</i>
Indicates for a particular transmission mode the maximum number of NZP CSI RS resource configurations supported within a CSI process applicable for band combinations for which the concerned capabilities are not signalled. | Yes |
| <i>laa-PUSCH-Mode1</i>
Indicates whether the UE supports LAA PUSCH mode 1 as defined in TS 36.213 [23]. | - |
| <i>laa-PUSCH-Mode2</i>
Indicates whether the UE supports LAA PUSCH mode 2 as defined in TS 36.213 [23]. | - |
| <i>laa-PUSCH-Mode3</i>
Indicates whether the UE supports LAA PUSCH mode 3 as defined in TS 36.213 [23]. | - |
| <i>locationReport</i>
Indicates whether the UE supports reporting of its geographical location information to eNB. | - |
| <i>loggedMBSFNMeasurements</i>
Indicates whether the UE supports logged measurements for MBSFN. A UE indicating support for logged measurements for MBSFN shall also indicate support for logged measurements in Idle mode. | - |
| <i>loggedMeasBT</i>
Indicates whether the UE supports Bluetooth measurements in RRC idle mode. | - |
| <i>loggedMeasIdleEventL1</i>
Indicates whether the UE supports event triggered logged measurements for <i>eventL1</i> in <i>camped normally</i> state. | - |
| <i>loggedMeasIdleEventOutOfCoverage</i>
Indicates whether the UE supports event triggered logged measurements for <i>outOfCoverage</i> in <i>any cell selection</i> state. | - |
| <i>loggedMeasUnComBarPre</i>
Indicates whether the UE supports uncompensated barometric pressure measurements in RRC_IDLE mode. | - |
| <i>loggedMeasurementsIdle</i>
Indicates whether the UE supports logged measurements in Idle mode. | - |
| <i>loggedMeasWLAN</i>
Indicates whether the UE supports WLAN measurements in RRC idle mode. | - |
| <i>logicalChannelSR-ProhibitTimer</i>
Indicates whether the UE supports the <i>logicalChannelSR-ProhibitTimer</i> as defined in TS 36.321 [6]. | - |
| <i>longDRX-Command</i>
Indicates whether the UE supports Long DRX Command MAC Control Element. | - |
| <i>lowerMSD-MRDC</i>
Indicates whether the UE supports lower maximum sensitivity degradation when the band is the victim band with sensitivity degradation as specified in TS 38.101-3 [101]. | - |
| <i>lwa</i>
Indicates whether the UE supports LTE-WLAN Aggregation (LWA). The UE which supports LWA shall also indicate support of <i>interRAT-ParametersWLAN-r13</i> . | - |
| <i>lwa-BufferSize</i>
Indicates whether the UE supports the layer 2 buffer sizes for "with support for split bearers" as defined in Table 4.1-3 and 4.1A-3 of TS 36.306 [5] for LWA. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| Iwa-HO-WithoutWT-Change
Indicates whether the UE supports handover where LWA configuration is retained without WT change and using LWA end-marker for PDCP key change indication for LWA operation. | - |
| Iwa-RLC-UM
Indicates whether the UE supports RLC UM for LWA bearer. | - |
| Iwa-SplitBearer
Indicates whether the UE supports the split LWA bearer (as defined in TS 36.300 [9]). | - |
| Iwa-UL
Indicates whether the UE supports UL transmission over WLAN for LWA bearer. | - |
| Iwip
Indicates whether the UE supports LTE/WLAN Radio Level Integration with IPsec Tunnel (LWIP). The UE which supports LWIP shall also indicate support of <i>interRAT-ParametersWLAN-r13</i> . | - |
| Iwip-Aggregation-DL, Iwip-Aggregation-UL
Indicates whether the UE supports aggregation of LTE and WLAN over DL/UL LWIP. The UE that indicates support of LWIP aggregation over DL or UL shall also indicate support of <i>Iwip</i> . | - |
| makeBeforeBreak
Indicates whether the UE supports intra-frequency Make-Before-Break handover, and whether the UE which indicates <i>dc-Parameters</i> supports intra-frequency Make-Before-Break SeNB change, as defined in TS 36.300 [9]. | - |
| measGapPatterns-NROnly
Indicates whether the UE supports gap patterns 2, 3 and 11 in LTE standalone when the frequencies to be measured within this measurement gap are all NR frequencies. | No |
| measGapPatterns-NROnly-ENDC
Indicates whether the UE supports gap patterns 2, 3 and 11 in (NG)EN-DC when the frequencies to be measured within this measurement gap are all NR frequencies. | No |
| maximumCCsRetrieval
Indicates whether UE supports reception of <i>requestedMaxCCsDL</i> and <i>requestedMaxCCsUL</i> . | - |
| maxLayersMIMO-Indication
Indicates whether the UE supports the network configuration of <i>maxLayersMIMO</i> . If the UE supports <i>fourLayerTM3-TM4</i> or <i>intraBandContiguousCC-InfoList</i> or <i>FeatureSetDL-PerCC</i> for MR-DC, UE supports the configuration of <i>maxLayersMIMO</i> for these cases regardless of indicating <i>maxLayersMIMO-Indication</i> . | - |
| maxLayersSlotOrSubslotPUSCH
Indicates the maximum number of layers for slot-PUSCH or subslot-PUSCH transmission. | Yes |
| maxNumberCCs-SPT
Indicates the maximum number of supported CCs for short processing time. The UE capability is reported per band combination. The reported number of carriers applies to all the FS-type(s) <i>frameStructureType-SPT-r15</i> supported in a given band combination. Absence of the field indicates that 0 number of CCs are supported for short processing time. | - |
| maxNumberDL-CCs, maxNumberUL-CCs
Indicates for each TTI combination "sTTI-SupportedCombinations", the maximum number of supported DL CCs/UL CCs for short TTI. Absence of the field indicates that 0 number of CCs are supported for short TTI. | - |
| maxNumberDecoding
Indicates the maximum number of blind decodes in UE-specific search space per UE in one subframe for CA with more than 5 CCs as defined in TS 36.213 [23] which is supported by the UE. The number of blind decodes supported by the UE is the field value * 32. Only values 5 to 32 can be used in this version of the specification. | No |
| maxNumberEHC-Contexts
Defines the maximum number of Ethernet header compression contexts supported by the UE across all DRBs and across UE's EHC compressor and EHC decompressor. The indicated number defines the number of contexts in addition to CID = "all zeros" as specified in Annex A of TS 38.323 [83]. | No |
| maxNumberROHC-ContextSessions
Set to the maximum number of concurrently active ROHC contexts supported by the UE, excluding context sessions that leave all headers uncompressed. cs2 corresponds with 2 (context sessions), cs4 corresponds with 4 and so on. The network ignores this field if the UE supports none of the ROHC profiles in <i>supportedROHC-Profiles</i> . If the UE indicates both <i>maxNumberROHC-ContextSessions</i> and <i>maxNumberROHC-ContextSessions-r14</i> , same value shall be indicated. | - |
| maxNumberUpdatedCSI-Proc, maxNumberUpdatedCSI-Proc-SPT
Indicates the maximum number of CSI processes to be updated across CCs. | No |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|---------------------|
| maxNumberUpdatedCSI-Proc-STTI-Comb77, maxNumberUpdatedCSI-Proc-STTI-Comb27, maxNumberUpdatedCSI-Proc-STTI-Comb22-Set1, maxNumberUpdatedCSI-Proc-STTI-Comb22-Set2
Indicates the maximum number of CSI processes to be updated across CCs. Comb77 is applicable for {slot, slot}, Comb27 for {subslot, slot}, Comb22-Set1 for {subslot, subslot} processing timeline set 1 and the Comb22-Set2 for {subslot, subslot} processing timeline set 2. | |
| mbms-AsyncDC
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, where (according to <i>supportedBandCombination</i>) the carriers that are or can be configured as serving cells in the MCG and the SCG are not synchronized. If this field is included, the UE shall also include <i>mbms-SCell</i> and <i>mbms-NonServingCell</i> . The field indicates that the UE supports the feature for xDD if <i>mbms-SCell</i> and <i>mbms-NonServingCell</i> are supported for xDD. | - |
| mbms-MaxBW
Indicates maximum supported bandwidth (T) for MBMS reception, see TS 36.213 [23], clause 11.1. If the value is set to <i>implicitValue</i> , the corresponding value of T is calculated as specified in TS 36.213 [23], clause 11.1. If the value is set to <i>explicitValue</i> , the actual value of T = <i>explicitValue</i> * 40 MHz. | - |
| mbms-NonServingCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, where (according to <i>supportedBandCombination</i> and to network synchronization properties) a serving cell may be additionally configured. If this field is included, the UE shall also include the <i>mbms-SCell</i> field. | Yes |
| mbms-ScalingFactor1dot25, mbms-ScalingFactor7dot5
Indicates parameter A ^(1..25) / A ^(7..5) , i.e., scaling factor for processing one unit of bandwidth corresponding to subcarrier spacing of 1.25 kHz / 7.5 kHz, with respect to one unit of bandwidth corresponding to subcarrier spacing of 15 kHz. See TS 36.213 [23], clause 11.1. This field is included only if <i>subcarrierSpacingMBMS-khz1dot25</i> / <i>subcarrierSpacingMBMS-khz7dot5</i> is included. This field shall be included if <i>mbms-MaxBW</i> and <i>subcarrierSpacingMBMS-khz1dot25</i> / <i>subcarrierSpacingMBMS-khz7dot5</i> are included. | - |
| mbms-ScalingFactor0dot37, mbms-ScalingFactor2dot5
Indicates parameter A ^(0..37) / A ^(2..5) , i.e., scaling factor for processing one unit of bandwidth corresponding to subcarrier spacing of 0.37 kHz / 2.5 kHz, with respect to one unit of bandwidth corresponding to subcarrier spacing of 15 kHz. See TS 36.213 [23], clause 11.1. This field is included only if <i>fembmsMixedCell</i> or <i>fembmsDedicatedCell</i> is included. This field shall be included if <i>subcarrierSpacingMBMS-khz0dot37</i> / <i>subcarrierSpacingMBMS-khz2dot5</i> is included for at least one E-UTRA band in <i>mbms-SupportedBandInfoList</i> . | - |
| mbms-SCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, when an SCell is configured on that frequency (regardless of whether the SCell is activated or deactivated). | Yes |
| mbms-SupportedBandInfoList
One entry corresponding to each supported E-UTRA band listed in the same order as in <i>supportedBandListEUTRA</i> . This list is included only if <i>fembmsMixedCell</i> or <i>fembmsDedicatedCell</i> is included. If <i>mbms-SupportedBandInfoList-v1700</i> is included, the UE shall include the same number of entries, and listed in the same order, as in <i>mbms-SupportedBandInfoList-r16</i> . | - |
| mcgRLF-RecoveryViaSCG
Indicates whether the UE supports recovery from MCG RLF via split SRB1 (if supported) and via SRB3 (if supported). | - |
| measGapPatterns-NRonly
Indicates whether the UE supports gap patterns 2, 3 and 11 in LTE standalone when the frequencies to be measured within this measurement gap are all NR frequencies. | No |
| measGapPatterns-NRonly-ENDC
Indicates whether the UE supports gap patterns 2, 3 and 11 in (NG)EN-DC when the frequencies to be measured within this measurement gap are all NR frequencies. | No |
| measurementEnhancements
This field defines whether UE supports measurement enhancements in high speed scenario (350 km/h) as specified in TS 36.133 [16]. | - |
| measurementEnhancements2
This field defines whether UE supports measurement enhancements in high speed scenario (up to 500 km/h velocity) as specified in TS 36.133 [16]. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| measurementEnhancementsSCell
This field defines whether UE supports SCell measurement enhancements in high speed scenario (350 km/h) as specified in TS 36.133 [16]. | - |
| measGapPatterns
Indicates whether the UE that supports NR supports gap patterns 4 to 11 in LTE standalone as specified in TS 36.133 [16], and for independent measurement gap configuration on FR1 and per-UE gap in (NG)EN-DC as specified in TS 38.133 [84]. The first/ leftmost bit covers pattern 4, and so on. Value 1 indicates that the UE supports the concerned gap pattern. | - |
| mfbf-UTRA
It indicates if the UE supports the signalling requirements of multiple radio frequency bands in a UTRA FDD cell, as defined in TS 25.307 [65]. | - |
| MIMO-BeamformedCapabilityList
A list of pairs of {k-Max, n-MaxList} values with the n th entry indicating the values that the UE supports for each CSI process in case n CSI processes would be configured. | No |
| MIMO-CapabilityDL
The number of supported layers for spatial multiplexing in DL. The field may be absent for category 0 and category 1 UE in which case the number of supported layers is 1. | - |
| MIMO-CapabilityUL
The number of supported layers for spatial multiplexing in UL. Absence of the field means that the number of supported layers is 1. | - |
| MIMO-CA-ParametersPerBoBC
A set of MIMO parameters provided per band of a band combination. In case a subfield is absent, the concerned capabilities are the same as indicated at the per UE level (i.e. by MIMO-UE-ParametersPerTM). | - |
| mimo-CBSR-AdvancedCSI
Indicates whether UE supports CBSR for advanced CSI reporting with and without amplitude restriction as defined in TS 36.213 [23], clause 7.2. | Yes |
| min-Proc-TimelineSubslot
Minimum processing timeline for subslot operation. The minimum processing timeline can belong to one of two sets of associated processing and maximum TA operation. The sets supported can be different for 1os CRS-based SPDCCH, 2os CRS-based SPDCCH and DMRS-based SPDCCH. The sequence applies to:
1. 1os CRS based SPDCCH
2. 2os CRS based SPDCCH
3. DMRS based SPDCCH | - |
| modifiedMPR-Behavior
Field encoded as a bit map, where at least one bit N is set to "1" if UE supports modified MPR/A-MPR behaviour N, see TS 36.101 [42]. All remaining bits of the field are set to "0". The leading / leftmost bit (bit 0) corresponds to modified MPR/A-MPR behaviour 0, the next bit corresponds to modified MPR/A-MPR behaviour 1 and so on.
Absence of this field means that UE does not support any modified MPR/A-MPR behaviour. | - |
| mpdcch-InLteControlRegionCE-ModeA, mpdcch-InLteControlRegionCE-ModeB
Indicates whether UE operating in CE mode A/B supports MPDCCH reception in LTE control channel region as specified in TS 36.211 [21]. | Yes |
| mpsPriorityIndication
Indicates whether the UE supports mpsPriorityIndication on release with redirect. | - |
| multiACK-CSI-reporting
Indicates whether the UE supports multi-cell HARQ ACK and periodic CSI reporting and SR on PUCCH format 3. | Yes |
| multiBandInfoReport
Indicates whether the UE supports the acquisition and reporting of multi band information for reportCGI. | - |
| multiClusterPUSCH-WithinCC | Yes |
| multiNS-Pmax
Indicates whether the UE supports the mechanisms defined for cells broadcasting NS-PmaxList. | - |
| multiNS-PmaxAerial
Indicates whether the UE supports the mechanisms defined for cells broadcasting NS-PmaxListAerial and freqBandInfoAerial. | - |
| multipleCellsMeasExtension
Indicates whether the UE supports numberOfTriggeringCells in the report configuration. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|---------------------|
| <i>multipleTimingAdvance</i>
Indicates whether the UE supports multiple timing advances for each band combination listed in <i>supportedBandCombination</i> . If the band combination comprised of more than one band entry (i.e., inter-band or intra-band non-contiguous band combination), the field indicates that the same or different timing advances on different band entries are supported. If the band combination comprised of one band entry (i.e., intra-band contiguous band combination), the field indicates that the same or different timing advances across component carriers of the band entry are supported. It is mandatory for UEs to support 2 TAGs for inter frequency DAPS handover. | - |
| <i>multipleUplinkSPS</i>
Indicates whether the UE supports multiple uplink SPS and reporting SPS assistance information. A UE indicating <i>multipleUplinkSPS</i> shall also support V2X communication via Uu, as defined in TS 36.300 [9]. | - |
| <i>must-CapabilityPerBand</i>
Indicates that UE supports MUST, as specified in 36.212 [22], clause 5.3.3.1, on the band in the band combination. | - |
| <i>must-TM234-UpTo2Tx-r14</i>
Indicates that the UE supports MUST operation for TM2/3/4 using up to 2Tx. | - |
| <i>must-TM89-UpToOneInterferingLayer-r14</i>
Indicates that the UE supports MUST operation for TM8/9 with assistance information for up to 1 interfering layer. | - |
| <i>must-TM89-UpToThreeInterferingLayers-r14</i>
Indicates that the UE supports MUST operation for TM8/9 with assistance information for up to 3 interfering layers. | - |
| <i>must-TM10-UpToOneInterferingLayer-r14</i>
Indicates that the UE supports MUST operation for TM10 with assistance information for up to 1 interfering layer. | - |
| <i>must-TM10-UpToThreeInterferingLayers-r14</i>
Indicates that the UE supports MUST operation for TM10 with assistance information for up to 3 interfering layers. | - |
| <i>naics-Capability-List</i>
Indicates that UE supports NAICS, i.e. receiving assistance information from serving cell and using it to cancel or suppress interference of neighbouring cell(s) for at least one band combination. If not present, UE does not support NAICS for any band combination. The field <i>numberOfNAICS-CapableCC</i> indicates the number of component carriers where the NAICS processing is supported and the field <i>numberOfAggregatedPRB</i> indicates the maximum aggregated bandwidth across these of component carriers (expressed as a number of PRBs) with the restriction that NAICS is only supported over the full carrier bandwidth. The UE shall indicate the combination of { <i>numberOfNAICS-CapableCC</i> , <i>numberOfNAICS-CapableCC</i> } for every supported <i>numberOfNAICS-CapableCC</i> , e.g. if a UE supports {x CC, y PRBs} and {x-n CC, y-m PRBs} where n>=1 and m>=0, the UE shall indicate both. | No |
| <ul style="list-style-type: none"> - For <i>numberOfNAICS-CapableCC</i> = 1, UE signals one value for <i>numberOfAggregatedPRB</i> from the range {50, 75, 100}; - For <i>numberOfNAICS-CapableCC</i> = 2, UE signals one value for <i>numberOfAggregatedPRB</i> from the range {50, 75, 100, 125, 150, 175, 200}; - For <i>numberOfNAICS-CapableCC</i> = 3, UE signals one value for <i>numberOfAggregatedPRB</i> from the range {50, 75, 100, 125, 150, 175, 200, 225, 250, 275, 300}; - For <i>numberOfNAICS-CapableCC</i> = 4, UE signals one value for <i>numberOfAggregatedPRB</i> from the range {50, 100, 150, 200, 250, 300, 350, 400}; - For <i>numberOfNAICS-CapableCC</i> = 5, UE signals one value for <i>numberOfAggregatedPRB</i> from the range {50, 100, 150, 200, 250, 300, 350, 400, 450, 500}. | |
| <i>ncsg</i>
Indicates whether the UE supports measurement NCSG Pattern Id 0, 1, 2 and 3, as specified in TS 36.133 [16]. If this field is included and the UE supports asynchronous DC, the UE shall support NCSG Pattern Id 0, 1, 2 and 3. If this field is included but the UE does not support asynchronous DC, only NCSG Pattern Id 0 and 1 shall be supported | No |
| <i>ng-EN-DC</i>
Indicates whether the UE supports NGEN-DC. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| <i>n-MaxList (in MIMO-UE-ParametersPerTM)</i>
Indicates for a particular transmission mode the maximum number of NZP CSI RS ports supported within a CSI process applicable for band combinations for which the concerned capabilities are not signalled. For $k\text{-Max}$ values exceeding 1, the UE shall include the field and signal $k\text{-Max}$ minus 1 bits. The first bit indicates $n\text{-Max}2$, with value 0 indicating 8 and value 1 indicating 16. The second bit indicates $n\text{-Max}3$, with value 0 indicating 8 and value 1 indicating 16. The third bit indicates $n\text{-Max}4$, with value 0 indicating 8 and value 1 indicating 32. The fourth bit indicates $n\text{-Max}5$, with value 0 indicating 16 and value 1 indicating 32. The fifth bit indicates $n\text{-Max}6$, with value 0 indicating 16 and value 1 indicating 32. The sixth bit indicates $n\text{-Max}7$, with value 0 indicating 16 and value 1 indicating 32. The seventh bit indicates $n\text{-Max}8$, with value 0 indicating 16 and value 1 indicating 64. | Yes |
| <i>n-MaxList (in MIMO-CA-ParametersPerBoBCPerTM)</i>
If signalled, the field indicates for a particular transmission mode the maximum number of NZP CSI RS ports supported within a CSI process applicable for band the concerned combination. Further details are as indicated for $n\text{-MaxList}$ in <i>MIMO-UE-ParametersPerTM</i> . | No |
| <i>NonContiguousUL-RA-WithinCC-List</i>
One entry corresponding to each supported E-UTRA band listed in the same order as in <i>supportedBandListEUTRA</i> . | No |
| <i>nonPrecoded (in MIMO-UE-ParametersPerTM)</i>
Indicates for a particular transmission mode the UE capabilities concerning non-precoded EBF/FD-MIMO operation (class A) for band combinations for which the concerned capabilities are not signalled in <i>MIMO-CA-ParametersPerBoBCPerTM</i> , and the FD-MIMO processing capability condition as described in NOTE 8 is satisfied. | Yes |
| <i>nonPrecoded (in MIMO-CA-ParametersPerBoBCPerTM)</i>
If signalled, the field indicates for a particular transmission mode, the UE capabilities concerning non-precoded EBF/ FD-MIMO operation (class A) applicable for the concerned band combination. | - |

TDD
diff |
|--|------------------------------|
| nonUniformGap
Indicates whether the UE supports measurement non uniform Pattern Id 1, 2, 3 and 4 in LTE standalone as specified in TS 36.133 [16]. | No |
| noResourceRestrictionForTTIBundling
Indicate whether the UE supports TTI bundling operation without resource allocation restriction. | No |
| nonCSG-SI-Reporting
Indicates whether UE will report PLMN list from non-CSG cells. | - |
| nr-AutonomousGaps-ENDC-FR1
Indicates whether the UE supports, upon configuration of <i>useAutonomousGapsNR</i> by the network, acquisition of relevant information from a neighbouring NR cell by reading the SI of the neighbouring cell on FR1 using autonomous gaps and reporting the acquired information to the network when it is configured with (NG)EN-DC. | Yes |
| nr-AutonomousGaps-ENDC-FR2
Indicates whether the UE supports, upon configuration of <i>useAutonomousGapsNR</i> by the network, acquisition of relevant information from a neighbouring NR cell by reading the SI of the neighbouring cell on FR2 using autonomous gaps and reporting the acquired information to the network when it is configured with (NG)EN-DC. | Yes |
| nr-AutonomousGaps-FR1
Indicates whether the UE supports, upon configuration of <i>useAutonomousGapsNR</i> by the network, acquisition of relevant information from a neighbouring NR cell by reading the SI of the neighbouring cell on FR1 using autonomous gaps and reporting the acquired information to the network when it is not configured with (NG)EN-DC. | Yes |
| nr-AutonomousGaps-FR2
Indicates whether the UE supports, upon configuration of <i>useAutonomousGapsNR</i> by the network, acquisition of relevant information from a neighbouring NR cell by reading the SI of the neighbouring cell on FR2 using autonomous gaps and reporting the acquired information to the network when it is not configured with (NG)EN-DC. | Yes |
| nr-CellIndividualOffset
Indicates whether the UE supports use of cell specific offset for NR inter-RAT measurements. | No |
| nr-HO-ToEN-DC
Indicates whether the UE supports inter-RAT handover from NR to EN-DC while NR-DC or NE-DC is not configured. This field is mandatory present if EN-DC is supported. | - |
| nr-IdleInactiveBeamMeasFR1
Indicates whether the UE supports performing eNB-configured SSB-based beam level RRM measurements for configured NR FR1 carrier(s) in RRC_IDLE and in RRC_INACTIVE as specified in TS 36.306 [5], clause 4.3.6.46. | No |
| nr-IdleInactiveBeamMeasFR2
Indicates whether the UE supports performing eNB-configured SSB-based beam level RRM measurements for configured NR FR2 carrier(s) in RRC_IDLE and in RRC_INACTIVE as specified in TS 36.306 [5], clause 4.3.6.47. | No |
| nr-IdleInactiveMeasFR1
Indicates whether UE supports reporting measurements performed on NR FR1 carrier(s) during RRC_IDLE and RRC_INACTIVE. | No |
| nr-IdleInactiveMeasFR2
Indicates whether UE supports reporting measurements performed on NR FR2 carrier(s) during RRC_IDLE and RRC_INACTIVE. | No |
| nr-RSSI-ChannelOccupancyReporting
Indicates whether the UE supports performing measurements and reporting of RSSI and channel occupancy on the corresponding NR band. | - |
| ntn-Autonomous-GNSS-Fix
This field indicates whether the UE supports autonomous GNSS position fix in RRC_CONNECTED. | - |
| ntn-Connectivity-EPC
Indicates whether the UE supports NTN access when connected to EPC. If the UE indicates this capability, the UE shall support all NTN essential features as specified in TS 36.306 [5]. | - |
| ntn-DCI-HarqDisableMultiTB-CE-ModeB
This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission when HARQ feedback disabling per HARQ process for downlink transmission is not configured by RRC and the UE is operating in CE mode B and when configured with ce-PDSCH-MultiTB-Config. | - |
| ntn-DCI-HarqDisableSingleTB-CE-ModeB
This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission when HARQ feedback disabling per HARQ process for downlink transmission is not configured by RRC and when the UE is operating in CE mode B. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|---------------------|
| ntn-EventA4BasedCHO
This field indicates whether the UE supports Event A4-based conditional handover, i.e., <i>CondEvent A4</i> . | - |
| ntn-GNSS-EnhScenarioSupport
This field indicates whether the UE supports GNSS measurement enhancements in RRC_CONNECTED for only GSO or NGSO scenario. If this field is not included, the GNSS measurement enhancements in RRC_CONNECTED that are indicated as supported are applicable for both GSO and NGSO scenario. | - |
| ntn-HarqEnhScenarioSupport
This field indicates whether the UE supports UL and DL HARQ process enhancements for only GSO or NGSO scenario. If this field is not included, the UL and DL HARQ process enhancements that are indicated as supported are applicable for both GSO and NGSO scenario. | - |
| ntn-LocationBasedCHO-EFC
This field indicates whether the UE supports location-based conditional handover for earth fixed cell, i.e., <i>CondEvent D1</i> . | - |
| ntn-LocationBasedCHO-EMC
This field indicates whether the UE supports location-based conditional handover for earth moving cell, i.e., <i>CondEvent D2</i> . | - |
| ntn-LocationBasedMeasTrigger-EFC
This field indicates whether the UE supports location-based measurement trigger in RRC_CONNECTED in earth fixed cell. | - |
| ntn-LocationBasedMeasTrigger-EMC
This field indicates whether the UE supports location-based measurement trigger in RRC_CONNECTED in earth moving cell. | - |
| ntn-OffsetTimingEnh
Indicates whether the UE supports timing relationship enhancement using <i>Differential Koffset</i> as specified in TS 36.321 [6] and TS 36.213 [23]. | - |
| ntn-OverriddenHarqDisableMultiTB-CE-ModeB
This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission by overriding the RRC configuration when the UE is operating in CE mode B and when configured with <i>ce-PDSCH-MultiTB-Config</i> . | - |
| ntn-OverriddenHarqDisableSingleTB-CE-ModeB
This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission by overriding the RRC configuration when the UE is operating in CE mode B. | - |
| ntn-PUR-TimerDelay
Indicates whether the UE supports delaying the start of the <i>pur-ResponseWindowTimer</i> for NTN, see TS 36.321 [6]. | - |
| ntn-RRC-HarqDisableMultiTB-CE-ModeA
This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration when the UE is operating in CE mode A and when configured with <i>ce-PDSCH-MultiTB-Config</i> . | - |
| ntn-RRC-HarqDisableMultiTB-CE-ModeB
This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration when the UE is operating in CE mode B and when configured with <i>ce-PDSCH-MultiTB-Config</i> . | - |
| ntn-RRC-HarqDisableSingleTB-CE-ModeA
This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration when the UE is operating in CE mode A. | - |
| ntn-RRC-HarqDisableSingleTB-CE-ModeB
This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration when the UE is operating in CE mode B. | - |
| ntn-SegmentedPrecompensationGaps
Indicates the minimum supported gap length between segments for segmented uplink transmission. Value <i>sym1</i> corresponds to 1 symbol, value <i>s1</i> corresponds to 1 slot, value <i>sf1</i> corresponds to 1 subframe. | - |
| ntn-ScenarioSupport
Indicates whether the UE supports NTN features only for GSO or NGSO scenario. If a UE does not include this field but includes <i>ntn-Connectivity-EPC-r17</i> , the UE supports the NTN features for both GSO and NGSO scenarios. | - |
| ntn-SemiStaticHarqDisableSPS
This field indicates whether the UE supports HARQ feedback transmission for the first SPS PDSCH transmission after activation when the UE is operating in CE mode A. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| ntn-TA-report
Indicates whether the UE supports timing advance reporting in RRC_CONNECTED, see TS 36.321 [6]. | - |
| ntn-TimeBasedCHO
This field indicates whether the UE supports time-based conditional handover, i.e., <i>CondEvent T1</i> . | - |
| ntn-TimeBasedMeasTrigger
This field indicates whether the UE supports time-based measurement trigger in RRC_CONNECTED. | - |
| ntn-Triggered-GNSS-Fix
This field indicates whether the UE supports network triggered GNSS position fix in RRC_CONNECTED. | - |
| ntn-UplinkHarq-ModeB-MultiTB
This field indicates whether the UE supports HARQ Mode B when scheduled with uplink transmission of multiple TBs. | - |
| ntn-UplinkHarq-ModeB-SingleTB
This field indicates whether the UE supports HARQ Mode B. For BL UE or UE in CE, this field also indicates whether the UE supports the corresponding LCP restrictions for uplink transmission. | - |
| ntn-UplinkTxExtension
This field indicates whether the UE supports to perform UL transmission in a duration after original GNSS validity duration expires without GNSS re-acquisition. | - |
| numberOfBlindDecodesUSS
Indicates the maximum number of blind decodes in UE specific search space in one subframe for CCs configured with sTTI operation supported by the UE. The number of blind decodes supported by the UE is the field value $X \times 68$. Field value ranges from 4 to 32. | Yes |
| nzp-CSI-RS-AperiodicInfo
Indicates whether the UE supports aperiodic NZP CSI-RS transmission for the indicated transmission mode. | Yes |
| nzp-CSI-RS-PeriodicInfo
Indicates whether the UE supports periodic NZP CSI-RS transmission for the indicated transmission mode. | Yes |
| otdoa-UE-Assisted
Indicates whether the UE supports UE-assisted OTDOA positioning, as specified in TS 36.355 [54]. | Yes |
| outOfOrderDelivery
Same as "outOfOrderDelivery" defined in TS 38.306 [87]. | No |
| outOfSequenceGrantHandling
Indicates whether the UE supports PUSCH transmissions with out of sequence UL grants as defined in TS 36.213 [23]. This field can be included only if uplinkLAA is included. | - |
| overheatingInd
Indicates whether the UE supports overheating assistance information. | No |
| overheatingIndForSCG
Indicates whether the UE supports the inclusion of NR SCG reduced configuration in the overheating assistance information. The UE which indicates support of <i>overheatingIndForSCG</i> shall also indicate support of <i>overheatingInd</i> . | - |
| pdcch-CandidateReductions
Indicates whether the UE supports PDCCH candidate reduction on UE specific search space as specified in TS 36.213 [23], clause 9.1.1. | No |
| pdcp-Duplication
Indicates whether the UE supports PDCP duplication. | - |
| pdcp-SN-Extension
Indicates whether the UE supports 15 bit length of PDCP sequence number. | - |
| pdcp-SN-Extension-18bits
Indicates whether the UE supports 18 bit length of PDCP sequence number. | - |
| pdcp-TransferSplitUL
Indicates whether the UE supports PDCP data transfer split in UL for the <i>drb-TypeSplit</i> as specified in TS 36.323 [8]. | - |
| pdcp-VersionChangeWithoutHO
Indicates whether, the UE supports changing the PDCP version of DRBs, from LTE PDCP to NR PDCP and vice versa, with and without handover. A UE supporting PDCP version change shall signal field <i>pdcp-Parameters-v1610</i> . When the field <i>pdcp-VersionChangeWithoutHO</i> is not included and <i>pdcp-Parameters-v1610</i> is included, it implies the UE supports PDCP version change only with handover. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| pdsch-CollisionHandling
Indicates whether the UE supports PDSCH collision handling as specified in TS 36.213 [23]. | No |
| pdsch-InLteControlRegionCE-ModeA, pdsch-InLteControlRegionCE-ModeB
Indicates whether UE operating in CE mode A/B supports PDSCH reception in LTE control channel region as specified in TS 36.211 [21]. | Yes |
| pdsch-MultiTB-CE-ModeA, pdsch-MultiTB-CE-ModeB
Indicates whether the UE supports multiple TB scheduling in connected mode for PDSCH when operating in CE mode A/B, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| pdsch-RepSubframe
Indicates whether the UE supports subframe PDSCH repetition. | Yes |
| pdsch-RepSlot
Indicates whether the UE supports slot PDSCH repetition. | Yes |
| pdsch-RepSubslot
Indicates whether the UE supports subslot PDSCH repetition. This field is only applicable for UEs supporting FDD. | - |
| pdsch-SlotSubslotPDSCH-Decoding
Indicates whether the UE supports decoding of PDSCH and slot-PDSCH/subslot-PDSCH assigned with C-RNTI/SPS C-RNTI in the same subframe for a given carrier. | Yes |
| perServingCellMeasurementGap
Indicates whether the UE supports per serving cell measurement gap indication, as specified in TS 36.133 [16]. | - |
| phy-TDD-ReConfig-FDD-PCell
Indicates whether the UE supports TDD UL/DL reconfiguration for TDD serving cell(s) via monitoring PDCCH with eIMTA-RNTI on a FDD PCell, and HARQ feedback according to UL and DL HARQ reference configurations. This bit can only be set to supported only if the UE supports FDD PCell and <i>phy-TDD-ReConfig-TDD-PCell</i> is set to supported. | No |
| phy-TDD-ReConfig-TDD-PCell
Indicates whether the UE supports TDD UL/DL reconfiguration for TDD serving cell(s) via monitoring PDCCH with eIMTA-RNTI on a TDD PCell, and HARQ feedback according to UL and DL HARQ reference configurations, and PUCCH format 3. | Yes |
| pmch-Bandwidth-n40, pmch-Bandwidth-n35, pmch-Bandwidth-n30
Indicates, for the E-UTRA band corresponding to the entry in <i>mbms-SupportedBandInfoList-v1700</i> , whether the UE in RRC_CONNECTED supports MBMS reception via MBSFN from MBMS-dedicated cells in an MBSFN area with PMCH bandwidth of 40/ 35/ 30 PRBs as described in TS 36.211 [21] and TS 36.213 [23]. | - |
| pmi-Disabling | Yes |
| powerClass-14dBm
Indicates whether the UE supports power class 14 dBm when operating in CE mode A or B for all the bands that are supported by the UE, as specified in TS 36.101 [42]. | - |
| powerPrefInd
Indicates whether the UE supports power preference indication. | No |
| powerUCI-SlotPUSCH, powerUCI-SubslotPUSCH
Indicates whether the UE supports BPRE derivation based on the actual derived O_CQI. The parameter <i>uplinkPower-CSIPayload</i> configures the UE to derive BPRE based on either the actual value of O_CQI or the largest value of O_CQI across all RI values. If the UE does not support the capability, the UE will derive BPRE based on the largest value of O_CQI across all RI values. | Yes |
| prach-Enhancements
This field defines whether the UE supports random access preambles generated from restricted set type B in high speed scenario as specified in TS 36.211 [21]. | - |
| processingTimelineSet
Indicates, for each SPDCCH configuration, support for a set of TA values. Each set consists of two different processing timelines and associated maximum TA. Set 1 indicates support for n+4 and n+6 and set 2 indicates support for n+6 and n+8, see TS 36.211 [21], clause 8.1, The minimum processing timeline to use, out of the two options for a given set is configured by parameter <i>proc-Timeline</i> . Support of Set 1 implicitly means support of Set 2. | - |
| pucch-Format4
Indicates whether the UE supports PUCCH format 4. | Yes |
| pucch-Format5
Indicates whether the UE supports PUCCH format 5. | Yes |
| pucch-SCell
Indicates whether the UE supports PUCCH on SCell. | No |

TDD
diff |
|--|------------------------------|
| <i>pur-CP-EPC-CE-ModeA, pur-CP-EPC-CE-ModeB, pur-CP-5GC-CE-ModeA, pur-CP-5GC-CE-ModeB</i>
Indicates whether UE operating in CE mode A/B supports CP transmission using PUR when connected to EPC/ 5GC. | Yes |
| <i>pur-CP-L1Ack</i>
Indicates whether UE supports L1 acknowledgement in response to CP transmission using PUR when connected to EPC/ 5GC. | Yes |
| <i>pur-FrequencyHopping</i>
Indicates whether UE supports frequency hopping for transmission using PUR. | Yes |
| <i>pur-PUSCH-NB-MaxTBS</i>
Indicates whether the UE supports 2984 bits max UL TBS in 1.4 MHz for transmission using PUR when operating in CE mode A, as specified in TS 36.212 [22] and TS 36.213 [23]. | Yes |
| <i>pur-RSRP-Validation</i>
Indicates whether UE supports serving cell RSRP for TA validation for transmission using PUR when connected to EPC/ 5GC. | Yes |
| <i>pur-SubPRB-CE-ModeA, pur-SubPRB-CE-ModeB</i>
Indicates whether UE supports subPRB resource allocation for PUSCH for transmission using PUR when operating in CE mode A/B. | Yes |
| <i>pur-UP-EPC-CE-ModeA, pur-UP-EPC-CE-ModeB, pur-UP-5GC-CE-ModeA, pur-UP-5GC-CE-ModeB</i>
Indicates whether UE operating in CE mode A/B supports UP transmission using PUR when connected to EPC/ 5GC. | Yes |
| <i>pusch-Enhancements</i>
Indicates whether the UE supports the PUSCH enhancement mode as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| <i>pusch-FeedbackMode</i>
Indicates whether the UE supports PUSCH feedback mode 3-2. | No |
| <i>pusch-MultiTB-CE-ModeA, pusch-MultiTB-CE-ModeB</i>
Indicates whether the UE supports multiple TB scheduling in connected mode for PUSCH when operating in CE mode A/B, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| <i>pusch-SPS-MaxConfigSlot</i>
Indicates the max number of SPS configurations across all cells for slot PUSCH. | Yes |
| <i>pusch-SPS-MultiConfigSlot</i>
Indicates the number of multiple SPS configurations of slot PUSCH for each serving cell. | Yes |
| <i>pusch-SPS-MaxConfigSubframe</i>
Indicates the max number of SPS configurations across all cells for subframe PUSCH. | Yes |
| <i>pusch-SPS-MultiConfigSubframe</i>
Indicates the number of multiple SPS configurations of subframe PUSCH for each serving cell. | Yes |
| <i>pusch-SPS-MaxConfigSubslot</i>
Indicates the max number of SPS configurations across all cells for subslot PUSCH. | - |
| <i>pusch-SPS-MultiConfigSubslot</i>
Indicates the number of multiple SPS configurations of subslot PUSCH for each serving cell.
This field is only applicable for UEs supporting FDD. | - |
| <i>pusch-SPS-SlotRepPCell</i>
Indicates whether the UE supports SPS repetition for slot PUSCH for PCell. | Yes |
| <i>pusch-SPS-SlotRepPSCell</i>
Indicates whether the UE supports SPS repetition for slot PUSCH for PSCell. | Yes |
| <i>pusch-SPS-SlotRepSCell</i>
Indicates whether the UE supports SPS repetition for slot PUSCH for serving cells other than SpCell. | Yes |
| <i>pusch-SPS-SubframeRepPCell</i>
Indicates whether the UE supports SPS repetition for subframe PUSCH for PCell. | Yes |
| <i>pusch-SPS-SubframeRepPSCell</i>
Indicates whether the UE supports SPS repetition for subframe PUSCH for PSCell. | Yes |
| <i>pusch-SPS-SubframeRepSCell</i>
Indicates whether the UE supports SPS repetition for subframe PUSCH for serving cells other than SpCell. | Yes |
| <i>pusch-SPS-SubslotRepPCell</i>
Indicates whether the UE supports SPS repetition for subslot PUSCH for PCell. This field is only applicable for UEs supporting FDD. | - |
| <i>pusch-SPS-SubslotRepPSCell</i>
Indicates whether the UE supports SPS repetition for subslot PUSCH for PSCell. This field is only applicable for UEs supporting FDD. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| pusch-SPS-SubslotRepSCell
Indicates whether the UE supports SPS repetition for subslot PUSCH for serving cells other than SpCell. This field is only applicable for UEs supporting FDD. | - |
| pusch-SRS-PowerControl-SubframeSet
Indicates whether the UE supports subframe set dependent UL power control for PUSCH and SRS. This field is only applicable for UEs supporting TDD. | Yes |
| qcl-CRI-BasedCSI-Reporting
Indicates whether the UE supports CRI based CSI feedback for the FeCoMP feature as specified in TS 36.213 [23], clause 7.1.10. | - |
| qcl-TypeC-Operation
The UE uses this field to indicate the support of all of the following three features: QCL Type-C operation for FeCoMP, the capability to support separate PDSCH RE mapping for different PDSCH CWs in non-coherent joint transmission and the capability to support handling new DMRS port to MIMO layer mapping for the CWs, as specified in TS 36.213 [23], clause 7.1.10. | - |
| qoe-MeasReport
Indicates whether the UE supports QoE Measurement Collection for streaming services. | - |
| qoe-MTSI-MeasReport
Indicates whether the UE supports QoE Measurement Collection for MTSI services. | |
| rach-Less
Indicates whether the UE supports RACH-less handover, and whether the UE which indicates <i>dc-Parameters</i> supports RACH-less SeNB change, as defined in TS 36.300 [9]. | - |
| rach-Report
Indicates whether the UE supports delivery of <i>rach-Report</i> . | - |
| rach-ReportForNR
Indicates whether the UE supports NR RACH report in LTE, upon request from the network. | - |
| rai-Support
Defines whether the UE supports release assistance indication (RAI) as specified in TS 36.321 [6] for BL UEs. | No |
| rai-SupportEnh
Indicates whether the UE supports 2-bit RAI when connected to EPC as specified in TS 36.321 [6]. | - |
| rclwi
Indicates whether the UE supports RCLWI, i.e. reception of <i>rclwi-Configuration</i> . The UE which supports RLCWI shall also indicate support of <i>interRAT-ParametersWLAN-r13</i> . The UE which supports RCLWI and <i>wlan-IW-RAN-Rules</i> shall also support applying WLAN identifiers received in <i>rclwi-Configuration</i> for the access network selection and traffic steering rules when in RRC_IDLE. | - |
| recommendedBitRate
Indicates whether the UE supports the bit rate recommendation message from the eNB to the UE as specified in TS 36.321 [6], clause 6.1.3.13. | No |
| recommendedBitRateMultiplier
Indicates whether the UE supports the bit rate multiplier for recommended bit rate MAC CE as specified in TS 36.321 [6], clause 6.1.3.13. If this field is included, the UE shall also include the <i>recommendedBitRate</i> field. | - |
| recommendedBitRateQuery
Indicates whether the UE supports the bit rate recommendation query message from the UE to the eNB as specified in TS 36.321 [6], clause 6.1.3.13. If this field is included, the UE shall also include the <i>recommendedBitRate</i> field. | No |
| reducedCP-Latency
Indicates whether the UE supports reduced CP latency. | Yes |
| reducedIntNonContComb
Indicates whether the UE supports receiving <i>requestReducedIntNonContComb</i> that requests the UE to exclude supported intra-band non-contiguous CA band combinations other than included in capability signalling as specified in TS 36.306 [5], clause 4.3.5.21. | - |
| reducedIntNonContCombRequested
Indicates that the UE excluded supported intra-band non-contiguous CA band combinations other than included in capability signalling as specified in TS 36.306 [5], clause 4.3.5.21. | - |
| reflectiveQoS
Indicates whether the UE supports AS reflective QoS. | No |
| relWeightTwoLayers/ relWeightFourLayers/ relWeightEightLayers
Indicates relative weight of processing FD-MIMO with 2/ 4/ 8 layers with respect to non-FD-MIMO with the same number of layers, see NOTE 8. Value v1 corresponds to relative weight of 1, value v1dot25 corresponds to relative weight of 1.25 and so on. This field can be included only if the UE supports the corresponding number of layers (i.e., 2/ 4/ 8 layers). | - |

| reportCGI-NR-EN-DC | Indicates whether the UE supports Inter-RAT report CGI procedure towards NR cell when it is configured with (NG)EN-DC. | Yes |
| reportCGI-NR-NoEN-DC | Indicates whether the UE supports Inter-RAT report CGI procedure towards NR cell when it is not configured with (NG)EN-DC. | Yes |
| resumeWithMCG-SCellConfig | Indicates whether the UE supports (re-)configuration of E-UTRA MCG SCells. | - |
| resumeWithSCG-Config | Indicates whether the UE supports (re-)configuration of an NR SCG. | - |
| resumeWithStoredMCG-SCells | Indicates whether the UE supports not deleting the stored E-UTRA MCG SCell configuration when initiating the resume procedure. | - |
| resumeWithStoredSCG | Indicates whether the UE supports not deleting the stored NR SCG configuration when initiating the resume procedure. | - |
| srs-CapabilityPerBandPairList | Indicates, for a particular pair of bands, the SRS carrier switching parameters when switching between the band pair to transmit SRS on a PUSCH-less SCell as specified in TS 36.212 [22] and TS 36.213 [23]. If included, the UE shall include a number of entries as indicated in the following, and listed in the same order, as in <i>bandParameterList</i> for the concerned band combination: <ul style="list-style-type: none"> - For the first band, the UE shall include the same number of entries as in <i>bandParameterList</i> i.e. first entry corresponds to first band in <i>bandParameterList</i> and so on, - For the second band, the UE shall include one entry less i.e. first entry corresponds to the second band in <i>bandParameterList</i> and so on - And so on. | - |
| requestedBands | Indicates the frequency bands requested by E-UTRAN. | - |
| requestedCCsDL, requestedCCsUL | Indicates the maximum number of CCs requested by E-UTRAN. | - |
| requestedDiffFallbackCombList | Indicates the CA band combinations for which report of different UE capabilities is requested by E-UTRAN. | - |
| rf-RetuningTimeDL | Indicates the interruption time on DL reception within a band pair during the RF retuning for switching between the band pair to transmit SRS on a PUSCH-less SCell. n0 represents 0 OFDM symbols, n0dot5 represents 0.5 OFDM symbols, n1 represents 1 OFDM symbol and so on. This field is mandatory present if switching between the band pair is supported. | - |
| rf-RetuningTimeUL | Indicates the interruption time on UL transmission within a band pair during the RF retuning for switching between the band pair to transmit SRS on a PUSCH-less SCell. n0 represents 0 OFDM symbols, n0dot5 represents 0.5 OFDM symbols, n1 represents 1 OFDM symbol and so on. This field is mandatory present if switching between the band pair is supported. | - |
| rlc-AM-Ooo-Delivery | Indicates whether the UE supports out-of-order delivery from RLC to PDCP for RLC AM. | - |
| rlc-UM-Ooo-Delivery | Indicates whether the UE supports out-of-order delivery from RLC to PDCP for RLC UM. | - |
| rlm-ReportSupport | Indicates whether the UE supports RLM event and information reporting. | - |
| rohc-ContextContinue | Same as "continueROHC-Context" defined in TS 38.306 [87]. | No |
| rohc-ContextMaxSessions | Same as "maxNumberROHC-ContextSessions" defined in TS 38.306 [87]. | No |
| rohc-Profiles | Same as "supportedROHC-Profiles" defined in TS 38.306 [87]. | No |
| rohc-ProfilesUL-Only | Same as "uplinkOnlyROHC-Profiles" defined in TS 38.306 [87]. | No |
| rsrqMeasWideband | Indicates whether the UE can perform RSRQ measurements with wider bandwidth. | Yes |

| UE-EUTRA-Capability field descriptions | | FDD/
TDD
diff |
|--|--|------------------------------|
| rsrq-OnAllSymbols
Indicates whether the UE can perform RSRQ measurement on all OFDM symbols and also support the extended RSRQ upper value range from -3dB to 2.5dB in measurement configuration and reporting as specified in TS 36.133 [16]. | | No |
| rs-SINR-Meas
Indicates whether the UE can perform RS-SINR measurements in RRC_CONNECTED as specified in TS 36.214 [48]. | | - |
| rssi-AndChannelOccupancyReporting
Indicates whether the UE supports performing measurements and reporting of RSSI and channel occupancy. This field can be included only if <i>downlinkLAA</i> is included. | | - |
| sa-NR
Indicates whether the UE supports standalone NR as specified in TS 38.331 [82]. | | No |
| scalingFactorTxSidelink, scalingFactorRxSidelink
Indicates, for a particular band combination of EUTRA, the scaling factor, as defined in TS 38.306 [87], for the PC5 band combination(s) <i>v2x-SupportedBandCombinationListEUTRA-NR</i> on which the UE supports simultaneous transmission/reception of EUTRA and NR sidelink communication respectively, or simultaneous transmission or reception of EUTRA and joint V2X sidelink communication and NR sidelink communication respectively (as indicated by <i>v2x-SupportedTxBandCombListPerBC-v1630 / v2x-SupportedRxBandCombListPerBC-v1630</i>). The leading / leftmost value corresponds to the first band combination included in <i>v2x-SupportedBandCombinationListEUTRA-NR</i> which is indicated with value 1 by <i>v2x-SupportedTxBandCombListPerBC-v1630 / v2x-SupportedRxBandCombListPerBC-v1630</i> , the next value corresponds to the second band combination included in <i>v2x-SupportedBandCombinationListEUTRA-NR</i> which is indicated with value 1 by <i>v2x-SupportedTxBandCombListPerBC-v1630 / v2x-SupportedRxBandCombListPerBC-v1630</i> and so on. For each value of <i>ScalingFactorSidelink-r16</i> , value f0p4 indicates the scaling factor 0.4, f0p75 indicates 0.75, and so on. | | - |
| scptm-AsyncDC
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via SC-MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, where (according to <i>supportedBandCombination</i>) the carriers that are or can be configured as serving cells in the MCG and the SCG are not synchronized. If this field is included, the UE shall also include <i>scptm-SCell</i> and <i>scptm-NonServingCell</i> . | | Yes |
| scptm-NonServingCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via SC-MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, where (according to <i>supportedBandCombination</i> and to network synchronization properties) a serving cell may be additionally configured. If this field is included, the UE shall also include the <i>scptm-SCell</i> field. | | Yes |
| scptm-Parameters
Presence of the field indicates that the UE supports SC-PTM reception as specified in TS 36.306 [5]. | | Yes |
| scptm-SCell
Indicates whether the UE in RRC_CONNECTED supports MBMS reception via SC-MRB on a frequency indicated in an <i>MBMSInterestIndication</i> message, when an SCell is configured on that frequency (regardless of whether the SCell is activated or deactivated). | | Yes |
| scptm-ParallelReception
Indicates whether the UE in RRC_CONNECTED supports parallel reception in the same subframe of DL-SCH transport blocks transmitted using C-RNTI/Semi-Persistent Scheduling C-RNTI and using SC-RNTI/G-RNTI as specified in TS 36.306 [5]. | | Yes |
| secondSlotStartingPosition
Indicates whether the UE supports reception of subframes with second slot starting position as described in TS 36.211 [21] and TS 36.213 [23]. This field can be included only if <i>downlinkLAA</i> is included. | | - |
| semiOL
Indicates whether the UE supports semi-open-loop transmission for the indicated transmission mode. | | Yes |
| semiStaticCFI
Indicates whether the UE supports the semi-static configuration of CFI for subframe/slot/sub-slot operation. | | Yes |
| semiStaticCFI-Pattern
Indicates whether the UE supports the semi-static configuration of CFI pattern for subframe/slot/sub-slot operation. This field is only applicable for UEs supporting TDD. | | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| sharedSpectrumMeasNR-EN-DC
Indicates whether the UE supports performing measurements and reporting of RSSI and channel occupancy on each supported NR band in EN-DC. If included, the UE shall include the same number of entries, and listed in the same order as in <i>supportedBandListEN-DC-r15</i> . | - |
| sharedSpectrumMeasNR-SA
Indicates whether the UE supports performing measurements and reporting of RSSI and channel occupancy on each supported NR band in NR SA. If included, the UE shall include the same number of entries, and listed in the same order as in <i>supportedBandListNR-SA-r15</i> . | - |
| shortCQI-ForSCellActivation
Indicates whether the UE supports additional CQI reporting periodicity after SCell activation. | Yes |
| shortMeasurementGap
Indicates whether the UE supports shorter measurement gap length (i.e. <i>gp2</i> and <i>gp3</i>) in LTE standalone as specified in TS 36.133 [16], and for independent measurement gap configuration on FR1 and per-UE gap in (NG)EN-DC as specified in TS38.133 [84]. | No |
| shortSPS-IntervalFDD
Indicates whether the UE supports uplink SPS intervals shorter than 10 subframes in FDD mode. | - |
| shortSPS-IntervalTDD
Indicates whether the UE supports uplink SPS intervals shorter than 10 subframes in TDD mode. | - |
| sigBasedEUTRA-LoggedMeasOverrideProtect
Indicates whether the UE supports the override protection of the signalling based logged measurements configured in E-UTRA when entering RRC_CONNECTED state in NR. | - |
| simultaneousPUCCH-PUSCH
Indicates whether the UE supports simultaneous transmission of PUSCH/PUCCH and SlotOrSubslotPUSCH/SPPUCCH (if supported). | Yes |
| simultaneousRx-Tx
Indicates whether the UE supports simultaneous reception and transmission on different bands for each band combination listed in <i>supportedBandCombination</i> . This field is only applicable for inter-band TDD band combinations. A UE indicating support of <i>simultaneousRx-Tx</i> and <i>dc-Support-r12</i> shall support different UL/DL configurations between PCell and PSCell. | - |
| simultaneousTx-DifferentTx-Duration
Indicates whether the UE supports simultaneous transmission of different transmission durations over different carriers. The different transmission durations can be of subframe, slot or subslot duration. | - |
| skipFallbackCombinations
Indicates whether UE supports receiving <i>requestSkipFallbackComb</i> that requests UE to exclude fallback band combinations from capability signalling. | - |
| skipFallbackCombRequested
Indicates whether <i>requestSkipFallbackComb</i> is requested by E-UTRAN. | - |
| skipMonitoringDCI-Format0-1A
Indicates whether UE supports blind decoding reduction on UE specific search space by not monitoring DCI Format 0 and 1A as specified in TS 36.213 [23], clause 9.1.1. | No |
| skipSubframeProcessing
This fields defines whether the UE supports aborting reception of PDSCH if the UE receives slot-PDSCH/subslot-PDSCH during an ongoing PDSCH reception and instead starts receiving the slot-PDSCH/subslot-PDSCH, as well as whether the UE supports aborting a PUSCH transmission if the UE gets a grant for a slot-PUSCH/ subslot-PUSCH transmission that overlaps with a grant received for a PUSCH transmission. The capability indicates the number of subframes that the UE may drop prior to the subframe in which it prioritizes the processing of slot/subslot PDSCH/PUSCH as described in TS 36.213 [23], clauses 7.1 and 8.0. Separate capability for UL and DL and per sTTI length in each direction: <i>skipProcessingDL-Slot</i> , <i>skipProcessingDL-Subslot</i> , <i>skipProcessingUL-Slot</i> and <i>skipProcessingUL-Subslot</i> . | - |
| skipUplinkDynamic
Indicates whether the UE supports skipping of UL transmission for an uplink grant indicated on PDCCH if no data is available for transmission as described in TS 36.321 [6]. | - |
| skipUplinkSPS
Indicates whether the UE supports skipping of UL transmission for a configured uplink grant if no data is available for transmission as described in TS 36.321 [6]. | - |
| sl-64QAM-Rx
Indicates whether the UE supports 64QAM for the reception of V2X sidelink communication. | - |
| sl-64QAM-Tx
Indicates whether the UE supports 64QAM for the transmission of V2X sidelink communication. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| sl-A2X-Service
Indicates whether the UE supports A2X service and dedicated resource pool for A2X service on the corresponding band or band combination. Value 'brid' indicates BRID is supported, value 'daa' indicates DAA is supported, and value 'bridAndDAA' indicates both are supported. | - |
| sl-CongestionControl
Indicates whether the UE supports Channel Busy Ratio measurement and reporting of Channel Busy Ratio measurement results to eNB for V2X sidelink communication. | - |
| sl-LowT2min
Indicates whether the UE supports 10ms as minimum value of T2 for resource selection procedure of V2X sidelink communication. | - |
| sl-ParameterNR
Includes the <i>SidelinkParametersNR</i> IE as specified in TS 38.331 [82]. The field includes the sidelink capability for NR-PC5, where <i>multipleSR-ConfigurationsSidelink</i> , <i>logicalChannelSR-DelayTimerSidelink</i> and <i>relayParameters</i> are not applicable. | - |
| sl-RateMatchingTBSScaling
Indicates whether the UE supports rate matching and TBS scaling for V2X sidelink communication. | - |
| slotPDSCH-TxDiv-TM8
Indicates whether the UE supports TX diversity transmission using ports 7 and 8 for TM8 for slot PDSCH. | - |
| slotPDSCH-TxDiv-TM9and10
Indicates whether the UE supports TX diversity transmission using ports 7 and 8 for TM9/10 for slot PDSCH. | Yes |
| slotSymbolResourceResvDL-CE-ModeA , slotSymbolResourceResvDL-CE-ModeB ,
slotSymbolResourceResvUL-CE-ModeA , slotSymbolResourceResvUL-CE-ModeB
Indicates whether the UE supports slot/symbol-level time-domain resource reservation in downlink/uplink when operating in CE mode A/B, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| slss-SupportedTxFreq
Indicates whether the UE supports the SLSS transmission on single carrier or on multiple carriers in the case of sidelink carrier aggregation. | - |
| slss-TxRx
Indicates whether the UE supports SLSS/PSBCH transmission and reception in UE autonomous resource selection mode and eNB scheduled mode in a band for V2X sidelink communication. | - |
| sl-TxDiversity
Indicates whether the UE supports transmit diversity for V2X sidelink communication. See TS 36.101 [42]. | - |
| sn-SizeLo
Same as "shortSN" defined in TS 38.306 [87]. | No |
| spatialBundling-HARQ-ACK
Indicates whether UE supports HARQ-ACK spatial bundling on PUCCH or PUSCH as specified in TS 36.213 [23], clauses 7.3.1 and 7.3.2. | No |
| spdcch-differentRS-types
Indicates whether the UE supports monitoring of sPDCCH on RB sets with different RS types within a TTI. | Yes |
| spdcch-Reuse
Indicates whether the UE supports L1 based SPDCCH reuse. | Yes |
| sps-CyclicShift
Indicates whether the UE supports RRC configuration of cyclic shift for DMRS for UL SPS using 1ms TTI. | Yes |
| sps-ServingCell
Indicates whether the UE supports multiple UL/DL SPS configurations simultaneously active on different serving cells as specified in TS 36.321 [6]. | - |
| sps-STI
Indicates whether the UE supports SPS in DL and/or UL for slot or subslot based PDSCH and PUSCH, respectively. | Yes |
| srs-DCI7-TriggeringFS2
Indicates whether the UE supports SRS triggering via DCI format 7 for FS2. | - |
| srs-Enhancements
Indicates whether the UE supports SRS enhancements. | Yes |
| srs-EnhancementsTDD
Indicates whether the UE supports TDD specific SRS enhancements. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|---------------------|
| srs-FlexibleTiming
Indicates whether the UE supports configuration of <i>soundingRS-FlexibleTiming-r14</i> for the corresponding band pair. For a TDD-TDD band pair, UE shall include at least one of <i>srs-FlexibleTiming</i> and/or <i>srs-HARQ-ReferenceConfig</i> when <i>rf-RetuningTimeDL</i> or <i>rf-RetuningTimeUL</i> corresponding to the band pair is larger than 1 OFDM symbol. | - |
| srs-HARQ-ReferenceConfig
Indicates whether the UE supports configuration of <i>harq-ReferenceConfig-r14</i> for the corresponding band pair. For a TDD-TDD band pair, UE shall include at least one of <i>srs-FlexibleTiming</i> and/or <i>srs-HARQ-ReferenceConfig</i> when <i>rf-RetuningTimeDL</i> or <i>rf-RetuningTimeUL</i> corresponding to the band pair is larger than 1 OFDM symbol. | - |
| srs-MaxSimultaneousCCs
Indicates the maximum number of simultaneously configurable target CCs for SRS switching (i.e., CCs for which <i>srs-SwitchFromServCellIndex</i> is configured) supported by the UE. | - |
| srs-UpPTS-6sym
Indicates whether the UE supports up to 6-symbol SRS in UpPTS. | - |
| srvc-FromUTRA-FDD-ToGERAN
Indicates whether UE supports SRVCC handover from UTRA FDD PS HS to GERAN CS. | - |
| srvc-FromUTRA-FDD-ToUTRA-FDD
Indicates whether UE supports SRVCC handover from UTRA FDD PS HS to UTRA FDD CS. | - |
| srvc-FromUTRA-TDD128-ToGERAN
Indicates whether UE supports SRVCC handover from UTRA TDD 1.28Mcps PS HS to GERAN CS. | - |
| srvc-FromUTRA-TDD128-ToUTRA-TDD128
Indicates whether UE supports SRVCC handover from UTRA TDD 1.28Mcps PS HS to UTRA TDD 1.28Mcps CS. | - |
| ss-CCH-InterfHandl
Indicates whether the UE supports synchronisation signal and common channel interference handling. | Yes |
| ss-SINR-Meas-NR-FR1, ss-SINR-Meas-NR-FR2
Indicates whether the UE can perform NR SS-SINR measurement for a frequency range (i.e. FR1 or FR2) as specified in TS 38.215 [89]. | - |
| ssp10-TDD-Only
Indicates the UE supports special subframe configuration 10 when operating only in TDD carriers (i.e., not in TDD/FDD CA or TDD/FS3 CA). A UE including this field shall not include <i>tdd-SpecialSubframe-r14</i> . | - |
| standaloneGNSS-Location
Indicates whether the UE is equipped with a standalone GNSS receiver that may be used to provide detailed location information in RRC measurement report and logged measurements. | - |
| sTTI-SPT-Supported
Indicates whether the UE supports the features STTI and/or SPT. If the UE supports STTI and/or SPT features, the UE shall report the field <i>sTTI-SPT-Supported</i> set to <i>supported</i> in capability signalling, irrespective of whether <i>requestSTTI-SPT-Capability</i> field is present or not. | - |
| sTTI-FD-MIMO-Coexistence
Indicates whether the UE supports CSI feedback for more than 8 NZP CSI-RS ports on subframe based PUSCH in any serving cell and supporting STTI in any serving cell. | - |
| sTTI-SupportedCombinations
Indicates the different combinations of short TTI lengths, see field description for <i>dl-STTI-Length</i> and <i>ul-STTI-Length</i> , that the UE supports in a single PUCCH group or in two PUCCH groups. A short TTI length combination is reported for DL first followed by UL. In case of two PUCCH groups the support for the primary PUCCH group is indicated first. | - |
| subcarrierPuncturingCE-ModeA, subcarrierPuncturingCE-ModeB
Indicates whether the UE supports subcarrier puncturing in downlink when operating in CE mode A/B, as specified in TS 36.211 [21] and TS 36.213 [23]. | Yes |
| subcarrierSpacingMBMS-khz7dot5, subcarrierSpacingMBMS-khz1dot25
Indicates the supported subcarrier spacings for MBSFN subframes in addition to 15 kHz subcarrier spacing. <i>subcarrierSpacingMBMS-khz1dot25</i> and <i>subcarrierSpacingMBMS-khz7dot5</i> indicates that the UE supports 1.25 and 7.5 kHz respectively for MBSFN subframes as described in TS 36.211 [21], clause 6.12. This field is included only if <i>fembmsMixedCell</i> or <i>fembmsDedicatedCell</i> is included. | - |
| subcarrierSpacingMBMS-khz2dot5, subcarrierSpacingMBMS-khz0dot37
Presence of this field indicates the supported subcarrier spacings of 2.5kHz / 0.37kHz for MBSFN subframes in addition to 15 kHz subcarrier spacing when operating on the E-UTRA band given by the entry in <i>mbms-SupportedBandInfoList</i> as described in TS 36.211 [21], clause 6.12. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| SupportedBandGERAN
GERAN band as defined in TS 45.005 [20]. | No |
| SupportedBandList1xRTT
One entry corresponding to each supported CDMA2000 1xRTT band class. | - |
| SupportedBandListEUTRA
Includes the supported E-UTRA bands. This field shall include all bands which are indicated in <i>BandCombinationParameters</i> . | - |
| SupportedBandListEUTRA-v9e0, SupportedBandListEUTRA-v1250, SupportedBandListEUTRA-v1310, SupportedBandListEUTRA-v1320
If included, the UE shall include the same number of entries, and listed in the same order, as in <i>supportedBandListEUTRA</i> (i.e. without suffix). | - |
| SupportedBandListGERAN | No |
| SupportedBandListHRPD
One entry corresponding to each supported CDMA2000 HRPD band class. | - |
| SupportedBandListNR-SA
Includes the NR bands supported by the UE in NR-SA (for handover and redirection). The field is included in case the UE supports NR SA as specified in TS 38.331 [32] and not otherwise. The presence of this field also indicates that the UE can perform both NR SS-RSRP and SS-RSRQ measurement in the included NR band(s) as specified in TS 38.215 [89]. | No |
| supportedBandListEN-DC
Includes the NR bands supported by the UE in (NG)EN-DC. The field is included in case the parameter <i>en-DC</i> or <i>ng-EN-DC</i> is present and set to <i>supported</i> and not otherwise. The presence of this field also indicates that the UE can perform both NR SS-RSRP and SS-RSRQ measurement in the included NR band(s) as specified in TS 38.215 [89]. | - |
| supportedBandListWLAN
Indicates the supported WLAN bands by the UE. | - |
| SupportedBandUTRA-FDD
UTRA band as defined in TS 25.101 [17]. | - |
| SupportedBandUTRA-TDD128
UTRA band as defined in TS 25.102 [18]. | - |
| SupportedBandUTRA-TDD384
UTRA band as defined in TS 25.102 [18]. | - |
| SupportedBandUTRA-TDD768
UTRA band as defined in TS 25.102 [18]. | - |
| supportedBandwidthCombinationSet
The <i>supportedBandwidthCombinationSet</i> indicated for a band combination is applicable to all bandwidth classes indicated by the UE in this band combination.
Field encoded as a bit map, where bit N is set to "1" if UE support Bandwidth Combination Set N for this band combination, see 36.101 [42]. The leading / leftmost bit (bit 0) corresponds to the Bandwidth Combination Set 0, the next bit corresponds to the Bandwidth Combination Set 1 and so on. The UE shall neither include the field for a non-CA band combination, nor for a CA band combination for which the UE only supports Bandwidth Combination Set 0. | - |
| supportedCellGrouping
This field indicates for which mapping of serving cells to cell groups (i.e. MCG or SCG) the UE supports asynchronous DC. This field is only present for a band combination with more than two but less than six band entries where the UE supports asynchronous DC. If this field is not present but asynchronous operation is supported, the UE supports all possible mappings of serving cells to cell groups for the band combination. The bitmap size is selected based on the number of entries in the combinations, i.e., in case of three entries, the bitmap corresponding to <i>threeEntries</i> is selected and so on.
A bit in the bit string set to 1 indicates that the UE supports asynchronous DC for the cell grouping option represented by the concerned bit position. Each bit position represents a different cell grouping option, as illustrated by a table, see NOTE 5. A cell grouping option is represented by a number of bits, each representing a particular band entry in the band combination with the left-most bit referring to the band listed first in the band combination, etc. Value 0 indicates that the carriers of the corresponding band entry are mapped to a first cell group, while value 1 indicates that the carriers of the corresponding band entry are mapped to a second cell group.
It is noted that the mapping table does not include entries with all bits set to the same value (0 or 1) as this does not represent a DC scenario (i.e. indicating that the UE supports that all carriers of the corresponding band entry are in one cell group). | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| <i>supportedCSI-Proc, sTTI-SupportedCSI-Proc</i>
Indicates the maximum number of CSI processes supported on a component carrier within a band. Value n1 corresponds to 1 CSI process, value n3 corresponds to 3 CSI processes, and value n4 corresponds to 4 CSI processes. If this field is included, the UE shall include the same number of entries listed in the same order as in <i>BandParameters/STTI-SPT-BandParameters</i> . If the UE supports at least 1 CSI process on any component carrier, then the UE shall include this field in all bands in all band combinations. | - |
| <i>supportedCSI-Proc (in FeatureSetDL-PerCC)</i>
In MR-DC, indicates the number of CSI processes for the component carrier in the corresponding bandwidth class. If the UE supports at least 1 CSI process, then the UE shall include this field. | - |
| <i>supportedMIMO-CapabilityDL-MRDC (in FeatureSetDL-PerCC)</i>
In MR-DC, indicates the maximum number of supported layers in TM9/10 for the component carrier in the corresponding bandwidth class. | - |
| <i>supportedNAICS-2CRS-AP</i>
If included, the UE supports NAICS for the band combination. The UE shall include a bitmap of the same length, and in the same order, as in <i>naics-Capability-List</i> , to indicate 2 CRS AP NAICS capability of the band combination. The first/ leftmost bit points to the first entry of <i>naics-Capability-List</i> , the second bit points to the second entry of <i>naics-Capability-List</i> , and so on. For band combinations with a single component carrier, UE is only allowed to indicate { <i>numberOfNAICS-CapableCC, numberOfAggregatedPRB</i> } = {1, 100} if NAICS is supported. | - |
| <i>supportedOperatorDic</i>
Indicates whether the UE supports operator defined dictionary. If UE supports operator defined dictionary, the UE shall report <i>versionOfDictionary</i> and <i>associatedPLMN-ID</i> of the stored operator defined dictionary. This parameter is not required to be present if the UE is in VPLMN. In this release of the specification, UE can only support one operator defined dictionary. The <i>associatedPLMN-ID</i> is only associated to the operator defined dictionary which has no relationship with UE's HPLMN ID. | - |
| <i>supportRohcContextContinue</i>
Indicates whether the UE supports ROHC context continuation operation where the UE does not reset the current ROHC context upon handover. | - |
| <i>supportedROHC-Profiles</i>
Indicates the ROHC profiles that UE supports in both uplink and downlink. | - |
| <i>supportedUplinkOnlyROHC-Profiles</i>
Indicates the ROHC profiles that UE supports in uplink and not in downlink, see TS 36.323 [8] | - |
| <i>supportedStandardDic</i>
Indicates whether the UE supports standard dictionary for SIP and SDP as specified in TS 36.323 [8]. | - |
| <i>supportedUDC</i>
Indicates whether the UE supports UL data compression, see TS 36.323 [8]. | - |
| <i>tdd-SpecialSubframe</i>
Indicates whether the UE supports TDD special subframe defined in TS 36.211 [21]. A UE shall indicate <i>tdd-SpecialSubframe-r11</i> if it supports the TDD special subframes ssp7 and ssp9. A UE shall indicate <i>tdd-SpecialSubframe-r14</i> if it supports the TDD special subframe ssp10, except when <i>ssp10-TDD-Only-r14</i> is included. | Yes |
| <i>tdd-FDD-CA-PCellDuplex</i>
The presence of this field indicates that the UE supports TDD/FDD CA in any supported band combination including at least one FDD band with <i>bandParametersUL</i> and at least one TDD band with <i>bandParametersUL</i> . The first bit is set to "1" if UE supports the TDD PCell. The second bit is set to "1" if UE supports FDD PCell. This field is included only if the UE supports band combination including at least one FDD band with <i>bandParametersUL</i> and at least one TDD band with <i>bandParametersUL</i> . If this field is included, the UE shall set at least one of the bits as "1". If this field is included with DC, then it is applicable within a CG, and the presence of this field indicates the capability of the UE to support TDD/FDD CA with at least one FDD band and at least one TDD band in the same CG, with the value indicating the support for TDD/FDD PCell (PSCell). | No |
| <i>tdd-TTI-Bundling</i>
The presence of this field indicates whether the UE supporting TDD special subframe configuration 10 also supports TTI bundling for TDD configuration 2 and 3 when PUSCH transmission in UpPTS is configured, see TS 36.213 [23], clause 8.0. If this field is present, the <i>tdd-SpecialSubframe-r14</i> or <i>ssp10-TDD-Only-r14</i> shall be present. | Yes |
| <i>timeReferenceProvision</i>
Indicates whether the UE supports provision of time reference in <i>DlInformationTransfer</i> message. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| timeSeparationSlot2, timeSeparationSlot4
Indicates whether the UE supports time staggering length of 2 slots (MBSFN reference signal pattern type 2) / 4 slots (MBSFN reference signal pattern type 1) for MBSFN-RS associated with PMCH with subcarrier spacing of 0.37 kHz for MBSFN subframes when operating on the E-UTRA band given by the entry in <i>mbms-SupportedBandInfoList</i> as described in TS 36.211 [21], clause 6.10.2.2.4. | - |
| timerT312
Indicates whether the UE supports T312. | No |
| tm5-FDD
Indicates whether the UE supports the PDSCH transmission mode 5 in FDD. | - |
| tm5-TDD
Indicates whether the UE supports the PDSCH transmission mode 5 in TDD. | - |
| tm6-CE-ModeA
Indicates whether the UE supports tm6 operation in CE mode A, see TS 36.213 [23], clause 7.2.3. This field can be included only if <i>ce-ModeA</i> is included. | Yes |
| tm8-slotPDSCH
Indicates whether the UE supports configuration and decoding of TM8 for slot PDSCH in TDD. | - |
| tm9-CE-ModeA
Indicates whether the UE supports tm9 operation in CE mode A, see TS 36.213 [23], clause 7.2.3. This field can be included only if <i>ce-ModeA</i> is included. | Yes |
| tm9-CE-ModeB
Indicates whether the UE supports tm9 operation in CE mode B, see TS 36.213 [23], clause 7.2.3. This field can be included only if <i>ce-ModeB</i> is included. | Yes |
| tm9-LAA
Indicates whether the UE supports tm9 operation on LAA cell(s). This field can be included only if <i>downlinkLAA</i> is included. | - |
| tm9-slotSubslot
Indicates whether the UE supports configuration and decoding of TM9 for slot and/or subslot PDSCH for non-MBSFN. | Yes |
| tm9-slotSubslotMBSFN
Indicates whether the UE supports configuration and decoding of TM9 for slot and/or subslot PDSCH for MBSFN. | Yes |
| tm9-With-8Tx-FDD
Indicates whether the UE supports PDSCH transmission mode 9 with 8 CSI reference signal ports for FDD when not operating in CE mode. | Yes |
| tm10-LAA
Indicates whether the UE supports tm10 operation on LAA cell(s). This field can be included only if <i>downlinkLAA</i> is included. | - |
| tm10-slotSubslot
Indicates whether the UE supports configuration and decoding of TM10 for slot and/or subslot PDSCH for non-MBSFN. | Yes |
| tm10-slotSubslotMBSFN
Indicates whether the UE supports configuration and decoding of TM10 for slot and/or subslot PDSCH for MBSFN. | Yes |
| totalWeightedLayers
Indicates total number of weighted layers the UE can process for FD-MIMO. See NOTE 8. | - |
| twoAntennaPortsForPUCCH | No |
| twoStepSchedulingTimingInfo
Presence of this field indicates that the UE supports uplink scheduling using PUSCH trigger A and PUSCH trigger B (as defined in TS 36.213 [23]).
This field also indicates the timing between the PUSCH trigger B and the earliest time the UE supports performing the associated UL transmission. For reception of PUSCH trigger B in subframe N, value <i>nPlus1</i> indicates that the UE supports performing the UL transmission in subframe N+1, value <i>nPlus2</i> indicates that the UE supports performing the UL transmission in subframe N+2, and so on.
This field can be included only if <i>uplinkLAA</i> is included. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|---------------------|
| <p>txAntennaSwitchDL, txAntennaSwitchUL
 The presence of <i>txAntennaSwitchUL</i> indicates the UE supports transmit antenna selection for this UL band in the band combination as described in TS 36.213 [23], clauses 8.2 and 8.7. The field <i>txAntennaSwitchDL</i> indicates the entry number of the first-listed band with UL in the band combination that affects this DL. The field <i>txAntennaSwitchUL</i> indicates the entry number of the first-listed band with UL in the band combination that switches together with this UL. Value 1 means first entry, value 2 means second entry and so on. All DL and UL that switch together indicate the same entry number.
 For the case of carrier switching, the antenna switching capability for the target carrier configuration is indicated as follows:
 For UE configured with a set of component carriers belonging to a band combination $C_{\text{baseline}} = \{b_1(1), \dots, b_x(1), \dots, b_y(0), \dots\}$, where "1/0" denotes whether the corresponding band has an uplink, if a component carrier in b_x is to be switched to a component carrier in b_y (according to <i>srs-SwitchFromServCellIndex</i>), the antenna switching capability is derived based on band combination $C_{\text{target}} = \{b_1(1), \dots, b_x(0), \dots, b_y(1), \dots\}$.</p> | - |
| <p>txDiv-PUCCH1b-ChSelect
 Indicates whether the UE supports transmit diversity for PUCCH format 1b with channel selection.</p> | Yes |
| <p>txDiv-SPUCCH
 Indicates whether the UE supports Tx diversity on SPUCCH format 1/1a/1b/3.</p> | Yes |
| <p>tx-Sidelink, rx-Sidelink
 Indicates that the UE supports sidelink transmission/reception on the band in the band combination.
 For NR sidelink transmission, <i>tx-Sidelink</i> is only applicable if the UE supports at least one of <i>sl-TransmissionMode1-r16</i> and <i>sl-TransmissionMode2-r16</i> on the band as specified in TS 38.331 [82].
 For NR sidelink reception, <i>rx-Sidelink</i> is only applicable if the UE supports <i>sl-Reception-r16</i> on the band as specified in TS 38.331 [82].</p> | - |
| <p>uci-PUSCH-Ext
 Indicates whether the UE supports an extension of UCI delivering more than 22 HARQ-ACK bits on PUSCH as specified in TS 36.212 [22], clause 5.2.2.6 and TS 36.213 [23], clause 8.6.3.</p> | No |
| <p>ue-AutonomousWithFullSensing
 Indicates whether the UE supports transmitting PSCCH/PSSCH using UE autonomous resource selection mode with full sensing (i.e., continuous channel monitoring) for V2X sidelink communication and the UE supports maximum transmit power associated with Power class 3 V2X UE, see TS 36.101 [42].</p> | - |
| <p>ue-AutonomousWithPartialSensing
 Indicates whether the UE supports transmitting PSCCH/PSSCH using UE autonomous resource selection mode with partial sensing (i.e., channel monitoring in a limited set of subframes) for V2X sidelink communication and the UE supports maximum transmit power associated with Power class 3 V2X UE, see TS 36.101 [42].</p> | - |
| <p>ue-Category
 UE category as defined in TS 36.306 [5]. Set to values 1 to 12 in this version of the specification.</p> | - |
| <p>ue-CategoryDL
 UE DL category as defined in TS 36.306 [5]. Value <i>n17</i> corresponds to UE category 17, value <i>m1</i> corresponds to UE category M1, value <i>oneBis</i> corresponds to UE category 1bis, value <i>m2</i> corresponds to UE category M2. For ASN.1 compatibility, a UE indicating DL category 0, <i>m1</i> or <i>m2</i> shall also indicate any of the categories (1..5) in <i>ue-Category</i> (without suffix), which is ignored by the eNB, a UE indicating UE category <i>oneBis</i> shall also indicate UE category 1 in <i>ue-Category</i> (without suffix), and a UE indicating UE category <i>m2</i> shall also indicate UE category <i>m1</i>. The field <i>ue-CategoryDL</i> is set to values 0, <i>m1</i>, <i>oneBis</i>, <i>m2</i>, 4, 6, 7, 9 to 16, <i>n17</i>, 18, 19, 20, 21, 22, 23, 24, 25, 26 in this version of the specification.</p> | - |
| <p>ue-CategorySL-C-TX
 UE SL category for V2X transmission as defined in TS 36.306 [5]. Set to values 1 to 5 in this version of the specification.</p> | - |
| <p>ue-CategorySL-C-RX
 UE SL category for V2X reception as defined in TS 36.306 [5]. Set to values 1 to 4 in this version of the specification.</p> | - |
| <p>ue-CategoryUL
 UE UL category as defined in TS 36.306 [5]. Value <i>n14</i> corresponds to UE category 14, value <i>n16</i> corresponds to UE category 16 and so on. Value <i>m1</i> corresponds to UE category M1, value <i>m2</i> corresponds to UE category M2, value <i>oneBis</i> corresponds to UE category 1bis. The field <i>ue-CategoryUL</i> is set to values <i>m1</i>, <i>m2</i>, 0, <i>oneBis</i>, 3, 5, 7, 8, 13, <i>n14</i>, 15, <i>n16</i> to <i>n21</i> or 22 to 26 in this version of the specification.</p> | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|---|------------------------------|
| ue-CA-PowerClass-N
Indicates whether the UE supports UE power class N in the E-UTRA band combination, see TS 36.101 [42] and TS 36.307 [78]. If <i>ue-CA-PowerClass-N</i> is not included, UE supports the default UE power class in the E-UTRA band combination, see TS 36.101 [42]. | - |
| ue-CE-NeedULGaps
Indicates whether the UE needs uplink gaps during continuous uplink transmission in FDD as specified in TS 36.211 [21] and TS 36.306 [5]. | - |
| ue-PowerClass-N, ue-PowerClass-5
Indicates whether the UE supports UE power class 1, 2, 4 or 5 in the E-UTRA band, see TS 36.101 [42] and TS 36.307 [79] and TS 36.102 [113] for NTN capable UE. UE includes either <i>ue-PowerClass-N</i> or <i>ue-PowerClass-5</i> . If neither <i>ue-PowerClass-N</i> nor <i>ue-PowerClass-5</i> is included, UE supports the default UE power class in the E-UTRA band, see TS 36.101 [42] and TS 36.102 [113] for NTN capable UE. | - |
| ue-Rx-TxTimeDiffMeasurements
Indicates whether the UE supports Rx - Tx time difference measurements. | No |
| ue-SpecificRefSigsSupported | No |
| ue-SSTD-Meas
Indicates whether the UE supports SSTD measurements between the PCell and the PSCell as specified in TS 36.214 [48] and TS 36.133 [16]. | - |
| ue-TxAntennaSelectionSupported
Except for the supported band combinations for which <i>bandParameterList-v1380</i> is included, TRUE indicates that the UE is capable of supporting UE transmit antenna selection such that all the supported bands in the band combination are affected by transmit antenna switching, as described in TS 36.213 [23], clause 8.7. E-UTRAN ignores this field for band combinations for which <i>bandParameterList-v1380</i> is included. | Yes |
| ue-TxAntennaSelection-SRS-1T4R
Indicates whether the UE supports selecting one antenna among four antennas to transmit SRS for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| ue-TxAntennaSelection-SRS-2T4R-2Pairs
Indicates whether the UE supports selecting one antenna pair between two antenna pairs to transmit SRS simultaneously for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| ue-TxAntennaSelection-SRS-2T4R-3Pairs
Indicates whether the UE supports selecting one antenna pair among three antenna pairs to transmit SRS simultaneously for the corresponding band of the band combination as described in TS 36.213 [23]. | - |
| ul-64QAM
Indicates whether the UE supports 64QAM in UL on the band. This field is only present when the field <i>ue-CategoryUL</i> indicates UL UE category that supports UL 64QAM, see TS 36.306 [5], Table 4.1A-2. If the field is present for one band, the field shall be present for all bands including downlink only bands. | - |
| ul-256QAM
Indicates whether the UE supports 256QAM in UL on the band in the band combination. This field is only present when the field <i>ue-CategoryUL</i> indicates UL UE category that supports 256QAM in UL, see TS 36.306 [5], Table 4.1A-2. The UE includes this field only if the field <i>ul-256QAM-perCC-InfoList</i> is not included. | - |
| ul-256QAM (in FeatureSetUL-PerCC)
Indicates whether the UE supports 256QAM in UL for MR-DC within the indicated feature set. This field is only present when the field <i>ue-CategoryUL</i> indicates UL UE category that supports 256QAM in UL, see TS 36.306 [5], Table 4.1A-2. | - |
| ul-256QAM-perCC-InfoList
Indicates, per serving carrier of which the corresponding bandwidth class includes multiple serving carriers (i.e. bandwidth class B, C, D and so on), whether the UE supports 256QAM in the band combination. The number of entries is equal to the number of component carriers in the corresponding bandwidth class. The UE shall support the setting indicated in each entry of the list regardless of the order of entries in the list. This field is only present when the field <i>ue-CategoryUL</i> indicates UL UE category that supports 256QAM in UL, see TS 36.306 [5], Table 4.1A-2. The UE includes this field only if the field <i>ul-256QAM</i> is not included. | - |
| ul-256QAM-Slot
Indicates whether the UE supports 256QAM in UL for slot TTI operation on the band. | - |
| ul-256QAM-Subslot
Indicates whether the UE supports 256QAM in UL for subslot TTI operation on the band. | - |
| ul-AsyncHarrSharingDiff-TTI-Lengths
Indicates whether the UE supports UL asynchronous HARQ sharing between different TTI lengths for an UL serving cell. | Yes |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| ul-CoMP
Indicates whether the UE supports UL Coordinated Multi-Point operation. | No |
| ul-dmrs-Enhancements
Indicates whether the UE supports UL DMRS enhancements as defined in TS 36.211 [21], clause 6.10.3A. | Yes |
| ul-PDCP-AvgDelay
Indicates whether the UE supports UL PDCP Packet Average Delay measurement (as specified in TS 38.314 [103]) and reporting in RRC_CONNECTED. | - |
| ul-PDCP-Delay
Indicates whether the UE supports UL PDCP Packet Delay per QCI measurement as specified in TS 36.314 [71]. | - |
| ul-powerControlEnhancements
Indicates whether UE supports UplinkPowerControlDedicated. | Yes |
| ul-RRC-Segmentation
Indicates the UE supports uplink RRC segmentation of <i>UECapabilityInformation</i> . | - |
| uplinkLAA
Presence of the field indicates that the UE supports uplink LAA operation. | - |
| uss-BlindDecodingAdjustment
Indicates whether the UE supports blind decoding adjustment on UE specific search space as defined in TS 36.213 [22]. This field can be included only if uplinkLAA is included. | - |
| uss-BlindDecodingReduction
Indicates whether the UE supports blind decoding reduction on UE specific search space by not monitoring DCI format 0A/0B/4A/4B as defined in TS 36.213 [22]. This field can be included only if uplinkLAA is included. | - |
| unicastFrequencyHopping
Indicates whether the UE supports frequency hopping for unicast MPDCCH/PDSCH (configured by <i>mpdcch-pdsch-HoppingConfig</i>) and unicast PUSCH (configured by <i>pusch-HoppingConfig</i>). | - |
| unicast-fembmsMixedSCell
Indicates whether the UE supports unicast reception from FeMBMS/Unicast mixed cell. This field is included only if UE supports carrier aggregation. | No |
| utra-GERAN-CGI-Reporting-ENDC
Indicates whether the UE supports Inter-RAT report CGI procedure towards GERAN/UTRA cell when it is configured with (NG)EN-DC wherein either MN and SN have different DRX cycles, or on-duration configured by MN does not contain on-duration configured by SN if their DRX cycles are same. | Yes |
| utran-ProximityIndication
Indicates whether the UE supports proximity indication for UTRAN CSG member cells. | - |
| utran-SI-AcquisitionForHO
Indicates whether the UE supports, upon configuration of si-RequestForHO by the network, acquisition and reporting of relevant information using autonomous gaps by reading the SI from a neighbouring UMTS cell. | Yes |
| v2x-BandParametersNR
Includes the NR <i>BandParametersSidelink-r16</i> IE as specified in TS 38.331 [82]. The field includes the per-band per-band-combination sidelink capability for NR-PC5. | - |
| v2x-BandParametersEUTRA-NR-v1710
Includes the <i>BandParametersSidelinkEUTRA-NR-v1710</i> IE as specified in TS 38.331 [82]. The field includes the per-band per-band-combination sidelink capability for NR-PC5. | - |
| v2x-BandwidthClassTxSL, v2x-BandwidthClassRxSL
The bandwidth class for V2X sidelink transmission and reception supported by the UE as defined in TS 36.101 [42], Table 5.6G.1-3.
The UE explicitly includes all the supported bandwidth class combinations for V2X sidelink transmission or reception in the band combination signalling. Support for one bandwidth class does not implicitly indicate support for another bandwidth class. | - |
| v2x-eNB-Scheduled
Indicates whether the UE supports transmitting PSCCH/PSSCH using dynamic scheduling, SPS in eNB scheduled mode for V2X sidelink communication, reporting SPS assistance information and the UE supports maximum transmit power associated with Power class 3 V2X UE, see TS 36.101 [42] in a band. | - |
| v2x-EnhancedHighReception
Indicates whether the UE supports reception of 30 PSCCH in a subframe and decoding of 204 RBs per subframe counting both PSCCH and PSSCH in a band for V2X sidelink communication. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| v2x-HighPower
Indicates whether the UE supports maximum transmit power associated with Power class 2 V2X UE for V2X sidelink transmission in a band, see TS 36.101 [42]. | - |
| v2x-HighReception
Indicates whether the UE supports reception of 20 PSCCH in a subframe and decoding of 136 RBs per subframe counting both PSCCH and PSSCH in a band for V2X sidelink communication. | - |
| v2x-nonAdjacentPSCCH-PSSCH
Indicates whether the UE supports transmission and reception in the configuration of non-adjacent PSCCH and PSSCH for V2X sidelink communication. | - |
| v2x-numberTxRxTiming
Indicates the number of multiple reference TX/RX timings counted over all the configured sidelink carriers for V2X sidelink communication. | - |
| v2x-SensingReportingMode3
Indicates whether the UE supports sensing measurements and reporting of measurement results in eNB scheduled mode for V2X sidelink communication. | - |
| v2x-SupportedBandCombinationList
Indicates the supported band combination list on which the UE supports simultaneous transmission and/or reception of V2X sidelink communication. | - |
| v2x-SupportedBandCombinationListEUTRA-NR
Indicates the supported band combination list on which the UE supports simultaneous transmission and/or reception of NR sidelink communication only, or joint V2X sidelink communication and NR sidelink communication. | - |
| v2x-SupportedTxBandCombListPerBC, v2x-SupportedRxBandCombListPerBC
Indicates, for a particular band combination of EUTRA, the supported band combination list among v2x-SupportedBandCombinationList on which the UE supports simultaneous transmission or reception of EUTRA and V2X sidelink communication respectively. The first bit refers to the first entry of v2x-SupportedBandCombinationList, with value 1 indicating V2X sidelink transmission/reception is supported. | - |
| v2x-SupportedTxBandCombListPerBC-v1630, v2x-SupportedRxBandCombListPerBC-v1630
Indicates, for a particular band combination of EUTRA, the supported band combination list among v2x-SupportedBandCombinationListEUTRA-NR on which the UE supports simultaneous transmission or reception of EUTRA and NR sidelink communication respectively, or simultaneous transmission or reception of EUTRA and joint V2X sidelink communication and NR sidelink communication respectively. The first bit refers to the first entry of v2x-SupportedBandCombinationListEUTRA-NR, with value 1 indicating V2X sidelink transmission/reception is supported. | - |
| v2x-TxWithShortResvInterval
Indicates whether the UE supports 20 ms and 50 ms resource reservation periods for UE autonomous resource selection and eNB scheduled resource allocation for V2X sidelink communication. | - |
| virtualCellID-BasicSRS
Indicates whether the UE supports virtual cell ID for basic SRS symbol(s). | - |
| virtualCellID-AddSRS
This field indicates whether the UE supports virtual cell ID for additional SRS symbol(s). | - |
| voiceOverPS-HS-UTRA-FDD
Indicates whether UE supports IMS voice according to GSMA IR.58 profile in UTRA FDD. | - |
| voiceOverPS-HS-UTRA-TDD128
Indicates whether UE supports IMS voice in UTRA TDD 1.28Mcps. | - |
| widebandPRG-Slot, widebandPRG-Subslot, widebandPRG-Subframe
Indicates whether the UE supports wideband precoding resource block group size for slot/subslot/subframe operation as specified in TS 36.213 [23]. | - |
| wlan-IW-RAN-Rules
Indicates whether the UE supports RAN-assisted WLAN interworking based on access network selection and traffic steering rules. | - |
| wlan-IW-ANDSF-Policies
Indicates whether the UE supports RAN-assisted WLAN interworking based on ANDSF policies. | - |
| wlan-MAC-Address
Indicates the WLAN MAC address of this UE. | - |
| wlan-PeriodicMeas
Indicates whether the UE supports periodic reporting of WLAN measurements. | - |

| UE-EUTRA-Capability field descriptions | FDD/
TDD
diff |
|--|------------------------------|
| wlan-ReportAnyWLAN
Indicates whether the UE supports reporting of WLANs not listed in the <i>measObjectWLAN</i> . | - |
| wlan-SupportedDataRate
Indicates the maximum WLAN data rate supported by the UE over all LWA bearers. Actual value of supported data rate is field value * 10 Mbps (i.e., value 1 corresponds to 10 Mbps, value 2 corresponds to 20 Mbps and so on). | - |
| zp-CSI-RS-AperiodicInfo
Indicates whether the UE supports aperiodic ZP-CSI-RS transmission for the indicated transmission mode. | Yes |

NOTE 1: The IE *UE-EUTRA-Capability* does not include AS security capability information, since these are the same as the security capabilities that are signalled by NAS. Consequently, AS need not provide "man-in-the-middle" protection for the security capabilities.

NOTE 2: The column FDD/ TDD diff indicates if the UE is allowed to signal, as part of the additional capabilities for an XDD mode i.e. within *UE-EUTRA-CapabilityAddXDD-Mode-xNM*, a different value compared to the value signalled elsewhere within *UE-EUTRA-Capability* (i.e. the common value, supported for both XDD modes). A '-' is used to indicate that it is not possible to signal different values (used for fields for which the field description is provided for other reasons). Annex E specifies for which TDD and FDD serving cells a UE supporting TDD/FDD CA shall support a capability for which it indicates support within the capability signalling.

NOTE 2a: From REL-15 onwards, the UE is not allowed to signal different values for FDD and TDD unless yes is indicated in column FDD/ TDD diff (i.e. no need to introduce field description solely for the purpose of indicate no).

NOTE 3: The *BandCombinationParameters* for the same band combination can be included more than once.

NOTE 4: UE CA and measurement capabilities indicate the combinations of frequencies that can be configured as serving frequencies.

NOTE 5: The grouping of the cells to the first and second cell group, as indicated by *supportedCellGrouping*, is shown in the table below. The leading / leftmost bit of *supportedCellGrouping* corresponds to the Bit String Position 1.

| Nr of Band Entries: | 5 | 4 | 3 |
|-----------------------|--|------|-----|
| Length of Bit-String: | 15 | 7 | 3 |
| Bit String Position | Cell grouping option (0= first cell group, 1= second cell group) | | |
| 1 | 00001 | 0001 | 001 |
| 2 | 00010 | 0010 | 010 |
| 3 | 00011 | 0011 | 011 |
| 4 | 00100 | 0100 | |
| 5 | 00101 | 0101 | |
| 6 | 00110 | 0110 | |
| 7 | 00111 | 0111 | |
| 8 | 01000 | | |
| 9 | 01001 | | |
| 10 | 01010 | | |
| 11 | 01011 | | |
| 12 | 01100 | | |
| 13 | 01101 | | |
| 14 | 01110 | | |
| 15 | 01111 | | |

NOTE 6: UE includes the *intraBandContiguousCC-InfoList-r12* also for bandwidth class A because of the presence conditions in *BandCombinationParameters-v1270*. For example, if UE supports CA_1A_41D band combination, if UE includes the field *intraBandContiguousCC-InfoList-r12* for band 41, the UE includes *intraBandContiguousCC-InfoList-r12* also for band 1.

NOTE 6a: For multiple *BandParameters* entries with the same *bandEUTRA* and same *ca-BandwidthClassDL* in a supported band combination, the UE capabilities indicated by *BandParameters* are agnostic to the order in which they are indicated in the *bandParameterList*, under the condition that the set of the capabilities indicated for the concerned *bandEUTRA* (e.g. *bandParametersDL* and *bandParametersUL*) are used together, and the concerned *BandParameters* correspond to the *supportedBandwidthCombinationSet* for which set of channel bandwidths for carrier(s) is the same among sub-blocks, as defined in TS 36.101 [42], Table 5.6A.1-3, Table 5.6A.1-4, Table 5.6A.1-5.

NOTE 7: For a UE that indicates release X in field *accessStratumRelease* but supports a feature specified in release X+N (i.e. early UE implementation), the ASN.1 comprehension requirement are specified in Annex F.

NOTE 8: For a UE that does not include *mimo-WeightedLayersCapabiliites-r13*, or for the case with no CC configured with FD-MIMO, the FD-MIMO processing capability condition is not applicable (i.e. considered as satisfied). For a UE that includes *mimo-WeightedLayersCapabiliites-r13*, the FD-MIMO processing capability condition is satisfied if the equation 4.3.28.13-1 in TS 36.306 [5] is satisfied.

– *UE-RadioPagingInfo*

The *UE-RadioPagingInfo* IE contains UE capability information needed for paging.

***UE-RadioPagingInfo* information element**

UE-RadioPagingInfo field descriptions

ce-ModeA, ce-ModeB

Indicates whether the UE supports operation in CE mode A and/or B, as specified in TS 36.211 [21] and TS 36.213 [23].

groupWakeUpSignal, groupWakeUpSignalTDD

Indicates whether the UE supports GWUS for paging in RRC_IDLE as specified in TS 36.211 [21], TS 36.213 [23] and TS 36.304 [4]. If this field is included, the minimum gap between GWUS and associated PO for DRX is fixed as 40 ms.

groupWakeUpSignalAlternation, groupWakeUpSignalAlternationTDD

Indicates whether the UE supports GWUS with group resource alternation for paging in RRC_IDLE as specified in TS 36.211 [21], TS 36.213 [23] and TS 36.304 [4]. If this field is included, the minimum gap between GWUS and associated PO for DRX is fixed as 40 ms.

inactiveStatePO-Determination

Indicates whether the UE other than BL UE or UE in CE supports to use the same i_s in RRC_INACTIVE state as in RRC_IDLE state, as specified in TS 36.304 [4].

ue-Category, ue-CategoryDL

UE category as defined in TS 36.306 [5]. A category M2 UE shall also include the field ue-CategoryDL-v1310 in this version of the specification.

wakeUpSignal, wakeUpSignal-TDD

Indicates whether the UE supports WUS for paging in RRC_IDLE as specified in TS 36.213 [22] and TS 36.304 [4]. If this field is included, the minimum gap between WUS and associated PO for DRX is fixed as 40 ms.

wakeUpSignalMinGap-eDRX, wakeUpSignalMinGap-eDRX-TDD

Indicates the minimum gap the UE supports between WUS and associated PO for eDRX as specified in TS 36.213 [22] and TS 36.304 [4]. Value ms40 corresponds to 40 ms, ms240 corresponds to 240 ms and so on. If this field is included, the UE shall also indicate support of WUS or GWUS for paging.

— UE-TimersAndConstants

The IE *UE-TimersAndConstants* contains timers and constants used by the UE in either RRC_CONNECTED or RRC_IDLE.

UE-TimersAndConstants information element

```

-- ASN1START

UE-TimersAndConstants ::= SEQUENCE {

#### ***UE-TimersAndConstants* field descriptions**

##### ***n3xy***

Constants are described in clause 7.4. n1 corresponds with 1, n2 corresponds with 2 and so on.

##### ***t3xy***

Timers are described in clause 7.3. Value ms0 corresponds with 0 ms, ms50 corresponds with 50 ms and so on. EUTRAN includes an extended value *t3xy-v1310* and *t3xy-v1330* only in the Bandwidth Reduced (BR) version of the SIB. UEs that support Coverage Enhancement (CE) mode B shall use the extended values *t3xy-v1310* and *t3xy-v1330*, if present, and ignore the value signaled by *t3xy* (without the suffix).

*t300-r15* is only applicable for EDT for mobile originating calls and for UL data transmission using PUR. UE performing EDT for mobile originating calls or UL data transmission using PUR shall use *t300-r15*, if present.

<b>Conditional presence</b>	<b>Explanation</b>
<i>EDTOrPUR</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> is present in SIB2 or the UE is configured with <i>pur-Config</i> ; otherwise the field is not present and the UE shall delete any existing value for this field.

#### ***VisitedCellInfoList***

The IE *VisitedCellInfoList* includes the mobility history information of maximum of 16 most recently visited cells or time spent outside E-UTRA. The most recently visited cell is stored first in the list. The list includes cells visited in RRC\_IDLE and RRC\_CONNECTED states.

#### ***VisitedCellInfoList* information element**

```

-- ASN1START

VisitedCellInfoList-r12 ::= SEQUENCE (SIZE (1..maxCellHistory-r12)) OF VisitedCellInfo-r12

VisitedCellInfo-r12 ::= SEQUENCE {

 }
 }
 OPTIONAL,
 timeSpent-r12
 INTEGER (0..4095),
 ...
}

-- ASN1STOP

```

<i>VisitedCellInfoList</i> field descriptions
-----------------------------------------------

**timeSpent**

This field indicates the duration of stay in the cell or outside E-UTRA approximated to the closest second. If the duration of stay exceeds 4095s, the UE shall set it to 4095s.

## — *WLAN-OffloadConfig*

The IE *WLAN-OffloadConfig* includes information for traffic steering between E-UTRAN and WLAN. The fields are applicable to both RAN-assisted WLAN interworking based on access network selection and traffic steering rules and RAN-assisted WLAN interworking based on ANDSF policies unless stated otherwise in the field description.

### *WLAN-OffloadConfig* information element

<b><i>WLAN-OffloadConfig</i></b> field descriptions	
<b><i>offloadPreferenceIndicator</i></b>	Indicates the offload preference indicator. Parameter: OPI in TS 24.312 [66]. Only applicable to RAN-assisted WLAN interworking based on ANDSF policies.
<b><i>thresholdBackhaulDLBandwidth-High</i></b>	Indicates the backhaul available downlink bandwidth threshold used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{BackhRateDLWLAN}, \text{High}}$ in TS 36.304 [4]. Value in kilobits/second. Value rN corresponds to N kbps.
<b><i>thresholdBackhaulDLBandwidth-Low</i></b>	Indicates the backhaul available downlink bandwidth threshold used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{BackhRateDLWLAN}, \text{Low}}$ in TS 36.304 [4]. Value in kilobits/second. Value rN corresponds to N kbps.
<b><i>thresholdBackhaulULBandwidth-High</i></b>	Indicates the backhaul available uplink bandwidth threshold used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{BackhRateULWLAN}, \text{High}}$ in TS 36.304 [4]. Value in kilobits/second. Value rN corresponds to N kbps.
<b><i>thresholdBackhaulULBandwidth-Low</i></b>	Indicates the backhaul available uplink bandwidth threshold used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{BackhRateULWLAN}, \text{Low}}$ in TS 36.304 [4]. Value in kilobits/second. Value rN corresponds to N kbps.
<b><i>thresholdChannelUtilization-High</i></b>	Indicates the WLAN channel utilization (BSS load) threshold used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{ChUtilWLAN}, \text{High}}$ in TS 36.304 [4].
<b><i>thresholdChannelUtilization-Low</i></b>	Indicates the WLAN channel utilization (BSS load) threshold used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{ChUtilWLAN}, \text{Low}}$ in TS 36.304 [4].
<b><i>thresholdRSRP-High</i></b>	Indicates the RSRP threshold (in dBm) used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{ServingOffloadWLAN}, \text{HighP}}$ in TS 36.304 [4].
<b><i>thresholdRSRP-Low</i></b>	Indicates the RSRP threshold (in dBm) used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{ServingOffloadWLAN}, \text{LowP}}$ in TS 36.304 [4].
<b><i>thresholdRSRQ-High, thresholdRSRQ-OnAllSymbolsHigh, thresholdRSRQ-WB-High, thresholdRSRQ-OnAllSymbolsWithWB-High</i></b>	Indicates the RSRQ threshold (in dB) used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{ServingOffloadWLAN}, \text{HighQ}}$ in TS 36.304 [4]. The UE shall only apply one of threshold values of <i>thresholdRSRQ-OnAllSymbolsWithWB-High</i> , <i>thresholdRSRQ-OnAllSymbolsHigh</i> , <i>thresholdRSRQ-WB-High</i> and <i>thresholdRSRQ-High</i> as present in <i>wlan-OffloadConfigCommon</i> and forward this to upper layer. NOTE 1.
<b><i>thresholdRSRQ-Low, thresholdRSRQ-OnAllSymbolsLow, thresholdRSRQ-WB-Low, thresholdRSRQ-OnAllSymbolsWithWB-Low</i></b>	Indicates the RSRQ threshold (in dB) used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{ServingOffloadWLAN}, \text{LowQ}}$ in TS 36.304 [4]. The UE shall only apply one of threshold values of <i>thresholdRSRQ-OnAllSymbolsWithWB-Low</i> , <i>thresholdRSRQ-OnAllSymbolsLow</i> , <i>thresholdRSRQ-WB-Low</i> and <i>thresholdRSRQ-Low</i> as present in <i>wlan-OffloadConfigCommon</i> and forward this to upper layer. NOTE 1.
<b><i>thresholdWLAN-RSSI-High</i></b>	Indicates the WLAN RSSI threshold used by the UE for traffic steering to WLAN. Parameter: $\text{Thresh}_{\text{WLANRSSI}, \text{High}}$ in TS 36.304 [4]. Value 0 corresponds to -128dBm, 1 corresponds to -127dBm and so on.
<b><i>thresholdWLAN-RSSI-Low</i></b>	Indicates the WLAN RSSI threshold used by the UE for traffic steering to E-UTRAN. Parameter: $\text{Thresh}_{\text{WLANRSSI}, \text{Low}}$ in TS 36.304 [4]. Value 0 corresponds to -128dBm, 1 corresponds to -127dBm and so on.
<b><i>t-SteeringWLAN</i></b>	Indicates the timer value during which the rules should be fulfilled before starting traffic steering between E-UTRAN and WLAN. Parameter: $\text{Tsteering}_{\text{WLAN}}$ in TS 36.304 [4]. Only applicable to RAN-assisted WLAN interworking based on access network selection and traffic steering rules.

NOTE 1: Within SIB17, E-UTRAN includes the fields corresponding to same RSRQ types as included in SIB1. E.g. if E-UTRAN includes *q-QualMinRSRQ-OnAllSymbols* in SIB1 it also includes *thresholdRSRQ-OnAllSymbols* in SIB17. Within the *RRCConnectionReconfiguration* message E-UTRAN only includes *thresholdRSRQ*, setting the value according to the RSRQ type used for E-UTRAN. The UE shall apply the RSRQ fields (RSRQ threshold, high and low) corresponding to one RSRQ type i.e. the same as it applies for E-UTRAN.

### 6.3.7 MBMS information elements

## – *MBMS-NotificationConfig*

The IE *MBMS-NotificationConfig* specifies the MBMS notification related configuration parameters, that are applicable for all MBSFN areas.

### ***MBMS-NotificationConfig* information element**

```
-- ASN1START

MBMS-NotificationConfig-r9 ::= SEQUENCE {
 notificationRepetitionCoeff-r9 ENUMERATED {n2, n4},
 notificationOffset-r9 INTEGER (0..10),
 notificationSF-Index-r9 INTEGER (1..6)
}

MBMS-NotificationConfig-v1430 ::= SEQUENCE {
 notificationSF-Index-v1430 INTEGER (7..10)
}

-- ASN1STOP
```

#### ***MBMS-NotificationConfig* field descriptions**

##### ***notificationOffset***

Indicates, together with the *notificationRepetitionCoeff*, the radio frames in which the MCCH information change notification is scheduled i.e. the MCCH information change notification is scheduled in radio frames for which: SFN mod notification repetition period = *notificationOffset*.

##### ***notificationRepetitionCoeff***

Actual change notification repetition period common for all MCCHs that are configured= shortest modification period/ *notificationRepetitionCoeff*. The 'shortest modifacaton period' corresponds with the lowest value of *mcch-ModificationPeriod* of all MCCHs that are configured. Value n2 corresponds to coefficient 2, and so on.

##### ***notificationSF-Index***

Indicates the subframe used to transmit MCCH change notifications on PDCCH. FDD: Value 1, 2, 3, 4, 5 and 6 correspond with subframe #1, #2, #3 #6, #7, and #8 respectively. Value 7, 8, 9 and 10 correspond with subframe #0, #4, #5 and #9 respectively. If *notificationSF-Index-v1430* is included, UE ignores *notificationSF-Index-r9*. TDD: Value 1, 2, 3, 4, and 5 correspond with subframe #3, #4, #7, #8, and #9 respectively.

## – *MBMS-ServiceList*

The IE *MBMS-ServiceList* provides the list of MBMS services which the UE is receiving or interested to receive.

### ***MBMS-ServiceList* information element**

```
-- ASN1START

MBMS-ServiceList-r13 ::= SEQUENCE (SIZE (0..maxMBMS-ServiceListPerUE-r13)) OF MBMS-
ServiceInfo-r13

MBMS-ServiceInfo-r13 ::= SEQUENCE {
 tmgi-r13
}

-- ASN1STOP
```

## – *MBSFN-Areald*

The IE *MBSFN-Areald* identifies an MBSFN area by means of a locally unique value at lower layers i.e. it concerns parameter  $N_{ID}^{MBSFN}$  in TS 36.211 [21], clause 6.10.2.1.

### ***MBSFN-Areald* information element**

```
-- ASN1START

MBSFN-Areald-r12 ::= INTEGER (0..255)

-- ASN1STOP
```

## MBSFN-AreaInfoList

The IE *MBSFN-AreaInfoList* contains the information required to acquire the MBMS control information associated with one or more MBSFN areas.

### ***MBSFN-AreaInfoList* information element**

```
-- ASN1START

MBSFN-AreaInfoList-r9 ::= SEQUENCE (SIZE(1..maxMBSFN-Area)) OF MBSFN-AreaInfo-r9

MBSFN-AreaInfo-r9 ::= SEQUENCE {
 mbsfn-AreaId-r9,
 non-MBSFNregionLength,
 notificationIndicator-r9,
 mcch-Config-r9 {

 ...
}

MBSFN-AreaInfoList-r17 ::= SEQUENCE (SIZE(1..maxMBSFN-Area)) OF MBSFN-AreaInfo-r17

MBSFN-AreaInfo-r17 ::= SEQUENCE {
 mbsfn-AreaInfo-r17,
 pmch-Bandwidth-r17 ENUMERATED {n40, n35, n30, spare1},
 ...
}

-- ASN1STOP
```

<b>MBSFN-AreaInfoList field descriptions</b>	
<b>mcch-ModificationPeriod</b>	Defines periodically appearing boundaries, i.e. radio frames for which SFN mod <i>mcch-ModificationPeriod</i> = 0. The contents of different transmissions of MCCH information can only be different if there is at least one such boundary in-between them. In case <i>mcch-ModificationPeriod-v1430</i> is configured, the UE shall ignore the <i>mcch-ModificationPeriod-r9</i> .
<b>mcch-Offset</b>	Indicates, together with the <i>mcch-RepetitionPeriod</i> , the radio frames in which MCCH is scheduled i.e. MCCH is scheduled in radio frames for which: SFN mod <i>mcch-RepetitionPeriod</i> = <i>mcch-Offset</i> .
<b>mcch-RepetitionPeriod</b>	Defines the interval between transmissions of MCCH information, in radio frames. Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on. In case <i>mcch-RepetitionPeriod-v1430</i> is configured, the UE shall ignore the <i>mcch-RepetitionPeriod-r9</i> .
<b>non-MBSFNregionLength</b>	Indicates how many symbols from the beginning of the subframe constitute the non-MBSFN region. This value applies in all subframes of the MBSFN area used for PMCH transmissions as indicated in the MSI. The values s1 and s2 correspond with 1 and 2 symbols, respectively: see TS 36.211 [21], Table 6.7-1.
<b>notificationIndicator</b>	Indicates which PDCCH bit is used to notify the UE about change of the MCCH applicable for this MBSFN area. Value 0 corresponds with the least significant bit as defined in TS 36.212 [22], clause 5.3.3.1 and so on.
<b>pmch-Bandwidth</b>	Indicates the PMCH and corresponding MBSFN-RS bandwidth applicable for this MBSFN area (parameter $N_{\text{RB}}^{\text{PMCH}}$ in TS 36.211 [21] and TS 36.213 [23]). Value n40 corresponds to 40 PRBs, n35 corresponds to 35 PRBs and so on.
<b>sf-AllocInfo-r9</b>	Indicates the subframes of the radio frames indicated by the <i>mcch-RepetitionPeriod</i> and the <i>mcch-Offset</i> , that may carry MCCH. Value "1" indicates that the corresponding subframe is allocated. If the bitmap is set to all zeros, the corresponding MBSFN area is considered as not configured. The following mapping applies: FDD: The first/ leftmost bit defines the allocation for subframe #1 of the radio frame indicated by <i>mcch-RepetitionPeriod</i> and <i>mcch-Offset</i> , the second bit for #2, the third bit for #3, the fourth bit for #6, the fifth bit for #7 and the sixth bit for #8. TDD: The first/leftmost bit defines the allocation for subframe #3 of the radio frame indicated by <i>mcch-RepetitionPeriod</i> and <i>mcch-Offset</i> , the second bit for #4, third bit for #7, fourth bit for #8, fifth bit for #9. Uplink subframes are not allocated. The last bit is not used.
<b>sf-AllocInfo-r16</b>	Indicates the subframes of the radio frames indicated by the <i>mcch-RepetitionPeriod</i> and the <i>mcch-Offset</i> , that may carry MCCH. Value "1" indicates that the corresponding subframe is allocated. The first/ leftmost bit defines the allocation for subframe #0 of the radio frame indicated by <i>mcch-RepetitionPeriod</i> and <i>mcch-Offset</i> , the second bit for #1 and so on. When <i>subcarrierSpacingMBMS</i> indicates 0.37 kHz subcarrier spacing, a valid MBMS slot can carry MCCH if any subframe corresponding to the slot is configured to carry MCCH.
<b>signallingMCS</b>	Indicates the MCS applicable for the subframes indicated by the field <i>sf-AllocInfo</i> and for each (P)MCH that is configured for this MBSFN area, for the first subframe allocated to the (P)MCH within each MCH scheduling period (which may contain the MCH scheduling information provided by MAC). Value n2 corresponds with the value 2 for parameter $I_{\text{MCS}}$ in TS 36.213 [23], Table 7.1.7.1-1, and so on.
<b>subcarrierSpacingMBMS</b>	The value indicates subcarrier spacing for MBSFN subframes, kHz7dot5 refers to 7.5 kHz subcarrier spacing, kHz2dot5 refers to 2.5 kHz subcarrier spacing and so on as defined in TS 36.211 [21], clause 6.12. These subframes do not have non-MBSFN region. If <i>subcarrierSpacingMBMS-r14</i> is present, then <i>non-MBSFNregionLength</i> shall be ignored. EUTRAN configures parameter <i>subcarrierSpacingMBMS</i> only when the MBSFN subframes have subcarrier spacing other than 15 kHz or when included in <i>mbsfn-ArealInfo-r17</i> . Value kHz15-r17 is applicable only when the field is included in <i>mbsfn-ArealInfo-r17</i> . If <i>subcarrierSpacingMBMS</i> indicates 0.37 kHz subcarrier spacing, the slot as defined in TS 36.211 [21], clause 4.1 is valid only when all the corresponding subframes are configured as MBSFN subframes in this slot.
<b>timeSeparation</b>	Indicates the staggering length for MBSFN-RS associated with PMCH as defined in TS 36.211 [21], clause 6.10.2.2.4. Value sl2 refers to staggering length of 2 slots (MBSFN reference signal pattern type 2) and sl4 refers to staggering length of 4 slots (MBSFN reference signal pattern type 1). E-UTRAN always configures this field when <i>subcarrierSpacingMBMS</i> indicates 0.37 kHz subcarrier spacing. Otherwise the field is not configured.

## – *MBSFN-SubframeConfig*

The IE *MBSFN-SubframeConfig* defines subframes that are reserved for MBSFN in downlink.

**MBSFN-SubframeConfig** information element

```
-- ASN1START

MBSFN-SubframeConfig ::= SEQUENCE {
 radioframeAllocationPeriod
 radioframeAllocationOffset
 subframeAllocation
 oneFrame
 fourFrames
 }
}

MBSFN-SubframeConfig-v1430 ::= SEQUENCE {
 subframeAllocation-v1430
 oneFrame-v1430
 fourFrames-v1430
}
}

MBSFN-SubframeConfig-v1610 ::= SEQUENCE {
 subframeAllocation-v1610
 oneFrame-v1610
 fourFrames-v1610
}
}

-- ASN1STOP
```

**MBSFN-SubframeConfig** field descriptions***fourFrames***

A bit-map indicating MBSFN subframe allocation in four consecutive radio frames, "1" denotes that the corresponding subframe is allocated for MBSFN. The bitmap is interpreted as follows:

FDD: Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation applies to subframes #1, #2, #3, #6, #7, and #8 in the sequence of the four radio-frames.

TDD: Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation applies to subframes #3, #4, #7, #8, and #9 in the sequence of the four radio-frames. The last four bits are not used. E-UTRAN allocates uplink subframes only if *eimta-MainConfig* is configured.

***fourFrames-v1430, fourFrames-v1610***

A bit-map indicating MBSFN subframe allocation in four consecutive radio frames, "1" denotes that the corresponding subframe is allocated for MBSFN. The bitmap is interpreted as follows:

FDD: Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation indicated by *fourFrames-v1430* applies to subframes #4 and #9 in the sequence of the four radio-frames. Starting from the first radioframe and from the first/leftmost bit in the bitmap, the allocation indicated by *fourFrames-v1610*, if present, applies to subframes #0 and #5 in the sequence of the four radio-frames.

***oneFrame***

"1" denotes that the corresponding subframe is allocated for MBSFN. The following mapping applies:

FDD: The first/leftmost bit defines the MBSFN allocation for subframe #1, the second bit for #2, third bit for #3, fourth bit for #6, fifth bit for #7, sixth bit for #8.

TDD: The first/leftmost bit defines the allocation for subframe #3, the second bit for #4, third bit for #7, fourth bit for #8, fifth bit for #9. E-UTRAN allocates uplink subframes only if *eimta-MainConfig* is configured. The last bit is not used.

***oneFrame-v1430, oneFrame-v1610***

"1" denotes that the corresponding subframe is allocated for MBSFN. The following mapping applies:

FDD: The first/leftmost bit indicated by *oneFrame-v1430* defines the MBSFN allocation for subframe #4 and the second bit for #9. The first/leftmost bit indicated by *oneFrame-v1610*, if present, defines the MBSFN allocation for subframe #0 and the second bit for #5.

***radioFrameAllocationPeriod, radioFrameAllocationOffset***

Radio-frames that contain MBSFN subframes occur when equation  $SFN \bmod radioFrameAllocationPeriod = radioFrameAllocationOffset$  is satisfied. Value *n1* for *radioFrameAllocationPeriod* denotes value 1, *n2* denotes value 2, and so on. When *fourFrames* is used for *subframeAllocation*, the equation defines the first radio frame referred to in the description below. Values *n1* and *n2* are not applicable when *fourFrames* is used.

***subframeAllocation***

Defines the subframes that are allocated for MBSFN within the radio frame allocation period defined by the *radioFrameAllocationPeriod* and the *radioFrameAllocationOffset*.

## PMCH-InfoList

The IE *PMCH-InfoList* specifies configuration of all PMCHs of an MBSFN area, while IE *PMCH-InfoListExt* includes additional PMCHs, i.e. extends the PMCH list using the general principles specified in 5.1.2. The information provided for an individual PMCH includes the configuration parameters of the sessions that are carried by the concerned PMCH. For all PMCH that E-UTRAN includes in *PMCH-InfoList*, the list of ongoing sessions has at least one entry.

### ***PMCH-InfoList* information element**

```
-- ASN1START

PMCH-InfoList-r9 ::= SEQUENCE (SIZE (0..maxPMCH-PerMBSFN)) OF PMCH-Info-r9
PMCH-InfoListExt-r12 ::= SEQUENCE (SIZE (0..maxPMCH-PerMBSFN)) OF PMCH-InfoExt-r12
PMCH-Info-r9 ::= SEQUENCE {
 pmch-Config-r9,
 mbms-SessionInfoList-r9,
 ...
}
PMCH-InfoExt-r12 ::= SEQUENCE {
 pmch-Config-r12,
 mbms-SessionInfoList-r12,
 ...
}
MBMS-SessionInfoList-r9 ::= SEQUENCE (SIZE (0..maxSessionPerPMCH)) OF MBMS-SessionInfo-r9
MBMS-SessionInfo-r9 ::= SEQUENCE {
 tmgi-r9,
 sessionId-r9,
 logicalChannelIdentity-r9,
 ...
}
PMCH-Config-r9 ::= SEQUENCE {
 sf-AllocEnd-r9,
 dataMCS-r9,
 mch-SchedulingPeriod-r9,
 ...
}
PMCH-Config-r12 ::= SEQUENCE {
 sf-AllocEnd-r12,
 dataMCS-r12,
 normal-r12,
 higerOrder-r12,
 },
 mch-SchedulingPeriod-r12
 ...
[[mch-SchedulingPeriod-v1430
]]
TMGI-r9 ::= SEQUENCE {
 plmn-Id-r9,
 plmn-Index-r9,
 explicitValue-r9,
 },
 serviceId-r9
}

-- ASN1STOP
```

<b>PMCH-InfoList field descriptions</b>	
<b>dataMCS</b>	Indicates the value for parameter $I_{\text{MCS}}$ in TS 36.213 [23], which defines the MCS applicable for the subframes of this (P)MCH as indicated by the field <i>commonSF-Alloc</i> . Value <i>normal</i> corresponds to Table 7.1.7.1-1 and value <i>higherOrder</i> corresponds to Table 7.1.7.1-1A. The MCS does however neither apply to the subframes that may carry MCCH i.e. the subframes indicated by the field <i>sf-AllocInfo</i> within <i>SystemInformationBlockType13</i> nor for the first subframe allocated to this (P)MCH within each MCH scheduling period (which may contain the MCH scheduling information provided by MAC).
<b>mch-SchedulingPeriod</b>	Indicates the MCH scheduling period i.e. the periodicity used for providing MCH scheduling information at lower layers (MAC) applicable for an MCH. Value rf8 corresponds to 8 radio frames, rf16 corresponds to 16 radio frames and so on. The <i>mch-SchedulingPeriod</i> starts in the radio frames for which: SFN mod <i>mch-SchedulingPeriod</i> = 0. E-UTRAN configures <i>mch-SchedulingPeriod</i> of the (P)MCH listed first in <i>PMCH-InfoList</i> to be smaller than or equal to <i>mcch-RepetitionPeriod</i> . In case <i>mch-SchedulingPeriod-v1430</i> is configured, the UE shall ignore <i>mch-SchedulingPeriod-r12</i> .
<b>plmn-Index</b>	Index of the entry across the <i>plmn-IdentityList</i> fields within <i>SystemInformationBlockType1</i> .
<b>sessionId</b>	Indicates the optional MBMS Session Identity, which together with TMGI identifies a transmission or a possible retransmission of a specific MBMS session: see TS 29.061 [51], clauses 20.5, 17.7.11, and 17.7.15. The field is included whenever upper layers have assigned a session identity i.e. one is available for the MBMS session in E-UTRAN.
<b>serviceId</b>	Uniquely identifies the identity of an MBMS service within a PLMN. The field contains octet 3- 5 of the IE Temporary Mobile Group Identity (TMGI) as defined in TS 24.008 [49]. The first octet contains the third octet of the TMGI, the second octet contains the fourth octet of the TMGI and so on.
<b>sf-AllocEnd</b>	Indicates the last subframe allocated to this (P)MCH within a period identified by field <i>commonSF-AllocPeriod</i> . The subframes allocated to (P)MCH corresponding with the $n^{\text{th}}$ entry in <i>pmch-InfoList</i> are the subsequent subframes starting from either the next subframe after the subframe identified by <i>sf-AllocEnd</i> of the $(n-1)^{\text{th}}$ listed (P)MCH or, for $n=1$ , the first subframe defined by field <i>commonSF-Alloc</i> , through the subframe identified by <i>sf-AllocEnd</i> of the $n^{\text{th}}$ listed (P)MCH. Value 0 corresponds with the first subframe defined by field <i>commonSF-Alloc</i> .

### 6.3.7a SC-PTM information elements

- **SC-MTCH-InfoList**

The IE *SC-MTCH-InfoList* provides the list of ongoing MBMS sessions transmitted via SC-MRB and for each MBMS session, the associated G-RNTI and scheduling information.

#### **SC-MTCH-InfoList information element**

```
-- ASN1START

SC-MTCH-InfoList-r13 ::= SEQUENCE (SIZE (0..maxSC-MTCH-r13)) OF SC-MTCH-Info-r13

#### ***SC-MTCH-InfoList* field descriptions**

***drx-InactivityTimerSCPTM***

Timer for SC-MTCH in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf0 corresponds to 0 PDCCH sub-frame and behaviour as specified in 7.3.2 applies, psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.

***g-RNTI***

G-RNTI used to scramble the scheduling and transmission of a SC-MTCH.

***mbmsSessionInfo***

Indicates the ongoing MBMS session in a SC-MTCH.

***onDurationTimerSCPTM***

Timer for SC-MTCH reception in TS 36.321 [6]. Value in number of PDCCH sub-frames. Value psf1 corresponds to 1 PDCCH sub-frame, psf2 corresponds to 2 PDCCH sub-frames and so on.

***p-a***

Parameter:  $P_A''$ , for the SC-MTCH per G-RNTI, see TS 36.213 [23], clause 5.2. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.

***schedulingPeriodStartOffsetSCPTM***

*SCPTM-SchedulingCycle* and *SCPTM-SchedulingOffset* in TS 36.321 [6]. The value of *SCPTM-SchedulingCycle* is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. The value of *SCPTM-SchedulingOffset* is in number of sub-frames. The E-UTRAN does not configure a maximum value 2048 for sf2048, 4096 for sf4096 or 8192 for sf8192.

***sc-mtch-neighbourCell***

Indicates neighbour cells which also provide this service on SC-MTCH. The first bit is set to 1 if the service is provided on SC-MTCH in the first cell in *scptmNeighbourCellList*, otherwise it is set to 0. The second bit is set to 1 if the service is provided on SC-MTCH in the second cell in *scptmNeighbourCellList*, and so on. If this field is absent, the UE shall assume that this service is not available on SC-MTCH in any neighbour cell.

***sc-mtch-schedulingInfo***

DRX information for the SC-MTCH. If this field is absent, the SC-MTCH may be scheduled in any subframe.

#### — ***SC-MTCH-InfoList-BR***

The IE *SC-MTCH-InfoList-BR* provides the list of ongoing MBMS sessions transmitted via SC-MRB and for each MBMS session, the associated G-RNTI and scheduling information.

#### ***SC-MTCH-InfoList-BR* information element**

<b>SC-MTCH-InfoList-BR field descriptions</b>	
<b>drx-InactivityTimerSCPTM</b>	Timer for SC-MTCH in TS 36.321 [6]. Value in number of MPDCCH sub-frames. Value psf0 corresponds to 0 MPDCCH sub-frame and behaviour as specified in 7.3.2 applies, psf1 corresponds to 1 MPDCCH sub-frame, psf2 corresponds to 2 MPDCCH sub-frames and so on.
<b>g-RNTI</b>	G-RNTI used to scramble the scheduling and transmission of a SC-MTCH
<b>mbmsSessionInfo</b>	Indicates the ongoing MBMS session in a SC-MTCH.
<b>mpdcch-Narrowband-SC-MTCH</b>	Narrowband for MPDCCH for SC-MTCH, see TS 36.213 [23].
<b>mpdcch-NumRepetitions-SC-MTCH</b>	The maximum number of MPDCCH repetitions the UE needs to monitor for SC-MTCH, see TS 36.213 [23].
<b>mpdcch-Offset-SC-MTCH</b>	Fractional period offset of starting subframes for MPDCCH search space for SC-MTCH, see TS 36.213 [23].
<b>mpdcch-PDSCH-CEmodeConfig-SC-MTCH</b>	Coverage enhancement mode configuration for MPDCCH/PDSCH for SC-MTCH, see TS 36.213 [23].
<b>mpdcch-PDSCH-HoppingConfig-SC-MTCH</b>	Frequency hopping configuration for MPDCCH/PDSCH for SC-MTCH, see TS 36.213 [23].
<b>mpdcch-PDSCH-MaxBandwidth-SC-MTCH</b>	Maximum PDSCH channel bandwidth for SC-MTCH, see TS 36.213 [23]. Value bw1dot4 corresponds to 1.4 MHz channel bandwidth and value bw5 corresponds to 5 MHz channel bandwidth. Corresponding maximum TBS are specified in TS 36.213 [23], clause 7.1.7.2.
<b>mpdcch-StartSF-SC-MTCH</b>	Starting subframes configuration of the MPDCCH search space for SC-MTCH, see TS 36.213 [23].
<b>onDurationTimerSCPTM</b>	Timer for SC-MTCH reception in TS 36.321 [6]. Value in number of MPDCCH sub-frames. Value psf300 corresponds to 300 MPDCCH sub-frames, psf400 corresponds to 400 MPDCCH sub-frames and so on.
<b>schedulingPeriodStartOffsetSCPTM</b>	SCPTM-SchedulingCycle and SCPTM-SchedulingOffset in TS 36.321 [6]. The value of SCPTM-SchedulingCycle is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. The value of SCPTM-SchedulingOffset is in number of sub-frames.
<b>sc-mtch-CarrierFreq</b>	Downlink carrier used for multicast SC-MTCH transmissions.
<b>sc-mtch-neighbourCell</b>	Indicates neighbour cells which also provide this service on SC-MTCH. The first bit is set to 1 if the service is provided on SC-MTCH in the first cell in scptmNeighbourCellList, otherwise it is set to 0. The second bit is set to 1 if the service is provided on SC-MTCH in the second cell in scptmNeighbourCellList, and so on. If this field is absent, the UE shall assume that this service is not available on SC-MTCH in any neighbour cell.
<b>sc-mtch-schedulingInfo</b>	DRX information for the SC-MTCH. If this field is absent, DRX is not used for SC-MTCH reception.
<b>p-a</b>	Parameter: $P_A''$ for the SC-MTCH per G-RNTI, see TS 36.213 [23], clause 5.2. Value dB-6 corresponds to -6 dB, dB-4dot77 corresponds to -4.77 dB etc.

### — SCPTM-NeighbourCellList

The IE SCPTM-NeighbourCellList indicates a list of neighbour cells where ongoing MBMS sessions provided via SC-MRB in the current cells are also provided.

```
-- ASN1START
SCPTM-NeighbourCellList-r13 ::= SEQUENCE (SIZE (1..maxNeighCell-SCPTM-r13)) OF PCI-ARFCN-r13
PCI-ARFCN-r13 ::= SEQUENCE {
 physCellId-r13
 carrierFreq-r13
}
OPTIONAL
} -- ASN1STOP
```

<b>SCPTM-NeighbourCellList field description</b>
--------------------------------------------------

***carrierFreq***

Indicates the frequency of the neighbour cell indicated by *physCellId*. Absence of the IE means that the neighbour cell is on the same frequency as the current cell.

### 6.3.8 Sidelink information elements

- ***SL-AnchorCarrierFreqList-V2X***

The IE *SL-AnchorCarrierFreqList-V2X* specifies the SL V2X anchor frequencies i.e. frequencies that include inter-carrier resource configuration for V2X sidelink communication.

***SL-AnchorCarrierFreqList-V2X* information element**

```
-- ASN1START
SL-AnchorCarrierFreqList-V2X-r14 ::= SEQUENCE (SIZE (1..maxFreqV2X-r14)) OF ARFCN-ValueEUTRA-r9
-- ASN1STOP
```

- ***SL-CBR-CommonTxConfigList***

The IE *SL-CBR-CommonTxConfigList* indicates the list of PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number, CR limit) in *sl-CBR-PSSCH-TxConfigList*, and the list of CBR ranges in *cbr-RangeCommonConfigList*, to configure congestion control to the UE for V2X sidelink communication.

***SL-CBR-CommonTxConfigList* information element**

```
-- ASN1START
SL-CBR-CommonTxConfigList-r14 ::= SEQUENCE {
 cbr-RangeCommonConfigList-r14 SEQUENCE (SIZE (1..maxSL-V2X-CBRConfig-r14)) OF SL-CBR-Levels-
Config-r14,
 sl-CBR-PSSCH-TxConfigList-r14 SEQUENCE (SIZE (1..maxSL-V2X-TxConfig-r14)) OF SL-CBR-PSSCH-
TxConfig-r14
}

SL-CBR-Levels-Config-r14 ::= SEQUENCE (SIZE (1..maxCBR-Level-r14)) OF SL-CBR-r14

SL-CBR-PSSCH-TxConfig-r14 ::= SEQUENCE {
 cr-Limit-r14
 tx-Parameters-r14
}
 INTEGER(0..10000),
 SL-PSSCH-TxParameters-r14

SL-CBR-r14 ::= INTEGER(0..100)

-- ASN1STOP
```

<b><i>SL-CBR-CommonTxConfigList</i></b> field descriptions	
<b><i>cbr-RangeCommonConfigList</i></b>	Indicates the list of CBR ranges. Each entry of the list indicates in <i>SL-CBR-Levels-Config</i> the upper bound of the CBR range for the respective entry. The upper bounds of the CBR ranges are configured in ascending order for consecutive entries of <i>cbr-RangeCommonConfigList</i> . For the first entry of <i>cbr-RangeCommonConfigList</i> the lower bound of the CBR range is 0.
<b><i>cr-Limit</i></b>	Indicates the maximum limit on the occupancy ratio. Value 0 corresponds to 0, value 1 to 0.0001, value 2 to 0.0002, and so on (i.e. in steps of 0.0001) until value 10000, which corresponds to 1.
<b><i>sl-CBR-PSSCH-TxConfigList</i></b>	Indicates the list of available PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number and CR limit) configurations.
<b><i>SL-CBR</i></b>	Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on.
<b><i>tx-Parameters</i></b>	Indicates PSSCH transmission parameters.

### — ***SL-CBR-PPPP-TxConfigList***

The IE *SL-CBR-PPPP-TxConfigList* indicates the mapping between PSSCH transmission parameter (such as MCS, PRB number, retransmission number, CR limit) sets by using the indexes of the configurations provided in *sl-CBR-PSSCH-TxConfigList*, CBR ranges by an index to the entry of the CBR range configuration in *cbr-RangeCommonConfigList*, and PPPP ranges. It also indicates the default PSSCH transmission parameters to be used when CBR measurement results are not available.

#### ***SL-CBR-PPPP-TxConfigList*** information element

```
-- ASN1START

SL-CBR-PPPP-TxConfigList-r14 ::= SEQUENCE (SIZE (1..8)) OF SL-PPPP-TxConfigIndex-r14

SL-PPPP-TxConfigIndex-r14 ::= SEQUENCE {
 priorityThreshold-r14,
 defaultTxConfigIndex-r14,
 cbr-ConfigIndex-r14,
 tx-ConfigIndexList-r14
}

Tx-ConfigIndex-r14 ::= INTEGER(0..maxSL-V2X-TxConfig-1-r14)

SL-CBR-PPPP-TxConfigList-v1530 ::= SEQUENCE (SIZE (1..8)) OF SL-PPPP-TxConfigIndex-v1530

SL-PPPP-TxConfigIndex-v1530 ::= SEQUENCE {
 mcs-PSSCH-RangeList-r15
 OPTIONAL
}
--Need OR

MCS-PSSCH-Range-r15 ::= SEQUENCE{
 minMCS-PSSCH-r15
 INTEGER (0..31),
 maxMCS-PSSCH-r15
 INTEGER (0..31)
}

SL-CBR-PPPP-TxConfigList-r15 ::= SEQUENCE (SIZE (1..8)) OF SL-PPPP-TxConfigIndex-r15

SL-PPPP-TxConfigIndex-r15 ::= SEQUENCE {
 priorityThreshold-r15,
 defaultTxConfigIndex-r15,
 cbr-ConfigIndex-r15,
 tx-ConfigIndexList-r15
 mcs-PSSCH-RangeList-r15
}
--SEQUENCE (SIZE (1..maxCBR-Level-r14)) OF Tx-ConfigIndex-r14,
--SEQUENCE (SIZE (1..maxCBR-Level-r14)) OF MCS-PSSCH-Range-r15

}

-- ASN1STOP
```

<b><i>SL-CBR-PPPP-TxConfigList</i></b> field descriptions	
<b><i>cbr-ConfigIndex</i></b>	Indicates the CBR ranges to be used by an index to the entry of the CBR range configuration in <i>cbr-RangeCommonConfigList</i> .
<b><i>defaultTxConfigIndex</i></b>	Indicates the PSSCH transmission parameters to be used by the UEs which do not have available CBR measurement results, by means of an index to the corresponding entry in <i>tx-ConfigIndexList</i> . Value 0 indicates the first entry in <i>tx-ConfigIndexList</i> . The field is ignored if the UE has available CBR measurement results.
<b><i>mcs-PSSCH-RangeList</i></b>	If included, this field applies to the PPPP(s) indicated by the <i>priorityThreshold</i> and each entry in this field sequentially corresponds to each CBR range indicated by <i>cbr-ConfigIndex</i> .
<b><i>minMCS-PSSCH, maxMCS-PSSCH</i></b>	Indicates the minimum and maximum MCS values which correspond to both the MCS table in Table 8.6.1-1 and Table 14.1.1-2 in TS 36.213 [23] used for transmission on PSSCH.
<b><i>priorityThreshold</i></b>	Indicates the upper bound of PPPP range which is associated with the configurations in <i>cbr-ConfigIndex</i> and in <i>tx-ConfigIndexList</i> . The upper bounds of the PPPP ranges are configured in ascending order for consecutive entries of <i>SL-PPPP-TxConfigIndex</i> in <i>SL-CBR-PPPP-TxConfigList</i> . For the first entry of <i>SL-PPPP-TxConfigIndex</i> , the lower bound of the PPPP range is 1.
<b><i>SL-CBR-PPPP-TxConfigList-v1530</i></b>	If included, E-UTRAN shall include the same number of entries, and listed in the same order, as in <i>SL-CBR-PPPP-TxConfigList-r14</i> .
<b><i>tx-ConfigIndexList</i></b>	Indicates the list of the PSSCH transmission parameters and CR limit by the indexes to the entries of the configurations in <i>sl-CBR-PSSCH-TxConfigList</i> . Each index in <i>tx-ConfigIndexList</i> sequentially maps to each CBR range indicated by <i>cbr-ConfigIndex</i> .

## — ***SL-CommConfig***

The IE *SL-CommConfig* specifies the dedicated configuration information for sidelink communication. In particular it concerns the transmission resource configuration for sidelink communication on the primary frequency.

### ***SL-CommConfig*** information element

```
-- ASN1START

SL-CommConfig-r12 ::= SEQUENCE {
 commTxResources-r12 CHOICE {
 release NULL,
 setup CHOICE {
 scheduled-r12 SEQUENCE {
 sl-RNTI-r12 C-RNTI,
 mac-MainConfig-r12 MAC-MainConfigSL-r12,
 sc-CommTxConfig-r12 SL-CommResourcePool-r12,
 mcs-r12 INTEGER (0..28) OPTIONAL -- Need OP

#### **SL-CommConfig field descriptions**

##### **commTxAllowRelayDedicated**

Indicates whether the UE is allowed to transmit relay related sidelink communication using the configured dedicated transmission resources i.e. either via scheduled or via UE selected resources.

##### **commTxPoolNormalDedicated**

Indicates a pool of transmission resources the UE is allowed to use while in RRC\_CONNECTED.

##### **logicalChGroupInfoList**

Indicates for each logical channel group the list of associated priorities, used as specified in TS 36.321 [6], in order of increasing logical channel group identity.

##### **mcs**

Indicates the MCS as defined in TS 36.212 [23], clause 14.2.1. If not configured, the selection of MCS is up to UE implementation.

##### **multipleTx**

Indicates whether the UE should perform multiple transmissions to different destinations in one SC period in accordance with TS 36.321 [6], clause 5.14.1.1. Value TRUE indicates that multiple transmissions should be performed.

##### **sc-CommTxConfig**

Indicates a pool of resources for SC when E-UTRAN schedules Tx resources (i.e. when indices included in DCI format 5 indicate the actual data resources to be used as specified in TS 36.212 [22], clause 5.3.3.1.9).

##### **scheduled**

Indicates the configuration for the case E-UTRAN schedules the transmission resources based on sidelink specific BSR from the UE.

##### **ue-Selected**

Indicates the configuration for the case the UE selects the transmission resources from a pool of resources configured by E-UTRAN.

#### **SL-CommResourcePool**

The IE *SL-CommResourcePool* and *SL-CommResourcePoolV2X* specifies the configuration information for an individual pool of resources for sidelink communication and V2X sidelink communication respectively. The IE covers the configuration of both the sidelink control information and the data.

#### **SL-CommResourcePool information element**

<b><i>SL-CommResourcePool</i> field descriptions</b>	
<b><i>adjacencyPSCCH-PSSCH</i></b>	Indicates whether a UE shall always transmit PSCCH and PSSCH in adjacent RBs (indicated by TRUE) or in non-adjacent RBs (indicated by FALSE) (see TS 36.213 [23]).
<b><i>cbr-pssch-TxConfigList</i></b>	Indicates the mapping between PPPPs, CBR ranges by using indexes of the entry in <i>cbr-RangeCommonConfigList</i> , and PSSCH transmission parameters and CR limit by using indexes of the entry in <i>sl-CBR-PSSCH-TxConfigList</i> . If <i>SL-CommResourcePool/V2X</i> is included in <i>MobilityControlInfoV2X</i> , it refers to <i>cbr-MobilityTxConfigList</i> for <i>cbr-RangeCommonConfigList</i> and <i>sl-CBR-PSSCH-TxConfigList</i> . If <i>SL-CommResourcePool/V2X</i> is included in <i>SL-V2X-ConfigDedicated</i> , it refers to <i>cbr-DedicatedTxConfigList</i> for <i>cbr-RangeCommonConfigList</i> and <i>sl-CBR-PSSCH-TxConfigList</i> . Otherwise, it refers to <i>cbr-CommonTxConfigList</i> included in the <i>SystemInformationBlockType21</i> of the serving cell / PCell for <i>cbr-RangeCommonConfigList</i> and <i>sl-CBR-PSSCH-TxConfigList</i> .
<b><i>minT2Value</i></b>	Indicates the minimum value of T2 that applies to the PPPP(s), as specified in TS 36.300 [9], included in <i>priorityList</i> .
<b><i>numSubchannel</i></b>	indicates the number of subchannels in the corresponding resource pool (see TS 36.213 [23]).
<b><i>poolReportId</i></b>	The identity of the transmission resource pool used for CBR measurement reporting, which is corresponding to the <i>poolIdentity</i> reported in <i>measResultListCBR</i> . This field is only present in the transmission pools configured in <i>RRCCollectionReconfiguration</i> and <i>v2x-CommTxPoolExceptional</i> , <i>p2x-CommTxPoolNormalCommon</i> , <i>v2x-CommTxPoolNormalCommon</i> , <i>v2x-CommTxPoolNormal</i> in <i>SystemInformationBlockType21</i> or <i>SystemInformationBlockType26</i> . Otherwise, the field is absent.
<b><i>resourceSelectionConfigP2X</i></b>	Indicates the allowed resource selection mechanism(s), i.e. partial sensing and/or random selection, for P2X related V2X sidelink communication.
<b><i>restrictResourceReservationPeriod</i></b>	If configured, the field <i>restrictResourceReservationPeriod</i> configured in <i>v2x-ResourceSelectionConfig</i> shall be ignored for transmission on this pool.
<b><i>sc-Period</i></b>	Indicates the period over which resources are allocated in a cell for SC and over which scheduled and UE selected data transmissions occur, see PSCCH period in TS 36.213 [23]. Value in number of subframes. Value sf40 corresponds to 40 subframes, sf80 corresponds to 80 subframes and so on. E-UTRAN configures values sf40, sf80, sf160 and sf320 for FDD and for TDD config 1 to 5, values sf70, sf140 and sf280 for TDD config 0, and finally values sf60, sf120 and sf240 for TDD config 6.
<b><i>sizeSubchannel</i></b>	Indicates the number of PRBs of each subchannel in the corresponding resource pool (see TS 36.213 [23]). The value n5 denotes 5 PRBs; n6 denotes 6 PRBs and so on. E-UTRAN configures values n5, n6, n10, n15, n20, n25, n50, n75 and n100 in the case of <i>adjacencyPSCCH-PSSCH</i> set to TRUE; otherwise, E-UTRAN configures values n4, n5, n6, n8, n9, n10, n12, n15, n16, n18, n20, n30, n48, n72 and n96 in the case of <i>adjacencyPSCCH-PSSCH</i> set to FALSE,
<b><i>si-A2X-Service</i></b>	Presence of this field indicates the resource pool is dedicated for A2X service, i.e., not to be used for other than A2X service. Value <i>brid</i> indicates the resource pool is for BRID, value <i>daa</i> indicates the resource pool is for DAA, and value <i>bridAndDAA</i> indicates the resource pool is for both BRID and DAA. If this field is absent in all the configured resource pools, the UE may choose non-dedicated resource pool for A2X service.
<b><i>si-minT2ValueList</i></b>	Indicates a list of minimum value sets for the parameter T2 which is used for UE autonomous resource selection in this resource pool (see TS 36.213 [23]).
<b><i>si-OffsetIndicator</i></b>	Indicates the offset of the first subframe of a resource pool, i.e., the starting subframe of the repeating bitmap <i>sl-Subframe</i> , within a SFN cycle. If absent, the resource pool starts from first subframe of SFN=0. This field is not applicable to V2X sidelink communication.
<b><i>si-Subframe</i></b>	Indicates the bitmap of the resource pool, which is defined by repeating the bitmap within a SFN cycle (see TS 36.213 [23]).
<b><i>startRB-PSCCH-Pool</i></b>	Indicates the lowest RB index of the PSCCH pool (see TS 36.213 [23]). This field is absent when a pool is (pre)configured such that a UE always transmits SC and data in adjacent RBs in the same subframe.
<b><i>startRB-Subchannel</i></b>	Indicates the lowest RB index of the subchannel with the lowest index (see TS 36.213 [23]).
<b><i>syncAllowed</i></b>	Indicates the allowed synchronization reference(s) which is (are) allowed to use the configured resource pool.
<b><i>syncConfigIndex</i></b>	Indicates the synchronisation configuration that is associated with a reception pool, by means of an index to the corresponding entry of <i>commSyncConfig</i> in <i>SystemInformationBlockType18</i> for sidelink communication, or by means of an index to the corresponding entry of <i>v2x-SyncConfig</i> in <i>SystemInformationBlockType21</i> or <i>SystemInformationBlockType26</i> for V2X sidelink communication.

<b><i>SL-CommResourcePool</i> field descriptions</b>	
<b><i>adjacencyPSCCH-PSSCH</i></b>	Indicates whether a UE shall always transmit PSCCH and PSSCH in adjacent RBs (indicated by TRUE) or in non-adjacent RBs (indicated by FALSE) (see TS 36.213 [23]).
<b><i>tdd-Config</i></b>	TDD configuration associated with the reception pool of the cell indicated by <i>syncConfigIndex</i> . Absence of the field indicates that the duplex mode is FDD and no TDD specific physical channel configuration is applicable.
<b><i>threshS-RSSI-CBR</i></b>	Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the CBR measurement, as specified in TS 36.214 [48]. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value n to (-112 + n*2) dBm, and so on.
<b><i>trpt-Subset</i></b>	Indicates the subset of T-RPT available (see TS 36.213 [23], clause 14.1.1.1.1). Consists of a bitmap which is used to indicate the set of available 'k' values to be used for sidelink communication (see TS 36.213 [23], clause 14.1.1.3). If T-RPT subset configuration is not signaled/ preconfigured then UE assumes the whole T-RPT set is available.
<b><i>zoneID</i></b>	Indicates the zone ID for which the UE shall use this resource pool as described in 5.10.13.2. The field is absent in <i>v2x-CommTxPoolExceptional</i> , <i>p2x-CommTxPoolNormalCommon</i> , <i>p2x-CommTxPoolNormal</i> and <i>v2x-CommRxPool</i> in SIB21, in SIB26 or in <i>mobilityControlInfoV2X</i> .

<b>Conditional presence</b>	<b>Explanation</b>
A2X	The field is mandatory present when included in <i>sl-A2X-ConfigCommon</i> . Otherwise the field is optionally present, Need OP.
Tx	The field is mandatory present when included in <i>commTxPoolNormalDedicated</i> , <i>commTxPoolNormalDedicatedExt</i> , <i>commTxPoolNormalCommon</i> , <i>commTxPoolNormalCommonExt</i> , <i>commTxPoolExceptional</i> , <i>sc-CommTxConfig</i> , <i>v2x-CommTxPoolNormalCommon</i> , <i>v2x-CommTxPoolExceptional</i> , <i>v2x-CommTxPoolNormalDedicated</i> , <i>p2x-CommTxPoolNormalCommon</i> or <i>v2x-CommTxPoolNormal</i> and <i>p2x-CommTxPoolNormal</i> in <i>v2x-InterFreqInfoList</i> . Otherwise the field is not present.
P2X	The field is mandatory present when included in <i>p2x-CommTxPoolNormalCommon</i> , <i>v2x-CommTxPoolNormalDedicated</i> in <i>sl-V2X-ConfigDedicated</i> for P2X related V2X sidelink communication or <i>p2x-CommTxPoolNormal</i> in <i>v2x-InterFreqInfoList</i> . Otherwise the field is not present.

### – *SL-CommTxPoolSensingConfig*

The IE *SL-CommTxPoolSensingConfig* specifies V2X sidelink communication configurations used for UE autonomous resource selection.

#### ***SL-CommTxPoolSensingConfig* information element**

```
-- ASN1START
SL-CommTxPoolSensingConfig-r14 ::= SEQUENCE {

-- ASN1STOP
```

<b><i>SL-CommTxPoolSensingConfig</i> field descriptions</b>	
<b><i>gapCandidateSensing</i></b>	Indicates which subframe should be sensed when a certain subframe is considered as a candidate resource (see TS 36.213 [23]).
<b><i>minNumCandidateSF</i></b>	Indicates the minimum number of subframes that are included in the possible candidate resources.
<b><i>p2x-SensingConfig</i></b>	Indicates the sensing configuration for P2X related V2X sidelink communication transmission only.
<b><i>probResourceKeep</i></b>	Indicates the probability with which the UE keeps the current resource when the resource reselection counter reaches zero for sensing based UE autonomous resource selection (see TS 36.321 [6]).
<b><i>pssch-TxConfigList</i></b>	Indicates PSSCH TX parameters such as MCS, PRB number, retransmission number, associated to different UE absolute speeds and different synchronization reference types for UE autonomous resource selection (see TS 36.213 [23]).
<b><i>restrictResourceReservationPeriod</i></b>	Indicates which values are allowed for the signaling of the resource reservation period in PSCCH.
<b><i>sl-ReselectAfter</i></b>	Indicates the number of consecutive skipped transmissions before triggering resource reselection for V2X sidelink communication (see TS 36.321 [6]).
<b><i>thresPSSCH-RSRP-List</i></b>	Indicates a list of 64 thresholds, and the threshold should be selected based on the priority in the decoded SCI and the priority in the SCI to be transmitted (see TS 36.213 [23]). A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH RSRP in the associated data resource is above a threshold.

### – *SL-CP-Len*

The IE *SL-CP-Len* indicates the cyclic prefix length, see TS 36.211 [21].

### **SL-DiscConfig field descriptions**

#### **discCellSelectionInfo**

Parameters that may be used by the UE to select/ reselect a cell on the concerned non serving frequency. If absent, the UE acquires the information from the target cell on the concerned frequency. See TS 36.304 [4], clause 11.4.

#### **discSysInfoToReportConfig**

Indicates the request to start a *SidelinkUEInformation* procedure for reporting system information acquired during an inter-frequency discovery procedure.

#### **discTF-IndexList**

Indicates a list of time-frequency resource indices pair where each pair of indices corresponds to one discovery message. E-UTRAN only configures *discTF-IndexList-r12b* when configuring the UE with scheduled SL discovery Tx resources. When receiving *discTF-IndexList-r12b*, the UE shall only consider this field (and hence ignore *discTF-IndexList-r12*, if included or previously configured).

#### **discTxConfig**

Indicates the resources configuration used when E-UTRAN schedules Tx resources (i.e. the fields *discSF-Index* and *discPRB-Index* indicate the actual resources to be used).

#### **discTxInterFreqInfo**

Indicates frequency applicable for the resources indicated by *discTxResources-r12* (i.e. original resource field may cover first inter-frequency), and possibly resource allocations on additional frequencies as may be indicated by field *discTxInfoInterFreqListAdd*.

#### **discTxRefCarrierDedicated**

Indicates if the PCell or an SCell is to be used as reference for DL measurements and synchronization, instead of the DL frequency paired with the one used to transmit sidelink discovery announcements on, see TS 36.213 [23], clause 14.3.1.

#### **discTxResources**

Indicates the resources assigned to the UE for discovery announcements, which can either be a pool from which the UE may select or a set of resources specifically assigned for use by the UE.

#### **discTxResourcesPS**

Indicates the resources assigned to the UE for PS discovery announcements, which can either be a pool from which the UE may select or a set of resources specifically assigned for use by the UE.

#### **SL-TF-IndexPair**

A pair of indices, one for the time domain and one for the frequency domain, indicating the start of resources within the pool covered by *discTxConfig*, see TS 36.211 [21], clause 9.5.6 for one discovery message. The upper limits of *discSF-Index* and *discPRB-Index* are defined in TS 36.213 [23], clause 14.3.1.

## – *SL-DiscResourcePool*

The IE *SL-DiscResourcePool* specifies the configuration information for an individual pool of resources for sidelink discovery.

### ***SL-DiscResourcePool* information element**

 threshHigh-r12
}
-- ASN1STOP

```

### ***SL-DiscResourcePool field descriptions***

#### ***discPeriod***

Indicates the period over which resources are allocated in a cell for discovery message transmission/reception, see PSDCH period in TS 36.213 [23]. Value in number of radio frames. Value rf32 corresponds to 32 radio frames, rf64 corresponds to 64 radio frames and so on. The extended values apply for PS discovery (not only for sidelink relaying). When broadcasting an extended value, E-UTRAN sets the original field to spare to ensure legacy UEs ignore the concerned pool entry.

#### ***numRepetition***

Indicates the number of times *subframeBitmap* is repeated for mapping to subframes that occurs within a *discPeriod*. The highest value E-UTRAN uses is value 5 for FDD and TDD configuration 0, value 13 for TDD configuration 1, value 25 for TDD configuration 2, value 17 for TDD configuration 3, value 25 for TDD configuration 4, value 50 for TDD configuration 5 and value 7 for TDD configuration 6. E-UTRAN configures *numRepetition* and *subframeBitmap* such that the mapped subframes do not exceed the *discPeriod*.

#### ***poolSelection***

Indicates the mechanism for selecting a (transmission) pool when multiple candidates are provided. E-UTRAN configures the same value (i.e. a pool selection method) for all candidate pools within one pool list (*discTxPoolCommon* or *discTxPoolDedicated*) but the pool selection method in different pool lists may or may not be the same.

#### ***syncConfigIndex***

Indicates the synchronisation configuration that is associated with a reception or transmission pool, by means of an index to the corresponding entry of *discSyncConfig* in *SystemInformationBlockType19*.

#### ***threshLow, threshHigh***

Specifies the thresholds used to select a resource pool in RSRP based pool selection. The E-UTRAN should configure *threshLow* and *threshHigh* such that the UE selects only one resource pool upon RSRP based pool selection.

#### ***txProbability***

Indicates the probability of transmitting announcement in a discovery period when configured with a pool of resources, see TS 36.321 [6].

Conditional presence	Explanation
TDD-OR	The field is optional present for TDD, need OR; it is not present for FDD.
Tx	The field is mandatory present when included in <i>discTxPoolDedicated</i> or <i>discTxPoolCommon</i> . Otherwise the field is not present.

### ***SL-DiscSysInfoReport***

The IE *SL-DiscSysInfoReport* contains the parameters related to sidelink discovery acquired from system information of inter-frequency cells (including inter-PLMN).

### ***SL-DiscSysInfoReport* information element**

```

-- ASN1START
SL-DiscSysInfoReport-r13 ::= SEQUENCE {
 plmn-IdentityList-r13
 cellIdentity-13
 carrierFreqInfo-13
 discRxResources-r13
 discTxPoolCommon-r13
 discTxPowerInfo-r13

 discCellSelectionInfo-r13
 q-RxLevMin-r13
 q-RxLevMinOffset-r13
 }
 cellReselectionInfo-r13
 q-Hyst-r13
 q-RxLevMin-r13
}

```

```

 t-ReselectionEUTRA-r13 T-Reselection
 }
 tdd-Config-r13 TDD-Config
 freqInfo-r13 SEQUENCE {
 ul-CarrierFreq-r13 ARFCN-ValueEUTRA OPTIONAL,
 ul-Bandwidth-r13 ENUMERATED {n6, n15, n25, n50, n75, n100} OPTIONAL,
 additionalSpectrumEmission-r13 AdditionalSpectrumEmission OPTIONAL
 }
 p-Max-r13 P-Max OPTIONAL,
 referenceSignalPower-r13 INTEGER (-60..50) OPTIONAL,
 ...
 [
 freqInfo-v1370 SEQUENCE {
 additionalSpectrumEmission-v1370 AdditionalSpectrumEmission-v1010
 }
]
}

-- ASN1STOP

```

#### ***SL-DiscSysInfoReport* field descriptions**

##### ***carrierFreqInfo***

Indicates the frequency of the cell from which the UE acquired the system information relevant for discovery

##### ***cellIdentity***

Indicated the identity of the cell from which the UE acquired the system information relevant for discovery

##### ***plmn-IdentityList***

Indicates the list of PLMN identity of the cell from which the UE acquired the system information relevant for discovery

### ***SL-DiscTxPowerInfo***

The IE *SL-DiscTxPowerInfo* specifies power control parameters for one or more power classes.

#### ***SL-DiscTxPowerInfo* information element**

```

-- ASN1START

SL-DiscTxPowerInfoList-r12 ::= SEQUENCE (SIZE (maxSL-DiscPowerClass-r12)) OF SL-DiscTxPowerInfo-r12

SL-DiscTxPowerInfo-r12 ::= SEQUENCE {
 discMaxTxPower-r12 P-Max,
 ...
}

-- ASN1STOP

```

#### ***SL-DiscTxPowerInfo* field descriptions**

##### ***discMaxTxPower***

Indicates the P-Max parameter used to calculate the maximum transmit power a UE configured with the concerned range class, see TS 24.333 [70], clause 4.2.11. The first entry in *SL-DiscTxPowerInfoList* corresponds to UE range class 'short', the second entry corresponds to 'medium' and the third entry corresponds to 'long'.

### ***SL-GapConfig***

The IE *SL-GapConfig* indicates the gaps, requested or assigned, to enable the UE to receive or transmit sidelink discovery, intra or inter frequency (includings inter-PLMN).

#### ***SL-GapConfig* information element**

```

-- ASN1START

SL-GapConfig-r13 ::= SEQUENCE {
 gapPatternList-r13
}

SL-GapPatternList-r13 ::= SEQUENCE (SIZE (1..maxSL-GP-r13)) OF SL-GapPattern-r13

```

```

SL-GapPattern-r13 ::= SEQUENCE {
 gapPeriod-r13 ENUMERATED {sf40, sf60, sf70, sf80, sf120, sf140, sf160,
 sf240, sf280, sf320, sf640, sf1280, sf2560, sf5120,
 sf10240},
 gapOffset-r12 SL-OffsetIndicator-r12,
 gapSubframeBitmap-r13 BIT STRING (SIZE (1..10240)),
 ...
}

-- ASN1STOP

```

### ***SL-GapConfig* field descriptions**

#### ***gapOffset***

Indicates the offset from the start of SFN 0 to the start of the first *gapPeriod*. If the SFN period is not an integer multiple of *gapPeriod*, no subframes within this period (i.e. from SFN 0 to offset) are considered part of the gap.

#### ***gapPeriod***

Indicates the period by which *gapSubframeBitmap* is repeated.

#### ***gapSubframeBitmap***

Indicates the subframes of one or more individual gaps, not only covering the subframes of the associated discovery resources but also including e.g. re-tuning and synchronisation delays. The UE and E-UTRAN signal bit strings of valid sizes only i.e. sizes equal to or less than *gapPeriod*. Value 1 indicates that the UE is allowed to use the subframe for sidelink discovery.

## — ***SL-GapRequest***

The IE *SL-GapRequest* indicates the gaps requested by the UE to receive or transmit sidelink discovery, intra or inter frequency (includings inter-PLMN).

### ***SL-GapRequest* information element**

```

-- ASN1START

SL-GapRequest-r13 ::= SEQUENCE (SIZE (1..maxFreq)) OF SL-GapFreqInfo-r13

SL-GapFreqInfo-r13 ::= SEQUENCE {
 carrierFreq-r13 OPTIONAL,
 gapPatternList-r13 OPTIONAL,
}

-- ASN1STOP

```

## — ***SL-HoppingConfig***

The IE *SL-HoppingConfig* indicates the hopping configuration used for sidelink.

### ***SL-HoppingConfig* information element**

```

-- ASN1START

SL-HoppingConfigComm-r12 ::= SEQUENCE {
 hoppingParameter-r12 INTEGER (0..504),
 numSubbands-r12 ENUMERATED {ns1, ns2, ns4},
 rb-Offset-r12 INTEGER (0..110)
}

SL-HoppingConfigDisc-r12 ::= SEQUENCE {
 a-r12 INTEGER (1..200),
 b-r12 INTEGER (1..10),
 c-r12 ENUMERATED {n1, n5}
}

-- ASN1STOP

```

<b><i>SL-HoppingConfig</i> field descriptions</b>	
<b>a</b>	Per cell parameter: $N_{PSDCH}^{(1)}$ see TS 36.213 [23], clause 14.3.1.
<b>b</b>	Per UE parameter: $N_{PSDCH}^{(2)}$ see TS 36.213 [23], clause 14.3.1.
<b>c</b>	Per cell parameter: $N_{PSDCH}^{(3)}$ see TS 36.213 [23], clause 14.3.1.
<b><i>hoppingParameter</i></b>	Affects the hopping performed as specified in TS 36.213 [23], clauses 14.1.1.2 and 14.1.1.4. In case value 504 is received, the value used by the UE is 510.
<b><i>numSubbands</i></b>	Parameter: $N_{sb}$ see TS 36.211 [21], clause 9.3.6.
<b><i>rb-Offset</i></b>	Parameter: $N_{RB}^{HO}$ , see TS 36.211 [21], clause 9.3.6.

### — ***SL-InterFreqInfoListV2X***

The IE ***SL-InterFreqInfoListV2X*** indicates synchronization and resource allocation configurations of the neighboring frequency for V2X sidelink communication.

#### ***SL-InterFreqInfoListV2X* information element**

```
-- ASN1START
SL-InterFreqInfoListV2X-r14 ::= SEQUENCE (SIZE (0..maxFreqV2X-1-r14)) OF SL-InterFreqInfoV2X-r14

SL-InterFreqInfoV2X-r14 ::= SEQUENCE {
 plmn-IdentityList-r14 PLMN-IdentityList OPTIONAL, -- Need OP
 v2x-CommCarrierFreq-r14 ARFCN-ValueEUTRA-r9,
 sl-MaxTxPower-r14 P-Max OPTIONAL, -- Need OR
 sl-Bandwidth-r14 ENUMERATED {n6, n15, n25, n50, n75, n100} OPTIONAL, --
Need OR
 v2x-SchedulingPool-r14 SL-CommResourcePoolV2X-r14 OPTIONAL, -- Need
OR
 v2x-UE-ConfigList-r14 SL-V2X-UE-ConfigList-r14 OPTIONAL, -- Need OR
 ...
 [[additionalSpectrumEmissionV2X-r14 CHOICE {
 additionalSpectrumEmission-r14 AdditionalSpectrumEmission,
 additionalSpectrumEmission-v1440 AdditionalSpectrumEmission-v1010
 } OPTIONAL -- Need ON
]], [
 [v2x-FreqSelectionConfigList-r15 SL-V2X-FreqSelectionConfigList-r15 OPTIONAL --Need OR
]
}

-- ASN1STOP
```

SL-InterFreqInfoListV2X field descriptions	
<b>plmn-IdentityList</b>	Indicates PLMN identities of this frequency for reception of V2X sidelink communication. If this field is not present, the UE considers this frequency for reception of V2X sidelink communication concerns the first PLMN entry in the <i>plmn-IdentityList</i> in <i>SystemInformationBlockType1</i> .
<b>sl-MaxTxPower</b>	Indicates the maximum transmission power for transmitting V2X sidelink communication on the corresponding frequency.
<b>additionalSpectrumEmissionV2X</b>	Indicates the <i>additionalSpectrumEmission</i> value defined in TS 36.101 [42], clause 6.2.4, for V2X sidelink communication.
<b>v2x-FreqSelectionConfigList</b>	Indicates the configuration information for the carrier selection for V2X sidelink communication transmission. The configuration applies to the carrier frequency identified by <i>v2x-CommCarrierFreq</i> (i.e. carrier specific configuration).
<b>v2x-SchedulingPool</b>	Indicates the resource pool for inter-carrier scheduled resource allocation. This field is configured in RRC dedicated signalling only when <i>scheduled</i> is configured in IE <i>SL-V2X-ConfigDedicated</i> .
<b>v2x-UE-ConfigList</b>	Indicates the inter-carrier resource configuration. If there is only one entry in the list without <i>physCellId</i> configured, the configuration is applied to the frequency identified by <i>v2x-CommCarrierFreq</i> (i.e. carrier specific configuration); if the entry of this field includes <i>physCellIdList</i> , the configuration is applied to the cell(s) identified by <i>physCellIdList</i> (i.e. cell specific configuration).

### *SL-NR-AnchorCarrierFreqList*

The IE *SL-NR-AnchorCarrierFreqList* specifies the NR anchor frequencies i.e. frequencies that include inter-carrier resource configuration for V2X sidelink communication.

### ***SL-NR-AnchorCarrierFreqList* information element**

```
-- ASN1START

SL-NR-AnchorCarrierFreqList-r16 ::= SEQUENCE (SIZE (1..maxFreqSL-NR-r16)) OF ARFCN-ValueNR-r15

-- ASN1STOP
```

## SL-V2X-UE-ConfigList

The IE *SL-V2X-UE-ConfigList* indicates inter-frequency resource configuration per-carrier or per-cell.

## **SL-V2X-UE-ConfigList information element**

```

-- ASN1START

SL-V2X-UE-ConfigList-r14 ::= SEQUENCE (SIZE (1.. maxCellIntra)) OF SL-V2X-InterFreqUE-Config-r14

SL-V2X-InterFreqUE-Config-r14 ::= SEQUENCE {
 physCellIdList-r14 OPTIONAL, -- Need OR
 typeTxSync-r14 OPTIONAL, -- Need OR
 v2x-SyncConfig-r14 OPTIONAL, -- Need OR
 v2x-CommRxPool-r14 OPTIONAL, -- Need OR
 OR
 v2x-CommTxPoolNormal-r14 SL-CommTxPoolListV2X-r14 OPTIONAL, --
 Need OR
 p2x-CommTxPoolNormal-r14 SL-CommTxPoolListV2X-r14 OPTIONAL, --
 Need OR
 v2x-CommTxPoolExceptional-r14 SL-CommResourcePoolV2X-r14 OPTIONAL, -- Need OR
 v2x-ResourceSelectionConfig-r14 SL-CommTxPoolSensingConfig-r14 OPTIONAL, -- Need OR
 zoneConfig-r14 SL-ZoneConfig-r14 OPTIONAL, -- Need OR
 offsetDFN-r14 INTEGER (0..1000) OPTIONAL, -- Need OR
 ...
}

-- ASN1STOP

```

<b><i>SL-V2X-UE-ConfigList</i> field descriptions</b>	
<b><i>offsetDFN</i></b>	Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 0 corresponds to 0 milliseconds, value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on.
<b><i>p2x-CommTxPoolNormal</i></b>	Indicates the resources on a carrier frequency by which the UE may transmit P2X related V2X sidelink communication.
<b><i>physCellIdList</i></b>	If configured, the resource configuration is applicable for the cell(s) identified by this field. Otherwise, the resource configuration is for a given carrier frequency.
<b><i>typeTxSync</i></b>	Indicates the prioritized synchronization type (i.e. eNB or GNSS) for performing V2X sidelink communication on a carrier frequency.
<b><i>v2x-CommRxPool</i></b>	Indicates the resources on a carrier frequency by which the UE may receive V2X sidelink communication. This field is absent within <i>v2x-InterFreqInfoList</i> included in <i>RRCConnectionReconfiguration</i> except if received with <i>MobilityControlInfo</i> or <i>MobilityControlInfoV2X</i> .
<b><i>v2x-CommTxPoolExceptional</i></b>	Indicates the resources on a carrier frequency by which the UE may transmit V2X sidelink communication in exceptional conditions, as specified in 5.10.13.
<b><i>v2x-CommTxPoolNormal</i></b>	Indicates the resources on a carrier frequency by which the UE may transmit V2X sidelink communication.
<b><i>v2x-SyncConfig</i></b>	Indicates the synchronization configuration used for transmission/reception of SLSS on the given frequency.

## — ***SL-OffsetIndicator***

The IE *SL-OffsetIndicator* indicates the offset of the pool of resources relative to SFN 0 of the cell from which it was obtained or, when out of coverage, relative to DFN 0.

### ***SL-OffsetIndicator* information element**

```
-- ASN1START
SL-OffsetIndicator-r12 ::= CHOICE {
 small-r12 INTEGER (0..319),
 large-r12 INTEGER (0..10239)
}
SL-OffsetIndicatorSync-r12 ::= INTEGER (0..39)
SL-OffsetIndicatorSync-v1430 ::= INTEGER (40..159)
SL-OffsetIndicatorSync-r14 ::= INTEGER (0..159)
-- ASN1STOP
```

<b><i>SL-OffsetIndicator</i> field descriptions</b>	
<b><i>SL-OffsetIndicator</i></b>	In <i>sc-TF-ResourceConfig</i> , it indicates the offset of the first period of pool of resources within a SFN cycle. For <i>data-TF-ResourceConfig</i> , it corresponds to the <i>offsetIndicator</i> as defined in TS 36.213 [23], clause 14.1.3.
<b><i>SL-OffsetIndicatorSync</i></b>	For sidelink discovery and sidelink communication, synchronisation resources are present in those SFN and subframes which satisfy the relation: $(\text{SFN} \times 10 + \text{Subframe Number}) \bmod 40 = \text{SL-OffsetIndicatorSync}$ . For V2X sidelink communication, synchronisation resources are present in those SFN and subframes which satisfy the relation: $(\text{SFN} \times 10 + \text{Subframe Number}) \bmod 160 = \text{SL-OffsetIndicatorSync}$ .

## – *SL-P2X-ResourceSelectionConfig*

The IE *SL-P2X-ResourceSelectionConfig* includes the configuration of resource selection for P2X related V2X sidelink communication. E-UTRAN configures at least one resource selection mechanism.

### ***SL-P2X-ResourceSelectionConfig* information element**

```
-- ASN1START
SL-P2X-ResourceSelectionConfig-r14 ::= SEQUENCE {
 partialSensing-r14 ENUMERATED {true} OPTIONAL, -- Need OR
 randomSelection-r14 ENUMERATED {true} OPTIONAL, -- Need OR
}
-- ASN1STOP
```

#### ***SL-P2X-ResourceSelectionConfig* field descriptions**

##### ***partialSensing***

Indicates that partial sensing is allowed for UE autonomous resource selection in a resource pool.

##### ***randomSelection***

Indicates that random selection is allowed for UE autonomous resource selection in a resource pool.

## – *SL-PeriodComm*

The IE *SL-PeriodComm* indicates the period over which resources allocated in a cell for sidelink communication.

### ***SL-PeriodComm* information element**

```
-- ASN1START
SL-PeriodComm-r12 ::= ENUMERATED {sf40, sf60, sf70, sf80, sf120, sf140,
 sf160, sf240, sf280, sf320, spare6, spare5,
 spare4, spare3, spare2, spare}
-- ASN1STOP
```

## – *SL-Priority*

The IE *SL-Priority* indicates the one or more priorities of resource pool used for sidelink communication, or of a logical channel group used in case of scheduled sidelink communication resources, see TS 36.321 [6].

### ***SL-Priority* information element**

```
-- ASN1START
SL-PriorityList-r13 ::= SEQUENCE (SIZE (1..maxSL-Prio-r13)) OF SL-Priority-r13
SL-Priority-r13 ::= INTEGER (1..8)
-- ASN1STOP
```

## – *SL-PSSCH-TxConfigList*

The IE *SL-PSSCH-TxConfigList* indicates PSSCH transmission parameters. When lower layers select parameters from the range indicated in IE *SL-PSSCH-TxConfigList*, the UE considers both configurations in IE *SL-PSSCH-TxConfigList* and the CBR-dependent configurations represented in IE *SL-CBR-PPPP-TxConfigList*. Only one IE *SL-PSSCH-TxConfig* is provided per *typeTxSync*.

### ***SL-PSSCH-TxConfigList* information element**

```
-- ASN1START
SL-PSSCH-TxConfigList-r14 ::= SEQUENCE (SIZE (1..maxPSSCH-TxConfig-r14)) OF SL-PSSCH-TxConfig-r14
```

```

SL-PSSCH-TxConfig-r14 ::= SEQUENCE {
 typeTxSync-r14 OPTIONAL, -- Need OR
 thresUE-Speed-r14 ENUMERATED {kmpf60, kmpf80, kmpf100, kmpf120,
 kmpf140, kmpf160, kmpf180, kmpf200},
 parametersAboveThres-r14 SL-PSSCH-TxParameters-r14,
 parametersBelowThres-r14 SL-PSSCH-TxParameters-r14,
 ...
 [[parametersAboveThres-v1530 SL-PSSCH-TxParameters-v1530 OPTIONAL, -- Need OR
 parametersBelowThres-v1530 SL-PSSCH-TxParameters-v1530 OPTIONAL, -- Need OR
]]
}

SL-PSSCH-TxParameters-r14 ::= SEQUENCE {
 minMCS-PSSCH-r14 INTEGER (0..31),
 maxMCS-PSSCH-r14 INTEGER (0..31),
 minSubChannel-NumberPSSCH-r14 INTEGER (1..20),
 maxSubchannel-NumberPSSCH-r14 INTEGER (1..20),
 allowedRetxNumberPSSCH-r14 ENUMERATED {n0, n1, both, spare1},
 maxTxPower-r14 SL-TxPower-r14 OPTIONAL
 -- Cond CBR
}
}

SL-PSSCH-TxParameters-v1530 ::= SEQUENCE {
 minMCS-PSSCH-r15 INTEGER (0..31),
 maxMCS-PSSCH-r15 INTEGER (0..31)
}

-- ASN1STOP

```

#### ***SL-PSSCH-TxConfigList* field descriptions**

***allowedRetxNumberPSSCH***

Indicates the allowed retransmission number for transmissions on PSSCH (see TS 36.213 [23]). The value n0 indicates no retransmission for a transport block allowed; the value n1 indicates that the UE shall perform one retransmission for a transport block; and the value both indicates that the UE may autonomously select no retransmission or one retransmission for a transport block.

***maxTxPower***

Indicates the maximum transmission power for transmission on PSSCH and PSCCH (see TS 36.213 [23]).

***minMCS-PSSCH, maxMCS-PSSCH***

Indicates the minimum and maximum MCS values used for transmissions on PSSCH (see TS 36.213 [23]). If included, *minMCS-PSSCH-r14* and *maxMCS-PSSCH-r14* correspond to the MCS table in Table 8.6.1-1 with 64QAM indices overridden by 16QAM used for transmission on PSSCH. If included, *minMCS-PSSCH-r15* and *maxMCS-PSSCH-r15* correspond to both the MCS table in Table 8.6.1-1 and Table 14.1.1-2 in TS 36.213 [23] used for transmission on PSSCH.

***minSubchannel-NumberPSSCH, maxSubchannel-NumberPSSCH***

Indicates the minimum and maximum number of sub-channels which may be used for transmissions on PSSCH (see TS 36.213 [23]).

***thresUE-Speed***

Indicates a UE speed threshold.

***typeTxSync***

Indicates the synchronization reference type (see TS 36.213 [23]). For configurations by the eNB, only *gnss* and *enb* can be configured; and for pre-configuration, only *gnss* and *ue* can be configured. If the field is absent, the configuration is applicable for all synchronization reference types.

***parametersAboveThres***

Indicates TX parameters for the UE speed above *thresUE-Speed*.

***parametersBelowThres***

Indicates TX parameters for the UE speed below *thresUE-Speed*.

Conditional presence	Explanation
<i>CBR</i>	The field is optionally present, need OR, in IE <i>SL-CBR-CommonTxConfigList-r14</i> , or in IE <i>SL-CBR-PreconfigTxConfigList-r14</i> . Otherwise the field is not present. Need OR.

#### *SL-Reliability*

The IE *SL-Reliability* indicates one or more reliabilities of a logical channel group used in case of scheduled sidelink communication resources or traffic reliability(ies) associated with the reported traffic pattern for V2X sidelink communication; see TS 36.321 [6].

### **SL-Reliability information element**

```
-- ASN1START
SL-ReliabilityList-r15 ::= SEQUENCE (SIZE (1..maxSL-Reliability-r15)) OF SL-Reliability-r15
SL-Reliability-r15 ::= INTEGER (1..8)
-- ASN1STOP
```

### **SL-RestrictResourceReservationPeriodList**

The IE *SL-RestrictResourceReservationPeriodList* indicates which values are allowed for the signaling of the resource reservation period in PSCCH for V2X sidelink communication, see TS 36.321 [6].

### **SL-RestrictResourceReservationPeriodList information element**

```
-- ASN1START
SL-RestrictResourceReservationPeriodList-r14 ::= SEQUENCE (SIZE (1..maxReservationPeriod-r14)) OF
SL-RestrictResourceReservationPeriod-r14
SL-RestrictResourceReservationPeriod-r14 ::= ENUMERATED {v0dot2, v0dot5, v1, v2, v3, v4, v5,
v6, v7, v8, v9, v10, spare4,spare3, spare2, spare1}
-- ASN1STOP
```

#### **SL-RestrictResourceReservationPeriodList field descriptions**

##### **SL-RestrictResourceReservationPeriod**

Value *v0dot2* means *SL-RestrictResourceReservationPeriod* is set to 0.2, value *v0dot5* means *SL-RestrictResourceReservationPeriod* is set to 0.5, value *v1* means *SL-RestrictResourceReservationPeriod* is set to 1, and so on. Value *v0dot2* and value *v0dot5* are configured in a pool-specific manner only. E-UTRAN should not set value *v0dot2* and *v0dot5* for transmission pool for P2X related V2X sidelink communication.

### **SLSSID**

The IE *SLSSID* identifies a cell and is used by the receiving UE to detect asynchronous neighbouring cells, and by transmitting UEs to extend the synchronisation signals beyond the cell's coverage area.

### **SLSSID information element**

```
-- ASN1START
SLSSID-r12 ::= INTEGER (0..167)
-- ASN1STOP
```

### **SL-SyncAllowed**

The IE *SL-SyncAllowed* indicates the allowed synchronization references for a transmission resource pool for V2X sidelink communication.

### **SL-SyncAllowed information element**

```
-- ASN1START
SL-SyncAllowed-r14 ::= SEQUENCE {
 gnss-Sync-r14 OPTIONAL, -- Need OR
 enb-Sync-r14 OPTIONAL, -- Need OR
 ue-Sync-r14 OPTIONAL, -- Need OR
}
-- ASN1STOP
```

<b><i>SL-SyncAllowed</i></b> field descriptions	
<b><i>enb-Sync</i></b>	If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to eNB (i.e., synchronized to a reference UE which is directly synchronized to eNB).
<b><i>gnss-Sync</i></b>	If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to GNSS (i.e. synchronized to a reference UE which is directly synchronized to GNSS).
<b><i>ue-Sync</i></b>	If configured, the (pre-) configured resources can be used if the UE is synchronized to a reference UE which is synchronized to neither GNSS nor eNB directly or indirectly.

## – ***SL-SyncConfig***

The IE ***SL-SyncConfig*** specifies the configuration information concerning reception of synchronisation signals from neighbouring cells as well as concerning the transmission of synchronisation signals for sidelink communication and sidelink discovery.

### ***SL-SyncConfig*** information element

```
-- ASN1START

SL-SyncConfigList-r12 ::= SEQUENCE (SIZE (1..maxSL-SyncConfig-r12)) OF SL-SyncConfig-r12
SL-SyncConfigListV2X-r14 ::= SEQUENCE (SIZE (1.. maxSL-V2X-SyncConfig-r14)) OF SL-SyncConfig-r12

SL-SyncConfig-r12 ::= SEQUENCE {

```

<b><i>SL-SyncConfig</i> field descriptions</b>	
<b><i>discSyncWindow</i></b>	Indicates the synchronization window over which the UE expects that SLSS or discovery resources indicated by the pool configuration (see TS 36.213 [23], clause 14.4). The value <i>w1</i> denotes 5 milliseconds. The value <i>w2</i> denotes the length corresponding to normal cyclic prefix divided by 2.
<b><i>gnss-Sync</i></b>	if configured, the synchronization configuration is used for SLSS transmission/reception when the UE is synchronized to GNSS, by using <i>slssid</i> =0 and ignoring <i>slssid-r12</i> configured. If not configured, the synchronization configuration is used for SLSS transmission/reception when the UE is synchronized to eNB, by using the configured <i>slssid-r12</i> .
<b><i>slss-TxDisabled</i></b>	Value TRUE indicates that the carrier, even though equipped with synchronisation resources, cannot be used as a synchronisation carrier frequency to transmit SLSS or PSBCH. This parameter cannot be included in <i>SystemInformationBlockType21</i> or <i>SystemInformationBlockType26</i> .
<b><i>syncCP-Len</i></b>	In case of V2X sidelink communications this field is always configured to <i>normal</i> .
<b><i>syncInfoReserved</i></b>	Reserved for future use.
<b><i>syncOffsetIndicator</i></b>	E-UTRAN should ensure <i>syncOffsetIndicator</i> is set to the same value as <i>syncOffsetIndicator1</i> or <i>syncOffsetIndicator2</i> in <i>preconfigSync</i> within <i>SL-Preconfiguration</i> , if configured. If <i>syncOffsetIndicator-v1430</i> is configured, the UE shall ignore the field <i>syncOffsetIndicator-r12</i> . E-UTRAN should ensure <i>syncOffsetIndicator</i> is set to the same value as <i>syncOffsetIndicator1</i> in <i>v2x-CommPreconfigSync</i> within <i>SL-V2X-Preconfiguration</i> , if configured. E-UTRAN should ensure <i>syncOffsetIndicator2</i> is set to the same value as <i>syncOffsetIndicator2</i> in <i>v2x-CommPreconfigSync</i> within <i>SL-V2X-Preconfiguration</i> , if configured. E-UTRAN should ensure <i>syncOffsetIndicator3</i> is set to the same value as <i>syncOffsetIndicator3</i> in <i>v2x-CommPreconfigSync</i> within <i>SL-V2X-Preconfiguration</i> , if configured. E-UTRAN should ensure all values in <i>syncOffsetIndicator</i> are same across all carrier frequencies configured for UEs performing V2X sidelink communication on multiple carrier frequencies. For <i>SL-V2X-Preconfiguration</i> , all values in <i>syncOffsetIndicator</i> should be same across all carrier frequencies configured for UEs performing V2X sidelink communication on multiple carrier frequencies.
<b><i>syncTxPeriodic</i></b>	Indicates whether in each discovery period in which UE transmits discovery, the UE transmits SLSS once or periodically (i.e. every 40ms). In the latter case (periodic) the UE also transmits the <i>MasterInformationBlock-SL</i> message alongside. E-UTRAN configures this field only for synchronisation configurations applicable for PS discovery.
<b><i>syncTxThreshIC</i></b>	Indicates the threshold used while in coverage. In case the RSRP measurement of the cell chosen for transmission of sidelink communication/ discovery announcements/ V2X sidelink communication, or of the cell used as reference for DL measurements and synchronization, is below the level indicated by this field, the UE may transmit SLSS (i.e. become synchronisation reference) when performing the corresponding sidelink transmission..
<b><i>txParameters</i></b>	Includes parameters relevant only for transmission. E-UTRAN includes the field in one entry per list, as included in <i>commSyncConfig</i> or <i>discSyncConfig</i> .

### – ***SL-TF-ResourceConfig***

The IE *SL-TF-ResourceConfig* specifies a set of time/ frequency resources used for sidelink.

#### ***SL-TF-ResourceConfig* information element**

```
-- ASN1START

SL-TF-ResourceConfig-r12 ::= SEQUENCE {
 prb-Num-r12 INTEGER (1..100),
 prb-Start-r12 INTEGER (0..99),
 prb-End-r12 INTEGER (0..99),
 offsetIndicator-r12 SL-OffsetIndicator-r12,
 subframeBitmap-r12 SubframeBitmapSL-r12
}

SubframeBitmapSL-r12 ::= CHOICE {
 bs4-r12 BIT STRING (SIZE (4)),
 bs8-r12 BIT STRING (SIZE (8)),
 bs12-r12 BIT STRING (SIZE (12)),
 bs16-r12 BIT STRING (SIZE (16)),
 bs30-r12 BIT STRING (SIZE (30)),
 bs40-r12 BIT STRING (SIZE (40)),
 bs42-r12 BIT STRING (SIZE (42))
}
```

```

SubframeBitmapSL-r14 ::= CHOICE {
 bs10-r14 BIT STRING (SIZE (10)),
 bs16-r14 BIT STRING (SIZE (16)),
 bs20-r14 BIT STRING (SIZE (20)),
 bs30-r14 BIT STRING (SIZE (30)),
 bs40-r14 BIT STRING (SIZE (40)),
 bs50-r14 BIT STRING (SIZE (50)),
 bs60-r14 BIT STRING (SIZE (60)),
 bs100-r14 BIT STRING (SIZE (100))
}

-- ASN1STOP

```

#### ***SL-TF-ResourceConfig* field descriptions**

***prb-Start, prb-End, prb-Num***

Sidelink transmissions on a sub-frame can occur on PRB with index greater than or equal to *prb-Start* and less than *prb-Start + prb-Num*, and on PRB with index greater than *prb-End - prb-Num* and less than or equal to *prb-End*. Even for neighbouring cells, *prb-Start* and *prb-End* are relative to PRB #0 of the cell from which it was obtained. See TS 36.213 [23], clauses 14.1.3, 14.2.3 and 14.3.3.

***subframeBitmap***

Indicates the subframe bitmap indicating resources used for sidelink. For sidelink communication, E-UTRAN configures value *bs40* for FDD and the following values for TDD: value *bs42* for configuration0, value *bs16* for configuration1, value *bs8* for configuration2, value *bs12* for configuration3, value *bs8* for configuration4, value *bs4* for configuration5 and value *bs30* for configuration6. For V2X sidelink communication, E-UTRAN configures value *bs16*, *bs20* or *bs100* for FDD or Frame Structure Type 1 as defined in TS 36.211 [21], and the following values for TDD or Frame Structure Type 2 as defined in TS 36.211 [21]: value *bs60* for configuration0, value *bs40* for configuration1, value *bs20* for configuration2, value *bs30* for configuration3, value *bs20* for configuration4, value *bs10* for configuration5 and value *bs50* for configuration6.

— ***SL-TxPower***

The IE *SL-TxPower* is used to limit the UE's sidelink transmission power on a carrier frequency. The unit is dBm. Value minusinfinity corresponds to –infinity.

#### ***SL-TxPower* information element**

```

-- ASN1START

SL-TxPower-r14 ::= CHOICE {
 minusinfinity-r14 NULL,
 txPower-r14 INTEGER (-41..31)
}

-- ASN1STOP

```

— ***SL-TypeTxSync***

The IE *SL-TypeTxSync* indicates the synchronization reference type.

#### ***SL-TypeTxSync* information element**

```

-- ASN1START

SL-TypeTxSync-r14 ::= ENUMERATED {gnss, enb, ue}

-- ASN1STOP

```

— ***SL-ThresPSSCH-RSRP-List***

IE *SL-ThresPSSCH-RSRP-List* indicates a threshold used for sensing based UE autonomous resource selection (see TS 36.213 [23]). A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH RSRP in the associated data resource is above the threshold defined by IE *SL-ThresPSSCH-RSRP-List*.

### ***SL-ThresPSSCH-RSRP-List* information element**

```
-- ASN1START
SL-ThresPSSCH-RSRP-List-r14 ::= SEQUENCE (SIZE (64)) OF SL-ThresPSSCH-RSRP-r14
SL-ThresPSSCH-RSRP-r14 ::= INTEGER (0..66)
-- ASN1STOP
```

#### ***SL-ThresPSSCH-RSRP-List* field descriptions**

##### ***SL-ThresPSSCH-RSRP***

Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to  $(-128 + (n-1)*2)$  dBm and so on, value 66 corresponds to infinity dBm.

### ***SL-TxParameters***

The IE *SL-TxParameters* identifies a set of parameters configured for sidelink transmission, used for communication, discovery and synchronisation.

### ***SL-TxParameters* information element**

```
-- ASN1START
SL-TxParameters-r12 ::= SEQUENCE {
 alpha-r12
 p0-r12
}
P0-SL-r12 ::= INTEGER (-126..31)
-- ASN1STOP
```

#### ***SL-TxParameters* field descriptions**

##### ***alpha***

Parameter(s):  $\alpha_{PSSCH,1}, \alpha_{PSSCH,2}, \alpha_{PSSCH,3}, \alpha_{PSSCH,4}, \alpha_{PSCCH,1}, \alpha_{PSCCH,2}, \alpha_{PSDCH,1}, \alpha_{PSSS}$  See TS 36.213 [23], clauses 14.1.1.5, 14.2.1.3, 14.3.1 and 14.4, where al0 corresponds to 0, al04 corresponds to value 0.4, al05 to 0.5, al06 to 0.6, al07 to 0.7, al08 to 0.8, al09 to 0.9 and al1 corresponds to 1. This field applies for sidelink power control.

##### ***p0***

Parameter:  $P_{O\_PSSCH,1}, P_{O\_PSSCH,2}, P_{O\_PSSCH,3}, P_{O\_PSSCH,4}, P_{O\_PSCCH,1}, P_{O\_PSCCH,2}, P_{O\_PSDCH,1}, P_{O\_PSSS}$  see TS 36.213 [23], clauses 14.1.1.5, 14.2.1.3, 14.3.1 and 14.4, unit dBm.

### ***SL-TxPoolIdentity***

The IE *SL-TxPoolIdentity* identifies an individual pool entry configured for sidelink transmission, used for communication and discovery.

### ***SL-TxPoolIdentity* information element**

```
-- ASN1START
SL-TxPoolIdentity-r12 ::= INTEGER (1.. maxSL-TxPool-r12)
SL-TxPoolIdentity-v1310 ::= INTEGER (maxSL-TxPool-r12Plus1-r13.. maxSL-TxPool-r13)
SL-V2X-TxPoolIdentity-r14 ::= INTEGER (1.. maxSL-V2X-TxPool-r14)
-- ASN1STOP
```

## — *SL-TxPoolToReleaseList*

The IE *SL-TxPoolToReleaseList* is used to release one or more individual pool entries used for sidelink transmission, for communication and discovery.

### ***SL-TxPoolToReleaseList* information element**

```
-- ASN1START

SL-TxPoolToReleaseList-r12 ::= SEQUENCE (SIZE (1..maxSL-TxPool-r12)) OF SL-TxPoolIdentity-r12
SL-TxPoolToReleaseListExt-r13 ::= SEQUENCE (SIZE (1..maxSL-TxPool-v1310)) OF SL-TxPoolIdentity-v1310
-- ASN1STOP
```

## — *SL-V2X-ConfigDedicated*

The IE *SL-V2X-ConfigDedicated* specifies the dedicated configuration information for V2X sidelink communication.

### ***SL-V2X-ConfigDedicated* information element**

```
-- ASN1START

SL-V2X-ConfigDedicated-r14 ::= SEQUENCE {
 commTxResources-r14 CHOICE {
 release NULL,
 setup CHOICE {
 scheduled-r14 SEQUENCE {
 sl-V-RNTI-r14 C-RNTI,

}
SL-TxPoolToReleaseListV2X-r14 ::= SEQUENCE (SIZE (1.. maxSL-V2X-TxPool-r14)) OF SL-V2X-
TxPoolIdentity-r14

-- ASN1STOP

```

### ***SL-V2X-ConfigDedicated* field descriptions**

***cbr-DedicatedTxConfigList***

Indicates the dedicated list of CBR range division and the list of PSCCH TX configurations available to configure congestion control to the UE for V2X sidelink communication.

***logicalChGroupInfoList***

Indicates for each logical channel group the list of associated priorities and reliabilities, used as specified in TS 36.321 [6], in order of increasing logical channel group identity. If E-UTRAN includes *logicalChGroupInfoList-v1530*, it includes the same number of entries, and listed in the same order, as in *logicalChGroupInfoList-r14*, and a logical channel group identity of the same entry in *logicalChGroupInfoList-r14* and in *logicalChGroupInfo-v1530* is associated with both the priorities (as in *logicalChGroupInfoList-r14*) and reliabilities (as in *logicalChGroupInfoList-v1530*) of that entry. If *logicalChGroupInfoList-v1530* is not included, this field indicates for each logical channel group the list of associated priorities.

***mcs***

Indicates the MCS as defined in TS 36.213 [23], clause 14.2.1. If not configured, the selection of MCS is up to UE implementation. If included, *mcs-r14* corresponds to the MCS table in Table 8.6.1-1 with 64QAM indices overridden by 16QAM used for transmission on PSSCH. If included, *mcs-r15* corresponds to both the MCS table in Table 8.6.1-1 in TS 36.213 [23] and the MCS table supporting 64QAM in Table 14.1.1-2 in TS 36.213 [23] used for transmission on PSSCH. If this field is present, E-UTRAN shall configure both *mcs-r14* and *mcs-r15*.

***scheduled***

Indicates the configuration for the case E-UTRAN schedules the transmission resources based on sidelink specific BSR from the UE.

***sl-V-RNTI***

Indicates the RNTI used for DCI dynamically scheduling sidelink resources for V2X sidelink communication.

***slss-TxDisabled***

Value TRUE indicates that the primary carrier, even though equipped with synchronisation resources, cannot be used as a synchronisation carrier frequency to transmit SLSS or PSBCH.

***thresSL-TxPrioritization***

Indicates the threshold used to determine whether SL V2X transmission is prioritized over uplink transmission if they overlap in time (see TS 36.321 [6]). This value shall overwrite *thresSL-TxPrioritization* configured in *SIB21* or *SL-V2X-Preconfiguration* if any.

***typeTxSync***

Indicates the prioritized synchronization type (i.e. eNB or GNSS) for performing V2X sidelink communication on PCell.

***ue-Selected***

Indicates the configuration for the case the UE selects the transmission resources from a pool of resources configured by E-UTRAN.

***v2x-InterFreqInfoList***

Indicates synchronization and resource allocation configurations of other carrier frequencies than the serving carrier frequency for V2X sidelink communication. For inter-carrier scheduled resource allocation, CIF=1 in DCI-5A corresponds to the first entry in this frequency list, CIF=2 corresponds to the second entry, and so on (see TS 36.213 [23]). CIF=0 in DCI-5A corresponds to the frequency where the DCI is received.

***v2x-SchedulingPool***

Indicates a pool of resources when E-UTRAN schedules Tx resources for V2X sidelink communications.

## – *SL-V2X-FreqSelectionConfigList*

The IE *SL-V2X-FreqSelectionConfigList* specifies the configuration information for carrier selection for V2X sidelink communication transmission using UE autonomous resource selection.

### ***SL-V2X-FreqSelectionConfigList* information element**

```
-- ASN1START

SL-V2X-FreqSelectionConfigList-r15 ::= SEQUENCE (SIZE (1..8)) OF SL-V2X-FreqSelectionConfig-r15

SL-V2X-FreqSelectionConfig-r15 ::= SEQUENCE {
 priorityList-r15 SL-PriorityList-r13,
 threshCBR-FreqReselection-r15 SL-CBR-r14 OPTIONAL, -- Need OR
 threshCBR-FreqKeeping-r15 SL-CBR-r14 OPTIONAL, -- Need OR
}

-- ASN1STOP
```

### **SL-V2X-FreqSelectionConfig field descriptions**

#### ***priorityList***

Indicates the list of PPPP(s) which is associated with the configurations in *threshCBR-FreqReselection* and in *threshCBR-FreqKeeping*.

#### ***threshCBR-FreqReselection***

Indicates the CBR threshold to determine whether the carrier frequency can be (re)selected for the transmission of V2X sidelink communication. See TS 36.321 [6].

#### ***threshCBR-FreqKeeping***

Indicates the CBR threshold to determine whether the UE can keep using the carrier which was selected for the transmission of V2X sidelink communication. See TS 36.321 [6].

## – *SL-V2X-PacketDuplicationConfig*

The IE *SL-V2X-PacketDuplicationConfig* specifies the configuration information for sidelink packet duplication for V2X sidelink communication transmission.

### ***SL-V2X-PacketDuplicationConfig* information element**

```
-- ASN1START

SL-V2X-PacketDuplicationConfig-r15 ::= SEQUENCE {
 threshSL-Reliability-r15 SL-Reliability-r15,
 allowedCarrierFreqConfig-r15 SL-PPPR-Dest-CarrierFreqList-r15 OPTIONAL, -- Need OR
 ...
}

SL-PPPR-Dest-CarrierFreqList-r15 ::= SEQUENCE (SIZE (1..maxSL-Dest-r12)) OF SL-PPPR-Dest-
CarrierFreq

SL-PPPR-Dest-CarrierFreq ::= SEQUENCE {
 destinationInfoList-r15 SL-DestinationInfoList-r12 OPTIONAL, -- Need OR
 allowedCarrierFreqList-r15 SL-AllowedCarrierFreqList-r15 OPTIONAL, -- Need OR
}

SL-AllowedCarrierFreqList-r15 ::= SEQUENCE {
 allowedCarrierFreqSet1 SEQUENCE (SIZE (1..maxFreqV2X-r14)) OF ARFCN-ValueEUTRA-r9,
 allowedCarrierFreqSet2 SEQUENCE (SIZE (1..maxFreqV2X-r14)) OF ARFCN-ValueEUTRA-r9
}

-- ASN1STOP
```

<b>SL-V2X-PacketDuplicationConfig field descriptions</b>	
<b>allowedCarrierFreqList, allowedCarrierFreqSet1, allowedCarrierFreqSet2</b>	Indicates, for V2X sidelink communication, the set of carrier frequencies applicable for the transmission of the MAC SDUs from the sidelink logical channels whose associated destination are included in <i>destinationInfoList</i> (see TS 36.321 [6]). If present, E-UTRAN shall ensure <i>allowedCarrierFreqSet1</i> and <i>allowedCarrierFreqSet2</i> do not include the same carrier frequency.
<b>threshSL-Reliability</b>	
	Indicates the reliability threshold used to determine whether sidelink packet duplication is configured and activated for V2X sidelink communication transmission. See TS 36.323 [8] and TS 36.321 [6].

## – **SL-V2X-SyncFreqList**

The IE *SL-V2X-SyncFreqList* specifies the list of candidate synchronisation carrier frequencies used for V2X sidelink communication.

### **SL-V2X-SyncFreqList information element**

```
-- ASN1START
SL-V2X-SyncFreqList-r15 ::= SEQUENCE (SIZE (1..maxFreqV2X-r14)) OF ARFCN-ValueEUTRA-r9
-- ASN1STOP
```

## – **SL-ZoneConfig**

The IE *SL-ZoneConfig* indicates zone configurations used for V2X sidelink communication.

### **SL-ZoneConfig information element**

```
-- ASN1START
SL-ZoneConfig-r14 ::= SEQUENCE {
 zoneLength-r14 ENUMERATED { m5, m10, m20, m50, m100, m200, m500, spare1 },
 zoneWidth-r14 ENUMERATED { m5, m10, m20, m50, m100, m200, m500, spare1 },
 zoneIdLongiMod-r14 INTEGER (1..4),
 zoneIdLatiMod-r14 INTEGER (1..4)
}
-- ASN1STOP
```

<b>SL-ZoneConfig field descriptions</b>	
<b>zoneLength</b>	Indicates the length of each geographic zone. Value m5 corresponds to 5 meters, m10 corresponds to 10 meters and so on.
<b>zoneWidth</b>	Indicates the width of each geographic zone. Value m5 corresponds to 5 meters, m10 corresponds to 10 meters and so on.
<b>zoneIdLongiMod</b>	Indicates the total number of zones that is configured with respect to longitude.
<b>zoneIdLatiMod</b>	Indicates the total number of zones that is configured with respect to latitude.

<b>Conditional presence</b>	<b>Explanation</b>
<i>EDToPUR</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> or <i>cp-PUR-5GC</i> or <i>cp-PUR-EPC</i> or <i>up-PUR-5GC</i> or <i>up-PUR-EPC</i> is present in SIB2-NB; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>TDD</i>	The field is optionally present, Need OR, in TDD mode. Otherwise, the field is not present.

## 6.4 RRC multiplicity and type constraint values

### – Multiplicity and type constraint definitions

```
-- ASN1START

maxAccessCat-1-r15 INTEGER ::= 63 -- Maximum number of Access Categories - 1
maxACDC-Cat-r13 INTEGER ::= 16 -- Maximum number of ACDC categories (per PLMN)
maxAvailNarrowBands-r13 INTEGER ::= 16 -- Maximum number of narrowbands
maxAvailNarrowBands-1-r16 INTEGER ::= 15 -- Maximum number of narrowbands minus one
maxBandComb-r10 INTEGER ::= 128 -- Maximum number of band combinations.
maxBandComb-r11 INTEGER ::= 256 -- Maximum number of additional band combinations.
maxBandComb-r13 INTEGER ::= 384 -- Maximum number of band combinations in Rel-13
maxBandCombSidelinkNR-r16 INTEGER ::= 512 -- Maximum number of NR sidelink band combinations
maxBands INTEGER ::= 64 -- Maximum number of bands listed in EUTRA UE caps
maxBandsNR-r15 INTEGER ::= 1024 -- Maximum number of NR bands listed in EUTRA UE caps
maxBandsENDC-r16 INTEGER ::= 10 -- Maximum number of NR bands from across all the PLMNs
 -- sharing the serving cell in EN-DC for the forwarding
 -- of upperLayerIndication.
maxBandwidthClass-r10 INTEGER ::= 16 -- Maximum number of supported CA BW classes per band
maxBandwidthCombSet-r10 INTEGER ::= 32 -- Maximum number of bandwidth combination sets per
 -- supported band combination
maxBarringInfoSet-r15 INTEGER ::= 8 -- Maximum number of UAC barring information sets
maxBT-IdReport-r15 INTEGER ::= 32 -- Maximum number of Bluetooth IDs to report
maxBT-Name-r15 INTEGER ::= 4 -- Maximum number of Bluetooth name

maxQuantSetsNR-r15	INTEGER ::= 2	-- Maximum number of NR quantity configuration sets
maxQCI-r13	INTEGER ::= 6	-- Maximum number of QCIs
maxRAT-Capabilities	INTEGER ::= 8	-- Maximum number of interworking RATs (incl EUTRA)
maxRE-MapQCL-r11	INTEGER ::= 4	-- Maximum number of PDSCH RE Mapping configurations (per carrier frequency)
maxReportConfigId	INTEGER ::= 32	
maxReservationPeriod-r14	INTEGER ::= 16	-- Maximum number of resource reservation periodicities for sidelink V2X communication
maxRS-Index-r15	INTEGER ::= 64	-- Maximum number of RS indices
maxRS-Index-1-r15	INTEGER ::= 63	-- Highest value of RS index as used to identify RS index in RRM reports.
maxRS-IndexCellQual-r15	INTEGER ::= 16	-- Maximum number of RS indices averaged to derive cell quality for RRM.
maxRS-IndexReport-r15	INTEGER ::= 32	-- Maximum number of RS indices for RRM.
maxRSTD-Freq-r10	INTEGER ::= 3	-- Maximum number of frequency layers for RSTD measurement
maxSAI-MBMS-r11	INTEGER ::= 64	-- Maximum number of MBMS service area identities broadcast per carrier frequency
maxSat-r17	INTEGER ::= 4	-- Maximum number of satellites
maxSCell-r10	INTEGER ::= 4	-- Maximum number of SCells
maxSCell-r13	INTEGER ::= 31	-- Highest value of extended number range of SCells
maxSCellGroups-r15	INTEGER ::= 4	-- Maximum number of SCell common parameter groups
maxSC-MTCH-r13	INTEGER ::= 1023	-- Maximum number of SC-MTCHs in one cell
maxSC-MTCH-BR-r14	INTEGER ::= 128	-- Maximum number of SC-MTCHs in one cell for feMTC
maxSL-CommRxPoolNFreq-r13	INTEGER ::= 32	-- Maximum number of individual sidelink communication Rx resource pools on neighbouring freq
maxSL-CommRxPoolPreconf-v1310	INTEGER ::= 12	-- Maximum number of additional preconfigured sidelink communication Rx resource pool entries
maxSL-TxPool-r12Plus1-r13	INTEGER ::= 5	-- First additional individual sidelink Tx resource pool
maxSL-TxPool-v1310	INTEGER ::= 4	-- Maximum number of additional sidelink Tx resource pool entries
maxSL-TxPool-r13	INTEGER ::= 8	-- Maximum number of individual sidelink Tx resource pools
maxSL-CommTxPoolPreconf-v1310	INTEGER ::= 7	-- Maximum number of additional preconfigured sidelink Tx resource pool entries
maxSL-Dest-r12	INTEGER ::= 16	-- Maximum number of sidelink destinations
maxSL-DiscCells-r13	INTEGER ::= 16	-- Maximum number of cells with similar sidelink configurations
maxSL-DiscPowerClass-r12	INTEGER ::= 3	-- Maximum number of sidelink power classes
maxSL-DiscRxPoolPreconf-r13	INTEGER ::= 16	-- Maximum number of preconfigured sidelink

```

maxSL-DiscSysInfoReportFreq-r13 INTEGER ::= 8 -- discovery Rx resource pool entries
 -- Maximum number of frequencies to include in a
 -- SidelinkUEInformation for SI reporting
maxSL-DiscTxPoolPreconf-r13 INTEGER ::= 4 -- Maximum number of preconfigured sidelink
 -- discovery Tx resource pool entries
maxSL-GP-r13 INTEGER ::= 8 -- Maximum number of gap patterns that can be requested
 -- for a frequency or assigned
maxSL-PoolToMeasure-r14 INTEGER ::= 72 -- Maximum number of TX resource pools for CBR
 -- measurement and report

maxSL-Prio-r13 INTEGER ::= 8 -- Maximum number of entries in sidelink priority list
maxSL-RxPool-r12 INTEGER ::= 16 -- Maximum number of individual sidelink Rx resource
pools
maxSL-Reliability-r15 INTEGER ::= 8 -- Maximum number of entries in sidelink reliability list
maxSL-SyncConfig-r12 INTEGER ::= 16 -- Maximum number of sidelink Sync configurations
maxSL-TF-IndexPair-r12 INTEGER ::= 64 -- Maximum number of sidelink Time Freq resource index
 -- pairs
maxSL-TxPool-r12 INTEGER ::= 4 -- Maximum number of individual sidelink Tx resource
pools
maxSL-V2X-RxPool-r14 INTEGER ::= 16 -- Maximum number of RX resource pools for
 -- V2X sidelink communication
maxSL-V2X-RxPoolPreconf-r14 INTEGER ::= 16 -- Maximum number of RX resource pools for
 -- V2X sidelink communication
maxSL-V2X-TxPool-r14 INTEGER ::= 8 -- Maximum number of TX resource pools for
 -- V2X sidelink communication
maxSL-V2X-TxPoolPreconf-r14 INTEGER ::= 8 -- Maximum number of TX resource pools for
 -- V2X sidelink communication
maxSL-V2X-SyncConfig-r14 INTEGER ::= 16 -- Maximum number of sidelink Sync configurations
 -- for V2X sidelink communication
maxSL-V2X-CBRConfig-r14 INTEGER ::= 4 -- Maximum number of CBR range configurations
 -- for V2X sidelink communication congestion
 -- control
maxSL-V2X-CBRConfig-1-r14 INTEGER ::= 3 -- Maximum number of TX parameter configurations
maxSL-V2X-TxConfig-r14 INTEGER ::= 64 -- Maximum number of TX parameter
 -- configurations for V2X sidelink communication congestion
 -- control
maxSL-V2X-TxConfig-1-r14 INTEGER ::= 63 -- Maximum number of CBR range configurations in
maxSL-V2X-CBRConfig2-r14 INTEGER ::= 8 -- pre-configuration for V2X sidelink
 -- communication congestion control
maxSL-V2X-CBRConfig2-1-r14 INTEGER ::= 7 -- Maximum number of TX parameter
maxSL-V2X-TxConfig2-r14 INTEGER ::= 128 -- configurations in pre-configuration for V2X
 -- sidelink communication congestion control
maxSL-V2X-TxConfig2-1-r14 INTEGER ::= 127
maxSTAG-r11 INTEGER ::= 3 -- Maximum number of STAGs
maxServCell-r10 INTEGER ::= 5 -- Maximum number of Serving cells
maxServCell-r13 INTEGER ::= 32 -- Highest value of extended number range of Serving
cells
maxServCellNR-r15 INTEGER ::= 16 -- Maximum number of NR serving cells
maxServiceCount INTEGER ::= 16 -- Maximum number of MBMS services that can be included
 -- in an MBMS counting request and response
maxServiceCount-1 INTEGER ::= 15
maxSessionPerPMCH INTEGER ::= 29
maxSessionPerPMCH-1 INTEGER ::= 28
maxSIB INTEGER ::= 32 -- Maximum number of SIBs
maxSIB-1 INTEGER ::= 31
maxSI-Message INTEGER ::= 32 -- Maximum number of SI messages
maxSimultaneousBands-r10 INTEGER ::= 64 -- Maximum number of simultaneously aggregated bands
maxSubframePatternIDC-r11 INTEGER ::= 8 -- Maximum number of subframe reservation patterns
 -- that the UE can simultaneously recommend to the
 -- E-UTRAN for use.
maxTAC-r17 INTEGER ::= 12 -- Maximum number of Tracking Area Codes
 -- broadcast in a cell
maxTrafficPattern-r14 INTEGER ::= 8 -- Maximum number of periodical traffic patterns
 -- that the UE can simultaneously report to the
 -- E-UTRAN.
maxUTRA-FDD-Carrier INTEGER ::= 16 -- Maximum number of UTRA FDD carrier frequencies
maxUTRA-TDD-Carrier INTEGER ::= 16 -- Maximum number of UTRA TDD carrier frequencies
maxWayPoint-r15 INTEGER ::= 20 -- Maximum number of flight path information waypoints
maxWLAN-Id-r12 INTEGER ::= 16 -- Maximum number of WLAN identifiers
maxWLAN-Bands-r13 INTEGER ::= 8 -- Maximum number of WLAN bands
maxWLAN-Id-r13 INTEGER ::= 32 -- Maximum number of WLAN identifiers
maxWLAN-Channels-r13 INTEGER ::= 16 -- maximum number of WLAN channels used in
 -- WLAN-CarrierInfo
maxWLAN-CarrierInfo-r13 INTEGER ::= 8 -- Maximum number of WLAN Carrier Information
maxWLAN-Id-Report-r14 INTEGER ::= 32 -- Maximum number of WLAN IDs to report
maxWLAN-Name-r15 INTEGER ::= 4 -- Maximum number of WLAN name

# 6.5 PC5 RRC messages

NOTE: The messages included in this clause reflect the current status of the discussions. Additional messages may be included at a later stage.

## 6.5.1 General message structure

### – *PC5-RRC-Definitions*

This ASN.1 segment is the start of the PC5 RRC PDU definitions.

```
-- ASN1START
PC5-RRC-Definitions DEFINITIONS AUTOMATIC TAGS ::=

BEGIN

IMPORTS
 TDD-ConfigSL-r12
FROM EUTRA-RRC-Definitions;

-- ASN1STOP
```

### – *SBCCH-SL-BCH-Message*

The *SBCCH-SL-BCH-Message* class is the set of RRC messages that may be sent from the UE to the UE via SL-BCH on the SBCCH logical channel.

```
-- ASN1START
SBCCH-SL-BCH-Message ::= SEQUENCE {
 message SBCCH-SL-BCH-MessageType
}
SBCCH-SL-BCH-MessageType ::= MasterInformationBlock-SL
-- ASN1STOP
```

### – *SBCCH-SL-BCH-Message-V2X*

The *SBCCH-SL-BCH-Message-V2X* class is the set of RRC messages that may be sent from the UE to the UE via SL-BCH on the SBCCH logical channel for V2X sidelink communication.

```
-- ASN1START
SBCCH-SL-BCH-Message-V2X-r14 ::= SEQUENCE {
 message SBCCH-SL-BCH-MessageType-V2X-r14
}
SBCCH-SL-BCH-MessageType-V2X-r14 ::= MasterInformationBlock-SL-V2X-r14
-- ASN1STOP
```

## 6.5.2 Message definitions

- ***MasterInformationBlock-SL***

The *MasterInformationBlock-SL* includes the information transmitted by a UE transmitting SLSS, i.e. acting as synchronisation reference, via SL-BCH.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: SBCCH

Direction: UE to UE

### ***MasterInformationBlock-SL***

```
-- ASN1START

MasterInformationBlock-SL ::= SEQUENCE {
 sl-Bandwidth-r12
 ENUMERATED {
 n6, n15, n25, n50, n75, n100},
 tdd-ConfigSL-r12,
 directFrameNumber-r12
 BIT STRING (SIZE (10)),
 directSubframeNumber-r12
 INTEGER (0..9),
 inCoverage-r12
 BOOLEAN,
 reserved-r12
 BIT STRING (SIZE (19))
}

-- ASN1STOP
```

#### ***MasterInformationBlock-SL* field descriptions**

##### ***directFrameNumber***

Indicates the frame number in which SLSS and SL-BCH are transmitted. The subframe in the frame corresponding to *directFrameNumber* is indicated by *directSubframeNumber*.

##### ***inCoverage***

Value *TRUE* indicates that the UE transmitting the *MasterInformationBlock-SL* is in E-UTRAN coverage.

##### ***sl-Bandwidth***

Parameter: transmission bandwidth configuration. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.

- ***MasterInformationBlock-SL-V2X***

The *MasterInformationBlock-SL-V2X* includes the information transmitted by a UE transmitting SLSS, i.e. acting as synchronisation reference, via SL-BCH for V2X sidelink communication.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: SBCCH

Direction: UE to UE

### ***MasterInformationBlock-SL-V2X***

```
-- ASN1START

MasterInformationBlock-SL-V2X-r14 ::= SEQUENCE {
 sl-Bandwidth-r14
 ENUMERATED {
 n6, n15, n25, n50, n75, n100},
 tdd-ConfigSL-r14,
 directFrameNumber-r14
 BIT STRING (SIZE (10)),
```

```

directSubframeNumber-r14 INTEGER (0..9),
inCoverage-r14 BOOLEAN,
reserved-r14 BIT STRING (SIZE (27))
}

-- ASN1STOP

```

#### ***MasterInformationBlock-SL-V2X field descriptions***

***directFrameNumber***

Indicates the frame number in which SLSS and SL-BCH for V2X sidelink communication are transmitted. The subframe in the frame corresponding to *directFrameNumber* is indicated by *directSubframeNumber*.

***inCoverage***

Value *TRUE* indicates that the UE transmitting the *MasterInformationBlock-SL-V2X* for V2X sidelink communication is in E-UTRAN coverage.

***sl-Bandwidth***

Parameter: transmission bandwidth configuration. n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on.

- End of *PC5-RRC-Definitions*

```

-- ASN1START
END
-- ASN1STOP

```

## 6.6 Direct Indication Information

Direct Indication information is transmitted on MPDCCH using P-RNTI but without associated *Paging* message or using SI-RNTI. Table 6.6-1 defines the Direct Indication information on MPDCCH using P-RNTI, see TS 36.212 [22], clause 5.3.3.1.14. Table 6.6-2 defines the Direct Indication on MPDCCH using SI-RNTI in RRC\_CONNECTED, see TS 36.212 [22], clauses 5.3.3.1.12 and 5.3.3.1.13.

When bit n is set to 1, UE shall behave as if the corresponding field is set in the *Paging* message, see 5.3.2.3. Bit 1 is the least significant bit.

**Table 6.6-1: Direct Indication information using P-RNTI**

Bit	Direct Indication information
1	<i>systemInfoModification</i>
2	<i>etws-Indication</i>
3	<i>cmas-Indication</i>
4	<i>eab-ParamModification</i>
5	<i>systemInfoModification-eDRX</i>
6	<i>uac-ParamModification</i>
6, 7, 8	Not used, and shall be ignored by UE if received.

**Table 6.6-2: Direct Indication information using SI-RNTI**

Bit	Direct Indication information
1	<i>etws-Indication</i>
2	<i>cmas-Indication</i>

3, 4, 5, 6, 7, 8	Not used, and shall be ignored by UE if received.
---------------------	---------------------------------------------------

## 6.6a Direct Indication FeMBMS

On MBMS-dedicated cell and on FeMBMS/Unicast-mixed cell, a Direct Indication FeMBMS is transmitted on PDCCH together with 8-bit MCCH change notification using M-RNTI, see TS 36.212 [22], clause 5.3.3.1.4. Table 6.6a-1 defines the Direct Indication FeMBMS.

When the first bit is set to 1, UE shall behave as if *systemInfoModification* field is set in the *Paging* message and when the second bit is set to 1, UE shall behave as if both *etws-Indication* and *cmas-Indication* are set in the *Paging* message, see 5.3.2.3. Bit 1 is the least significant bit.

**Table 6.6a-1: Direct Indication FeMBMS**

Bit	Direct Indication FeMBMS
1	<i>systemInfoModification</i>
2	<i>etws-Indication</i> and <i>cmas-Indication</i>

## 6.7.2 NB-IoT Message definitions

### *DLInformationTransfer-NB*

The *DLInformationTransfer-NB* message is used for the downlink transfer of NAS dedicated information.

Signalling radio bearer: SRB1 or SRB1bis

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

### ***DLInformationTransfer-NB* message**

```

-- ASN1START

DLInformationTransfer-NB ::= SEQUENCE {
 rrc-TransactionIdentifier RRC-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {
 dlInformationTransfer-r13 DLInformationTransfer-NB-r13-IES,

<b><i>MasterInformationBlock-NB</i></b> field descriptions	
<b><i>ab-Enabled</i></b>	Value TRUE indicates that access barring is enabled for UEs connected to EPC.
<b><i>ab-Enabled-5GC</i></b>	Value TRUE indicates that access barring is enabled for UEs connected to 5GC.
<b><i>additionalTransmissionSIB1</i></b>	Value TRUE indicates that additional SIB1-NB transmissions are present. See TS 36.211 [21] and TS 36.213 [23]. E-UTRAN only configures <i>additionalTransmissionSIB1</i> to <i>TRUE</i> if <i>schedulingInfoSIB1</i> indicates that the number of NPDSCH repetitions is 16, see TS 36.213 [23], Table 16.4.1.3-3.
<b><i>earfcn-LSB</i></b>	Indicates the 2 least significant bits of the EARFCN for NTN bands where 100 kHz raster is used, see TS 36.102 [113].
<b><i>eutra-CRS-SequenceInfo</i></b>	Information of the carrier containing NPSS/NSSS/NPBCH. Each value is associated with an E-UTRA PRB index as an offset from the middle of the LTE system sorted out by channel raster offset. See TS 36.211[21] and TS 36.213 [23].
<b><i>eutra-NumCRS-Ports</i></b>	Number of E-UTRA CRS antenna ports, either the same number of ports as NRS or 4 antenna ports. See TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].
<b><i>hyperSFN-LSB</i></b>	Indicates the 2 least significant bits of hyper SFN. The remaining bits are present in <i>SystemInformationBlockType1-NB</i> .
<b><i>operationModelInfo</i></b>	Deployment scenario (in-band/guard-band/standalone) and related information. See TS 36.211 [21] and TS 36.213 [23]. <i>Inband-SamePCI</i> indicates an in-band deployment and that the NB-IoT and LTE cell share the same physical cell id and have the same number of NRS and CRS ports. <i>Inband-DifferentPCI</i> indicates an in-band deployment and that the NB-IoT and LTE cell have different physical cell id. <i>guardband</i> indicates a guard-band deployment. <i>standalone</i> indicates a standalone deployment.
<b><i>schedulingInfoSIB1</i></b>	This field contains an index to a table specified in TS 36.213 [23], Table 16.4.1.3-3, that defines <i>SystemInformationBlockType1-NB</i> scheduling information.
<b><i>systemFrameNumber-MSB</i></b>	Defines the 4 most significant bits of the SFN. As indicated in TS 36.211 [21], the 6 least significant bits of the SFN are acquired implicitly by decoding the NPBCH.
<b><i>systemInfoValueTag</i></b>	Common for all SIBs other than MIB-NB, SIB14-NB, SIB16-NB and SIB31-NB.

### ***MasterInformationBlock-TDD-NB***

The *MasterInformationBlock-TDD-NB* includes the system information transmitted on BCH in TDD.

Signalling radio bearer: N/A

RLC-SAP: TM

}

SIB-GuardbandInbandDiffPCI-TDD-NB-r15 ::= SEQUENCE {
 sib-EUTRA-NumCRS-Ports-r15 ENUMERATED {same, four}
}

-- ASN1STOP

```

<b><i>MasterInformationBlock-TDD-NB</i> field descriptions</b>	
<b><i>ab-Enabled</i></b>	Value TRUE indicates that access barring is enabled for UEs connected to EPC.
<b><i>ab-Enabled-5GC</i></b>	Value TRUE indicates that access barring is enabled for UEs connected to 5GC.
<b><i>eutra-Bandwidth</i></b>	EUTRA system bandwidth. Value <i>bw5or10</i> corresponds to bandwidth 5 or 10 MHz, value <i>bw15or20</i> corresponds to bandwidth 15 or 20 MHz. If the value of <i>eutra-Bandwidth</i> is <i>bw5or10</i> and <i>rasterOffset</i> is set to <i>khz7dot5</i> or <i>khz-7dot5</i> , the E-UTRA system bandwidth is 5 MHz. If the value of <i>eutra-Bandwidth</i> is <i>bw5or10</i> and <i>rasterOffset</i> is set to <i>khz2dot5</i> or <i>khz-2dot5</i> , the E-UTRA system bandwidth is 10 MHz. If the value of <i>eutra-Bandwidth</i> is <i>bw15or20</i> and <i>rasterOffset</i> is set to <i>khz7dot5</i> or <i>khz-7dot5</i> , the E-UTRA system bandwidth is 15 MHz. If the value of <i>eutra-Bandwidth</i> is <i>bw15or20</i> and <i>rasterOffset</i> is set to <i>khz2dot5</i> or <i>khz-2dot5</i> , the E-UTRA system bandwidth is 20 MHz. When the E-UTRA system bandwidth is 5 MHz or 15 MHz, if the value of <i>sib-GuardbandInfo</i> is <i>sib-GuardbandInbandSamePCI</i> or <i>sib-GuardbandinbandDiffPCI</i> , the offset between the anchor carrier and the non-anchor carrier used for SIB1 and/or SI transmission is 45 kHz.
<b><i>eutra-CRS-Sequencelinfo</i></b>	Information of the carrier containing NPSS/NSSS/NPBCH. Each value is associated with an E-UTRA PRB index as an offset from the middle of the LTE system sorted out by channel raster offset. See TS 36.211 [21] and TS 36.213 [23].
<b><i>eutra-NumCRS-Ports, sib-eutra-NumCRS-Ports</i></b>	Number of E-UTRA CRS antenna ports, either the same number of ports as NRS or 4 antenna ports. See TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].
<b><i>hyperSFN-LSB</i></b>	Indicates the 2 least significant bits of hyper SFN. The remaining bits are present in <i>SystemInformationBlockType1-NB</i> .
<b><i>operationModelInfo</i></b>	Deployment scenario (in-band/guard-band/standalone) and related information. See TS 36.211 [21] and TS 36.213 [23]. <i>Inband-SamePCI</i> indicates an in-band deployment and that the NB-IoT and LTE cell share the same physical cell id and have the same number of NRS and CRS ports. <i>Inband-DifferentPCI</i> indicates an in-band deployment and that the NB-IoT and LTE cell have different physical cell id. <i>guardband</i> indicates a guard-band deployment. <i>standalone</i> indicates a standalone deployment. When <i>operationmodeInfo</i> is set to <i>guardband</i> , if <i>rasterOffset</i> is set to <i>khz-7dot5</i> or <i>khz-2dot5</i> , the guardband anchor carrier is at the higher edge of the LTE carrier. If <i>rasterOffset</i> is set to <i>khz7dot5</i> or <i>khz2dot5</i> , the guardband anchor carrier is at the lower edge of the LTE carrier
<b><i>schedulingInfoSIB1</i></b>	This field contains an index to a table specified in TS 36.213 [23], Table 16.4.1.3-5 or Table 16.4.1.3-7 when <i>sib1-CarrierInfo</i> is set to <i>anchor</i> or to <i>non-anchor</i> respectively, that defines <i>SystemInformationBlockType1-NB</i> scheduling information. If <i>sib1-CarrierInfo</i> is set to <i>non-anchor</i> , E-UTRAN configures a value between 0 and 7.
<b><i>sib-GuardbandGuardbandLocation</i></b>	Location of the non-anchor carrier used for SIB1 and/or SI transmission when <i>operationmodelInfo</i> is set to <i>guardband</i> and the non-anchor carrier is in guardband. See TS 36.213 [23]. Value <i>same</i> corresponds to the carrier adjacent to the anchor carrier on the outer side of the guardband, value <i>opposite</i> corresponds to the carrier closest to the edge of the LTE carrier in the opposite guardband.
<b><i>sib-GuardbandInfo</i></b>	Information of the carrier used for SIB1 and/or SI transmission when <i>operationmodelInfo</i> is set to <i>guardband</i> . See TS 36.213 [23]. <i>sib-GuardbandAnchor</i> indicates the anchor carrier. <i>sib-GuardbandGuardband</i> indicates a non-anchor carrier in guardband mode. <i>sib-GuardbandInbandSamePCI</i> or <i>sib-GuardbandinbandDiffPCI</i> indicates a non-anchor carrier in inband mode, and at the edge of the LTE carrier and on the same side as the anchor carrier.
<b><i>sib-InbandLocation</i></b>	Location of the non-anchor carrier used for SIB1 and/or SI transmission when <i>operationmodelInfo</i> is set to <i>inband-SamePCI</i> or <i>inband-DifferentPCI</i> , and <i>sib1-CarrierInfo</i> value and/or <i>tdd-SI-CarrierInfo</i> in SIB1-NB is set to <i>non-anchor</i> . See TS 36.213 [23]. Value <i>lower</i> corresponds to the lower adjacent carrier relative to the anchor carrier and value <i>higher</i> corresponds to the higher adjacent carrier relative to the anchor carrier. If both <i>sib1-CarrierInfo</i> value and <i>tdd-SI-CarrierInfo</i> value in SIB1-NB are set to <i>anchor</i> , the UE ignores <i>sib-InbandLocation</i> .

<b><i>MasterInformationBlock-TDD-NB</i> field descriptions</b>	
<b><i>sib-StandaloneLocation</i></b>	Location of the non-anchor carrier used for SIB1 and/or SI transmission when <i>operationmodeInfo</i> is set to <i>standalone</i> , and <i>sib1-CarrierInfo</i> value and/or <i>tdd-SI-CarrierInfo</i> in SIB1-NB is set to <i>non-anchor</i> . See TS 36.213 [23]. Value <i>lower</i> corresponds to the lower adjacent carrier relative to the anchor carrier and value <i>higher</i> corresponds to the higher adjacent carrier relative to the anchor carrier. If both <i>sib1-CarrierInfo</i> value and <i>tdd-SI-CarrierInfo</i> value in SIB1-NB are set to <i>anchor</i> , the UE ignores <i>sib-StandaloneLocation</i> .
<b><i>sib1-CarrierInfo</i></b>	Carrier used for SIB1 transmission. See TS 36.213 [23], clause 16.4.1.3. Value <i>anchor</i> corresponds to anchor carrier, value <i>non-anchor</i> corresponds to non-anchor carrier.
<b><i>systemFrameNumber-MSB</i></b>	Defines the 4 most significant bits of the SFN. As indicated in TS 36.211 [21], the 6 least significant bits of the SFN are acquired implicitly by decoding the NPBCH.
<b><i>systemInfoValueTag</i></b>	Common for all SIBs other than MIB-NB, SIB14-NB and SIB16-NB.

## — *Paging-NB*

The *Paging-NB* message is used for the notification of one or more UEs.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: PCCH

Direction: E-UTRAN to UE

### *Paging-NB message*

```
-- ASN1START

Paging-NB ::= SEQUENCE {
 pagingRecordList-r13 OPTIONAL, -- Need ON
 systemInfoModification-r13 OPTIONAL, -- Need ON
 systemInfoModification-eDRX-r13 OPTIONAL, -- Need ON
 nonCriticalExtension OPTIONAL
}

Paging-NB-v1610-IEs ::= SEQUENCE {
 pagingRecordList-v1610 OPTIONAL, -- Need ON
 nonCriticalExtension OPTIONAL
}

PagingRecordList-NB-r13 ::= SEQUENCE (SIZE (1..maxPageRec)) OF PagingRecord-NB-r13
PagingRecordList-NB-v1610 ::= SEQUENCE (SIZE (1..maxPageRec)) OF PagingRecord-NB-v1610

PagingRecord-NB-r13 ::= SEQUENCE {
 ue-Identity-r13
 ...
}

PagingRecord-NB-v1610 ::= SEQUENCE {
 mt-EDT-r16
}
OPTIONAL -- Need ON

-- ASN1STOP
```

<b>Paging-NB field descriptions</b>	
<b>mt-EDT</b>	Indication of mobile-terminated EDT.
<b>pagingRecordList</b>	If E-UTRAN includes <i>pagingRecordList-v1610</i> , it includes the same number of entries, and listed in the same order, as in <i>pagingRecordList</i> (i.e. without suffix).
<b>systemInfoModification</b>	If present: indication of a BCCH modification other than for <i>SystemInformationBlockType14-NB</i> (SIB14-NB), <i>SystemInformationBlockType16-NB</i> (SIB16-NB) and <i>SystemInformationBlockType31-NB</i> (SIB31-NB). This indication does not apply to UEs using eDRX cycle longer than the BCCH modification period.
<b>systemInfoModification-eDRX</b>	If present: indication of a BCCH modification other than for <i>SystemInformationBlockType14-NB</i> (SIB14-NB), <i>SystemInformationBlockType16-NB</i> (SIB16-NB) and <i>SystemInformationBlockType31-NB</i> (SIB31-NB). This indication applies only to UEs using eDRX cycle longer than the BCCH modification period.
<b>ue-Identity</b>	Provides the NAS identity of the UE that is being paged.

### *PURConfigurationRequest-NB*

The *PURConfigurationRequest-NB* message is used by the UE to transfer PUR related information to the E-UTRAN.

Signalling radio bearer: SRB1 or SRB1bis

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

#### *PURConfigurationRequest-NB message*

```
-- ASN1START

PURConfigurationRequest-NB-r16 ::= SEQUENCE {
 criticalExtensions CHOICE {
 purConfigurationRequest-r16 PURConfigurationRequest-NB-r16-IEs,
 criticalExtensionsFuture SEQUENCE {}
 }
}

PURConfigurationRequest-NB-r16-IEs ::= SEQUENCE {
 pur-ConfigRequest-r16 PUR-ConfigRequest-NB-r16 OPTIONAL,
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

PUR-ConfigRequest-NB-r16 ::= CHOICE {
 pur-ReleaseRequest NULL,
 pur-SetupRequest SEQUENCE {
 requestedNumOccasions-r16 ENUMERATED {one, infinite},
 requestedPeriodicityAndOffset-r16 PUR-PeriodicityAndOffset-NB-r16,
 requestedTBS-r16 ENUMERATED {b328, b376, b424, b472, b504, b552, b584,
 b616, b680, b744, b776, b808, b872, b904,
 b936, b968, b1000, b1032, b1096, b1128,
 b1192, b1224, b1256, b1352, b1384, b1544,
 b1608, b1736, b1800, b2024, b2280, b2536},
 rrc-ACK-r16 ENUMERATED {true} OPTIONAL
 }
}

-- ASN1STOP
```

<b>PURConfigurationRequest-NB field descriptions</b>	
<b>requestedNumOccasions</b>	Indicates the requested number of PUR occasions. Value <i>one</i> corresponds to one occasion and value <i>infinite</i> corresponds to infinite occasions.
<b>requestedPeriodicityAndOffset</b>	Indicates the requested periodicity of the PUR occasions and time offset until the first PUR occasion.
<b>requestedTBS</b>	Indicates the requested TBS. Value <i>b328</i> corresponds to 328 bits, value <i>b376</i> corresponds to 376 bits, and so on.
<b>rrc-ACK</b>	Indicates RRC response message is preferred by the UE for acknowledging the reception of a transmission using PUR.

### — *RRCConnectionReconfiguration-NB*

The *RRCConnectionReconfiguration-NB* message is the command to modify an RRC connection. It may convey information for resource configuration (including RBs, MAC main configuration and physical channel configuration) including any associated dedicated NAS information.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

### ***RRCConnectionReconfiguration-NB message***

```
-- ASN1START

RRCConnectionReconfiguration-NB ::= SEQUENCE {
 rrc-TransactionIdentifier RRC-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {
 rrcConnectionReconfiguration-r13 RRCConnectionReconfiguration-NB-r13-IEs,
 spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
}

RRCConnectionReconfiguration-NB-r13-IEs ::= SEQUENCE {
 dedicatedInfoNASList-r13 SEQUENCE (SIZE(1..maxDRB-NB-r13)) OF
 DedicatedInfoNAS OPTIONAL, -- Need ON
 radioResourceConfigDedicated-r13 RadioResourceConfigDedicated-NB-r13 OPTIONAL, -- Need ON
 fullConfig-r13 ENUMERATED {true} OPTIONAL, -- Cond
 Reestab
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 nonCriticalExtension RRCConnectionReconfiguration-NB-v16f0-IEs OPTIONAL
 }

RRCConnectionReconfiguration-NB-v16f0-IEs ::= SEQUENCE {
 obtainLocationNB-r16 ENUMERATED {setup} OPTIONAL, -- Need OR
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

<b><i>RRCConnectionReconfiguration-NB field descriptions</i></b>	
<b>dedicatedInfoNASList</b>	This field is used to transfer UE specific NAS layer information between the network and the UE. The RRC layer is transparent for each PDU in the list.
<b>fullConfig</b>	Indicates the full configuration option is applicable for the RRC Connection Reconfiguration message.

Conditional presence	Explanation
Reestab	This field is optionally present, need ON upon the first reconfiguration after RRC connection re-establishment; otherwise the field is not present.

### *RRCConnectionReconfigurationComplete-NB*

The *RRCConnectionReconfigurationComplete-NB* message is used to confirm the successful completion of an RRC connection reconfiguration.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

#### ***RRCConnectionReconfigurationComplete-NB message***

```
-- ASN1START

RRCConnectionReconfigurationComplete-NB ::= SEQUENCE {
 rrc-TransactionIdentifier RRC-TransactionIdentifier,
 criticalExtensions CHOICE {

}
```

```

}

RRCConnectionReestablishment-NB-v1430-IEs ::= SEQUENCE {
 dl-NAS-MAC
 BIT STRING (SIZE (16)) OPTIONAL, -- Cond Reestablish-CP
 nonCriticalExtension
 SEQUENCE {} OPTIONAL
}
-- ASN1STOP

```

#### **RRCConnectionReestablishment-NB field descriptions**

##### **dl-NAS-MAC**

Downlink authentication token, see TS 33.401 [32]. If this field is present, the UE shall ignore the field *nextHopChainingCount*.

Conditional presence	Explanation
Reestablish-CP	This field is mandatory present for NB-IoT UE using the Control Plane CloT EPS/5GS optimisation; otherwise the field is not present.

### **RRCConnectionReestablishmentComplete-NB**

The *RRCConnectionReestablishmentComplete-NB* message is used to confirm the successful completion of an RRC connection re-establishment.

Signalling radio bearer: SRB1 or SRB1bis

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

#### **RRCConnectionReestablishmentComplete-NB message**

```

-- ASN1START

RRCConnectionReestablishmentComplete-NB ::= SEQUENCE {

### ***RRCConnectionReestablishmentRequest-NB field descriptions***

#### ***earlyContentionResolution***

Value TRUE indicates UE supports MAC PDU containing the UE contention resolution identity MAC control element without RRC response message. This field is always set to TRUE in this version of the specification.

#### ***reestablishmentCause***

Indicates the failure cause that triggered the re-establishment procedure.  
eNB is not expected to reject a *RRCConnectionReestablishmentRequest* due to unknown cause value being used by the UE.

#### ***truncated5G-S-TMSI***

For description of this field see TS 23.003 [27].

#### ***ue-Identity***

UE identity included to retrieve UE context and to facilitate contention resolution by lower layers.

#### ***ul-NAS-Count***

For description of this field see TS 33.401 [32] for EPC, and TS 33.501 [86] for 5GC.

#### ***ul-NAS-MAC***

For description of this field see TS 33.401 [32] for EPC, and TS 33.501 [86] for 5GC.

## ***RRCConnectionReject-NB***

The *RRCConnectionReject-NB* message is used to reject the RRC connection establishment or RRC connection resume or to reject the EDT procedure.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: E-UTRAN to UE

### ***RRCConnectionReject-NB message***

```

-- ASN1START

RRCConnectionReject-NB ::= SEQUENCE {

```

### RRCConnectionRelease-NB field descriptions

***cbp-Index***

Index to the coverage-based paging configuration. Value 1 corresponds to the first entry in *cbp-ConfigList* and value 2 corresponds to the second entry in *cbp-ConfigList* in *SystemInformationBlockType22-NB*.

***drb-ContinueROHC***

This field indicates whether to continue or reset the header compression protocol context for the DRBs configured with the header compression protocol. Presence of the field indicates that the header compression protocol context continues when UE initiates UP-EDT in the same cell, while absence indicates that the header compression protocol context is reset.

***extendedWaitTime***

Value in seconds.

***extendedWaitTime-CPdata***

Wait time for data transfer using the Control Plane CloT EPS optimisation. Value in seconds. See TS 24.301 [35].

***noLastCellUpdate***

Presence of the field indicates that the last used cell for (G)WUS shall not be updated.

***redirectedCarrierInfo***

The *redirectedCarrierInfo* indicates a carrier frequency (downlink for FDD) and is used to redirect the UE to a NB-IoT carrier frequency, by means of the cell selection upon leaving RRC\_CONNECTED as specified in TS 36.304 [4].

***redirectedCarrierOffsetDedicated***

Parameter "Qoffsetdedicated<sub>frequency</sub>" in TS 36.304 [4]. For NB-IoT carrier frequencies, a UE that supports multi-band cells considers the *redirectedCarrierOffsetDedicated* to be common for all overlapping bands (i.e. regardless of the EARFCN that is used).

***releaseCause***

The *releaseCause* is used to indicate the reason for releasing the RRC Connection.

E-UTRAN should not set the *releaseCause* to *loadBalancingTAURequired* if the *extendedWaitTime* is present and/or if the UE is connected to 5GC.

***resumelDentity***

UE identity to facilitate UE context retrieval at eNB. E-UTRAN configures *resumelDentity-r13* only when the UE is connected to EPC and configures *resumelDentity-r16* only when the UE is connected to 5GC.

***t322***

Timer T322 as described in clause 7.3. Value minN corresponds to N minutes.

Conditional presence	Explanation
NoExtendedWaitTime	The field is optionally present, Need ON, if the <i>extendedWaitTime</i> is not included; otherwise the field is not present.
Redirection	The field is optionally present, Need ON, if <i>redirectedCarrierInfo</i> is included; otherwise the field is not present.
Redirection-TDD	The field is optionally present, Need ON, if <i>redirectedCarrierInfo</i> is included in TDD mode. Otherwise, the field is not present.
UP-EDT	The field is optionally present, Need ON, if the UE supports UP-EDT or UP transmission using PUR and <i>releaseCause</i> is set to <i>rrc-Suspend</i> ; otherwise the field is not present.
EarlySec	For EPC, the field is optionally present, Need ON, if the UE supports early security reactivation or UP-EDT or UP transmission using PUR and <i>releaseCause</i> is set to <i>rrc-Suspend</i> ; otherwise the field is not present. For 5GC, the field is mandatory present if <i>releaseCause</i> is set to <i>rrc-Suspend</i> ; otherwise the field is not present.

### – *RRCConnectionRequest-NB*

The *RRCConnectionRequest-NB* message is used to request the establishment of an RRC connection.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: UE to E-UTRAN

### *RRCConnectionRequest-NB* message

```
-- ASN1START
RRCConnectionRequest-NB ::= SEQUENCE {
 criticalExtensions CHOICE {
 rrcConnectionRequest-r13
 later CHOICE {
 rrcConnectionRequest-r16

}
-- ASN1STOP
```

<b><i>RRCConnectionRequest-NB</i> field descriptions</b>	
<b><i>earlyContentionResolution</i></b>	Value TRUE indicates UE supports MAC PDU containing the UE contention resolution identity MAC control element without RRC response message. This field is always set to TRUE in this version of the specification.
<b><i>establishmentCause</i></b>	Provides the establishment cause for the RRC connection request as provided by the upper layers. eNB is not expected to reject a <i>RRCConnectionRequest</i> due to unknown cause value being used by the UE.
<b><i>multiCarrierSupport</i></b>	If present, this field indicates that the UE supports multi-carrier operation in the mode, FDD or TDD, used for access.
<b><i>multiToneSupport</i></b>	If present, this field indicates that the UE supports UL multi-tone transmissions on NPUSCH in the mode, FDD or TDD, used for access.
<b><i>randomValue</i></b>	Integer value in the range 0 to $2^{48} - 1$ .
<b><i>ue-Identity</i></b>	UE identity included to facilitate contention resolution by lower layers.

### *RRCConnectionResume-NB*

The *RRCConnectionResume-NB* message is used to resume the suspended RRC connection.

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

### *RRCConnectionResume-NB* message

```
-- ASN1START

RRCConnectionResume-NB ::= SEQUENCE {
 rrc-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {

}

RRCConnectionResume-NB-v16f0-IEs ::= SEQUENCE {
 obtainLocationNB-r16 ENUMERATED {setup} OPTIONAL, -- Need OR
 nonCriticalExtension SEQUENCE {}
}

-- ASN1STOP
```

<b><i>RRCConnectionResume-NB</i></b> field descriptions	
<b><i>drb-ContinueROHC</i></b>	This field indicates whether to continue or reset the header compression protocol context for the DRBs configured with the header compression protocol. Presence of the field indicates that the header compression protocol context continues while absence indicates that the header compression protocol context is reset.
<b><i>fullConfig</i></b>	Indicates that the full configuration option is applicable for the <i>RRCConnectionResume-NB</i> message.

Conditional presence	Explanation
5GC	The field is optionally present, Need ON, if the UE is connected to 5GC; otherwise the field is not present.

### – *RRCConnectionResumeComplete-NB*

The *RRCConnectionResumeComplete-NB* message is used to confirm the successful completion of an RRC connection resumption

Signalling radio bearer: SRB1

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

### ***RRCConnectionResumeComplete-NB* message**

```

}

-- ASN1STOP
```

<b><i>RRCConnectionResumeComplete-NB</i></b> field descriptions	
<b><i>anr-InfoAvailable</i></b>	Indicates the availability of ANR measurement information.
<b><i>measResultServCell</i></b>	This field refers to the last idle mode measurement results taken of the serving cell.
<b><i>rlf-InfoAvailable</i></b>	Indicates the availability of radio link failure related information.
<b><i>selectedPLMN-Identity</i></b>	Index of the PLMN selected by the UE from the <i>plmn-IdentityList</i> included in <i>SystemInformationBlockType1-NB</i> . 1 if the 1st PLMN is selected from the <i>plmn-IdentityList</i> included in SIB1-NB, 2 if the 2nd PLMN is selected from the <i>plmn-IdentityList</i> included in SIB1-NB and so on.

### ***RRCConnectionResumeRequest-NB***

The *RRCConnectionResumeRequest-NB* message is used to request the resumption of a suspended RRC connection or to perform UP-EDT.

Signalling radio bearer: SRB0

RLC-SAP: TM

Logical channel: CCCH

Direction: UE to E-UTRAN

### ***RRCConnectionResumeRequest-NB*** message

```

```

<b><i>RRCConnectionSetupComplete-NB</i></b> field descriptions	
<b><i>anr-InfoAvailable</i></b>	This field is used to indicate the availability of ANR measurement information.
<b><i>attachWithoutPDN-Connectivity</i></b>	This field is used to indicate that the UE performs an Attach without PDN connectivity procedure, as indicated by the upper layers, TS 24.301 [35].
<b><i>dcn-ID</i></b>	The Dedicated Core Network Identity, see TS 23.401 [41].
<b><i>guami-Type</i></b>	This field is used to indicate whether the GUAMI included is native (derived from native 5G-GUTI) or mapped (from EPS, derived from EPS GUTI) as specified in TS 24.501 [95].
<b><i>gummei-Type</i></b>	This field is used to indicate that the GUMMEI included is mapped (from 2G/3G identifiers or 5G identifiers) as indicated by the upper layers, TS 24.301 [35] and TS 24.501 [95]. The value <i>mapped</i> indicates the GUMMEI is mapped from 2G/3G identifiers, and <i>mappedFrom5G</i> indicates the GUMMEI is mapped from 5G identifiers. A UE shall not include both <i>gummei-Type-r14</i> and <i>gummei-Type-v1610</i> .
<b><i>measResultServCell</i></b>	This field refers to the last idle mode measurement results taken of the serving cell.
<b><i>ng-U-DataTransfer</i></b>	This field is included when the UE supports NG-U data transfer, as indicated by the upper layers, see TS 24.501 [95].
<b><i>registeredAMF</i></b>	This field is used to transfer the GUAMI of the AMF where the UE is registered, as provided by upper layers, see TS 23.003 [27].
<b><i>registeredMME</i></b>	This field is used to transfer the GUMMEI of the MME where the UE is registered, as provided by upper layers.
<b><i>rlf-InfoAvailable</i></b>	This field is used to indicate the availability of radio link failure related information.
<b><i>selectedPLMN-Identity</i></b>	Index of the PLMN selected by the UE from the <i>plmn-IdentityList</i> included in <i>SystemInformationBlockType1-NB</i> . 1 if the 1st PLMN is selected from the <i>plmn-IdentityList</i> included in SIB1, 2 if the 2nd PLMN is selected from the <i>plmn-IdentityList</i> included in SIB1 and so on.
<b><i>s-NSSAI-List</i></b>	This field is a list of S-NSSAI as indicated by the upper layers. The UE can report up to eight S-NSSAI per NSSAI, see TS 23.003 [27].
<b><i>up-CIoT-5GS-Optimisation</i></b>	This field is included when the UE supports User plane CloT 5GS Optimisation, as indicated by the upper layers, see TS 24.501 [95].
<b><i>up-CIoT-EPS-Optimisation</i></b>	This field is included when the UE supports S1-U data transfer or the User plane CloT EPS Optimisation, as indicated by the upper layers, see TS 24.301 [35].

#### ***RRCEarlyDataRequest-NB field descriptions***

***establishmentCause***

Provides the establishment cause for the RRC early data request as provided by the upper layers.  
eNB is not expected to reject a *RRCEarlyDataRequest* due to unknown cause value being used by the UE.

### ***SCPTMConfiguration-NB***

The *SCPTMConfiguration-NB* message contains the control information applicable for MBMS services transmitted via SC-MRB.

Signalling radio bearer: N/A

RLC-SAP: UM

Logical channel: SC-MCCH

Direction: E-UTRAN to UE

#### ***SCPTMConfiguration-NB message***

```

-- ASN1START

SCPTMConfiguration-NB-r14 ::= SEQUENCE {
 sc-mtch-InfoList-r14 SC-MTCH-InfoList-NB-r14,

 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP

```

#### ***SCPTMConfiguration-NB field descriptions***

***multiTB-Gap***

Indicates the scheduling gap for SC-MTCH using multiple TB scheduling, see TS 36.211 [21] and TS 36.213 [23].  
Value *sf16* corresponds to 16 subframes, *sf32* corresponds to 32 subframes, and so on. If the field is absent, there is no scheduling gap.

***sc-mtch-InfoList***

Provides the configuration of each SC-MTCH not using multiple TB scheduling in the current cell.

***sc-mtch-InfoListMultiTB***

Provides the configuration of each SC-MTCH using multiple TB scheduling in the current cell.  
The total number of signalled SC-MTCH configuration in *sc-mtch-InfoList* and *sc-mtch-InfoListMultiTB* cannot be more than *maxSC-MTCH-NB-r14*.

***scptm-NeighbourCellList***

List of neighbour cells providing MBMS services via SC-MRB. When absent, the UE shall assume that MBMS services listed in the *SCPTMConfiguration-NB* message are not provided via SC-MRB in any neighbour cell.

## – *SystemInformation-NB*

The *SystemInformation-NB* message is used to convey one or more System Information Blocks. All the SIBs included are transmitted with the same periodicity.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: BCCH

Direction: E-UTRAN to UE

### ***SystemInformation-NB message***

## – *SystemInformationBlockType1-NB*

The *SystemInformationBlockType1-NB* message contains information relevant when evaluating if a UE is allowed to access a cell and defines the scheduling of other system information.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: BCCH

Direction: E-UTRAN to UE

<b>SystemInformationBlockType1-NB field descriptions</b>	
<b>attachWithoutPDN-Connectivity</b>	
If present, the field indicates that attach without PDN connectivity as specified in TS 24.301 [35] is supported for this PLMN.	
<b>ce-authorisationOffset</b>	Parameter "Qoffset <sub>authorization</sub> " in TS 36.304 [4]. Value in dB. Value dB5 corresponds to 5 dB, dB10 corresponds to 10 dB and so on. If the field is absent, the value of 0 dB shall be used for "Qoffset <sub>authorization</sub> ".
<b>cellBarred</b>	Barred means the cell is barred for connectivity to EPC, as defined in TS 36.304 [4].
<b>cellBarred-5GC</b>	Barred means the cell is barred for connectivity to 5GC, as defined in TS 36.304 [4].
<b>cellBarred-NTN</b>	Barred means the cell is barred for connectivity to NTN, as defined in TS 36.304 [4]. E-UTRAN always includes <i>cellBarred-NTN</i> and sets <i>cellBarred</i> to 'barred' in an NTN cell.
<b>cellIdentity</b>	Indicates the cell identity. If the field is absent in <i>cellAccessRelatedInfo-5GC</i> , the cell identity indicated by the <i>cellIdentity</i> field included in <i>cellAccessRelatedInfo</i> for EPC is used when connected to 5GC.
<b>cellReservedForOperatorUse</b>	As defined in TS 36.304 [4].
<b>cellSelectionInfo</b>	Cell selection information as specified in TS 36.304 [4].
<b>downlinkBitmap</b>	For FDD, NB-IoT downlink subframe configuration for downlink transmission as specified in TS 36.213 [23], clause 16.4. For TDD, NB-IoT downlink, uplink and special subframes configuration for transmission on the anchor carrier as specified in TS 36.213 [23], clause 16.4. If the bitmap is not present, the UE shall assume that all subframes are valid (except for subframes carrying NPSS/NSSS/NPBCH/SIB1-NB) as specified in TS 36.213 [23], clause 16.4.
<b>eutraControlRegionSize</b>	Indicates the control region size of the E-UTRA cell for the in-band operation mode, see TS 36.213 [23]. Unit is in number of OFDM symbols.
<b>freqBandInfo</b>	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values as defined in TS 36.101 [42], clause 6.2.4F and TS 36.102 [113], clause 6.2B.3 for the NTN capable UE, for the frequency band in <i>freqBandIndicator</i> .
<b>hyperSFN-MSB</b>	Indicates the 8 most significant bits of hyper-SFN. Together with hyperSFN-LSB in MIB-NB, the complete hyper-SFN is built up. hyper-SFN is incremented by one when the SFN wraps around.
<b>intraFreqReselection</b>	Used to control cell reselection to intra-frequency cells when the highest ranked cell is barred, or treated as barred by the UE, as specified in TS 36.304 [4].
<b>multiBandInfoList</b>	A list of additional frequency band indicators, <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [42], table 5.5-1 and TS 36.102 [113], table 5.2-1 for the NTN capable UE. If the UE supports the frequency band in the <i>freqBandIndicator</i> IE it shall apply that frequency band. Otherwise, the UE shall apply the first listed band which it supports in the <i>multiBandInfoList</i> IE.
<b>ng-U-DataTransfer</b>	Indicates whether the NG-U data transfer as specified in TS 24.501 [95] is supported.
<b>nrs-CRS-PowerOffset</b>	NRS power offset between NRS and E-UTRA CRS, see TS 36.213 [23], clause 16.2.2. Unit in dB. Default value of 0.
<b>plmn-IdentityList</b>	List of PLMN identities. The first listed PLMN-Identity is the primary PLMN. If <i>plmn-IdentityList-v1700</i> is included, E-UTRAN includes the same number of entries, and listed in the same order, as in <i>plmn-IdentityList-r13</i> .
<b>plmn-Index</b>	Index of the PLMN in the <i>plmn-IdentityList</i> field included in <i>cellAccessRelatedInfo</i> for EPC, indicating the same PLMN ID is used when connected to 5GC.
<b>powerClass14dBm-Offset</b>	Parameter "Poffset" in TS 36.304 [4]. Only applicable for UE supporting <i>powerClassNB-14dBm</i> . Value in dB. Value dB-6 corresponds to -6 dB, dB-3 corresponds to -3 dB and so on. If the field is absent, the UE applies the (default) value of 0 dB for "Poffset" in TS 36.304 [4].
<b>p-Max</b>	Value applicable for the cell. If absent the UE applies the maximum power according to the UE capability.
<b>q-QualMin</b>	Parameter "Qqualmin" in TS 36.304 [4].
<b>q-RxLevMin, delta-RxLevMin</b>	Parameter Q <sub>rxlevmin</sub> in TS 36.304 [4]. If <i>delta-RxLevMin</i> is not included, actual value Q <sub>rxlevmin</sub> = q-RxLevMin * 2 [dBm]. If <i>delta-RxLevMin</i> is included, actual value Q <sub>rxlevmin</sub> = (q-RxLevMin + <i>delta-RxLevMin</i> ) * 2 [dBm].

<b><i>SystemInformationBlockType1-NB</i> field descriptions</b>	
<b><i>schedulingInfoList</i></b>	Indicates additional scheduling information of SI messages. The <i>schedulingInfoList-v1530</i> (if present) provides additional SIBs mapped into the SI message scheduled via <i>schedulingInfoList-r13</i> . If E-UTRAN includes <i>schedulingInfoList-v1530</i> , it includes the same number of entries, and listed in the same order, as in <i>schedulingInfoList-r13</i> .
<b><i>si-Periodicity</i></b>	Periodicity of the SI-message in radio frames, such that rf256 denotes 256 radio frames, rf512 denotes 512 radio frames, and so on.
<b><i>si-RadioFrameOffset</i></b>	Offset in number of radio frames to calculate the start of the SI window. If the field is absent, no offset is applied.
<b><i>si-RepetitionPattern</i></b>	Indicates the starting radio frames within the SI window used for SI message transmission. Value every2ndRF corresponds to every 2 radio frames, value every4thRF corresponds to every 4 radio frames and so on. The first transmission of the SI message is transmitted from the first radio frame of the SI window.
<b><i>si-TB</i></b>	This field indicates the transport block size in number of bits and the corresponding number of consecutive NB-IoT downlink subframes that are used to broadcast the SI message. Value b56 corresponds to 56 bits, b120 corresponds to 120 bits and so on. TBS of 56 bits and 120 bits are transmitted over 2 sub-frames, other TBS are transmitted over 8 sub-frames, see TS 36.213 [23], Table 16.4.1.5.1-1.
<b><i>si-WindowLength</i></b>	Common SI scheduling window for all SIs. Unit in milliseconds, where ms160 denotes 160 milliseconds, ms320 denotes 320 milliseconds and so on.
<b><i>sib-MappingInfo</i></b>	List of the SIBs mapped to this <i>SystemInformation</i> message. There is no mapping information of SIB2-NB; it is always present in the first <i>SystemInformation</i> message listed in the <i>schedulingInfoList-r13</i> list. If present, <i>sib-MappingInfo-v1530</i> indicates one or more additional SIBs mapped to the concerned SI message listed in the <i>schedulingInfoList-r13</i> list. If <i>schedulingInfoList-v1530</i> is present, E-UTRAN ensures that the total number of entries of this field plus <i>sib-MappingInfo-r13</i> shall not exceed the value of <i>maxSIB-1</i> .
<b><i>systemInfoValueTagList</i></b>	Indicates SI message specific value tags. It includes the same number of entries, and listed in the same order, as in <i>SchedulingInfoList</i> .
<b><i>systemInfoValueTagSI</i></b>	SI message specific value tag as specified in Clause 5.2.1.3. Common for all SIBs within the SI message other than SIB14-NB, SIB31-NB, and SIB33-NB.
<b><i>tdd-Config</i></b>	Indicates the the TDD specific physical channel configuration.
<b><i>tdd-SI-CarrierInfo</i></b>	Carrier used for SI message transmission. Value <i>anchor</i> corresponds to anchor carrier, value <i>non-anchor</i> corresponds to non-anchor carrier. See TS 36.213 [23]. When <i>tdd-SI-CarrierInfo</i> set to value <i>non-anchor</i> then <i>sib-GuardbandInfo</i> in MIB-TDD-NB (in case of <i>operationmodelInfo</i> is set to <i>guardband</i> ) or <i>sib-InbandLocation</i> in MIB-TDD-NB (in case of <i>operationmodelInfo</i> is set to <i>inband-SamePCI</i> or <i>inband-DifferentPCI</i> ) or <i>sib-StandaloneLocation</i> in MIB-TDD-NB (in case of <i>operationmodelInfo</i> is set to <i>standalone</i> ) defines which non-anchor carrier is used (see MIB-NB-TDD).
<b><i>tdd-SI-SubframesBitmap</i></b>	NB-IoT downlink, uplink and special subframes configuration for transmission on the carrier carrying the SI message as specified in TS 36.213 [23], clause 16.4.
<b><i>trackingAreaCode, trackingAreaCode-5GC</i></b>	A <i>trackingAreaCode</i> that is common for all the PLMNs listed in <i>plmn-IdentityList-r13</i> or <i>plmn-IdentityList-r16</i> respectively.
<b><i>trackingAreaList</i></b>	A list of tracking area codes for the PLMN listed. For the first entry in <i>plmn-IdentityList-v1700</i> : If this field is present, the list of tracking area codes include the tracking area code in <i>trackingAreaCode-r13</i> and the tracking area codes in <i>trackingAreaList</i> . If this field is absent, only <i>trackingAreaCode-r13</i> applies. For other entries in <i>plmn-IdentityList-v1700</i> : If this field is present, the list of tracking area codes include the tracking area codes in <i>trackingAreaList</i> . If this field is absent, the list of tracking area codes of the preceding entry in <i>plmn-IdentityList-v1700</i> applies. The total number of signalled tracking area codes across all PLMNs cannot be more than <i>maxTAC-NB-r17</i> .
<b><i>up-CIoT-5GS-Optimisation</i></b>	Indicates whether the UE is allowed to resume the connection with User plane CIoT 5GS Optimisation, see TS24.501 [95].

Conditional presence	Explanation
<i>inband</i>	In FDD: The field is mandatory present if IE <i>operationModelInfo</i> in MIB-NB is set to <i>inband-SamePCI</i> or <i>inband-DifferentPCI</i> . Otherwise the field is not present. In TDD: The field is mandatory present if: - IE <i>operationModelInfo</i> in MIB-TDD-NB is set to <i>inband-SamePCI</i> or <i>inband-DifferentPCI</i> or - IE <i>operationModelInfo</i> in MIB-TDD-NB is set to <i>guardband</i> and IE <i>sib-GuardbandInfo</i> in MIB-TDD-NB is set to <i>sib-GuardbandInbandSamePCI</i> or <i>sib-GuardbandInbandDiffPCI</i> and IE <i>tdd-SI-CarrierInfo</i> is set to non-anchor
<i>inband-SamePCI</i>	The field is mandatory present, if IE <i>operationModelInfo</i> in MIB-NB is set to <i>inband-SamePCI</i> . Otherwise the field is not present.
<i>inband-SamePCI-ExceptAnchor</i>	The field is optionally present if IE <i>operationModelInfo</i> in MIB-NB is set to a value other than <i>inband-SamePCI</i> , and at least one non-anchor carrier is inband carrier and uses the same PCI as the E-UTRA carrier. Otherwise the field is not present.
<i>Qrxlevmin</i>	This field is optionally present, Need OR, if <i>q-RxLevMin</i> is set to the minimum value. Otherwise the field is not present.
<i>SIB1</i>	The field is mandatory present if IE <i>additionalTransmissionSIB1</i> in MIB-NB is set to <i>TRUE</i> . Otherwise the field is optionally present, Need OP.
<i>TDD</i>	The field is mandatory present for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>TDD-SI-NonAnchor</i>	The field is mandatory present for TDD if <i>si-CarrierInfo</i> is set to <i>non-anchor</i> , otherwise the field is not present and the UE shall delete any existing value for this field.

### – *UECapabilityEnquiry-NB*

The *UECapabilityEnquiry-NB* message is used to request the transfer of UE radio access capabilities for NB-IoT.

Signalling radio bearer: SRB1 or SRB1bis

RLC-SAP: AM

Logical channel: DCCH

Direction: E-UTRAN to UE

#### *UECapabilityEnquiry-NB* message

<b><i>UEInformationResponse-NB</i></b> field descriptions	
<b><i>anr-MeasReport</i></b>	Indicates the ANR measurement information.
<b><i>contentionDetected</i></b>	Value TRUE indicates that contention was detected for at least one of the transmitted preambles, see TS 36.321 [6].
<b><i>edt-Fallback</i></b>	Value TRUE indicates that EDT fallback indication was received from the lower layers, see TS 36.321 [6].
<b><i>failedPCellId</i></b>	Indicates the PCell in which RLF is detected.
<b><i>initialNRSRP-Level</i></b>	Indicates the NRSRP level of the NPRACH resource selected for the first preamble transmission.
<b><i>measResultLastServCell</i></b>	Refers to the last measurement results taken in the PCell, where radio link failure happened.
<b><i>numberOfPreamblesSent</i></b>	Indicates the number of RACH preambles that were transmitted. Corresponds to parameter PREAMBLE_TRANSMISSION_COUNTER in TS 36.321 [6].
<b><i>reestablishmentCellId</i></b>	Indicates the cell in which the re-establishment attempt was made after connection failure.
<b><i>timeSinceFailure</i></b>	Indicates the time that elapsed since the connection failure. Value in seconds. The maximum value 172800 means 172800s or longer.

### – ***ULInformationTransfer-NB***

The ***ULInformationTransfer-NB*** message is used for the uplink transfer of NAS information.

Signalling radio bearer: SRB1 or SRB1bis

RLC-SAP: AM

Logical channel: DCCH

Direction: UE to E-UTRAN

<b><i>SystemInformationBlockType2-NB</i> field descriptions</b>	
<b><i>additionalSpectrumEmission</i></b>	
The UE requirements related to IE <i>AdditionalSpectrumEmission</i> are defined in TS 36.101 [42], clause 6.2.4F and TS 36.102 [113], clause 6.2B.3 for NTN capable UE.	
<b><i>cp-EDT</i></b>	
For FDD: This field indicates whether the UE is allowed to initiate CP-EDT when connected to EPC, see 5.3.3.1b.	
<b><i>cp-EDT-5GC</i></b>	
For FDD: This field indicates whether the UE is allowed to initiate CP-EDT when connected to 5GC, see 5.3.3.1b.	
<b><i>cp-PUR-5GC</i></b>	
For FDD: Indicates whether CP transmission using PUR is allowed in the cell when connected to 5GC, see 5.3.3.1c.	
<b><i>cp-PUR-EPC</i></b>	
For FDD: Indicates whether CP transmission using PUR is allowed in the cell when connected to EPC, see 5.3.3.1c.	
<b><i>cp-Reestablishment</i></b>	
This field indicates if the NB-IoT UE is allowed to trigger RRC connection re-establishment when AS security has not been activated.	
<b><i>cqi-Reporting</i></b>	
For FDD: This field indicates if downlink channel quality reporting in <i>RRCConnectionReestablishmentRequest-NB</i> , <i>RRCConnectionRequest-NB</i> and <i>RRCConnectionResumeRequest-NB</i> message is allowed.	
<b><i>earlySecurityReactivation</i></b>	
Indicates that early security reactivation when resuming a suspended RRC connection as specified in 5.3.3.18 is supported.	
<b><i>enhancedPHR</i></b>	
For FDD: This field indicates if the NB-IoT UE is allowed to report enhanced PHR in MSG3 as specified in TS 36.321 [6].	
<b><i>gnss-PositionFixDurationReporting</i></b>	
If present, this field indicates that UEs capable of performing GNSS position fix in RRC_CONNECTED are configured to include the time duration required to acquire a GNSS position in <i>RRCConnectionSetupComplete-NB</i> , <i>RRCConnectionResumeComplete-NB</i> , and <i>RRCConnectionReestablishmentComplete-NB</i> .	
<b><i>multiBandInfoList</i></b>	
A list of <i>additionalSpectrumEmission</i> i.e. one for each additional frequency band included in <i>multiBandInfoList</i> in <i>SystemInformationBlockType1-NB</i> , listed in the same order.	
<b><i>rai-ActivationEnh</i></b>	
Indicates whether the UE is allowed to report the AS Release Assistance Indication using the DCQR and AS RAI MAC CE as specified in TS 36.321 [6] when connected to EPC.	
<b><i>servingCellMeasInfo</i></b>	
This field indicates if serving cell idle mode measurement reporting in <i>RRCConnectionReestablishmentComplete-NB</i> , <i>RRCConnectionResumeComplete-NB</i> and <i>RRCConnectionSetupComplete-NB</i> is allowed.	
<b><i>tdd-UL-DL-AlignmentOffset</i></b>	
Indicates the offset between the UL carrier frequency center with respect to DL carrier frequency center for the anchor carrier.	
<b><i>ul-CarrierFreq</i></b>	
For FDD: Uplink carrier frequency as defined in TS 36.101 [42], clause 5.7.3F and TS 36.102 [113], clause 5.4B.2. If <i>operationModelInfo</i> in the MIB-NB is set to <i>standalone</i> and the field is absent, the value of the carrier frequency is determined by the TX-RX frequency separation defined in TS 36.101 [42], table 5.7.4-1, and the value of the carrier frequency offset is 0. If <i>operationModelInfo</i> in the MIB-NB is not set to <i>standalone</i> , the field is mandatory present. For TDD: This field is absent and the uplink carrier frequency is same as the downlink frequency.	
<b><i>up-EDT</i></b>	
For FDD: This field indicates whether the UE is allowed to initiate UP-EDT when connected to EPC, see 5.3.3.1b.	
<b><i>up-EDT-5GC</i></b>	
For FDD: This field indicates whether the UE is allowed to initiate UP-EDT when connected to 5GC, see 5.3.3.1b.	
<b><i>up-PUR-5GC</i></b>	
For FDD: Indicates whether UP transmission using PUR is allowed in the cell when connected to 5GC, see 5.3.3.1c.	
<b><i>up-PUR-EPC</i></b>	
For FDD: Indicates whether UP transmission using PUR is allowed in the cell when connected to EPC, see 5.3.3.1c.	

<b>Conditional presence</b>	<b>Explanation</b>
TDD	The field is mandatory present for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.

### – *SystemInformationBlockType3-NB*

The IE *SystemInformationBlockType3-NB* contains cell re-selection information common for intra-frequency, and inter-frequency cell re-selection as well as intra-frequency cell re-selection information other than neighbouring cell related.

<b><i>SystemInformationBlockType3-NB</i></b> field descriptions	
<b><i>ce-AuthorisationOffset</i></b>	Parameter "Qoffset <sub>authorization</sub> " in TS 36.304 [4]. Value in dB. Value dB5 corresponds to 5 dB, dB10 corresponds to 10 dB and so on. If the field is absent, the UE applies the value of <i>ce-authorisationOffset</i> in <i>SystemInformationBlockType1-NB</i> .
<b><i>multiBandInfoList</i></b>	A list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values as defined in TS 36.101 [42], clause 6.2.4F and TS 36.102 [113], clause 6.2B.3 for NTN capable UE, applicable for the intra-frequency neighbouring NB-IoT cells if the UE selects the frequency band from <i>freqBandIndicator</i> in <i>SystemInformationBlockType1-NB</i> .
<b><i>npbch-RRM-Config</i></b>	For FDD: Configuration for NPBCH-based RRM measurements. See TS 36.214 [24]. If enabled, NPBCH can be used in addition to NRS for RRM measurements for serving cell.
<b><i>nsss-RRM-Config</i></b>	For FDD: Configuration for NSSS-based RRM measurements for the serving cell.
<b><i>powerClass14dBm-Offset</i></b>	Parameter "Poffset" in TS 36.304 [4], only applicable for UE supporting <i>powerClassNB-14dBm</i> . Value in dB. Value dB-6 corresponds to -6 dB, dB-3 corresponds to -3 dB and so on. If the field is absent, the UE applies the (default) value of 0 dB for "Poffset" in TS 36.304 [4].
<b><i>p-Max</i></b>	Value applicable for the intra-frequency neighbouring E-UTRA cells. If absent the UE applies the maximum power according to the UE capability.
<b><i>q-Hyst</i></b>	Parameter <i>Q<sub>hyst</sub></i> in TS 36.304 [4], Value in dB. Value dB1 corresponds to 1 dB, dB2 corresponds to 2 dB and so on.
<b><i>q-QualMin</i></b>	Parameter " <i>Q<sub>qualmin</sub></i> " in TS 36.304 [4], applicable for intra-frequency neighbour cells. If the field is not present, the UE applies the (default) value of negative infinity for <i>Q<sub>qualmin</sub></i> .
<b><i>q-RxLevMin, delta-RxLevMin</i></b>	Parameter " <i>Q<sub>rxlevmin</sub></i> " in TS 36.304 [4], applicable for intra-frequency neighbour cells. If <i>delta-RxLevMin</i> is not included, actual value <i>Q<sub>rxlevmin</sub></i> = <i>q-RxLevMin</i> * 2 [dBm]. If <i>delta-RxLevMin</i> is included, actual value <i>Q<sub>rxlevmin</sub></i> = ( <i>q-RxLevMin</i> + <i>delta-RxLevMin</i> ) * 2 [dBm].
<b><i>s-IntraSearchP</i></b>	Parameter " <i>S<sub>intraSearchP</sub></i> " in TS 36.304 [4]. In case <i>s-IntraSearchP-v1360</i> is included, the UE shall ignore <i>s-IntraSearchP</i> (i.e. without suffix).
<b><i>s-MeasureDeltaP</i></b>	Threshold of change in serving cell NRSRP to trigger neighbour cell measurement in RRC_CONNECTED state.
<b><i>s-MeasureInter</i></b>	NRSRP threshold to trigger inter-frequency neighbour cell measurement in RRC_CONNECTED state. If the field is absent in <i>connMeasConfig</i> , the UE applies the value of <i>s-MeasureIntra</i> .
<b><i>s-MeasureIntra</i></b>	NRSRP threshold to trigger intra-frequency neighbour cell measurement in RRC_CONNECTED state.
<b><i>s-NonIntraSearch</i></b>	Parameter " <i>S<sub>nonIntraSearchP</sub></i> " in TS 36.304 [4].
<b><i>s-SearchDeltaP</i></b>	Parameter " <i>S<sub>searchDeltaP</sub></i> " in TS 36.304 [4]. This parameter is only applicable for UEs supporting relaxed monitoring as specified in TS 36.306 [5]. Value dB6 corresponds to 6 dB, dB9 corresponds to 9 dB and so on.
<b><i>satelliteAssistanceInfo</i></b>	List of satellite ID(s), used to associate with the satellite assistance information for intra-frequency neighbour cell measurements.
<b><i>t-MeasureDeltaP</i></b>	Duration after which the UE is not required to perform neighbour cell measurement in RRC_CONNECTED when <i>s-MeasureDeltaP</i> criterion is fulfilled.
<b><i>t-Reselection</i></b>	Parameter " <i>T<sub>reselectionNB-IoT_Intra</sub></i> " in TS 36.304 [4].
<b><i>t-Service</i></b>	Time information on when a NTN quasi-Earth fixed cell is going to stop serving the area it is currently covering.

Conditional presence	Explanation
<i>Qrxlevmin</i>	This field is optionally present, Need OR, if <i>q-RxLevMin</i> is set to the minimum value. Otherwise the field is not present.

## – *SystemInformationBlockType4-NB*

The IE *SystemInformationBlockType4-NB* contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters.

### ***SystemInformationBlockType4-NB* information element**

```
-- ASN1START

SystemInformationBlockType4-NB-r13 ::= SEQUENCE {
 intraFreqNeighCellList-r13 IntraFreqNeighCellList OPTIONAL, -- Need OR

}

-- ASN1STOP
```

### ***SystemInformationBlockType4-NB* field descriptions**

#### ***intraFreqExcludedCellList***

List of exclude-listed intra-frequency neighbouring cells.

#### ***intraFreqNeighCellList***

List of intra-frequency neighbouring cells with specific cell re-selection parameters.

#### ***nsss-RRM-Config***

For FDD: Configuration for NSSS-based RRM measurements.

If *intraFreqNeighCellList-NB-v1530* is present then for a cell which is included in *intraFreqNeighCellList*, the UE applies the *nsss-RRM-Config* configured in the corresponding entry of *IntraFreqNeighCellList-NB-v1530*. Otherwise, the UE applies the *nsss-RRM-Config* configured in *SystemInformationBlockType4-NB-r13*.

Conditional presence	Explanation
NSSS-RRM	This field is optionally present, Need OR, when <i>nsss-RRM-Config</i> is present in <i>SystemInformationBlockType4-NB</i> . Otherwise, the field is not present, and the UE shall delete any existing value for this field.

## – *SystemInformationBlockType5-NB*

The IE *SystemInformationBlockType5-NB* contains information relevant only for inter-frequency cell re-selection i.e. information about other NB-IoT frequencies and inter-frequency neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

-- ASN1STOP

```

<b><i>SystemInformationBlockType5-NB</i> field descriptions</b>	
<b><i>ce-AuthorisationOffset</i></b>	Parameter "Qoffset <sub>authorization</sub> " in TS 36.304 [4]. Value in dB. Value dB5 corresponds to 5 dB, dB10 corresponds to 10 dB and so on. If the field is absent, the UE applies the value of <i>ce-authorisationOffset</i> in <i>SystemInformationBlockType1-NB</i> .
<b><i>interFreqExcludedCellList</i></b>	List of exclude-listed inter-frequency neighbouring cells.
<b><i>interFreqCarrierFreqList</i></b>	List of neighbouring inter-frequencies. E-UTRAN does not configure more than one entry for the same physical frequency regardless of the E-ARFCN used to indicate this.
<b><i>interFreqNeighCellList</i></b>	List of inter-frequency neighbouring cells. E-UTRAN may include <i>interFreqNeighCellList</i> when including <i>InterFreqNeighCellList-NB-v1530</i> to provide cell specific NSSS-based measurement configuration. The UE that does not support NSSS-based RRM measurements shall ignore this field in this version of the specification.
<b><i>multiBandInfoList</i></b>	Indicates the list of frequency bands, with the associated <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values as defined in TS 36.101 [42], clause 6.2.4, in addition to the band represented by dl-CarrierFreq for which cell reselection parameters are common.
<b><i>nsss-RRM-Config</i></b>	For FDD: Configuration for NSSS-based RRM measurements. If <i>InterFreqNeighCellList-NB-v1530</i> is present then for a cell which is included in <i>interFreqNeighCellList</i> , the UE applies the <i>nsss-RRM-Config</i> configured in the corresponding entry of <i>InterFreqNeighCellList-NB-v1530</i> . Otherwise, the UE applies the <i>nsss-RRM-Config</i> configured in <i>InterFreqCarrierFreqInfo</i> .
<b><i>p-Max</i></b>	Value applicable for the neighbouring NB-IoT cells on this carrier frequency. If absent the UE applies the maximum power according to the UE capability.
<b><i>powerClass14dBm-Offset</i></b>	Parameter "Poffset" in TS 36.304 [4], only applicable for UE supporting <i>powerClassNB-14dBm</i> . Value in dB. Value dB-6 corresponds to -6 dB, dB-3 corresponds to -3 dB and so on. If the field is absent, the UE applies the (default) value of 0 dB for "Poffset" in TS 36.304 [4]
<b><i>q-OffsetFreq</i></b>	Parameter "Qoffset <sub>frequency</sub> " in TS 36.304 [4].
<b><i>q-QualMin</i></b>	Parameter "Qqualmin" in TS 36.304 [4]. If the field is not present, the UE applies the (default) value of negative infinity for Q <sub>qualmin</sub> .
<b><i>q-RxlevMin, delta-RxLevMin</i></b>	Parameter "Qrxlevmin" in TS 36.304 [4]. If <i>delta-RxLevMin</i> is not included, actual value Q <sub>rxlevmin</sub> = <i>q-RxLevMin</i> * 2 [dBm]. If <i>delta-RxLevMin</i> is included, actual value Q <sub>rxlevmin</sub> = ( <i>q-RxLevMin</i> + <i>delta-RxLevMin</i> ) * 2 [dBm].
<b><i>satelliteAssistanceInfo</i></b>	List of satellite ID(s), used to associate with the satellite assistance information for neighbour cell measurements on this frequency. If the field is not present for a frequency and <i>SystemInformationBlockType33-NB</i> is broadcast, the UE considers the cells on the frequency to be terrestrial cells.
<b><i>scptm-FreqOffset</i></b>	Parameter Qoffset <sub>SCPTM</sub> in TS 36.304 [4]. Actual value Qoffset <sub>SCPTM</sub> = field value * 2 [dB]. If the field is absent, the UE uses infinite dBs for the SC-PTM frequency offset with cell ranking as specified in TS 36.304 [4].
<b><i>t-Reselection</i></b>	Parameter "TreselectionNB-IoT_Inter" in TS 36.304 [4].

Conditional presence	Explanation
NSSS-RRM	This field is optionally present, Need OR, when <i>nsss-RRM-Config</i> is present in <i>InterFreqCarrierFreqInfo</i> . Otherwise, the field is not present, and the UE shall delete any existing value for this field.
Qrxlevmin	This field is optionally present, Need OR, if <i>q-RxLevMin</i> is set to the minimum value. Otherwise the field is not present.
TDD	The field is optionally present, Need OR, in TDD. Otherwise, the field is not present.

## – *SystemInformationBlockType14-NB*

The IE *SystemInformationBlockType14-NB* contains the AB parameters for EPC and 5GC.

#### SystemInformationBlockType14-NB field descriptions

***ab-BarringBitmap***

Access class barring for AC 0-9. The first/ leftmost bit is for AC 0, the second bit is for AC 1, and so on.

***ab-BarringForExceptionData***

Indicates whether ExceptionData is subject to access barring.

***ab-BarringForSpecialAC***

Access class barring for AC 11-15. The first/ leftmost bit is for AC 11, the second bit is for AC 12, and so on.

***ab-Category***

Indicates the category of UEs for which AB applies. Value *a* corresponds to all UEs, value *b* corresponds to the UEs that are neither in their HPLMN nor in a PLMN that is equivalent to it, and value *c* corresponds to the UEs that are neither in the PLMN listed as most preferred PLMN of the country where the UEs are roaming in the operator-defined PLMN selector list on the USIM, nor in their HPLMN nor in a PLMN that is equivalent to their HPLMN, see TS 22.011 [10].

***ab-Common***

The AB parameters applicable for all PLMN(s).

***ab-Param***

The AB parameters for connectivity to EPC

***ab-PerNRSRP***

Access barring per NRSRP. Value *thresh1* corresponds to the first entry configured in *rsrp-ThresholdsPrachInfoList*, value *thresh2* corresponds to the second entry configured in *rsrp-ThresholdsPrachInfoList*.

***ab-PerPLMN-List***

The AB parameters per PLMN, listed in the same order as the PLMN(s) occur in *plmn-IdentityList* in *SystemInformationBlockType1-NB*.

<b><i>SystemInformationBlockType14-NB</i></b> field descriptions	
<b><i>ab-BarringBitmap</i></b>	Access class barring for AC 0-9. The first/ leftmost bit is for AC 0, the second bit is for AC 1, and so on.
<b><i>ab-BarringForExceptionData</i></b>	Indicates whether ExceptionData is subject to access barring.
<b><i>ab-BarringForSpecialAC</i></b>	Access class barring for AC 11-15. The first/ leftmost bit is for AC 11, the second bit is for AC 12, and so on.
<b><i>uac-AC1-SelectAssistInfo</i></b>	Information used to determine whether Access Category 1 applies to the UE, as defined in TS 22.261 [96]. The field is forwarded to upper layers, if present.
<b><i>uac-accessCategory</i></b>	The Access Category according to TS 22.261 [96].
<b><i>uac-BarringCommon</i></b>	The UAC parameters applicable for all PLMN(s).
<b><i>uac-BarringFactor</i></b>	Represents the probability that access attempt would be allowed during access barring check.
<b><i>uac-BarringForAccessIdentity</i></b>	Indicates whether access attempt is allowed for each Access Identity. The leftmost bit, bit 0 in the bit string corresponds to Access Identity 1, bit 1 in the bit string corresponds to Access Identity 2, bit 2 in the bit string corresponds to Access Identity 11, bit 3 in the bit string corresponds to Access Identity 12, and so on. Value 0 means that access attempt is allowed for the corresponding access identity.
<b><i>uac-BarringPerCatList</i></b>	Access control parameters for each access category for the specific PLMN.
<b><i>uac-BarringPerPLMN-List</i></b>	The UAC parameters per PLMN, listed in the same order as the PLMN(s) occur in <i>plmn-IdentityList</i> in <i>SystemInformationBlockType1-NB</i> .
<b><i>uac-BarringTime</i></b>	The average time in seconds before a new access attempt is to be performed after an access attempt was barred at access barring check for the same access category, see 5.3.16.5.
<b><i>uac-Param</i></b>	The UAC parameters for connectivity to 5GC.

## — ***SystemInformationBlockType15-NB***

The IE *SystemInformationBlockType15-NB* contains the MBMS Service Area Identities (SAI) of the current and/ or neighbouring carrier frequencies.

### ***SystemInformationBlockType15-NB*** information element

```
-- ASN1START

SystemInformationBlockType15-NB-r14 ::= SEQUENCE {
 mbms-SAI-IntraFreq-r14 MBMS-SAI-List-r11 OPTIONAL, -- Need OR
 mbms-SAI-InterFreqList-r14 MBMS-SAI-InterFreqList-NB-r14 OPTIONAL, -- Need OR
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 ...
}

MBMS-SAI-InterFreqList-NB-r14 ::= SEQUENCE (SIZE (1..maxFreq)) OF MBMS-SAI-InterFreq-NB-r14

MBMS-SAI-InterFreq-NB-r14 ::= SEQUENCE {
 dl-CarrierFreq-r14 CarrierFreq-NB-r13,
 mbms-SAI-List-r14 MBMS-SAI-List-r11,
 multiBandInfoList-r14 AdditionalBandInfoList-NB-r14 OPTIONAL -- Need OR
}

-- ASN1STOP
```

<b><i>SystemInformationBlockType15-NB</i></b> field descriptions	
<b><i>mbms-SAI-InterFreqList</i></b>	Contains a list of neighboring frequencies including additional frequency bands, if any, that provide MBMS services and the corresponding MBMS SAIs.
<b><i>mbms-SAI-IntraFreq</i></b>	Contains the list of MBMS SAIs for the current frequency. A duplicate MBMS SAI indicates that this and all following SAIs are not offered by this cell but only by neighbour cells on the current frequency. For MBMS service continuity, the UE shall use all MBMS SAIs listed in <i>mbms-SAI-IntraFreq</i> to derive the MBMS frequencies of interest.
<b><i>mbms-SAI-List</i></b>	Contains a list of MBMS SAIs for a specific frequency.
<b><i>multiBandInfoList</i></b>	A list of additional frequency bands applicable for the cells participating in the SC-PTM transmission.

### – ***SystemInformationBlockType16-NB***

The IE *SystemInformationBlockType16-NB* contains information related to GPS time and Coordinated Universal Time (UTC). The UE may use the parameters provided in this system information block to obtain the UTC, the GPS and the local time.

```
-- ASN1START
SystemInformationBlockType16-NB-r13 ::= SystemInformationBlockType16-r11
-- ASN1STOP
```

### – ***SystemInformationBlockType20-NB***

For FDD, the IE *SystemInformationBlockType20-NB* contains the information required to acquire the control information associated with transmission of MBMS using SC-PTM.

### *SystemInformationBlockType20-NB* field descriptions

***dl-CarrierConfig***

Downlink carrier used for SC-MCCH. E-UTRAN cannot configure a downlink carrier operating in mixed operation mode.

***dl-CarrierIndex***

Index to a downlink carrier signalled in system information. Value '0' corresponds to the anchor carrier, value '1' corresponds to the first entry in *dl-ConfigList* in *SystemInformationBlockType22-NB*, value '2' corresponds to the second entry in *dl-ConfigList* and so on.

***drx-InactivityTimerSCPTM***

Timer for SC-MCCH reception in TS 36.321 [6]. Value in number of NPDCCH periods. Value pp1 corresponds to 1 NPDCCH period, pp2 corresponds to 2 NPDCCH periods and so on.

***npdcch-NumRepetitions-SC-MCCH***

The maximum number of NPDCCH repetitions the UE needs to monitor for SC-MCCH multicast search space, see TS 36.213 [23].

***npdcch-Offset-SC-MCCH***

Fractional period offset of starting subframe for NPDCCH multicast search space for SC-MCCH, see TS 36.213 [23].

***npdcch-StartSF-SC-MCCH***

Starting subframes configuration of the NPDCCH multicast search space for SC-MCCH, see TS 36.213 [23].

***onDurationTimerSCPTM***

Timer for SC-MCCH reception in TS 36.321 [6]. Value in number of NPDCCH periods. Value pp1 corresponds to 1 NPDCCH period, pp2 corresponds to 2 NPDCCH periods and so on.

***schedulingPeriodStartOffsetSCPTM***

*SCPTM-SchedulingCycle* and *SCPTM-SchedulingOffset* in TS 36.321 [6]. The value of *SCPTM-SchedulingCycle* is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. The value of *SCPTM-SchedulingOffset* is in number of sub-frames.

***sc-mcch-CarrierConfig***

Downlink carrier that is used for SC-MCCH.

***sc-mcch-ModificationPeriod***

Defines periodically appearing boundaries, i.e. radio frames for which  $(\text{H-SFN} * 1024 + \text{SFN}) \bmod \text{sc-mcch-ModificationPeriod} = 0$ . The contents of different transmissions of SC-MCCH information can only be different if there is at least one such boundary in-between them. Value rf32 corresponds to 32 radio frames, value rf128 corresponds to 128 radio frames and so on.

***sc-mcch-Offset***

Indicates, together with the sc-mcch-RepetitionPeriod, the boundary of the repetition period:  $(\text{H-SFN} * 1024 + \text{SFN}) \bmod \text{sc-mcch-RepetitionPeriod} = \text{sc-mcch-Offset}$ .

***sc-mcch-RepetitionPeriod***

Defines the interval between transmissions of SC-MCCH information, in radio frames. Value rf32 corresponds to 32 radio frames, rf128 corresponds to 128 radio frames and so on.

***sc-mcch-SchedulingInfo***

DRX information for the SC-MCCH. If the field is absent, DRX is not used for SC-MCCH reception.

## – *SystemInformationBlockType22-NB*

The IE *SystemInformationBlockType22-NB* contains radio resource configuration for paging and random access procedure on non-anchor carriers.

```

<b><i>SystemInformationBlockType22-NB</i></b> field descriptions	
<b><i>cbp-ConfigList</i></b>	List of coverage-based paging configurations.
<b><i>cbp-HystTimer</i></b>	The minimum duration, in milliseconds, a UE configured with coverage-based paging uses the same carrier for paging, see TS 36.304 [4]. Value <i>ms2560</i> corresponds to 2560ms, value <i>ms7680</i> corresponds to 7680ms, and so on.
<b><i>cbp-Index</i></b>	Index to the coverage-based paging configuration associated with the downlink carrier. Value 1 corresponds to the first entry in <i>cbp-ConfigList</i> , and value 2 corresponds to the second entry in the <i>cbp-ConfigList</i> .
<b><i>dl-CarrierConfig</i></b>	For FDD: Provides the configuration of the DL non-anchor carrier. For TDD: Provides the configuration of the non-anchor carrier.
<b><i>dl-ConfigList</i>, <i>dl-ConfigListMixed</i></b>	For FDD: List of DL non-anchor carriers and associated configuration that can be used for paging and/or random access. E-UTRAN configures DL non-anchor carriers operating in mixed operation mode only in <i>dl-ConfigListMixed</i> and only a UE that supports mixed operation mode uses the carriers in <i>dl-ConfigListMixed</i> . A given carrier is either signalled in the <i>dl-ConfigList</i> or in <i>dl-ConfigListMixed</i> . If <i>dl-ConfigListMixed</i> is present and at least one of the carriers in <i>dl-ConfigListMixed</i> is configured for paging: <ul style="list-style-type: none"> <li>- If <i>pagingDistribution</i> is present, the UE supporting mixed operation mode creates a combined list of DL carriers for paging by appending <i>dl-ConfigListMixed</i> to the <i>dl-ConfigList</i> while maintaining the order among <i>dl-ConfigList</i> and <i>dl-ConfigListMixed</i>; the total number of signalled DL non-anchor carriers cannot be more than <i>maxNonAnchorCarriers-NB-r14</i>.</li> <li>- If <i>pagingDistribution</i> is absent, the UE supporting mixed operation mode uses the list of DL carriers for paging provided in <i>dl-ConfigListMixed</i> and considers <i>pagingWeightAnchor</i> being set to w0, i.e. the anchor carrier is not used.</li> </ul> Otherwise, the <i>pagingDistribution</i> field is not applicable and the UE shall ignore the value.
	For TDD: List of non-anchor carriers and associated configuration that can be used for paging and/or random access.
<b><i>gwus-Config</i></b>	For FDD: Carrier specific GWUS Configuration. If both <i>gwus-Config</i> and <i>wus-Config</i> are present for the carrier, E-UTRAN configures the same value for both fields.
<b><i>mixedOperationModeConfig</i></b>	For FDD: Provides the configuration of DL and UL non-anchor carriers that can be used for paging and random access by a UE that supports mixed operation mode. For TDD: This parameter is absent.
<b><i>nB</i></b>	Parameter: nB is used as one of parameters to derive the Paging Frame and Paging Occasion according to TS 36.304 [4]. Value in multiples of 'T' as defined in TS 36.304 [4]. A value of fourT corresponds to 4 * T, a value of twoT corresponds to 2 * T and so on. If the field is absent, the value of <i>nB</i> configured in <i>SystemInformationBlockType2-NB</i> in IE <i>pcch-Config</i> applies.
<b><i>npdch-NumRepetitionPaging</i></b>	Maximum number of repetitions for NPDCCH common search space (CSS) for paging, see TS 36.213 [23], clause 16.6. If the field is absent, the value of <i>npdch-NumRepetitionPaging</i> configured in <i>SystemInformationBlockType2-NB</i> in IE <i>pcch-Config</i> applies.
<b><i>nprach-Distribution</i></b>	Indicates which UL carriers a UE supporting mixed operation mode uses for random access as defined in description of <i>ul-ConfigList</i> , <i>ul-ConfigListMixed</i> .
<b><i>nprach-ParametersList</i>, <i>nprach-ParametersList-EDT</i></b>	Configure NPRACH parameters for each NPRACH resource on one non-anchor UL carrier. Up to three NPRACH resources can be configured on one non-anchor UL carrier. Each NPRACH resource is associated with a different number of NPRACH repetitions. NPRACH resources in <i>nprach-ParametersListEDT</i> are used to initiate EDT. Each NPRACH resource is associated with a maximum TBS signalled in the corresponding entry of <i>edt-TBS-InfoList</i> in <i>SystemInformationBlockType2-NB</i> . E-UTRAN includes the same number of entries, and listed in the same order, as in <i>nprach-ParametersList</i> in <i>SystemInformationBlockType2-NB</i> .
<b><i>nprach-ParametersListTDD</i></b>	For TDD: Configure NPRACH parameters for each NPRACH resource on one non-anchor UL carrier. Up to three NPRACH resources can be configured on one non-anchor UL carrier. Each NPRACH resource is associated with a different number of NPRACH repetitions. E-UTRAN includes the same number of entries in <i>nprach-ParametersListTDD</i> , and listed in the same order, as in <i>nprach-ParametersListTDD</i> in <i>SystemInformationBlockType2-NB</i> .

***nprach-ProbabilityAnchor***

Configure the selection probability for the anchor carrier NPRACH resource, see TS 36.321 [6]. Value zero corresponds to a probability of 0, oneSixteenth corresponds to the probability of 1/16, oneFifteenth corresponds to the probability of 1/15, and so on.

If the field is absent, the selection probability of the anchor carrier NPRACH resource is 1.

All non-anchor carriers NPRACH resources have equal probability between them.

If there is no NPRACH resource defined on the anchor carrier for one repetition level in *nprach-ParametersList-EDT*, (respectively *nprach-ParametersListFmt2*, *nprach-ParametersListFmt2-EDT*), the UE shall use the value 'zero' and ignore the signalled value of *nprach-ProbabilityAnchor* for this repetition level for the NPRACH resources defined by *nprach-ParametersList-EDT* (respectively *nprach-ParametersListFmt2*, *nprach-ParametersListFmt2-EDT*).

***nprach-ProbabilityAnchorList***

Configures the selection probability for each NPRACH resource on the anchor carrier.

E-UTRAN includes the same number of entries, and listed in the same order, as in *nprach-ParametersList* in *SystemInformationBlockType2-NB*.

***nrsrpMin***

The minimum serving cell NRSRP applicable to the coverage-based paging carrier configuration, see TS 36.304 [4].

***pagingDistribution***

Indicates which DL carriers a UE supporting mixed operation mode monitors for paging as defined in description of *dl-ConfigList*, *dl-ConfigListMixed*.

***pagingWeight***

Weight of the non-anchor paging carrier for uneven paging load distribution across the carriers. Value w1 corresponds to a relative weight of 1, w2 corresponds to a relative weight of 2, and so on.

The paging load for a carrier 'i' is equal to  $w(i)/W$  where i is equal to 0 for the anchor carrier and equal to the index of the carrier in the *dl-ConfigList* / *dl-ConfigListMixed* for a non-anchor carrier, W is the sum of the weights of all paging carriers.

To avoid correlation between paging carrier and paging occasion, the weights should be assigned such that:  $nB * W \leq 16384$ .

***pagingWeightAnchor***

Weight of the anchor carrier for uneven paging load distribution across the carriers. Value w1 corresponds to a relative weight of 1, w2 corresponds to a relative weight of 2, and so on.

If the field is absent, the (default) value of w0 is applied, i.e. the anchor carrier is not used for paging.

***pcch-Config***

Configure the PCCH parameters for the non-anchor DL carrier.

***rsrp-ThresholdsPrachInfoList***

The criterion for UE to select an NPRACH resource on the non-anchor carrier. The threshold values are related to the anchor carrier NRSRP measurement. See TS 36.321 [6]. E-UTRAN includes the same number of entries, and listed in the same order, as in *rsrp-ThresholdsPrachInfoList* in *SystemInformationBlockType2-NB*.

A UE that supports powerClassNB-14dBm-r14 shall correct the RSRP threshold values before applying them as follows:

RSRP threshold = Signalled RSRP threshold - min{0, (14-min(23, P-Max))} where P-Max is the value of *p-Max* field in *SystemInformationBlockType1-NB*.

***tdd-UL-DL-AlignmentOffset***

Indicates the offset between the UL carrier frequency center with respect to DL carrier frequency center for the non-anchor carrier.

***ue-SpecificDRX-CycleMin***

Minimum UE specific DRX cycle for the coverage-based paging configuration, see TS 36.304 [4]. Value *rf32* corresponds to 32 radio frames, *rf64* corresponds to 64 radio frames and so on.

If present, E-UTRAN ensures PCCH configuration does not lead to CSS overlap for *ue-SpecificDRX-CycleMin*.

***ul-CarrierFreq***

For FDD: UL carrier frequency of the non-anchor carrier as defined in TS 36.101 [42], clause 5.7.3F and TS 36.108 [114], clause 5.4B.2.

For TDD: This field is absent and the uplink carrier frequency is same as the downlink frequency.

***ul-ConfigList, ul-ConfigListMixed***

For FDD: List of UL non-anchor carriers and associated configuration that can be used for random access. E-UTRAN configures UL non-anchor carriers operating in mixed operation mode only in *ul-ConfigListMixed* and only a UE that supports mixed operation mode uses the carriers in *ul-ConfigListMixed*. A given carrier is either signalled in the *ul-ConfigList* or in *ul-ConfigListMixed*.

If *ul-ConfigListMixed* is present and at least one of the carriers in *ul-ConfigListMixed* is configured for random access:

- If *nprach-Distribution* is present, the UE supporting mixed operation mode creates a combined list of UL carriers for random access by appending *ul-ConfigListMixed* to the *ul-ConfigList* while maintaining the order among both *ul-ConfigList* and *ul-ConfigListMixed*; the total number of signalled UL non-anchor carriers cannot be more than *maxNonAnchorCarriers-NB-r14*.
- If *nprach-Distribution* is absent, the UE supporting mixed operation mode uses the list of UL carriers for random access provided in *ul-ConfigListMixed* and considers *nprach-ProbabilityAnchor* being set to zero for each NPRACH resource, i.e. the anchor carrier is not used for random access.

Otherwise, the *nprach-Distribution* field is not applicable and the UE shall ignore the value.

For TDD: E-UTRAN configures *ul-ConfigList-r15* and includes the same number of entries as in *dl-ConfigList*. The UL carrier frequency of the non-anchor carrier is same as the DL carrier frequency.

***wus-Config***

For FDD: Carrier specific WUS Configuration.

Conditional presence	Explanation
<i>dl-ConfigList</i>	This field is optionally present, Need OR, if the field <i>dl-ConfigList</i> is present. Otherwise the field is not present.
<i>EDT</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> in <i>SystemInformationBlockType2-NB</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>GWUS</i>	This field is optionally present, Need OR, if <i>gwus-Config-r16</i> is present in <i>SystemInformationBlockType2-NB</i> . Otherwise the field is not present.
<i>pcch-config</i>	This field is optionally present, Need OP, if the field <i>dl-ConfigList</i> is present and at least one of the carriers in <i>dl-ConfigList</i> is configured for paging. Otherwise the field is not present and only the anchor carrier is used for paging.
<i>pcch-config2</i>	This field is optionally present, need OR, if the field <i>pcch-Config-r14</i> is not present for the same carrier and <i>coverageBasedPagingConfig</i> is present. Otherwise the field is not present and the UE shall delete any existing value for this field.
<i>nprach-config</i>	This field is mandatory present, if the field <i>ul-ConfigList</i> is present and at least one of the carriers in <i>ul-ConfigList</i> is configured for random access. Otherwise the field is not present and only the anchor carrier is used for random access.
<i>TDD</i>	This field is optionally present, Need OR, for TDD. Otherwise the field is not present.
<i>ul-ConfigList</i>	This field is optionally present, Need OR, if the field <i>ul-ConfigList</i> is present. Otherwise the field is not present.
<i>WUS</i>	This field is mandatory present, if the field <i>wus-Config</i> is present in <i>SystemInformationBlockType2-NB</i> . Otherwise the field is not present, Need OR.

### – *SystemInformationBlockType23-NB*

For FDD, the IE *SystemInformationBlockType23-NB* contains radio resource configuration for NPRACH resources using preamble format 2 on non-anchor carriers.

#### *SystemInformationBlockType23-NB* information element

```
-- ASN1START

SystemInformationBlockType23-NB-r15 ::= SEQUENCE {
 ul-ConfigList-v1530 OPTIONAL, -- Need OR
 ul-ConfigListMixed-v1530 OPTIONAL, -- Need OR
 lateNonCriticalExtension OCTET STRING
}
...
}

UL-ConfigCommonList-NB-v1530 ::= SEQUENCE (SIZE (1.. maxNonAnchorCarriers-NB-r14)) OF
 UL-ConfigCommon-NB-v1530

UL-ConfigCommon-NB-v1530 ::= SEQUENCE {
 ...
 nprach-ParametersListFmt2-r15 OPTIONAL, -- Need OR
 nprach-ParametersListFmt2EDT-r15 OPTIONAL, -- Cond
 ...
}
 ...
}

-- ASN1STOP
```

<b><i>SystemInformationBlockType23-NB</i> field descriptions</b>	
<b><i>nprach-ParametersListFmt2, nprach-ParametersListFmt2EDT</i></b>	
Configures NPRACH parameters for each NPRACH resource format 2 on one UL carrier. Up to three NPRACH resources can be configured on one carrier. Each NPRACH resource is associated with a different number of NPRACH repetitions.	
E-UTRAN includes the same number of entries, and listed in the same order, as in <i>nprach-ParametersList</i> in <i>SystemInformationBlockType2-NB</i> .	
The NPRACH resources in <i>nprach-ParametersListFmt2EDT</i> are used to initiate EDT. Each NPRACH resource is associated with a TBS signalled in the corresponding entry of <i>edt-TBS-InfoList</i> .	
E-UTRAN configures the NPRACH resources format 2 so that they do not overlap in time domain with the NPRACH resources configured in <i>nprach-ParametersList</i> and <i>nprach-ParametersListEDT</i> on the same UL carrier.	
If there is no NPRACH resource in <i>nprach-ParametersListFmt2</i> (respectively <i>nprach-ParametersListFmt2EDT</i> ) on any UL carrier, including the anchor carrier, for one NPRACH repetition level, the UE uses the NPRACH resources in <i>nprach-ParametersList</i> (respectively <i>nprach-ParametersListEDT</i> ) for this NPRACH repetition level. Otherwise, the UE uses only NPRACH resources in <i>nprach-ParametersListFmt2</i> (respectively <i>nprach-ParametersListFmt2EDT</i> ).	
If E-UTRAN configures NPRACH resources format 2 in one NPRACH repetition level, the E-UTRAN configures NPRACH resources format 2 in all NPRACH repetition levels upwards.	
<b><i>ul-ConfigList, ul-ConfigListMixed</i></b>	
<i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) is parallel to <i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) in <i>SystemInformationBlockType22-NB</i> .	
E-UTRAN includes the same number of entries and in the same order in <i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) in <i>SystemInformationBlockType23-NB</i> as in <i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) in <i>SystemInformationBlockType22-NB</i> . The UE combines each entry in <i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) in <i>SystemInformationBlockType23-NB</i> with the corresponding entry in <i>ul-ConfigList</i> (respectively <i>ul-ConfigListMixed</i> ) in <i>SystemInformationBlockType22-NB</i> .	

<b>Conditional presence</b>	<b>Explanation</b>
<i>EDT</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> in <i>SystemInformationBlockType2-NB</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.

## — *SystemInformationBlockType27-NB*

The IE *SystemInformationBlockType27-NB* contains information relevant only for inter-RAT cell selection i.e. assistance information about E-UTRA frequencies and/ or GERAN frequencies for cell selection.

### ***SystemInformationBlockType27-NB* information element**

```
-- ASN1START

```

-- ASN1STOP

<b><i>SystemInformationBlockType27-NB</i></b> field descriptions	
<b><i>carrierFreq</i></b>	E-UTRAN carrier frequency.
<b><i>carrierFreqListEUTRA</i></b>	Provides a list of neighbouring E-UTRA carrier frequencies, which may be searched for neighbouring E-UTRAN cells.
<b><i>carrierFreqs</i></b>	The list of GERAN carrier frequencies organised into one group of GERAN carrier frequencies.
<b><i>carrierFREQsListGERAN</i></b>	Provides a list of neighbouring GERAN carrier frequencies, which may be searched for neighbouring GERAN cells. The GERAN carrier frequencies are organised in groups and the parameters are indicated per group of GERAN carrier frequencies.
<b><i>ec-GSM-IOT</i></b>	Indicates that the GERAN carrier frequencies support EC-GSM-IOT.
<b><i>peo</i></b>	Indicates that the GERAN carrier frequencies support Power Efficient Operation (PEO).
<b><i>sib1</i></b>	Indicates that SIB1 is scheduled in the E-UTRAN cells.
<b><i>sib1-BR</i></b>	Indicates that SIB1-BR is scheduled in the E-UTRAN cells.

### – ***SystemInformationBlockType31-NB***

The IE *SystemInformationBlockType31-NB* contains satellite assistance information. *SystemInformationBlockType31-NB* is only signalled in a NTN cell.

```

-- ASN1STOP

<b><i>CarrierConfigDedicated-NB</i></b> field descriptions	
<b><i>dl-CarrierConfig</i></b>	Downlink carrier used for all unicast transmissions.
<b><i>dl-CarrierFreq</i></b>	DL carrier frequency. The downlink carrier is not in a E-UTRA PRB which contains E-UTRA PSS/SSS/PBCH.
<b><i>dl-GapNonAnchor</i></b>	Downlink transmission gap configuration for the anchor/ non-anchor carrier, see TS 36.211 [21], clause 10.2.3.4. E-UTRAN may configure <i>dl-GapNonAnchor-v1530</i> only if <i>dl-GapNonAnchor-r13</i> is set to <i>explicitGapConfiguration</i> .
<b><i>downlinkBitmapNonAnchor</i></b>	For FDD: NB-IoT downlink subframe configuration for downlink transmission on the anchor/ non-anchor carrier. See TS 36.213 [23], clause 16.4. For TDD: NB-IoT downlink, uplink and special subframes configuration for transmission on the anchor/ non-anchor carrier. See TS 36.213 [23], clause 16.4.
<b><i>eutraControlRegionSize</i></b>	Indicates the control region size of the E-UTRA cell for the in-band operation mode, see TS 36.213 [23]. Unit is in number of OFDM symbols. If <i>operationModelInfo</i> in MIB-NB is set to <i>inband-SamePCI</i> or <i>inband-DifferentPCI</i> , it should be set to the value broadcast in SIB1-NB.
<b><i>eutra-NumCRS-Ports</i></b>	Number of E-UTRA CRS antenna ports, either the same number of ports as NRS or 4 antenna ports. See TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].
<b><i>inbandCarrierInfo</i></b>	Provides the configuration of the anchor/ non-anchor inband carrier. If <i>operationModelInfo</i> is set to standalone in the MIB-NB, E-UTRAN only configures this field if the UE supports mixed operation mode.
<b><i>indexToMidPRB</i></b>	The PRB index is signaled by offset from the middle of the EUTRA system.
<b><i>nrs-PowerOffsetNonAnchor</i></b>	Provides the power offset of the downlink narrowband reference-signal EPRE of the anchor/ non-anchor carrier relative to the anchor carrier, unit in dB. Value dB-12 corresponds to -12 dB, dB-10 corresponds to -10 dB and so on. See TS 36.213 [23], clause 16.2.2.
<b><i>samePCI-Indicator</i></b>	This parameter specifies whether the anchor/ non-anchor carrier reuses the same PCI as the EUTRA carrier.
<b><i>ul-CarrierConfig</i></b>	Uplink anchor/ non-anchor carrier used for all unicast transmissions.
<b><i>ul-CarrierFreq</i></b>	For FDD: UL carrier frequency as defined in TS 36.101 [42], clause 5.7.3F and TS 36.108 [114], clause 5.4B.2. If absent, the same TX-RX frequency separation and carrier frequency offset as for the anchor carrier applies. For TDD: This field is absent and the uplink carrier frequency is equal to the downlink frequency.

Conditional presence	Explanation
<i>non-anchor-inband</i>	The field is mandatory present if the anchor/ non-anchor carrier is an inband carrier; otherwise it is not present.
<i>anchor-guardband-or-standalone</i>	The field is mandatory present if <i>operationModelInfo</i> is set to <i>guardband</i> or <i>standalone</i> in the MIB; otherwise it is not present.
<i>TDD</i>	The field is mandatory present for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>TDD1</i>	The field is optionally present, Need OR, for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.

## – *CarrierFreq-NB*

The IE *CarrierFreq-NB* is used to provide the NB-IoT carrier frequency, as defined in TS 36.101 [42] and TS 36.108 [114].

### *CarrierFreq-NB* information elements

-- ASN1START

```
CarrierFreq-NB-r13 ::= SEQUENCE {
 carrierFreq-r13 ARFCN-ValueEUTRA-r9,
 carrierFreqOffset-r13 ENUMERATED {
 v-10, v-9, v-8, v-7, v-6, v-5, v-4, v-3, v-2, v-1, v-0dot5,
 v0, v1, v2, v3, v4, v5, v6, v7, v8, v9
 } OPTIONAL -- Need ON
```

```

}

CarrierFreq-NB-v1550 ::= SEQUENCE {
 carrierFreqOffset-v1550 ENUMERATED {v-8dot5, v-4dot5, v3dot5, v7dot5}
}

-- ASN1STOP

```

#### ***CarrierFreq-NB field descriptions***

***carrierFreq***

Provides the ARFCN applicable for the NB-IoT carrier frequency as defined in TS 36.101 [42], Table 5.7.3-1 and TS 36.108 [114], Table 5.4A.2-1.

***carrierFreqOffset***

Offset of the NB-IoT channel number to EARFCN as defined in TS 36.101 [42], clause 5.7.3F and TS 36.108 [114], clause 5.4B.2. Value v-10 means -10, v-9 means -9, and so on. E-UTRAN may configure the values v-8dot5, v-4dot5, v3dot5 and v7dot5 only for a carrier in a TDD band.

For TDD, the UE shall use the value signalled in *carrierFreqOffset-v1550*, if present, and ignore the value signaled in *carrierFreqOffset-r13*.

### ***ChannelRasterOffset-NB***

The IE *ChannelRasterOffset-NB* is used to specify the NB-IoT offset from LTE channel raster. Unit in kHz in set { -7.5, -2.5, 2.5, 7.5} See TS 36.211[21] and TS 36.213 [23].

#### ***ChannelRasterOffset-NB information element***

```

-- ASN1START

ChannelRasterOffset-NB-r13 ::= ENUMERATED {khz-7dot5, khz-2dot5, khz2dot5, khz7dot5}

-- ASN1STOP

```

### ***DL-Bitmap-NB***

The IE *DL-Bitmap-NB* is used to specify the set of NB-IoT downlink subframes for downlink transmission.

#### ***DL-Bitmap-NB information element***

```

-- ASN1START

DL-Bitmap-NB-r13 ::= CHOICE {
 subframePattern10-r13 BIT STRING (SIZE (10)),
 subframePattern40-r13 BIT STRING (SIZE (40))
}

-- ASN1STOP

```

#### ***DL-Bitmap-NB field descriptions***

***subframePattern10, subframePattern40***

For FDD: NB-IoT downlink subframe configuration over 10ms or 40ms for inband and 10ms for standalone/guardband.

For TDD: NB-IoT downlink, uplink and special subframes configuration over 10ms or 40ms for inband and 10ms for standalone/guardband.

The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod x = 0, where x is the size of the bit string divided by 10. Value 0 in the bitmap indicates that the corresponding subframe is invalid for transmission. Value 1 in the bitmap indicates that the corresponding subframe is valid for transmission.

### ***DL-CarrierConfigCommon-NB***

The IE *DL-CarrierConfigCommon-NB* is used to specify the common configuration of a DL non-anchor carrier in NB-IoT.

### ***DL-CarrierConfigCommon-NB*** information elements

```
-- ASN1START

DL-CarrierConfigCommon-NB-r14 ::= SEQUENCE {
 dl-CarrierFreq-r14 CarrierFreq-NB-r13,

 eutra-NumCRS-Ports-r14 ENUMERATED {same, four}
 }
 } OPTIONAL, -- Cond anchor-guardband-or-standalone
 eutraControlRegionSize-r14 ENUMERATED {n1, n2, n3}
 } OPTIONAL, -- Cond non-anchor-inband
 nrs-PowerOffsetNonAnchor-r14 ENUMERATED {dB-12, dB-10, dB-8, dB-6,
 dB-4, dB-2, dB0, dB3} DEFAULT dB0,
 . . .
 [[dl-GapNonAnchor-v1530 DL-GapConfig-NB-v1530 OPTIONAL -- Cond TDD
]],
 [[dl-CarrierFreq-v1550 CarrierFreq-NB-v1550 OPTIONAL -- Cond TDD
]]
}

-- ASN1STOP
```

#### ***DL-CarrierConfigCommon-NB*** field descriptions

***dl-CarrierFreq***

DL carrier frequency. The downlink carrier is not in a E-UTRA PRB which contains E-UTRA PSS/SSS/PBCH.

***dl-GapNonAnchor***

Downlink transmission gap configuration for the non-anchor carrier, see TS 36.211 [21], clause 10.2.3.4.  
E-UTRAN may configure *dl-GapNonAnchor-v1530* only if *dl-GapNonAnchor-r14* is set to *explicitGapConfiguration*.

***downlinkBitmapNonAnchor***

For FDD: NB-IoT downlink subframe configuration for downlink transmission on the non-anchor carrier. See TS 36.213 [23], clause 16.4.

For TDD: NB-IoT downlink, uplink and special subframes configuration for transmission on the anchor/ non-anchor carrier. See TS 36.213 [23], clause 16.4.

***eutraControlRegionSize***

Indicates the control region size of the E-UTRA cell for the in-band operation mode, see TS 36.213 [23]. Unit is in number of OFDM symbols. If *operationModelInfo* in MIB-NB is set to *inband-SamePCI* or *inband-DifferentPCI*, it should be set to the value broadcast in SIB1-NB.

***eutra-NumCRS-Ports***

Number of E-UTRA CRS antenna ports, either the same number of ports as NRS or 4 antenna ports. See TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].

***inbandCarrierInfo***

Provides the configuration of a non-anchor inband carrier.

***indexToMidPRB***

The PRB index is signaled by offset from the middle of the EUTRA system.

***nrs-PowerOffsetNonAnchor***

Provides the downlink narrowband reference-signal EPRE offset of the non-anchor carrier relative to the downlink narrowband reference-signal EPRE of the anchor carrier, unit in dB. Value dB-12 corresponds to -12 dB, dB-10 corresponds to -10 dB and so on. See TS 36.213 [23], clause 16.2.2.

***samePCI-Indicator***

This parameter specifies whether the non-anchor carrier reuses the same PCI as the EUTRA carrier.

Conditional presence	Explanation
<i>non-anchor-inband</i>	The field is mandatory present if the non-anchor carrier is an inband carrier; otherwise it is not present.
<i>anchor-guardband-or-standalone</i>	The field is mandatory present, if <i>operationModelInfo</i> is set to <i>guardband</i> or <i>standalone</i> in the MIB; otherwise it is not present.
<i>TDD</i>	The field is optionally present, Need OR, for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.

### – *DL-GapConfig-NB*

The IE *DL-GapConfig-NB* is used to specify the downlink gap configuration for NPDCCH and NPDSCH. Downlink gaps apply to all NPDCCH/NPDSCH transmissions except for BCCH.

#### ***DL-GapConfig-NB* information element**

```
-- ASN1START

DL-GapConfig-NB-r13 ::= SEQUENCE {
 dl-GapThreshold-r13 ENUMERATED {n32, n64, n128, n256},
 dl-GapPeriodicity-r13 ENUMERATED {sf64, sf128, sf256, sf512},
 dl-GapDurationCoeff-r13 ENUMERATED {oneEighth, oneFourth, threeEighth, oneHalf}
}

DL-GapConfig-NB-v1530 ::= SEQUENCE {
 dl-GapPeriodicity-v1530 ENUMERATED {sf1024}
}

-- ASN1STOP
```

#### ***DL-GapConfig-NB* field descriptions**

##### ***dl-GapDurationCoeff***

Coefficient to calculate the gap duration of a DL transmission: *dl-GapDurationCoeff* \* *dl-GapPeriodicity*, Duration in number of subframes. See TS 36.211 [21], clause 10.2.3.4.

##### ***dl-GapPeriodicity***

Periodicity of a DL transmission gap in number of subframes. See TS 36.211 [21], clause 10.2.3.4. Value *sf64* corresponds to 64 subframes, value *sf128* corresponds to 128 subframes, value *sf256* corresponds to 256 subframes and so on. E-UTRAN may configure the value *sf64* only in FDD mode and the value *sf1024* only in TDD mode.

The UE shall use the value signalled in *dl-GapPeriodicity-v1530*, if present, and ignore the value signalled in *dl-GapPeriodicity-r13*.

##### ***dl-GapThreshold***

Threshold on the maximum number of repetitions configured for NPDCCH before application of DL transmission gap configuration. See TS 36.211 [21], clause 10.2.3.4.

### – *GWUS-Config-NB*

The IE *GWUS-Config-NB* is used to specify the GWUS configuration. For UEs supporting GWUS, E-UTRAN uses GWUS to indicate that the UE shall attempt to receive paging in that cell, see TS 36.304 [4].

#### ***GWUS-Config-NB* information element**

```
-- ASN1START

GWUS-Config-NB-r16 ::= SEQUENCE {
 groupAlternation-r16 ENUMERATED {true} OPTIONAL, -- Need OR

 INTEGER (1..maxGWUS-Groups-1-NB-r16)

-- ASN1STOP

```

<b><i>GWUS-Config-NB</i> field descriptions</b>	
<b><i>commonSequence</i></b>	Presence of the field indicates common WUS sequence is configured. Value <i>g0</i> indicates common WUS sequence for the shared WUS resource is <i>g=0</i> , value <i>g126</i> indicates common WUS sequence for the shared WUS resource is <i>g=126</i> , see TS 36.211 [21].
<b><i>groupAlternation</i></b>	Presence of the field enables WUS group alternation between the two WUS resources for the gap type, see TS 36.304 [4].
<b><i>groupsForServiceList</i></b>	Number of WUS groups for each paging probability group, see TS 36.304 [4]. The first entry corresponds to the first paging probability group, second entry corresponds to the second paging probability group, and so on. E-UTRAN includes the same number of entries and in the same order in <i>groupsForServiceList</i> and <i>probThreshList</i> . Total number of WUS groups in this list cannot be more than total number of WUS groups in <i>numGroupsList</i> .
<b><i>numGroupsList</i></b>	List of WUS groups for each WUS resource, see TS 36.304 [4]. First entry corresponds to the first resource, the second entry corresponds to the second resource. <i>numGroupsList</i> shall be present in <i>resourceConfigDRX</i> . If <i>numGroupsList</i> is not present in <i>resourceconfig-eDRX-Short</i> , parameters for DRX WUS resource applies for short eDRX WUS resource. If <i>numGroupsList</i> is not present in <i>resourceConfig-eDRX-Long</i> , parameters for short eDRX WUS resource applies for long eDRX WUS resource.
<b><i>probThreshList</i></b>	Paging probability thresholds corresponding to the paging probability groups, see TS 36.304 [4]. Value <i>p20</i> corresponds to 20%, value <i>p30</i> corresponds to 30%, and so on.
<b><i>resourceConfigDRX, resourceConfig-eDRX-Short, resourceConfig-eDRX-Long</i></b>	WUS resource configured for each gap type, see TS 36.304 [4]. If <i>resourceConfig-eDRX-Short</i> is not present, DRX WUS parameters apply for short eDRX WUS resource. If <i>resourceConfig-eDRX-Long</i> is not present, short eDRX WUS parameters apply for long eDRX WUS resource.
<b><i>resourcePosition</i></b>	Indicates the position of the WUS resource corresponding to the first entry in <i>numGroupsList</i> . Value <i>primary</i> indicates that the end of the WUS resource is defined by the timeoffset value for the corresponding gap type, value <i>secondary</i> indicates that the end of the WUS resource is immediately before the WUS resource configured by <i>wus-Config</i> . E-UTRAN may only configure <i>secondary</i> when only one entry exists in <i>numGroupsList</i> and <i>wus-Config</i> is present in <i>SystemInformationBlockType2-NB</i> . If two entries exist in <i>numGroupsList</i> , the position for the second WUS resource corresponds to value <i>secondary</i> .
<b><i>timeParameters</i></b>	Time domain WUS configuration information. For individual field descriptions, see <i>WUS-Config-NB</i> . If the field is absent, the parameters in <i>wus-Config</i> apply.

Conditional presence	Explanation
<i>noWUSr15</i>	The field is mandatory present if <i>wus-Config-r15</i> is not present in <i>SystemInformationBlockType2-NB</i> ; otherwise the field is not present.
<i>probabilityBased</i>	The field is mandatory present if paging probability based WUS group selection is configured; otherwise the field is not present, and the UE shall delete any existing value for this field.
<i>timeOffset</i>	The field is optionally present, Need OP, if <i>timeOffset-eDRX-Long</i> is present in <i>timeParameters</i> ; otherwise the field is not present, and the UE shall delete any existing value for this field.

### — *LogicalChannelConfig-NB*

The IE *LogicalChannelConfig-NB* is used to configure the logical channel parameters.

#### ***LogicalChannelConfig-NB* information element**

```
-- ASN1START
LogicalChannelConfig-NB-r13 ::= SEQUENCE {
 priority-r13 INTEGER (1..16) OPTIONAL, -- Cond UL
 logicalChannelsR-Prohibit-r13 BOOLEAN OPTIONAL, -- Need ON
 ...
}
-- ASN1STOP
```

#### ***LogicalChannelConfig-NB* field descriptions**

##### ***logicalChannelsR-Prohibit***

Value *TRUE* indicates that the *logicalChannelSR-ProhibitTimer* is enabled for the logical channel. If *logicalChannelSR-Prohibit* is configured (i.e. indicates value *TRUE*), E-UTRAN also configures *logicalChannelSR-ProhibitTimer*. See TS 36.321 [6].

##### ***priority***

Logical channel priority in TS 36.321 [6]. Value is an integer.

Conditional presence	Explanation
<i>UL</i>	The field is mandatory present for UL logical channels; otherwise it is not present.

### — *MAC-MainConfig-NB*

The IE *MAC-MainConfig-NB* is used to specify the MAC main configuration for signalling and data radio bearers.

#### ***MAC-MainConfig-NB* information element**

```

<b>MAC-MainConfig-NB field descriptions</b>	
<b>drx-Config</b>	Used to configure DRX as specified in TS 36.321 [6].
<b>drx-Cycle</b>	<i>longDRX-Cycle</i> in TS 36.321 [6]. The value of <i>longDRX-Cycle</i> is in number of sub-frames. Value sf256 corresponds to 256 sub-frames, sf512 corresponds to 512 sub-frames and so on. In case <i>drx-Cycle-v1430</i> is signalled, the UE shall ignore <i>drx-Cycle-r13</i> .
<b>drx-StartOffset</b>	<i>drxStartOffset</i> in TS 36.321 [6]. Value is in number of sub-frames by step of ( <i>drx-cycle / 256</i> ).
<b>drx-InactivityTimer</b>	Timer for DRX in TS 36.321 [6]. Value in number of PDCCH periods. Value pp0 corresponds to 0 PDCCH period and behaviour as specified in 7.3.2 applies, pp1 corresponds to 1 PDCCH period, pp2 corresponds to 2 PDCCH periods and so on.
<b>drx-RetransmissionTimer</b>	Timer for DRX in TS 36.321 [6]. Value in number of PDCCH periods. Value pp0 corresponds to 0 PDCCH period and behaviour as specified in 7.3.2 applies, pp1 corresponds to 1 PDCCH period, pp2 corresponds to 2 PDCCH periods and so on.
<b>drx-ULRetransmissionTimer</b>	Timer for DRX in TS 36.321 [6]. Value in number of PDCCH periods. Value pp0 corresponds to 0 PDCCH period and behaviour as specified in 7.3.2 applies, value pp1 corresponds to 1 PDCCH period, pp2 corresponds to 2 PDCCH periods and so on.
<b>logicalChannelSR-ProhibitTimer</b>	Timer used to delay the transmission of an SR. See TS 36.321 [6]. Value in number of PDCCH periods. Value pp2 corresponds to 2 PDCCH periods, pp8 corresponds to 8 PDCCH periods and so on.
<b>offsetThresholdTA</b>	Offset for TA reporting as specified in TS 36.321 [6]. Value <i>ms0dot5</i> corresponds to 0.5 millisecond, value <i>ms1</i> corresponds to 1 millisecond and so on.
<b>periodicBSR-Timer</b>	Timer for BSR reporting in TS 36.321 [6]. Value in number of PDCCH periods. Value pp2 corresponds to 2 PDCCH periods, pp4 corresponds to 4 PDCCH periods and so on.
<b>ra-CFRA-Config</b>	Activation of contention free random access (CFRA), see TS 36.321 [6].
<b>rai-Activation</b>	Activation of release assistance indication (RAI) in TS 36.321 [6].
<b>retxBsr-Timer</b>	Timer for BSR reporting in TS 36.321 [6]. Value in number of PDCCH periods. Value pp4 corresponds to 4 PDCCH periods, pp16 corresponds to 16 PDCCH periods and so on.
<b>onDurationTimer</b>	Timer for DRX in TS 36.321 [6]. Value in number of PDCCH periods. Value pp1 corresponds to 1 PDCCH period, pp2 corresponds to 2 PDCCH periods and so on.
<b>timeAlignmentTimer</b>	Indicates the value of the time alignment timer, see TS 36.321 [6].

### – *NPDCCH-ConfigDedicated-NB*

The IE *NPDCCH-ConfigDedicated-NB* specifies the subframes and resource blocks for NPDCCH monitoring.

#### ***NPDCCH-ConfigDedicated-NB* information element**

```
-- ASN1START

NPDCCH-ConfigDedicated-NB-r13 ::= SEQUENCE {
 npdcch-NumRepetitions-r13 ENUMERATED {r1, r2, r4, r8, r16, r32, r64, r128,
 r256, r512, r1024, r2048,
 spare4, spare3, spare2, spare1},
 npdcch-StartSF-USS-r13 ENUMERATED {vldot5, v2, v4, v8, v16, v32, v48, v64},
 npdcch-Offset-USS-r13 ENUMERATED {zero, oneEighth, oneFourth, threeEighth}
}

NPDCCH-ConfigDedicated-NB-v1530 ::= SEQUENCE {
 npdcch-StartSF-USS-v1530 ENUMERATED {v96, v128}
}

-- ASN1STOP
```

<b>NPDCCH-ConfigDedicated-NB field descriptions</b>	
<b>npdcch-NumRepetitions</b>	Maximum number of repetitions for NPDCCH UE specific search space (USS), see TS 36.213 [23], clause 16.6. UE monitors one set of values (consisting of aggregation level, number of repetitions and number of blind decodes) according to the configured maximum number of repetitions.
<b>npdcch-Offset-USS</b>	Fractional period offset of starting subframe for NPDCCH UE specific search space (USS), see TS 36.213 [23], clause 16.6.
<b>npdcch-StartSF-USS</b>	Starting subframe configuration for an NPDCCH UE-specific search space, see TS 36.213 [23], clause 16.6. Value v1dot5 corresponds to 1.5, value 2 corresponds to 2 and so on. E-UTRAN may configure values v1dot5 and v2 only in FDD mode and values v96 and v128 only in TDD mode. The UE shall use the value signalled in <i>npdcch-StartSF-USS-v1530</i> , if present, and ignore the value signalled in <i>npdcch-StartSF-USS-r13</i> .

### — **NPDSCH-Config-NB**

The IE *NPDSCH-ConfigCommon-NB* is used to specify the common NPDSCH configuration. The IE *NPDSCH-ConfigDedicated-NB* is used to specify the UE specific NPDSCH configuration.

#### **NPDSCH-Config-NB information element**

```
-- ASN1START

NPDSCH-ConfigCommon-NB-r13 ::= SEQUENCE {
 nrs-Power-r13
 INTEGER (-60..50)
}

NPDSCH-ConfigDedicated-NB-r16 ::= SEQUENCE {
 npdsch-MultiTB-Config-r16
 NPDSCH-MultiTB-Config-NB-r16 OPTIONAL -- Cond twoHARQ
}

NPDSCH-MultiTB-Config-NB-r16 ::= SEQUENCE {
 multiTB-Config-r16
 ENUMERATED {interleaved, nonInterleaved},
 harq-AckBundling-r16
 ENUMERATED {true} OPTIONAL -- Cond interleaved
}

NPDSCH-ConfigDedicated-NB-v1710 ::= SEQUENCE {
 npdsch-16QAM-Config-r17
 SetupRelease {NPDSCH-16QAM-Config-NB-r17}
}

NPDSCH-ConfigDedicated-NB-v1800 ::= SEQUENCE {
 downlinkHARQ-FeedbackDisabledBitmap-NB-r18
 SetupRelease {DownlinkHARQ-FeedbackDisabledBitmap-NB-r18} OPTIONAL, -- Need ON
 downlinkHARQ-FeedbackDisabledDCI-NB-r18 ENUMERATED {true} OPTIONAL -- Need OR
}

NPDSCH-16QAM-Config-NB-r17 ::=SEQUENCE{
 nrs-PowerRatio-r17

 ENUMERATED {dB-6, dB-4dot77, dB-3, dB-1dot77, dB0, dB1, dB2, dB3}
 OPTIONAL -- Cond InBand
}

DownlinkHARQ-FeedbackDisabledBitmap-NB-r18 ::= BIT STRING (SIZE(2))

-- ASN1STOP
```

<b>NPDSCH-Config-NB field descriptions</b>	
<b>downlinkHARQ-FeedbackDisabledBitmap-NB</b>	Used to disable the DL HARQ feedback, sent in the uplink, per HARQ process ID, see TS 36.321 [6]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1. The bit corresponding to HARQ process ID that is not configured shall be ignored. A bit set to one identifies a HARQ process with disabled DL HARQ feedback and a bit set to zero identifies a HARQ process with enabled DL HARQ feedback.
<b>downlinkHARQ-FeedbackDisabledDCI-NB</b>	Presence of this field indicates that DCI indication is used to directly indicate or override RRC configuration for disabling HARQ feedback
<b>harq-AckBundling</b>	For FDD: Activation of HARQ ACK bundling for DL multiple TBs scheduling with interleaved transmission, see TS 36.213 [23].
<b>npdsch-16QAM-Config</b>	Activation of 16QAM for DL, see TS 36.213 [23].
<b>nrs-Power</b>	Provides the downlink narrowband reference-signal EPRE, see TS 36.213 [23], clause 16.2. The actual value in dBm.
<b>nrs-PowerRatio</b>	The power ratio of NPDSCH EPRE to NRS EPRE in symbols without NRS for standalone and guardband deployments, or in symbols without NRS nor CRS for in-band deployments. See TS 36.213 [23].
<b>nrs-PowerRatioWithCRS</b>	The power ratio of NPDSCH EPRE to NRS EPRE in symbols with CRS for inband deployments, see TS 36.213 [23].
<b>multiTB-Config</b>	For FDD: Activation of multiple TBs scheduling in DL, see TS 36.213 [23]. Value <i>interleaved</i> indicates that multiple TBs scheduling with interleaved transmission is enabled, value <i>nonInterleaved</i> indicates that multiple TBs scheduling without interleaved transmission is enabled.

<b>Conditional presence</b>	<b>Explanation</b>
<i>InBand</i>	The field is mandatory present if carrier is inband; otherwise, the field is not present and the UE shall delete any existing value for this field.
<i>interleaved</i>	The field is optionally present, Need OR, if <i>multiTB-Config</i> is set to <i>interleaved</i> ; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>twoHARQ</i>	The field is optionally present, Need OR, if <i>twoHARQ-ProcessesConfig</i> is configured; otherwise the field is not present and the UE shall delete any existing value for this field.

## – **NPRACH-ConfigSIB-NB**

The IE *NPRACH-ConfigSIB-NB* is used to specify the NPRACH configuration for the anchor and non-anchor carriers.

```

<b>NPRACH-ConfigSIB-NB field descriptions</b>	
<b>dummy</b>	This field is not used in the specification. If received it shall be ignored by the UE.
<b>edt-SmallTBS-Enabled</b>	Value TRUE indicates UE performing EDT is allowed to select TBS smaller than <i>edt-TBS</i> for Msg3 according to the corresponding NPRACH resource, as specified in TS 36.213 [23].
<b>edt-SmallTBS-Subset</b>	Presence indicates only two of the TBS values can be used according to <i>edt-TBS</i> corresponding to the NPRACH resource, as specified in TS 36.213 [23]. When the field is not present, any of the TBS values according to <i>edt-TBS</i> corresponding to the NPRACH resource can be used. This field is applicable for a NPRACH resource only when <i>edt-SmallTBS-Enabled</i> is included for the corresponding NPRACH resource.
<b>edt-TBS</b>	Largest TBS for Msg3 for a NPRACH resource applicable to a UE performing EDT. Value in bits. Value b328 corresponds to 328 bits, value b408 corresponds to 408 bits and so on. See TS 36.213 [23].
<b>maxNumPreambleAttemptCE</b>	Maximum number of preamble transmission attempts per NPRACH resource. See TS 36.321 [6]. If the UE supports enhanced random access power control and <i>maxNumPreambleAttemptCE-r14</i> is included, the UE shall use <i>maxNumPreambleAttemptCE-r14</i> instead of <i>maxNumPreambleAttemptCE-r13</i> for the first entry in <i>nprach-ParametersList</i> . <i>maxNumPreambleAttemptCE-r13</i> applies to FDD and <i>maxNumPreambleAttemptCE-v1550</i> applies to TDD.
<b>npdcch-CarrierIndex</b>	For FDD: Index of the carrier in the list of DL non anchor carriers. The first entry in the list has index '1', the second entry has index '2' and so on. If the UE supports mixed operation mode and <i>dl-ConfigListMixed</i> is present in <i>SystemInformationBlockType22-NB</i> , the UE creates a combined list of DL carriers for random access by appending <i>dl-ConfigListMixed</i> to the <i>dl-ConfigList</i> while maintaining the order among both <i>dl-ConfigList</i> and <i>dl-ConfigListMixed</i> ; only the first <i>maxNonAnchorCarriers-NB-r14</i> DL non-anchor carriers in the concatenated list can be used for random access. If the field is absent in the entry in <i>nprach-ParametersListEDT</i> in <i>SystemInformationBlockType22-NB</i> , the value of <i>npdcch-CarrierIndex</i> in the corresponding entry of <i>nprach-ParametersList</i> applies, if present. If the field is absent in an entry in <i>nprach-ParametersListFmt2EDT</i> in <i>SystemInformationBlockType23-NB</i> , the value of <i>npdcch-CarrierIndex</i> in the corresponding entry of <i>nprach-ParametersListFmt2</i> applies, if present. Otherwise, the DL anchor carrier is used. For TDD: This parameter is absent and the same carrier is used in uplink and downlink.
<b>npdcch-NumRepetitions-RA</b>	Maximum number of repetitions for NPDCCH common search space (CSS) for RAR, Msg3 retransmission and Msg4, see TS 36.213 [23], clause 16.6. See NOTE.
<b>npdcch-Offset-RA</b>	Fractional period offset of starting subframe for NPDCCH common search space (CSS Type 2), see TS 36.213 [23], clause 16.6. See NOTE.
<b>npdcch-StartSF-CSS-RA</b>	Starting subframe configuration for NPDCCH common search space (CSS), including RAR, Msg3 retransmission, and Msg4, see TS 36.213 [23], clause 16.6. See NOTE.
<b>nprach-CP-Length</b>	Cyclic prefix length for NPRACH transmission ( <i>T<sub>CP</sub></i> ), see TS 36.211 [21], clause 10.1.6. Value us66dot7 corresponds to 66.7 microseconds and value us266dot7 corresponds to 266.7 microseconds. If the UE uses a NPRACH resource for preamble format 2, the UE ignores the value signalled in <i>nprach-CP-Length</i> and considers the value to be 800 microseconds.
<b>nprach-NumCBRA-StartSubcarriers</b>	The number of start subcarriers from which a UE can randomly select a start subcarrier as specified in TS 36.321 [6]. If <i>nprach-Config-v1330</i> is not included in <i>SystemInformationBlockType2-NB</i> , the UE sets the value of <i>nprach-NumCBRA-StartSubcarriers-r13</i> to the value signalled by <i>nprach-NumSubcarriers-r13</i> for the corresponding NPRACH resource. The start subcarrier indices that the UE is allowed to randomly select from, are given by: <i>nprach-SubcarrierOffset</i> + [0, <i>nprach-NumCBRA-StartSubcarriers</i> - 1]. See NOTE.
<b>nprach-NumSubcarriers</b>	Number of sub-carriers in a NPRACH resource, see TS 36.211 [21], clause 10.1.6. In number of subcarriers. See NOTE.

<b>NPRACH-ConfigSIB-NB field descriptions</b>	
<b>nprach-ParametersList, nprach-ParametersListEDT</b>	Configures NPRACH parameters for each NPRACH resource. Up to three PRACH resources can be configured in <i>nprach-ParametersList</i> in a cell. Each NPRACH resource is associated with a different number of NPRACH repetitions. E-UTRAN includes the same number of entries, and listed in the same order for <i>nprach-ParametersListEDT</i> , as in <i>nprach-ParametersList</i> in <i>SystemInformationBlockType2-NB</i> . The NPRACH resources in <i>nprach-ParametersListEDT</i> are used to initiate EDT. Each NPRACH resource is associated with a TBS signalled in the corresponding entry of <i>edt-TBS-InfoList</i> . For TDD: The UE shall use <i>nprach-ParametersListTDD</i> and ignore <i>nprach-ParametersList</i> .
<b>nprach-ParametersListTDD</b>	For TDD: Configure NPRACH parameters for each NPRACH. Up to three NPRACH resources can be configured in a cell. Each NPRACH resource is associated with a different number of NPRACH repetitions.
<b>nprach-ParametersListFmt2, nprach-ParametersListFmt2EDT</b>	Configures NPRACH parameters for each NPRACH resource format 2. Up to three NPRACH resources can be configured on one carrier. Each NPRACH resource is associated with a different number of NPRACH repetitions. E-UTRAN includes the same number of entries, and listed in the same order, as in <i>nprach-ParametersList</i> in <i>SystemInformationBlockType2-NB</i> . The NPRACH resources in <i>nprach-ParametersListFmt2EDT</i> are used to initiate EDT. Each NPRACH resource is associated with a TBS signalled in the corresponding entry of <i>edt-TBS-InfoList</i> . E-UTRAN configures the NPRACH resources format 2 so that they do not overlap in time domain with the NPRACH resources configured in <i>nprach-ParametersList</i> and <i>nprach-ParametersListEDT</i> . If there is no NPRACH resource in <i>nprach-ParametersListFmt2</i> (respectively <i>nprach-ParametersListFmt2EDT</i> ) on any UL carrier for one NPRACH repetition level, the UE uses the NPRACH resources in <i>nprach-ParametersList</i> (respectively <i>nprach-ParametersListEDT</i> ) for this NPRACH repetition level. Otherwise, the UE uses only NPRACH resources in <i>nprach-ParametersListFmt2</i> (respectively <i>nprach-ParametersListFmt2EDT</i> ).
<b>nprach-Periodicity</b>	Periodicity of a NPRACH resource, see TS 36.211 [21], clause 10.1.6. Unit in millisecond. See NOTE.
<b>nprach-PreambleFormat</b>	TDD: TDD preamble format, see TS 36.211 [21], clause 10.1.6, Value <i>fmt0</i> corresponds to preamble format 0, value <i>fmt1</i> corresponds to preamble format 1 and so on.
<b>nprach-StartTime</b>	Start time of the NPRACH resource in one period, see TS 36.211 [21], clause 10.1.6. Unit in millisecond. See NOTE.
<b>nprach-SubcarrierOffset</b>	Frequency location of the NPRACH resource, see TS 36.211 [21], clause 10.1.6. In number of subcarriers, offset from sub-carrier 0. See NOTE.
<b>nprach-SubcarrierMSG3-RangeStart</b>	Fraction for calculating the starting subcarrier index of the range reserved for indication of UE support for multi-tone Msg3 transmission, within the NPRACH resource, see TS 36.211 [21], clause 10.1.6. Multi-tone Msg3 transmission is not supported for {32, 64, 128} repetitions of NPRACH. For at least one of the NPRACH resources with the number of NPRACH repetitions other than {32, 64, 128}, the value of <i>nprach-SubcarrierMSG3-RangeStart</i> should not be 0. If <i>nprach-SubcarrierMSG3-RangeStart</i> is equal to zero, no start subcarrier index for the single-tone Msg3 NPRACH is allocated and the start subcarrier indexes for the multi-tone Msg3 NPRACH partition are given by <i>nprach-SubcarrierOffset + [0, nprach-NumCBRA-StartSubcarriers - 1]</i> . If <i>nprach-SubcarrierMSG3-RangeStart</i> is equal to oneThird or twoThird, the start subcarrier indexes for the two partitions are given by: <i>nprach-SubcarrierOffset + [0, FLOOR (nprach-NumCBRA-StartSubcarriers * nprach-SubcarrierMSG3-RangeStart) - 1]</i> for the single-tone Msg3 NPRACH partition; <i>nprach-SubcarrierOffset + [FLOOR (nprach-NumCBRA-StartSubcarriers * nprach-SubcarrierMSG3-RangeStart), nprach-NumCBRA-StartSubcarriers - 1]</i> for the multi-tone Msg3 NPRACH partition; If <i>nprach-SubcarrierMSG3-RangeStart</i> is equal to one, the start subcarrier indexes for the single-tone Msg3 NPRACH are given by <i>nprach-SubcarrierOffset + [0, nprach-NumCBRA-StartSubcarriers - 1]</i> and no start subcarrier index for the multi-tone Msg3 NPRACH partition is allocated. See NOTE.
<b>nprach-TxDurationFmt1</b>	Duration of PRACH segment transmission for PRACH resource format 0 and format 1 in NTN transmission, see TS 36.213 [23]. Unit in duration of preamble repetition unit, i.e., 4 * (TCP+TSEQ). Value <i>n2</i> corresponds to the duration of 2 preamble repetition units, value <i>n4</i> corresponds to the duration of 4 preamble repetition units and so on.
<b>nprach-TxDurationFmt2</b>	Duration of PRACH segment transmission for PRACH resource format 2 in NTN transmission, see TS 36.213 [23]. Unit in duration of preamble repetition unit, i.e., 6 * (TCP+TSEQ). Value <i>n1</i> corresponds to the duration of 1 preamble repetition unit, value <i>n2</i> corresponds to the duration of 2 preamble repetition units and so on.

<b>NPRACH-ConfigSIB-NB field descriptions</b>	
<b>numRepetitionsPerPreambleAttempt</b>	Number of NPRACH repetitions per attempt for each NPRACH resource. See TS 36.211 [21], clause 10.1.6. <i>numRepetitionsPerPreambleAttempt-r13</i> applies to FDD and <i>numRepetitionsPerPreambleAttempt-v1550</i> applies to TDD.
<b>rsrp-ThresholdsPrachInfoList</b>	The criterion for UEs to select a NPRACH resource. Up to 2 RSRP threshold values can be signalled. The first element corresponds to RSRP threshold 1, the second element corresponds to RSRP threshold 2. See TS 36.321 [6]. If absent, there is only one NPRACH resource. A UE that supports <i>powerClassNB-14dBm-r14</i> shall correct the RSRP threshold values before applying them as follows: RSRP threshold = Signalled RSRP threshold - min{0, (14-min(23, P-Max))} where P-Max is the value of <i>p-Max</i> field in <i>SystemInformationBlockType1-NB</i> .

NOTE:

- If the field is absent in an entry of *nprach-ParametersList* in *SystemInformationBlockType22-NB*, the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.
- If the field is absent in the entry in *nprach-ParametersListEDT*, the value of the same field in the corresponding entry of *nprach-ParametersList* on the same UL carrier applies, if present. Otherwise, the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.
- If the field is absent in an entry of *nprach-ParametersListTDD* in *SystemInformationBlockType22-NB*, the value of the same field in the corresponding entry of *nprach-ParametersListTDD* in *SystemInformationBlockType2-NB* applies. The field is mandatory present in *nprach-ParametersListTDD* in *SystemInformationBlockType2-NB*.
- If the field is absent in an entry of *nprach-ParametersListFmt2* in *SystemInformationBlockType23-NB*, the value of the same field, if present, in the corresponding entry of *nprach-ParametersListFmt2* in *SystemInformationBlockType2-NB* applies. Otherwise the value of the same field, if present, in the corresponding entry of the first occurrence of *nprach-ParametersListFmt2* in the non anchor carrier list applies. Otherwise, the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.
- If the field is absent in an entry of *nprach-ParametersListFmt2* in *SystemInformationBlockType2-NB*, the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.
- If the field is absent in an entry of *nprach-ParametersListFmt2EDT* in *SystemInformationBlockType23-NB*, the value of the same field, if present, in the corresponding entry of *nprach-ParametersListFmt2* on the same UL carrier applies. Otherwise, the value of the same field, if present, in the corresponding entry of *nprach-ParametersListFmt2* in *SystemInformationBlockType2-NB* applies. Otherwise the value of the same field, if present, in the corresponding entry of the first occurrence of *nprach-ParametersListFmt2* in the non anchor carrier list applies. Otherwise, the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.
- If the field is absent in an entry of *nprach-ParametersListFmt2EDT* in *SystemInformationBlockType2-NB*, the value of the same field, if present, in the corresponding entry of *nprach-ParametersListFmt2* in *SystemInformationBlockType2-NB* applies. Otherwise the value of the same field in the corresponding entry of *nprach-ParametersList* in *SystemInformationBlockType2-NB* applies.

Conditional presence	Explanation
<i>EDT1</i>	The field is mandatory present if <i>cp-EDT</i> , <i>cp-EDT-5GC</i> , <i>up-EDT</i> or <i>up-EDT-5GC</i> in <i>SystemInformationBlockType2-NB</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>EDT2</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>TDD</i>	This field is mandatory present for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.

## NPUSCH-Config-NB

The IE *NPUSCH-ConfigCommon-NB* is used to specify the common NPUSCH configuration. The IE *NPUSCH-ConfigDedicated-NB* is used to specify the UE specific NPUSCH configuration.

### **NPUSCH-Config-NB information element**

-- ASN1STOP
```

<b>NPUSCH-Config-NB field descriptions</b>	
<b>ack-NACK-NumRepetitions</b>	Number of repetitions for the ACK NACK resource unit carrying HARQ response to NPDSCH, see TS 36.213 [23], clause 16.4.2. If this field is absent and no value was configured via dedicated signalling, the value used for reception of Msg4 is used.
<b>ack-NACK-NumRepetitions-Msg4</b>	Number of repetitions for ACK/NACK HARQ response to NPDSCH containing Msg4 per NPRACH resource, see TS 36.213 [23], clause 16.4.2.
<b>groupAssignmentNPUSCH</b>	See TS 36.211 [21], clause 10.1.4.1.3.
<b>groupHoppingDisabled</b>	See TS 36.211 [21], clause 10.1.4.1.3.
<b>groupHoppingEnabled</b>	See TS 36.211 [21], clause 10.1.4.1.3.
<b>npusch-16QAM-Config</b>	Activation of 16QAM for UL, see TS 36.213 [23].
<b>npusch-AllSymbols</b>	If set to TRUE, the UE shall use all NB-IoT symbols for NPUSCH transmission. If set to FALSE, the UE punctures the NPUSCH transmissions in the symbols that collides with SRS. If the field is not present, the UE uses all NB-IoT symbols for NPUSCH transmission. See TS 36.211 [21], clause 10.1.3.6.
<b>npusch-MultiTB-Config</b>	For FDD: Activation of multiple TBs scheduling in UL, see TS 36.213 [23]. Value <i>interleaved</i> indicates that multiple TBs scheduling with interleaved transmission is enabled, value <i>nonInterleaved</i> indicates that multiple TBs scheduling without interleaved transmission is enabled.
<b>npusch-TxDuration</b>	Duration of NPUSCH segment transmission in NTN transmission, see TS 36.213 [23]. Unit in ms. Value <i>ms2</i> corresponds to 2 ms, value <i>ms4</i> corresponds to 4 ms and so on.
<b>sixTone-BaseSequence</b>	The base sequence of DMRS sequence in a cell for 6 tones transmission; see TS 36.211 [21], clause 10.1.4.1.2. If absent, it is given by NB-IoT CellID mod 14. Value 14 is not used.
<b>sixTone-CyclicShift</b>	Define 4 cyclic shifts for the 6-tone case, see TS 36.211 [21], clause 10.1.4.1.2.
<b>srs-SubframeConfig</b>	SRS SubframeConfiguration. See TS 36.211 [21], table 5.5.3.3-1. Value <i>sc0</i> corresponds to value 0, <i>sc1</i> to value 1 and so on.
<b>threeTone-BaseSequence</b>	The base sequence of DMRS sequence in a cell for 3 tones transmission; see TS 36.211 [21], clause 10.1.4.1.2. If absent, it is given by NB-IoT CellID mod 12. Value 12 is not used.
<b>threeTone-CyclicShift</b>	Define 3 cyclic shifts for the 3-tone case, see TS 36.211 [21], clause 10.1.4.1.2.
<b>twelveTone-BaseSequence</b>	The base sequence of DMRS sequence in a cell for 12 tones transmission; see TS 36.211 [21], clause 10.1.4.1.2. If absent, it is given by NB-IoT CellID mod 30. Value 30 is not used.
<b>ul-ReferenceSignalsNPUSCH</b>	Used to specify parameters needed for the transmission on NPUSCH.
<b>uplinkHARQ-Mode</b>	Used to set the HARQ mode per HARQ process ID, see TS 36.321 [6]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1. The Bit corresponding to HARQ process ID that is not configured shall be ignored. A bit set to one identifies a HARQ process with HARQ mode A and a bit set to zero identifies a HARQ process with HARQ mode B. This field applies for SRBs and DRBs.

Conditional presence	Explanation
SRS	This field is optionally present, need OP, if <i>srs-SubframeConfig</i> is broadcasted. Otherwise, the IE is not present.

## – PDCP-Config-NB

The IE *PDCP-Config-NB* is used to set the configurable PDCP parameters for data radio bearers.

### PDCP-Config-NB information element

-- ASN1START	
PDCP-Config-NB-r13 ::=	SEQUENCE { discardTimer-r13 ENUMERATED {

```

ms5120, ms10240, ms20480, ms40960,
ms81920, infinity, spare2, spare1
} OPTIONAL, -- Cond Setup
headerCompression-r13 CHOICE {
 notUsed NULL,
 rohc SEQUENCE {
 maxCID-r13 INTEGER (1..16383) DEFAULT 15,
 profiles-r13 SEQUENCE {
 profile0x0002 BOOLEAN,
 profile0x0003 BOOLEAN,
 profile0x0004 BOOLEAN,
 profile0x0006 BOOLEAN,
 profile0x0102 BOOLEAN,
 profile0x0103 BOOLEAN,
 profile0x0104 BOOLEAN
 },
 ...
 },
 ...
},
[[cipheringDisabled-r16 ENUMERATED {true} OPTIONAL -- Cond ConnectedTo5GC
]]
}

-- ASN1STOP

```

#### **PDCP-Config-NB field descriptions**

##### **cipheringDisabled**

If included, ciphering is disabled for this DRB regardless of which ciphering algorithm is configured for the SRB/DRBs. E-UTRAN may include this field only when the UE is connected to 5GC. The value for this field cannot be changed after the DRB is set up.

##### **discardTimer**

Indicates the discard timer value specified in TS 36.323 [8]. Value in milliseconds. Value ms5120 means 5120 ms, ms10240 means 10240 ms and so on.

##### **headerCompression**

E-UTRAN does not reconfigure header compression except optionally upon RRC Connection Resumption.

##### **maxCID**

Indicates the value of the MAX\_CID parameter as specified in TS 36.323 [8]. The total value of MAX\_CIDs across all bearers for the UE should be less than or equal to the value of *maxNumberROHC-ContextSessions* parameter as indicated by the UE.

##### **profiles**

The profiles used by both compressor and decompressor in both UE and E-UTRAN. The field indicates which of the ROHC profiles specified in TS 36.323 [8] are supported, i.e. value *true* indicates that the profile is supported. Profile 0x0000 shall always be supported when the use of ROHC is configured. If support of two ROHC profile identifiers with the same 8 LSB's is signalled, only the profile corresponding to the highest value shall be applied.

Conditional presence	Explanation
<i>ConnectedTo5GC</i>	The field is optionally present, need OR, if the UE is connected to 5GC. Otherwise the field is not present and the UE shall delete any existing value for this field.
<i>Setup</i>	The field is mandatory present in case of radio bearer setup. Otherwise the field is optionally present, need ON.

### **PhysicalConfigDedicated-NB**

The IE *PhysicalConfigDedicated-NB* is used to specify the UE specific physical channel configuration.

#### **PhysicalConfigDedicated-NB information element**

#### ***PhysicalConfigDedicated-NB field descriptions***

***additionalTxSIB1-Config***

Indicates if subframe #3 not containing additional SIB1 transmission is a NB-IoT DL subframe, as specified in TS 36.213 [23], clause 16.4.

***carrierConfigDedicated***

Anchor/ non-anchor carrier used for all unicast transmissions.

***interferenceRandomisationConfig***

For FDD: Interference randomisation enabled in connected mode, except for random access procedure in connected mode, see TS 36.211 [21]. For random access in connected mode interference randomisation on non-anchor is used and is not used on anchor carrier, see TS 36.211 [21].  
For TDD: the parameter is not present.

***npdcch-ConfigDedicated***

NPDCCH configuration.

***npdsch-ConfigDedicated***

NPDSCH configuration.

***npusch-ConfigDedicated***

UL unicast configuration.

***resourceReservationConfigDL***

Configuration of downlink reserved resources, e.g. for NB-IoT co-existence with NR, see TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].

***resourceReservationConfigUL***

Configuration of uplink reserved resources, e.g. for NB-IoT co-existence with NR, see TS 36.211 [21], TS 36.212 [22], and TS 36.213 [23].

***twoHARQ-ProceduresConfig***

Activation of two HARQ processes, see TS 36.212 [22] and TS 36.213 [23].

***uplink-PowerControlDedicated***

UL power control parameter.

***uplinkSegmentedPrecompensationGap***

Indicates the gap value between segments for NPUSCH for TA pre-compensation. Value *sym1* corresponds to 1 symbol, value *s11* corresponds to 1 slot, value *s12* corresponds to 2 slots.

Conditional presence	Explanation
<i>additionalSIB1</i>	This field is optionally present, Need OR, if <i>additionalTransmissionSIB1</i> is set to TRUE in <i>MasterInformationBlock-NB</i> ; otherwise it is not present.
<i>dl-NonAnchor</i>	The field is optionally present, Need ON, for a DL non-anchor carrier; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>npusch-16QAM</i>	This field is mandatory present, if <i>npusch-16QAM-Config-r17</i> is true; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>NTN</i>	The field is optionally present, Need ON, for NTN. Otherwise, the field is not present and the UE shall delete any existing value for this field.
<i>TDD</i>	The field is optionally present, Need OR, for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>twoHARQ</i>	The field is optionally present, Need OR, if <i>twoHARQ-ProceduresConfig</i> is configured; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>ul-NonAnchor</i>	The field is optionally present, Need ON, for an UL non-anchor carrier; otherwise the field is not present and the UE shall delete any existing value for this field.

## PUR-Config-NB

The IE *PUR-Config-NB* is used to specify PUR configuration.

```

<b>PUR-Config-NB field descriptions</b>	
<b>ack-NACK-NumRepetitions</b>	Number of repetitions for the ACK NACK resource unit carrying HARQ response to NPDSCH, see TS 36.213 [23], clause 16.4.2. If this field is absent and no value was configured via <i>pur-Config</i> , the value of <i>ack-NACK-NumRepetitions</i> used for HARQ response to NPDSCH containing this <i>RRCConnectionRelease-NB</i> message applies.
<b>alpha</b>	Parameter: $\alpha_c(3)$ . See TS 36.213 [23], clause 16.2.1.1.1.
<b>carrierConfig</b>	Carrier used for PUR.
<b>hsfn-LSB-Info</b>	LSB of the H-SFN corresponding to the last subframe of the first transmission of <i>RRCConnectionRelease</i> message containing <i>pur-Config</i> .
<b>npdcch-Config</b>	NPDCCH configuration for PUR.
<b>npusch-CyclicShift</b>	Parameter: $n_{cs}$ . See TS 36.211 [21], clause 10.1.4.1.2. Value $n0$ corresponds to value 0 and value $n6$ corresponds to value 6.
<b>npusch-MCS</b>	Index to tables specified in TS 36.213 [23], Table 16.5.1.2-1 and Table 16.5.1.2-2 for single tone and multi tone respectively, that defines modulation and TBS index for NPUSCH for PUR. If 16QAM UL for PUR is configured, value <i>singleTone</i> is not applicable, signalled value of <i>multiTone</i> shall be less than or equal to 7, and actual value = signalled value + 14.
<b>npusch-NumRepetitionsIndex</b>	Index to a table specified in TS 36.213 [23], Table 16.5.1.1-3, that defines number of repetitions for NPUSCH for PUR.
<b>npusch-NumRUsIndex</b>	Index to a table specified in TS 36.213 [23], Table 16.5.1.1-2, that defines number of resource units for NPUSCH for PUR.
<b>npusch-SubCarrierSetIndex</b>	For NPUSCH transmission with subcarrier spacing 3.75 kHz, indicates the subcarrier used for PUR specified in TS 36.213 [23]. For NPUSCH transmission with subcarrier spacing 15 kHz, index to a table specified in TS 36.213 [23], Table 16.5.1.1-1, that defines the set of subcarriers for NPUSCH for PUR.
<b>p0-UE-NPUSCH</b>	Parameter: $P_{O\_UE\_NPUSCH,c} (3)$ . See TS 36.213 [23], clause 16.2.1.1.1, unit dB.
<b>pur-DL-16QAM-Config</b>	Activation of 16QAM for downlink, see TS 36.213 [23].
<b>pur-ImplicitReleaseAfter</b>	Number of consecutive PUR occasions that can be skipped before implicit release of PUR configuration. Value $n2$ corresponds to 2 PUR occasions, value $n4$ corresponds to 4 PUR occasions, and so on.
<b>pur-NRSRP-ChangeThreshold</b>	Threshold(s) of change in serving cell NRSRP in dB for TA validation. Value $dB4$ corresponds to 4 dB, value $dB6$ corresponds to 6 dB, and so on. When <i>pur-NRSRP-ChangeThreshold</i> is set to <i>setup</i> , if <i>decreaseThrsh</i> is absent the value of <i>increaseThresh</i> is also used for <i>decreaseThresh</i> .
<b>pur-NumOccasions</b>	Number of PUR occasions. Value <i>one</i> corresponds to 1 PUR occasion, and value <i>infinite</i> corresponds to an infinite number of PUR occasions.
<b>pur-PeriodicityAndOffset</b>	Indicates the periodicity for the PUR occasions and time offset until the first PUR occasion.
<b>pur-ResponseWindowTimer</b>	Duration of the PUR response window in TS 36.321 [6]. Value in PDCCH periods. Value $pp2$ corresponds to 2 PDCCH periods, $pp3$ corresponds to 3 PDCCH periods, and so on. The value considered by the UE is: <i>pur-ResponseWindowTimer</i> = Min (signaled value x PDCCH period, 10.24s).
<b>pur-TimeAlignmentTimer</b>	Value of the time alignment timer for PUR. Value in number of periodicity of PUR.
<b>pur-UL-16QAM-Config</b>	Activation of 16QAM for uplink, see TS 36.213 [23].

## – PUR-ConfigID-NB

The IE *PUR-ConfigID-NB* is used to indicate the PUR configuration identity.

### **PUR-ConfigID-NB information element**

-- ASN1START

```
PUR-ConfigID-NB-r16 ::= BIT STRING (SIZE(20))
-- ASN1STOP
```

### ***PUR-PeriodicityAndOffset-NB***

The IE *PUR-PeriodicityAndOffset* is used to indicate H-SFN of the first PUR occasion and periodicity of the subsequent PUR occasions. The value of periodicity is in the unit of H-SFN duration (i.e., 10.24s). Value *periodicity8* corresponds to periodicity of 8 H-SFN, value *periodicity16* corresponds to periodicity of 16 H-SFN and so on. The value of offset is in the unit of H-SFN duration (i.e., 10.24s).

#### ***PUR-PeriodicityAndOffset-NB information element***

```
-- ASN1START

#### RACH-ConfigCommon-NB field descriptions

##### **connEstFailOffset**

Parameter "Qoffset<sub>temp</sub>" in TS 36.304 [4]. If the field is not present the value of infinity shall be used for "Qoffset<sub>temp</sub>".

##### **mac-ContentionResolutionTimer**

Timer for contention resolution in TS 36.321 [6]. Value in PDCCH periods. Value pp1 corresponds to 1 PDCCH period, pp2 corresponds to 2 PDCCH periods and so on. *mac-ContentionResolutionTimer-r15* is only applicable for EDT. UE performing EDT shall use *mac-ContentionResolutionTimer-r15*, if present.

For FDD: The value considered by the UE is: *mac-ContentionResolutionTimer* = Min (signaled value x PDCCH period, 10.24s).

For TDD: The value considered by the UE is: *mac-ContentionResolutionTimer* = Min (signaled value x PDCCH period, 20.48s).

##### **powerRampingParameters, powerRampingParametersCE1**

Power ramping step and preamble initial received target power – same as TS 36.213 [23] and TS 36.321 [6].

For FDD, if the UE does not support enhanced random access power control and more than one repetition level is configured in the cell, then the UE transmits NPRACH with max power except for the lowest repetition level.

Otherwise, the UE uses NPRACH power ramping.

For FDD, if the UE supports enhanced random access power control and *powerRampingParameters-v1450* is signalled, or for TDD, the UE uses NPRACH power ramping across repetition levels as specified in TS 36.321 [6]. If *preambleInitialReceivedTargetPower-v1450* is present, the UE shall use *preambleInitialReceivedTargetPower-v1450* instead of *preambleInitialReceivedTargetPower* (i.e. without suffix). If *powerRampingParametersCE1* is present, the UE shall use *powerRampingParametersCE1* instead of *powerRampingParameters* for NPRACH power ramping in the second repetition level.

##### **preambleTransMax-CE**

Maximum number of preamble transmission in TS 36.321 [6]. Value is an integer.

##### **ra-ResponseWindowSize**

Duration of the RA response window in TS 36.321 [6]. Value in PDCCH periods. Value pp2 corresponds to 2 PDDCH periods, pp3 corresponds to 3 PDCCH periods and so on.

For FDD: The value considered by the UE is: *ra-ResponseWindowSize* = Min (signaled value x PDCCH period, 10.24s).

For TDD: The value considered by the UE is: *ra-ResponseWindowSize* = Min (signaled value x PDCCH period, 20.48s).

Conditional presence	Explanation
<i>EDT</i>	The field is optionally present, Need OR, if <i>edt-Parameters</i> is present; otherwise the field is not present and the UE shall delete any existing value for this field.

### – RadioResourceConfigCommonSIB-NB

The IE *RadioResourceConfigCommonSIB-NB* is used to specify common radio resource configurations in the system information, e.g., the random access parameters and the static physical layer parameters.

#### RadioResourceConfigCommonSIB-NB information element

```

-- ASN1START

RadioResourceConfigCommonSIB-NB-r13 ::= SEQUENCE {

}

PCCH-Config-NB-r13 ::= SEQUENCE {
 defaultPagingCycle-r13 ENUMERATED {rf128, rf256, rf512, rf1024},
 nB-r13
 npdcch-NumRepetitionPaging-r13
}
}
-- ASN1STOP

```

<b><i>RadioResourceConfigCommonSIB-NB</i></b> field descriptions	
<b><i>defaultPagingCycle</i></b>	Default paging cycle, used to derive 'T' in TS 36.304 [4]. Value <i>rf128</i> corresponds to 128 radio frames, <i>rf256</i> corresponds to 256 radio frames and so on.
<b><i>dl-Gap</i></b>	Downlink transmission gap configuration for the anchor carrier. See TS 36.211 [21], clause 10.2.3.4. If the field is absent, there is no gap.
<b><i>gwus-Config</i></b>	For FDD: GWUS Configuration.
<b><i>modificationPeriodCoeff</i></b>	Actual modification period, expressed in number of radio frames= <i>modificationPeriodCoeff</i> * <i>defaultPagingCycle</i> . n16 corresponds to value 16, n32 corresponds to value 32, and so on. The BCCH modification period should be larger or equal to 40.96s.
<b><i>nB</i></b>	Parameter: nB is used as one of parameters to derive the Paging Frame and Paging Occasion according to TS 36.304 [4]. Value in multiples of 'T' as defined in TS 36.304 [4]. A value of fourT corresponds to 4 * T, a value of twoT corresponds to 2 * T and so on.
<b><i>npdch-NumRepetitionPaging</i></b>	Maximum number of repetitions for NPDCCH common search space (CSS) for paging, see TS 36.213 [23], clause 16.6.
<b><i>nrs-NonAnchorConfig</i></b>	For FDD: Indicates if NRS are present on non-anchor paging carriers even when no paging NPDCCH is transmitted, see TS 36.211 [21], clause 10.2.6.
<b><i>t318</i></b>	The value of timer T318. Value <i>ms0</i> corresponds with 0 ms, <i>ms50</i> corresponds with 50 ms and so on.
<b><i>ta-Report</i></b>	When this field is included in <i>SystemInformationBlockType2-NB</i> , it indicates reporting of timing advance is enabled during Random Access due to RRC connection establishment, RRC connection resume or RRC connection reestablishment, see TS 36.321 [6], clause 5.4.9.
<b><i>ue-SpecificDRX-CycleMin</i></b>	Minimum UE specific DRX cycle in the cell, see TS 36.304 [4], clause 7.1. Value <i>rf32</i> corresponds to 32 radio frames, <i>rf64</i> corresponds to 64 radio frames and so on. If present, E-UTRAN ensures PCCH configuration does not lead to CSS overlap for <i>ue-SpecificDRX-CycleMin</i> . If the field is not present, use of UE specific DRX cycle is not allowed in the cell.
<b><i>wus-Config</i></b>	For FDD: WUS Configuration.

Conditional presence	Explanation
<i>EnhPowerControl</i>	This field is optional present, Need OR, if <i>PowerRampingParameters-NB-v1450</i> is included in <i>SIB2-NB</i> . Otherwise the field is not present.
<i>NTN</i>	The field is mandatory present for NTN. Otherwise, the field is not present.
<i>TDD</i>	The field is optionally present, Need OR, for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.
<i>TDD1</i>	The field is mandatory present for TDD; otherwise the field is not present and the UE shall delete any existing value for this field.

## — ***RadioResourceConfigDedicated-NB***

The IE *RadioResourceConfigDedicated-NB* is used to setup/modify/release RBs, to modify the MAC main configuration, and to modify dedicated physical configuration.

```

<b><i>RadioResourceConfigDedicated-NB</i></b> field descriptions	
<b><i>gnss-AutonomousEnabled</i></b>	Presence of this field indicates that autonomous GNSS re-acquisition is enabled by network.
<b><i>logicalChannelConfig</i></b>	For SRB a choice is used to indicate whether the logical channel configuration is signalled explicitly or set to the default logical channel configuration for SRB1 as specified in 9.2.1.1.
<b><i>logicalChannelIdentity</i></b>	The logical channel identity for both UL and DL for a DRB. Value 3 is not used.
<b><i>mac-MainConfig</i></b>	The default MAC MAIN configuration is specified in 9.2.2.
<b><i>newUE-Identity</i></b>	C-RNTI used after moving to RRC_CONNECTED in response to transmission using PUR.
<b><i>pdu-Session</i></b>	Identity of the PDU session whose QoS flow is mapped to the DRB.
<b><i>physicalConfigDedicated</i></b>	The default dedicated physical configuration is specified in 9.2.4.
<b><i>rlc-Config</i></b>	For SRBs a choice is used to indicate whether the RLC configuration is signalled explicitly or set to the values defined in the default RLC configuration for SRB1 in 9.2.1.1. RLC AM is the only applicable RLC mode for SRB1 and SRB1bis.
<b><i>schedulingRequestConfig</i></b>	For FDD: Scheduling request configuration.
<b><i>ul-TransmissionExtensionEnabled</i></b>	Presence of this field indicates that UL transmission extension after original GNSS validity duration expires is enabled by the network.
<b><i>ul-TransmissionExtensionValue</i></b>	Indicates the duration after original GNSS validity duration expires within which UL transmission is allowed. Value in number of sub-frames, value sf500 corresponds to 500 sub-frames, sf750 corresponds to 750 sub-frames and so on.

Conditional presence	Explanation
<i>DRB-Setup</i>	The field is mandatory present if the corresponding DRB is being set up; otherwise it is not present.
<i>DRB-Setup-5GC</i>	The field is mandatory present if the corresponding DRB is being set up when connected to 5GC; otherwise it is not present.
<i>DRB-Setup-EPC</i>	The field is mandatory present if the corresponding DRB is being set up when connected to EPC; otherwise it is not present.
<i>Setup</i>	The field is mandatory present if the corresponding SRB/DRB is being setup; otherwise the field is optionally present, need ON.

## – *ResourceReservationConfig-NB*

The IE *ResourceReservationConfig-NB* is used to specify the reserved downlink or uplink resources on a NB-IoT carrier, e.g. for deployment within a NR carrier.

### ***ResourceReservationConfig-NB*** information element

```
-- ASN1START

ResourceReservationConfig-NB-r16 ::= SEQUENCE {
 periodicity-r16 ENUMERATED {ms10, ms20, ms40, ms80, ms160, spare3, spare2, spare1},
 startPosition-r16 INTEGER (0..15),
 resourceReservation-r16 CHOICE {
 subframeBitmap-r16 CHOICE {
 subframePattern10ms BIT STRING (SIZE (10)),
 subframePattern40ms BIT STRING (SIZE (40))
 },
 slotConfig-r16 SEQUENCE {
 slotBitmap-r16 CHOICE {
 slotPattern10ms BIT STRING (SIZE (20)),
 slotPattern40ms BIT STRING (SIZE (80))
 },
 symbolBitmap-r16 CHOICE {
 symbolBitmapFddDl SEQUENCE {
 symbolBitmap1-r16 BIT STRING (SIZE (5)) OPTIONAL, -- Cond Bitmap1
 symbolBitmap2-r16 BIT STRING (SIZE (5)) OPTIONAL, -- Cond Bitmap2
 },
 symbolBitmapFddUlOrTdd SEQUENCE {

```

```

 symbolBitmap1-r16 BIT STRING (SIZE (7)) OPTIONAL, -- Cond Bitmap1
 symbolBitmap2-r16 BIT STRING (SIZE (7)) OPTIONAL, -- Cond Bitmap2
 }
}
},
...
}

-- ASN1STOP

```

### ResourceReservationConfig field descriptions

#### **periodicity**

Periodicity of the reserved resource. Value *ms10* corresponds to 10 milliseconds, value *ms20* corresponds to 20 milliseconds, and so on.

#### **slotPattern10ms, slotPattern40ms**

For FDD: Downlink slot-level resource reservation configuration over 10ms or 40ms.

Parameter slot-reserved-resource-config-DL in TS 36.211 [21] and TS 36.213 [23]

The first/leftmost 2-bits corresponds to the subframe #0 of the radio frame satisfying SFN mod x = *startPosition*, where x is the periodicity of the reserved resource divided by 10. Two bits for each subframe coded as:

00: both slots are not reserved

01: the first slot is not reserved, the second slot is reserved

10: the first slot is reserved, the second slot is not reserved

11: both slots are reserved

#### **startPosition**

Start time of the resource reservation pattern in one period. Unit in multiple of 10 milliseconds.

E-UTRAN configures the value of *startPosition* such as *startPosition* \* 10 < *periodicity*.

#### **subframePattern10ms, subframePattern40ms**

For FDD: Downlink subframe-level resource reservation configuration over 10ms or 40ms.

Parameters valid-subframe-config-DL in TS 36.211 [21] and TS 36.213 [23].

The first/leftmost bit corresponds to the subframe #0 of the radio frame satisfying SFN mod x = *startPosition*, where x is the periodicity of the reserved resource divided by 10. Value 0 indicates that the corresponding subframe is not reserved, value 1 indicates that the corresponding subframe is reserved.

#### **symbolBitmap**

Symbol-level resource reservation for one subframe.

E-UTRAN configures *symbolConfigFddDl* for a DL FDD NB-IoT carrier. E-UTRAN configures *symbolConfigFddUOrTdd* for an UL FDD NB-IoT carrier or a TDD NB-IoT carrier.

#### **symbolBitmap1, symbolBitmap2**

Symbol-level resource reservation over the first or the second slot of one subframe, see TS 36.211 [21].

The first/leftmost bit corresponds to the symbol #0 in the slot. Value 0 indicates that the corresponding symbol is not reserved, value 1 indicates that the corresponding symbol is reserved.

If *symbolBitmap1* is absent, value '01' in the *slotBitmap* corresponds to the second slot being reserved.

If *symbolBitmap2* is absent, value '10' in the *slotBitmap* corresponds to the first slot being reserved.

#### **symbolBitmapFddDl**

For FDD: Downlink symbol-level resource reservation over the first and the second slot of one subframe, see TS 36.211 [21].

Symbols that carry NRS are not reserved.

#### **symbolBitmapFddUOrTdd**

For FDD: Uplink symbol-level resource reservation over the first and the second slot of one subframe, see TS 36.211 [21].

For TDD: Uplink or downlink symbol-level resource reservation over the first and the second slot of one subframe, see TS 36.211 [21].

Symbols that carry NRS are not reserved.

Conditional presence	Explanation
<i>Bitmap1</i>	The field is optional present, need OR, if value of <i>slotBitmap</i> corresponding to at least one subframe is '01'; otherwise the field is not present.
<i>Bitmap2</i>	The field is optional present, need OR, if value of <i>slotBitmap</i> corresponding to at least one subframe is '10'; otherwise the field is not present.

## – RLC-Config-NB

The IE *RLC-Config-NB* is used to specify the RLC configuration of SRBs and DRBs.

***RLC-Config-NB information element***

```
-- ASN1START

RLC-Config-NB-r13 ::= CHOICE {
 am SEQUENCE {
 ul-AM-RLC-r13 UL-AM-RLC-NB-r13,
 dl-AM-RLC-r13 DL-AM-RLC-NB-r13
 },
 ...,
 um-Bi-Directional-r15 NULL,
 um-Uni-Directional-UL-r15 NULL,
 um-Uni-Directional-DL-r15 NULL
}

RLC-Config-NB-v1430 ::= SEQUENCE {
 t-Reordering-r14 T-Reordering OPTIONAL -- Cond twoHARQ
}

RLC-Config-NB-v1700 ::= SEQUENCE {
 t-ReorderingExt-r17 SetupRelease {T-ReorderingExt-r17}
}

UL-AM-RLC-NB-r13 ::= SEQUENCE {
 t-PollRetransmit-r13 T-PollRetransmit-NB-r13,
 maxRetxThreshold-r13 ENUMERATED {t1, t2, t3, t4, t6, t8, t16, t32}
}

DL-AM-RLC-NB-r13 ::= SEQUENCE {
 enableStatusReportSN-Gap-r13 ENUMERATED {true} OPTIONAL
}

T-PollRetransmit-NB-r13 ::= ENUMERATED {
 ms250, ms500, ms1000, ms2000, ms3000, ms4000,
 ms6000, ms10000, ms15000, ms25000, ms40000, ms60000,
 ms90000, ms120000, ms180000, ms300000-v1530
}

-- ASN1STOP
```

***RLC-Config-NB field descriptions******enableStatusReportSN-Gap***

Indicates that status reporting due to detection of reception failure is enabled, as specified in TS 36.322 [7].

***maxRetxThreshold***

Parameter for RLC AM in TS 36.322 [7]. Value t1 corresponds to 1 retransmission, t2 to 2 retransmissions and so on.

***t-PollRetransmit***

Timer for RLC AM in TS 36.322 [7], in milliseconds. Value msX means X ms, msY means Y ms and so on.  
E-UTRAN may configure the value *msX-v1530* (with suffix) only in TDD mode.

***t-Reordering***

Timer for reordering in TS 36.322 [7], in milliseconds.

***t-ReorderingExt***

Timer for reordering in TS 36.322 [7], in milliseconds.

The UE shall use the extended value *t-ReorderingExt-r17*, if present, and ignore the value signaled by *t-Reordering-r14*.

E-UTRAN may configure *t-ReorderingExt* only if *twoHARQ-ProceduresConfig* is set to TRUE.

Conditional presence	Explanation
<i>twoHARQ</i>	The field is mandatory present if <i>twoHARQ-ProceduresConfig</i> is set to TRUE. Otherwise, the field is not present and, if previously configured, the timer is released.

***RLF-TimersAndConstants-NB***

The IE *RLF-TimersAndConstants-NB* contains UE specific timers and constants applicable for UEs in RRC\_CONNECTED.

***RLF-TimersAndConstants-NB information element***

```
-- ASN1START
```

```

RLF-TimersAndConstants-NB-r13 ::= CHOICE {
 release
 setup
 t301-r13
 t310-r13
 n310-r13
 t311-r13
 n311-r13
 ...

],
 t311-v1530
 ENUMERATED { ms160000, ms200000 }
 OPTIONAL -- Cond TDD
]
}
}

-- ASN1STOP

```

#### **RLF-TimersAndConstants-NB field descriptions**

##### **n3xy**

Constants are described in clause 7.4. n1 corresponds with 1, n2 corresponds with 2 and so on.

##### **t3xy**

Timers are described in clause 7.3. Value ms0 corresponds with 0 ms, ms200 corresponds with 200 ms and so on. The UE shall use the extended values *t311-v1350*, *t301-v1530* and *t311-v1530*, if present, and ignore the value signaled by *t311-r13*, *t301-r13* and *t311-r13* respectively.

Conditional presence	Explanation
TDD	The field is optionally present, Need OR, in TDD mode. Otherwise, the field is not present.

### **SchedulingRequestConfig-NB**

The IE *SchedulingRequestConfig-NB* is used to specify the Scheduling Request related parameters.

#### **SchedulingRequestConfig-NB information element**

```

-- ASN1START

SchedulingRequestConfig-NB-r15 ::= SEQUENCE {
 sr-WithHARQ-ACK-Config-r15 ENUMERATED {true} OPTIONAL,

 sf1280, sf2048, sf2560, sf5120}
 }
}

SR-ProhibitTimerOffset-NB-r17 ::= ENUMERATED {
 ms90, ms180, ms270, ms360, ms450, ms540, ms1080, spare
}

-- ASN1STOP
```

<b><i>SchedulingRequestConfig-NB</i></b> field descriptions	
<b><i>alpha</i></b>	Parameter: $\alpha_c$ . Fractional power control parameter for SR without HARQ-ACK. See TS 36.213 [23], clause 16.2.1.2.1, where value <i>al0</i> corresponds to 0, value <i>al04</i> corresponds to 0.4, value <i>al05</i> to 0.5, value <i>al06</i> to 0.6, value <i>al07</i> to 0.7, value <i>al08</i> to 0.8, value <i>al09</i> to 0.9 and value <i>al1</i> corresponds to 1.
<b><i>nprach-CarrierIndex</i></b>	Index of the carrier in the list of UL non anchor carriers in <i>SystemInformationBlockType22-NB</i> . The first entry in the list has index '1', the second entry has index '2' and so on. Value '0' indicates the anchor carrier.
<b><i>nprach-ResourceIndex</i></b>	Index of the NPRACH resource in the list of NPRACH resources in <i>NPRACH-ParametersList</i> or <i>NPRACH-ParametersList-Fmt2</i> for the UL carrier indicated by <i>nprach-CarrierIndex</i> . The first entry in the list has index '1', the second entry has index '2' and so on. E-UTRAN configures a NPRACH resource in <i>NPRACH-ParametersList-Fmt2</i> only to UEs that have reported support of NPRACH resource Format2.
<b><i>nprach-SubCarrierIndex</i></b>	Index of the subcarrier in the NPRACH resource in <i>NPRACH-ParametersList</i> or <i>NPRACH-ParametersList-Fmt2</i> for the indicated UL carrier. E-UTRAN does not configure <i>nprach-SubcarrierIndex</i> to a smaller value than <i>nprach-SubcarrierOffset</i> + <i>nprach-NumCBRA-StartSubcarriers</i> for the indicated NPRACH resource.
<b><i>p0-SR</i></b>	Parameter: $P_{0\_SR,c}$ . Target power for SR without HARQ-ACK. See TS 36.213 [23], clause 16.2.1.2.1, unit dBm.
<b><i>semiPersistSchedC-RNTI</i></b>	Semi-persistent Scheduling C-RNTI, see TS 36.321 [6].
<b><i>semiPersistSchedIntervalUL</i></b>	Semi-persistent scheduling interval in uplink, see TS 36.321 [6]. Value in number of sub-frames. Value <i>sf128</i> corresponds to 128 sub-frames, value <i>sf256</i> corresponds to 256 sub-frames and so on.
<b><i>sr-NPRACH-Resource</i></b>	NPRACH resource for physical layer SR without HARQ-ACK, see TS 36.211 [21] and TS 36.213 [23].
<b><i>sr-ProhibitTimer</i></b>	Timer for SR transmission on the NPRACH resource for SR in TS 36.321 [6]. Value in number of SR period, where the SR period is equal to the field <i>nprach-Periodicity</i> of the NPRACH resource. Value 0 means that behaviour as specified in 7.3.2 applies. Value 1 corresponds to one SR period, Value 2 corresponds to 2*SR period and so on. If <i>sr-ProhibitTimerOffset</i> is present, actual value of <i>sr-ProhibitTimer</i> = CEIL ( <i>sr-ProhibitTimerOffset</i> / SR period) + signalled value of <i>sr-ProhibitTimer</i> .
<b><i>sr-ProhibitTimerOffset</i></b>	Time offset for SR transmission on the NPRACH resource for SR in TS 36.321 [6]. Value in milliseconds. Value <i>ms90</i> corresponds to 90 ms, value <i>ms180</i> corresponds to 180 ms and so on.
<b><i>sr-WithHARQ-ACK-Config</i></b>	Activation of physical layer SR with HARQ ACK, see TS 36.213 [23].
<b><i>sr-WithoutHARQ-ACK-Config</i></b>	Activation of physical layer SR without HARQ ACK, see TS 36.211 [21] and TS 36.213 [23]. E-UTRAN cannot configure <i>sr-WithoutHARQ-ACK-Config</i> together with <i>sr-SPS-BSR-Config</i> .

## — ***TDD-Config-NB***

The IE *TDD-Config-NB* is used to specify the TDD specific physical channel configuration.

### ***TDD-Config*** information element

```
-- ASN1START
TDD-Config-NB-r15 ::= SEQUENCE {
 subframeAssignment-r15 ENUMERATED {
 sa1, sa2, sa3, sa4, sa5},
 specialSubframePatterns-r15 ENUMERATED {
 ssp0, ssp1, ssp2, ssp3, ssp4, ssp5, ssp6, ssp7,
 ssp8, ssp9, ssp10, ssp10-CRS-LessDwPTS}
}
-- ASN1STOP
```

<b>TDD-Config field descriptions</b>	
<b>specialSubframePatterns</b>	Indicates Configuration as in TS 36.211 [21], table 4.2-1 where ssp0 points to Configuration 0, ssp1 to Configuration 1 etc. Value ssp10-CRS-LessDwPTS corresponds to ssp10 without CRS transmission on the 5th symbol of DwPTS.
<b>subframeAssignment</b>	Indicates DL/UL subframe configuration where sa1 points to Configuration1, sa2 to Configuration 2 and so on, as specified in TS 36.211 [21], table 4.2-2. E-UTRAN configures the same value for serving cells residing on same frequency band.

### – *TDD-UL-DL-AlignmentOffset-NB*

The IE *TDD-UL-DL-AlignmentOffset-NB* is used to specify the offset between the UL carrier frequency center with respect to DL carrier frequency center. This information should be used to calculate the Mul value, see TS 36.101 [42].

#### ***TDD-UL-DL-AlignmentOffset-NB* information element**

```
-- ASN1START
TDD-UL-DL-AlignmentOffset-NB-r15 ::= ENUMERATED { khz-7dot5, khz0, khz7dot5}
-- ASN1STOP
```

### – *UplinkPowerControl-NB*

The IE *UplinkPowerControlCommon-NB* and IE *UplinkPowerControlDedicated-NB* are used to specify parameters for uplink power control in the system information and in the dedicated signalling, respectively.

#### ***UplinkPowerControl-NB* information elements**

```
-- ASN1START
UplinkPowerControlCommon-NB-r13 ::= SEQUENCE {
 p0-NominalNPUSCH-r13 INTEGER (-126..24),
 alpha-r13 ENUMERATED {a10, a104, a105, a106, a107, a108, a109, a11},
 deltaPreambleMsg3-r13 INTEGER (-1..6)
}

UplinkPowerControlDedicated-NB-r13 ::= SEQUENCE {
 p0-UE-NPUSCH-r13 INTEGER (-8..7)
}

UplinkPowerControlDedicated-NB-v1700 ::= SEQUENCE {
 deltaMCS-Enabled-r17 ENUMERATED {en0, en1}
}
-- ASN1STOP
```

<b><i>UplinkPowerControl-NB field descriptions</i></b>	
<b><i>alpha</i></b>	Parameter: $\alpha_c(1)$ . See TS 36.213 [23], clause 16.2.1.1, where al0 corresponds to 0, al04 corresponds to value 0.4, al05 to 0.5, al06 to 0.6, al07 to 0.7, al08 to 0.8, al09 to 0.9 and al1 corresponds to 1.
<b><i>deltaMCS-Enabled</i></b>	Parameter: $K_S$ . See TS 36.213 [23], clause 16.2.1.1.1. Value <i>en0</i> corresponds to value 0 corresponding to state "disabled" and value <i>en1</i> corresponds to value 1.25 corresponding to state "enabled".
<b><i>deltaPreambleMsg3</i></b>	Parameter: $\Delta_{\text{PREAMBLE\_Msg3}}$ . See TS 36.213 [23], clause 16.2.1.1. Actual value = IE value * 2 [dB].
<b><i>p0-NominalNPUSCH</i></b>	Parameter: $P_{0\text{-NOMINAL\_NPUSCH,c}}(1)$ . See TS 36.213 [23], clause 16.2.1.1, unit dBm.
<b><i>p0-UE-NPUSCH</i></b>	Parameter: $P_{0\text{-UE\_NPUSCH,c}}(1)$ . See TS 36.213 [23], clause 16.2.1.1, unit dB.

### — *WUS-Config-NB*

The IE *WUS-Config-NB* is used to specify the WUS configuration. For UEs supporting WUS, E-UTRAN uses WUS to indicate that the UE shall attempt to receive paging in that cell, see TS 36.304 [4].

#### ***WUS-Config-NB information element***

```
-- ASN1START

WUS-Config-NB-r15 ::= SEQUENCE {
 maxDurationFactor-r15 WUS-MaxDurationFactor-NB-r15,
 numPOs-r15 ENUMERATED {n1, n2, n4} DEFAULT n1,
 numDRX-CyclesRelaxed-r15 ENUMERATED {n1, n2, n4, n8},
 timeOffsetDRX-r15 ENUMERATED {ms40, ms80, ms160, ms240},
 timeOffset-eDRX-Short-r15 ENUMERATED {ms40, ms80, ms160, ms240},
 timeOffset-eDRX-Long-r15 ENUMERATED {ms1000, ms2000} OPTIONAL, -- Need OP
 ...
}

WUS-ConfigPerCarrier-NB-r15 ::= SEQUENCE {
 maxDurationFactor-r15 WUS-MaxDurationFactor-NB-r15
}

WUS-MaxDurationFactor-NB-r15 ::= ENUMERATED {one128th, one64th, one32th, one16th,
 oneEighth, oneQuarter, oneHalf}
-- ASN1STOP
```

<b><i>WUS-Config-NB field descriptions</i></b>	
<b><i>maxDurationFactor</i></b>	Maximum WUS duration, expressed as a ratio of Rmax for Type 1-CSS. Value <i>one128th</i> means Rmax * 1/128, value <i>one64th</i> means Rmax * 1/64 and so on. The value $L_{NWUS\_max}$ in TS 36.213 [23] considered by the UE is : $\text{maxDuration} = \text{Max}(\text{signalled value} * \text{Rmax}, 1)$ where Rmax is the value of <i>npdch-NumRepetitionPaging</i> for the carrier.
<b><i>numDRX-CyclesRelaxed</i></b>	Maximum number of consecutive DRX cycles during which the UE may use WUS for synchronisation and skip serving cell measurements, see TS 36.133 [16]. Value n1 corresponds to 1 DRX cycle, value n2 corresponds to 2 DRX cycles and so on.
<b><i>numPOs</i></b>	Number of consecutive Paging Occasions (PO) mapped to one Wake Up Signal (WUS), applicable to UEs configured to use extended DRX, see TS 36.304 [4]. Value n1 corresponds to 1 PO and value n2 corresponds to 2 POs and so on.
<b><i>timeOffsetDRX</i></b>	When DRX is used, non-zero gap from the end of the configured maximum WUS duration to the associated PO, see TS 36.304 [4], clause 7.4 and TS 36.211 [21]. In milliseconds. Value <i>ms40</i> corresponds to 40ms, value <i>ms80</i> corresponds to 80 ms and so on.
<b><i>timeOffset-eDRX-Short</i></b>	When eDRX is used, the short non-zero gap from the end of the configured maximum WUS duration to the associated PO, see TS 36.304 [4], clause 7.4 and TS 36.211 [21]. In milliseconds. Value <i>ms40</i> corresponds to 40ms, value <i>ms80</i> corresponds to 80 ms and so on. E-UTRAN configures <i>timeOffset-eDRX-Short</i> to a value longer than or equal to <i>timeOffsetDRX</i> .
<b><i>timeOffset-eDRX-Long</i></b>	When eDRX is used, the long non-zero gap from the end of the configured maximum WUS duration to the associated PO, see TS 36.304 [4], clause 7.4 and TS 36.211 [21]. In milliseconds. Value <i>ms1000</i> corresponds to 1000 ms, value <i>ms2000</i> corresponds to 2000 ms.

### 6.7.3.3 NB-IoT Security control information elements

Void

### 6.7.3.4 NB-IoT Mobility control information elements

- *AdditionalBandInfoList-NB*

***AdditionalBandInfoList-NB information element***

```
-- ASN1START
AdditionalBandInfoList-NB-r14 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF FreqBandIndicator-NB-r13
-- ASN1STOP
```

- *FreqBandIndicator-NB*

The IE *FreqBandIndicator-NB* indicates the E-UTRA operating band as defined in TS 36.101 [42], table 5.5-1 and TS 36.102 [113], table 5.2-1 for NTN capable UE.

***FreqBandIndicator-NB information element***

```
-- ASN1START
FreqBandIndicator-NB-r13 ::= INTEGER (1.. maxFBI2)
-- ASN1STOP
```

- *MultiBandInfoList-NB*

***MultiBandInfoList-NB information element***

```
-- ASN1START
```

```

MultiBandInfoList-NB-r13 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF MultiBandInfo-NB-r13
MultiBandInfo-NB-r13 ::= SEQUENCE {
 freqBandIndicator-r13 FreqBandIndicator-NB-r13 OPTIONAL, -- Need OR
 freqBandInfo-r13 NS-PmaxList-NB-r13 OPTIONAL, -- Need OR
}
-- ASN1STOP

```

### *NS-PmaxList-NB*

The IE *NS-PmaxList-NB* concerns a list of *additionalPmax* and *additionalSpectrumEmission* as defined in TS 36.101 [42], clause 6.2.4F and TS 36.102 [113], clause 6.2B.3 for NTN capable UE, for a given frequency band. E-UTRAN does not include the same value of *additionalSpectrumEmission* in *SystemInformationBlockType2-NB* within this list.

#### ***NS-PmaxList-NB* information element**

```

-- ASN1START
NS-PmaxList-NB-r13 ::= SEQUENCE (SIZE (1..maxNS-Pmax-NB-r13)) OF NS-PmaxValue-NB-r13
NS-PmaxValue-NB-r13 ::= SEQUENCE {
 additionalPmax-r13 P-Max OPTIONAL, -- Need OR
 additionalSpectrumEmission-r13 AdditionalSpectrumEmission
}
-- ASN1STOP

```

### *ReselectionThreshold-NB*

The IE *ReselectionThreshold-NB* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = field value \* 2 [dB].

#### ***ReselectionThreshold-NB* information element**

```

-- ASN1START
ReselectionThreshold-NB-v1360 ::= INTEGER (32..63)
-- ASN1STOP

```

### *T-Reselection-NB*

The IE *T-Reselection-NB* concerns the cell reselection timer *Treselection<sub>RAT</sub>* for NB-IoT.

Value in seconds. s0 means 0 second and behaviour as specified in 7.3.2 applies, s3 means 3 seconds and so on.

#### ***T-Reselection-NB* information element**

```

-- ASN1START
T-Reselection-NB-r13 ::= ENUMERATED {s0, s3, s6, s9, s12, s15, s18, s21}
-- ASN1STOP

```

## 6.7.3.5 NB-IoT Measurement information elements

### *ANR-MeasConfig-NB*

The IE *ANR-MeasConfig-NB* is used to convey the configuration of the measurements to be performed by the UE in RRC\_IDLE for ANR.

***ANR-MeasConfig-NB* information element**

```
-- ASN1START

ANR-MeasConfig-NB-r16 ::= SEQUENCE {
 anr-QualityThreshold-r16 NRSRP-Range-NB-r14,
 anr-CarrierList-r16 ANR-CarrierList-NB-r16,
 ...
}

ANR-CarrierList-NB-r16 ::= SEQUENCE (SIZE (1..maxFreqANR-NB-r16)) OF ANR-Carrier-NB-r16

ANR-Carrier-NB-r16 ::= SEQUENCE {
 carrierFreqIndex-r16 INTEGER (1..maxFreq),
 excludedCellList-r16 ANR-ExcludedCellList-NB-r16 OPTIONAL, -- Need OP
 ...
}

ANR-ExcludedCellList-NB-r16 ::= SEQUENCE (SIZE (1..maxExcludedCell)) OF PhysCellId

-- ASN1STOP
```

***ANR-MeasConfig-NB* field descriptions*****anr-CarrierList***

List of NB-IoT carriers to be measured for ANR.

***anr-QualityThreshold***

Indicates the quality threshold for reporting the CGI of the strongest cell.

***carrierFreqIndex***

Index of the carrier frequency in *interFreqCarrierFreqList* in *SystemInformationBlockType5-NB*.

***excludedCellList***

List of exclude-listed neighbouring cells for ANR reporting.

***ANR-MeasReport-NB***

The IE *ANR-MeasReport-NB* includes the ANR measurements information.

***ANR-MeasReport-NB* information element**

```
-- ASN1START

ANR-MeasReport-NB-r16 ::= SEQUENCE {
 servCellIdentity-r16 CellGlobalIdEUTRA OPTIONAL,
 measResultServCell-r16 MeasResultServCell-NB-r14,
 relativeTimeStamp-r16 INTEGER (0..95),
 measResultList-r16 SEQUENCE (SIZE (1..maxFreqANR-NB-r16)) OF ANR-MeasResult-NB-
r16,
 ...
}

ANR-MeasResult-NB-r16 ::= SEQUENCE {
 carrierFreq-r16 CarrierFreq-NB-r13,
 physCellId-r16 PhysCellId OPTIONAL,
 measResultLastServCell-r16 MeasResultServCell-NB-r14,
 measResult-r16 NRSRP-Range-NB-r14 OPTIONAL,
 cgi-Info-r16 SEQUENCE {
 cellGlobalId-r16 CellGlobalIdEUTRA,
 trackingAreaCode-r16 TrackingAreaCode,
 plmn-IdentityList-r16 PLMN-IdentityList2 OPTIONAL
 } OPTIONAL
}
-- ASN1STOP
```

<b><i>ANR-MeasReport-NB</i> field descriptions</b>	
<b><i>carrierFreq</i></b>	Indicates the carrier frequency of the reported cell.
<b><i>cgi-info</i></b>	Broadcast information of the reported cell.
<b><i>measResult</i></b>	Measured result of the reported cell.
<b><i>measResultList</i></b>	List of measured results for the maximum number of reported carrier frequencies.
<b><i>measResultLastServCell</i></b>	The last measurement results taken in the serving cell when the measured results of the reported cell is stored.
<b><i>measResultServingCell</i></b>	Measurement results taken in the serving cell when the configuration of the measurements is received.
<b><i>plmn-IdentityList</i></b>	The list of PLMN Identity read from the broadcast information of the reported cell.
<b><i>relativeTimeStamp</i></b>	Indicates the time when the ANR measurements are complete, measured relative to the time when the configuration of the measurements was received. Value in hours.
<b><i>servingCellIdentity</i></b>	Indicates the cell where the measurement configuration was received. If the field is absent, it is the same as the current serving cell.

### – **CQI-NPDCCH-NB**

The IE *CQI-NPDCCH-NB* represents the downlink channel quality measurement of the NB-IoT carrier where the random access response is received. The codepoints for the CQI-NPDCCH measurements are according to the mapping table in TS 36.133 [16]. The value *noMeasurements* indicates no measurement reporting.

#### **CQI-NPDCCH-NB information element**

```
-- ASN1START
CQI-NPDCCH-NB-r14 ::= ENUMERATED {
 noMeasurements, candidateRep-A, candidateRep-B, candidateRep-C,
 candidateRep-D, candidateRep-E, candidateRep-F, candidateRep-G,
 candidateRep-H, candidateRep-I, candidateRep-J, candidateRep-K,
 candidateRep-L}
-- ASN1STOP
```

### – **CQI-NPDCCH-Short-NB**

The IE *CQI-NPDCCH-Short-NB* represents the short version of the downlink channel quality measurement of the NB-IoT carrier where the random access response is received. The codepoints for the CQI-NPDCCH-Short measurements are according to the mapping table in TS 36.133 [16]. The value *noMeasurements* indicates no measurement reporting.

#### **CQI-NPDCCH-Short-NB information element**

```
-- ASN1START
CQI-NPDCCH-Short-NB-r14 ::= ENUMERATED {
 noMeasurements, candidateRep-1, candidateRep-2, candidateRep-3}
-- ASN1STOP
```

### – **MeasResultServCell-NB**

The IE *MeasResultServCell-NB* covers the measured results for the serving cell.

#### **MeasResultServCell-NB information element**

```
-- ASN1START
MeasResultServCell-NB-r14 ::= SEQUENCE {
```

```

 nrsrpResult-r14 NRSRP-Range-NB-r14 ,
 nrsrqResult-r14 NRSRQ-Range-NB-r14
}

-- ASN1STOP

```

### **NRSRP-Range-NB**

The IE *NRSRP-Range-NB* specifies the value range used in NRSRP measurements and thresholds. Integer value for NRSRP measurements according to mapping table in TS 36.133 [16], Table 9.1.22.9-1.

#### **NRSRP-Range-NB information element**

```

-- ASN1START

NRSRP-Range-NB-r14 ::= INTEGER(0..113)

-- ASN1STOP

```

### **NRSRQ-Range-NB**

The IE *NRSRQ-Range-NB* specifies the value range used in NRSRQ measurements and thresholds. Integer value for RSRQ measurements is according to mapping table in TS 36.133 [16], Table 9.1.22.14-1. The UE shall not report values 0 and 34.

#### **NRSRQ-Range-NB information element**

```

-- ASN1START

NRSRQ-Range-NB-r14 ::= INTEGER(-30..46)

-- ASN1STOP

```

### **NSSS-RRM-Config-NB**

The IE *NSSS-RRM-Config-NB* provides the configuration for NSSS-based RRM measurements. See TS 36.133 [16], TS 36.211 [21] and TS 36.214 [48]. The UE only performs NSSS-based RRM measurement on cells for which the configuration has been provided.

#### **NSSS-RRM-Config-NB information element**

```

-- ASN1START

NSSS-RRM-Config-NB-r15 ::= SEQUENCE {
 nsss-RRM-PowerOffset-r15 ENUMERATED {dB-3, dB0, dB3},
 nsss-NumOccDiffPrecoders-r15 ENUMERATED {n1, n2, n4, n8} OPTIONAL -- Need OP
}
-- ASN1STOP

```

#### **NSSS-RRM-Config-NB field descriptions**

##### **nsss-RRM-PowerOffset**

NSSS to NRS ratio for the serving cell as specified in TS 36.214 [48]. Value in dB. Value dB-3 corresponds to -3 dB, dB0 corresponds to 0 dB and so on.

##### **nsss-NumOccDiffPrecoders**

Number of consecutive NSSS occasions that use different precoders for NSSS transmission. See TS 36.211 [21]. Value *n1* corresponds to 1 occasion, *n2* corresponds to 2 occasions and so on.

For value *n2*, *n4*, and *n8*, UE may assume for *nsss-NumOccDiffPrecoders* consecutive NSSS occasions, E-UTRAN uses different precoders for NSSS transmission. For value *n1*, UE may assume that E-UTRAN always uses the same precoder.

If the field is absent, the UE makes no assumption on the antenna port(s) used for NSSS.

### 6.7.3.6 NB-IoT Other information elements

- ***EstablishmentCause-NB***

The IE *EstablishmentCause-NB* provides the establishment cause for the RRC connection request or the RRC connection resume request as provided by the upper layers.

#### ***EstablishmentCause-NB* information element**

```
-- ASN1START

EstablishCause-NB-r13 ::= ENUMERATED {
 mt-Access, mo-Signalling, mo-Data, mo-ExceptionData,
 delayTolerantAccess-v1330, mt-EDT-v1610, spare2, spare1}

-- ASN1STOP
```

- ***UE-Capability-NB***

The IE *UE-Capability-NB* is used to convey the NB-IoT UE Radio Access Capability Parameters, see TS 36.306 [5]. The IE *UE-Capability-NB* is transferred in NB-IoT only.

#### ***UE-Capability-NB* information element**

```
-- ASN1START

UE-Capability-NB-r13 ::= SEQUENCE {

<b>UE-Capability-NB field descriptions</b>	<b>FDD/TDD appl</b>	<b>FDD/TDD diff</b>
<b>accessStratumRelease</b> Set to rel17 in this version of the specification.	FDD/TDD	No
<b>additionalTransmissionSIB1</b> Indicates whether the UE supports additional SIB1 transmission as specified in TS 36.213 [23].	FDD	-
<b>anr-Report</b> Indicates whether the UE supports ANR measurements in RRC_IDLE.	FDD/TDD	No
<b>connModeMeasIntraFreq, connModeMeasInterFreq</b> Indicates whether the UE in RRC_CONNECTED supports neighbour cell measurements.	FDD/TDD	No
<b>coverageBasedPaging</b> Indicates whether the UE in RRC_IDLE supports coverage based paging carrier selection as defined in TS 36.304 [4].	FDD/TDD	No
<b>dataInactMon</b> Indicates whether the UE supports the data inactivity monitoring as specified in TS 36.321 [6].	FDD/TDD	No
<b>dl-ChannelQualityReporting-r16</b> Indicates whether the UE supports DL channel quality reporting in connected mode as specified in TS 36.321 [6].	FDD	-
<b>dummy</b> This field is not used in the specification. It shall not be sent by the UE.	NA	NA
<b>earlyData-UP, earlyData-UP-5GC</b> Indicates whether the UE supports EDT for User plane CIoT EPS/5GS optimisations, as defined in TS 24.301 [35] and 24.501 [95] respectively.	FDD	-
<b>earlySecurityReactivation</b> Indicates whether the UE supports early security reactivation when resuming a suspended RRC connection.	FDD/TDD	No
<b>interferenceRandomisation</b> For FDD: Indicates whether the UE supports interference randomisation in connected mode as defined in TS.36.211 [21].	FDD	-
<b>locationInfo</b> Indicates whether the UE supports reporting of <i>locationInfo</i> in RLF report.	FDD/TDD	No
<b>maxNumberROHC-ContextSessions</b> Set to the maximum number of concurrently active ROHC contexts supported by the UE, excluding context sessions that leave all headers uncompressed. cs2 corresponds with 2 (context sessions), cs4 corresponds with 4 and so on. The network ignores this field if the UE supports none of the ROHC profiles in <i>supportedROHC-Profiles</i> .	FDD/TDD	No
<b>mixedOperationMode</b> Defines whether the UE supports multi-carrier operation with mixed operation mode, standalone or inband/guardband, between the anchor carrier and the non-anchor carrier for unicast, paging, and random access as specified in TS 36.300 [9].	FDD	-
<b>multiCarrier</b> Defines whether the UE supports multi -carrier operation.	FDD/TDD	Yes
<b>multicarrier-NPRACH</b> Defines whether the UE supports NPRACH on non-anchor carrier as specified in TS 36.321 [6].	FDD/TDD	Yes
<b>multipleDRB</b> Defines whether the UE supports multiple DRBs.	FDD/TDD	No
<b>multiNS-Pmax</b> Defines whether the UE supports the mechanisms defined for NB-IoT cells broadcasting NS-PmaxList-NB.	FDD/TDD	No
<b>multiTB-HARQ-AckBundling</b> Indicates whether the UE supports HARQ ACK bundling for interleaved transmission for DL. If <i>multiTB-HARQ-AckBundling</i> is included, the UE shall also indicate support for <i>npdsch-MultiTB-Interleaving</i> .	FDD	-
<b>multiTone</b> Defines whether the UE supports UL multi-tone transmissions on NPUSCH.	FDD/TDD	Yes
<b>npdsch-16QAM</b> Indicates whether the UE supports 16QAM for DL unicast as defined in TS 36.213 [23].	FDD/TDD	Yes
<b>npdsch-MultiTB</b> Indicates whether the UE supports multiple TBs scheduling in RRC_CONNECTED for DL. If <i>npdsch-MultiTB</i> is included, the UE shall also indicate support for <i>twoHARQ-Processes</i> .	FDD	-
<b>npdsch-MultiTB-Interleaving</b> Indicates whether the UE supports interleaved transmission when multiple TBs is scheduled in RRC_CONNECTED for DL.	FDD	-

<b>UE-Capability-NB field descriptions</b>	<b>FDD/TDD appl</b>	<b>FDD/TDD diff</b>
<b>nprach-Format2</b> Defines whether the UE supports NPRACH resources using preamble format 2.	FDD	-
<b>npusch-16QAM</b> Indicates whether the UE supports 16QAM for UL unicast on the band as defined in TS 36.213 [23].	FDD/TDD	No
<b>npusch-3dot75kHz-SCS-TDD</b> Indicates whether the UE supports NPUSCH with 3.75kHz SCS for TDD.	TDD	-
<b>npusch-MultiTB</b> Indicates whether the UE supports multiple TBs scheduling in RRC_CONNECTED for UL. If npusch-MultiTB is included, the UE shall also indicate support for twoHARQ-Processes.	FDD	-
<b>npusch-MultiTB-Interleaving</b> Indicates whether the UE supports interleaved transmission when multiple TBs is scheduled in RRC_CONNECTED for UL.	FDD	-
<b>ntn-Autonomous-GNSS-Fix</b> This field indicates whether the UE supports autonomous GNSS position fix in RRC_CONNECTED.	FDD	-
<b>ntn-Connectivity-EPC</b> Indicates whether the UE supports NTN access when connected to EPC. If the UE indicates this capability, the UE shall support all NTN essential features as specified in TS 36.306 [5].	FDD	-
<b>ntn-DCI-HarqDisableMultiTB</b> This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission when HARQ feedback disabling per HARQ process for downlink transmission is not configured by RRC and when configured with npdsch-MultiTB-Config.	FDD	-
<b>ntn-DCI-HarqDisableSingleTB</b> This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission when HARQ feedback disabling per HARQ process for downlink transmission is not configured by RRC.	FDD	-
<b>ntn-GNSS-EnhScenarioSupport</b> This field indicates whether the UE supports GNSS measurement enhancements in RRC_CONNECTED for only GSO or NGSO scenario. If this field is not included, the GNSS measurement enhancements in RRC_CONNECTED that are indicated as supported are not applicable for both GSO and NGSO scenario.	FDD	-
<b>ntn-HarqEnhScenarioSupport</b> This field indicates whether the UE supports UL and DL HARQ process enhancements for only GSO or NGSO scenario. If this field is not included, the UL and DL HARQ process enhancements that are indicated as supported are applicable for both GSO and NGSO scenario.	FDD	-
<b>ntn-LocationBasedMeasTrigger-EFC</b> This field indicates whether the UE supports location-based measurement trigger in RRC_CONNECTED in earth fixed cell.	FDD	-
<b>ntn-LocationBasedMeasTrigger-EMC</b> This field indicates whether the UE supports location-based measurement trigger in RRC_CONNECTED in earth moving cell.	FDD	-
<b>ntn-OffsetTimingEnh</b> Indicates whether the UE supports timing relationship enhancement using <i>Differential Koffset</i> as specified in TS 36.321 [6] and TS 36.213 [23].	FDD	-
<b>ntn-OverriddenHarqDisableMultiTB</b> This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission by overriding the RRC configuration when configured with npdsch-MultiTB-Config.	FDD	-
<b>ntn-OverriddenHarqDisableSingleTB</b> This field indicates whether the UE supports DCI-based HARQ feedback disabling for downlink transmission by overriding the RRC configuration.	FDD	-
<b>ntn-PUR-TimerDelay</b> Indicates whether the UE supports delaying the start of the <i>pur-ResponseWindowTimer</i> for NTN, see TS 36.321 [6].	FDD	
<b>ntn-RRC-HarqDisableMultiTB</b> This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration when configured with npdsch-MultiTB-Config.	FDD	-
<b>ntn-RRC-HarqDisableSingleTB</b> This field indicates whether the UE supports HARQ feedback disabling per HARQ process for downlink transmission by RRC configuration.	FDD	-

<b>UE-Capability-NB field descriptions</b>	<b>FDD/TDD appl</b>	<b>FDD/TDD diff</b>
<b><i>ntn-SegmentedPrecompensationGaps</i></b> Indicates the minimum supported gap length between segments for segmented uplink transmission. Value <i>sym1</i> corresponds to 1 symbol, value <i>s1/1</i> corresponds to 1 slot, value <i>s1/2</i> corresponds to 2 slots.	FDD	-
<b><i>ntn-ScenarioSupport</i></b> Indicates whether the UE supports NTN features for only GSO or NGSO scenario. If a UE does not include this field but includes <i>ntn-Connectivity-EPC-r17</i> , the UE supports the NTN features for both GSO and NGSO scenarios.	FDD	-
<b><i>ntn-TA-report</i></b> Indicates whether the UE supports timing advance reporting in RRC_CONNECTED, see TS 36.321 [6].	FDD	-
<b><i>ntn-TimeBasedMeasTrigger</i></b> This field indicates whether the UE supports time-based measurement trigger in RRC_CONNECTED.	FDD	-
<b><i>ntn-Triggered-GNSS-Fix</i></b> This field indicates whether the UE supports network triggered GNSS position fix in RRC_CONNECTED.	FDD	-
<b><i>ntn-UplinkHarq-ModeB-MultiTB</i></b> This field indicates whether the UE supports HARQ Mode B when scheduled with uplink transmission of multiple TBs.	FDD	-
<b><i>ntn-UplinkHarq-ModeB-SingleTB</i></b> This field indicates whether the UE supports HARQ Mode B.	FDD	-
<b><i>ntn-UplinkTxExtension</i></b> This field indicates whether the UE supports to perform UL transmission in a duration after original GNSS validity duration expires without GNSS re-acquisition.	FDD	-
<b><i>powerClassNB-14dBm</i></b> Defines whether the UE supports power class 14dBm in all the bands supported by the UE as specified in TS 36.101 [42]. If <i>powerClassNB-20dBm</i> is included, the UE shall not include the field <i>powerClassNB-14dBm</i> .	FDD/TDD	No
<b><i>powerClassNB-20dBm</i></b> Defines whether the UE supports power class 20dBm in NB-IoT for the band, as specified in TS 36.101 [42] and TS 36.102 [113] for NTN capable UE. If neither <i>powerClassNB-14dBm</i> nor <i>powerClassNB-20dBm</i> is included, UE supports power class 23 dBm in the NB-IoT band.	FDD/TDD	No
<b><i>pur-CP-EPC, pur-CP-5GC</i></b> Indicates whether the UE supports transmission using PUR for Control plane CloT EPS/5GS optimisations, as defined in TS 24.301 [35] and TS 24.501 [95] respectively.	FDD	-
<b><i>pur-CP-L1Ack</i></b> Indicates whether UE supports L1 acknowledgement in response to CP transmission using PUR. If <i>pur-CP-L1Ack</i> is included, the UE shall also indicate support for <i>pur-CP-EPC</i> or <i>pur-CP-5GC</i> .	FDD	-
<b><i>pur-NRSRP-Validation</i></b> Indicates whether UE supports serving cell NRSRP for TA validation for transmission using PUR. If <i>pur-NRSRP-Validation</i> is included, the UE shall also indicate support for <i>pur-CP-EPC</i> , <i>pur-CP-5GC</i> , <i>pur-UP-EPC</i> or <i>pur-CP-5GC</i> .	FDD	-
<b><i>pur-UP-EPC, pur-UP-5GC</i></b> Indicates whether the UE supports transmission using PUR for User plane CloT EPS/5GS optimisations, as defined in TS 24.301 [35] and TS 24.501 [95] repectively.	FDD	-
<b><i>rach-Report</i></b> Indicates whether the UE supports delivery of <i>rach-Report</i> .	FDD/TDD	No
<b><i>rai-Support</i></b> Defines whether the UE supports release assistance indication (RAI) as specified in TS 36.321 [6].	FDD/TDD	No
<b><i>rai-SupportEnh</i></b> Indicates whether the UE supports AS Release Assistance Indication via the DCQR and AS RAI MAC CE when connected to EPC as specified in TS 36.321 [6].	FDD/TDD	No
<b><i>rlc-UM</i></b> Defines whether the UE supports RLC UM as specified in TS 36.322 [7].	FDD/TDD	No
<b><i>slotSymbolResourceResvDL</i></b> Indicates whether the UE supports slot/symbol-level time-domain DL resource reservation, e.g. for NB-IoT coexistence with NR. If <i>slotSymbolResourceResvDL</i> is included, the UE shall also indicate support for <i>subframeResourceResvDL</i> .	FDD/TDD	Yes

<b>UE-Capability-NB field descriptions</b>	<b>FDD/TDD appl</b>	<b>FDD/TDD diff</b>
<b>slotSymbolResourceResvUL</b> Indicates whether the UE supports slot/symbol-level time-domain UL resource reservation, e.g. for NB-IoT coexistence with NR. If <i>slotSymbolResourceResvUL</i> is included, the UE shall also indicate support for <i>subframeResourceResvUL</i> .	FDD/TDD	Yes
<b>supportedBandList, supportedBandList-v1710</b> Includes the supported NB-IoT bands as defined in TS 36.101 [42] and TS 36.102 [113] for NTN capable UE. If <i>supportedBandList-v1710</i> is included, the UE shall include the same number of entries, and listed in the same order, as in <i>supportedBandList-r13</i> .	FDD/TDD	No
<b>sr-SPS-BSR</b> Defines whether the UE supports SR using SPS BSR as specified in TS 36.321 [6].	FDD	-
<b>sr-withHARQ-ACK</b> Defines whether the UE supports physical layer SR with HARQ ACK as specified in TS 36.213 [23].	FDD	-
<b>sr-withoutHARQ-ACK</b> Defines whether the UE supports physical layer SR without HARQ ACK as specified in TS 36.211 [21] and TS 36.213 [23].	FDD	-
<b>subframeResourceResvDL</b> Indicates whether the UE supports subframe-level time-domain DL resource reservation, e.g. for NB-IoT coexistence with NR.	FDD/TDD	Yes
<b>subframeResourceResvUL</b> Indicates whether the UE supports subframe-level time-domain UL resource reservation, e.g. for NB-IoT coexistence with NR.	FDD/TDD	Yes
<b>supportedROHC-Profiles</b> List of supported ROHC profiles as defined in TS 36.323 [8].	FDD/TDD	No
<b>twoHARQ-Processes</b> Defines whether the UE supports two HARQ processes operation in DL and UL as specified in TS 36.212 [22] and TS 36.213 [23].	FDD/TDD	Yes
<b>ue-Category-NB</b> UE category as defined in TS 36.306 [5]. Value nb1 corresponds to UE category NB1, value nb2 corresponds to UE category NB2. A UE shall always include the field <i>ue-Category-NB-r13</i> in this version of the specification.	FDD/TDD	Yes

NOTE 1: The IE *UE-Capability-NB* does not include AS security capability information, since these are the same as the security capabilities that are signalled by NAS. Consequently AS need not provide "man-in-the-middle" protection for the security capabilities.

NOTE 2: The column 'FDD/TDD appl' indicates the applicability to the xDD mode: 'FDD' means applicable to FDD only, 'TDD' means applicable to TDD only and 'FDD/TDD' means applicable to FDD and TDD.

NOTE 3: The column 'FDD/TDD diff' indicates if the UE is allowed to signal a different value for FDD and TDD when the capability applies to both FDD and TDD modes. '-' is used when the capability applies to one mode only, 'No' is used for dual mode capabilities where a common value is signalled for both modes, and 'Yes' is used for dual mode capabilities where a separate value is signalled for each mode. Common capabilities and FDD capabilities are reported in the fields of *UE-Capability-NB* except field *tdd-UE-Capability*. TDD capabilities are reported in *tdd-UE-Capability*.

## – *UE-RadioPagingInfo-NB*

The IE *UE-RadioPagingInfo-NB* contains UE NB-IoT capability information needed for paging.

### ***UE-RadioPagingInfo-NB* information element**

```
-- ASN1START
UE-RadioPagingInfo-NB-r13 ::= SEQUENCE {
 ue-Category-NB-r13 ENUMERATED {nb1} OPTIONAL,
 ...
 [[multiCarrierPaging-r14 ENUMERATED {true} OPTIONAL
]],
 [[mixedOperationMode-r15 ENUMERATED {supported} OPTIONAL,
 wakeUpSignal-r15 ENUMERATED {true} OPTIONAL,

groupWakeUpSignal-r16 ENUMERATED {true} OPTIONAL,
groupWakeUpSignalAlternation-r16 ENUMERATED {true} OPTIONAL
]]
}

-- ASN1STOP
```

### **UE-RadioPagingInfo-NB field descriptions**

#### **groupWakeUpSignal**

Indicates whether the UE in RRC\_IDLE supports GWUS without group resource alternation for paging in DRX in FDD as specified in TS 36.211 [21], TS 36.213 [23] and TS 36.304 [4]. If this field is included, the minimum gap between GWUS and associated PO for DRX is fixed as 40 ms.

#### **groupWakeUpSignalAlternation**

Indicates whether the UE in RRC\_IDLE supports GWUS with group resource alternation for paging in DRX in FDD as specified in TS 36.211 [21], TS 36.213 [23] and TS 36.304 [4]. If this field is included, the minimum gap between GWUS and associated PO for DRX is fixed as 40 ms.

#### **mixedOperationMode**

Indicates whether the UE supports multi-carrier operation with mixed operation mode, standalone or inband/guardband, between the anchor carrier and non-anchor carrier for unicast, paging, and random access, as specified in TS 36.300 [9].

#### **multiCarrierPaging**

Indicates whether the UE supports paging on non-anchor carriers as defined in TS 36.304 [4].

#### **multiCarrierPagingTDD**

Indicates whether the UE supports paging on non-anchor carriers for TDD as defined in TS 36.304 [4].

#### **ue-Category-NB**

UE NB-IoT category as defined in TS 36.306 [5]. Value *nb1* corresponds to UE category NB1, value *nb2* corresponds to UE category NB2.

A UE shall always include the field *ue-Category-NB-r13* in this version of the specification.

#### **wakeUpSignal**

Indicates whether the UE supports WUS for paging in DRX in FDD as specified in TS 36.304 [4]. If this field is included, the minimum gap between WUS and associated PO for DRX is fixed as 40 ms.

#### **wakeUpSignalMinGap-eDRX**

Indicates the minimum gap the UE supports between WUS or GWUS and associated PO in case of eDRX in FDD, as specified in TS 36.304 [4]. Value *ms40* corresponds to 40 ms, value *ms240* corresponds to 240 ms and so on. If this field is included, the UE shall also indicate support for WUS or GWUS for paging in DRX.

## **UE-TimersAndConstants-NB**

The IE *UE-TimersAndConstants-NB* contains timers and constants used by the UE in either RRC\_CONNECTED or RRC\_IDLE.

### **UE-TimersAndConstants-NB information element**

```
-- ASN1START

UE-TimersAndConstants-NB-r13 ::= SEQUENCE {
 t300-r13 ENUMERATED {

#### ***UE-TimersAndConstants-NB field descriptions***

***n3xy***

Constants are described in clause 7.4. n1 corresponds with 1, n2 corresponds with 2 and so on.

***t3xy***

Timers are described in clause 7.3. Value ms0 corresponds with 0 ms, ms200 corresponds with 200 ms and so on. The UE shall use the extended values *t311-v1350*, *t300-v1530*, *t301-v1530* and *t311-v1530*, if present, and ignore the value signaled by *t311-r13*, *t300-r13*, *t301-r13* and *t311-r13* respectively.

*t300-r15* is only applicable for EDT or transmission using PUR with uplink data. UE performing EDT or transmission using PUR with uplink data shall use *t300-r15*, if present.

### 6.7.3.7 NB-IoT MBMS information elements

Void

#### 6.7.3.7a NB-IoT SC-PTM information elements

- ***SC-MTCH-InfoList-NB***

The IE *SC-MTCH-InfoList-NB* provides the list of ongoing MBMS sessions transmitted via SC-MRB and for each MBMS session, the associated G-RNTI and scheduling information.

#### ***SC-MTCH-InfoList-NB information element***

```

-- ASN1START

### SC-MTCH-InfoList-NB field descriptions

#### ***dl-CarrierConfig***

Downlink carrier used for SC-MTCH. E-UTRAN cannot configure a downlink carrier operating in mixed operation mode.

#### ***dl-CarrierIndex***

Index to a downlink carrier signalled in system information. Value '0' corresponds to the anchor carrier, value '1' corresponds to the first entry in *dl-ConfigList* in *SystemInformationBlockType22-NB*, value '2' corresponds to the second entry in *dl-ConfigList* and so on.

#### ***drx-InactivityTimerSCPTM***

Timer for SC-MTCH reception in TS 36.321 [6]. Value in number of NPDCCH periods. Value pp1 corresponds to 1 NPDCCH period, pp2 corresponds to 2 NPDCCH periods and so on.

#### ***g-RNTI***

G-RNTI used to scramble the scheduling and transmission of a SC-MTCH.

#### ***mbmsSessionInfo***

Indicates the ongoing MBMS session in a SC-MTCH.

#### ***npcch-NPDSCH-MaxTBS-SC-MTCH***

Maximum NPDSCH TBS for the SC-MTCH, see TS 36.213 [23]. Value *n680* corresponds to 680 bits and value *n2536* corresponds to 2536 bits.

#### ***npcch-NumRepetition-SC-MTCH***

The maximum number of NPDCCH repetitions the UE needs to monitor for SC-MTCH multicast search space, see TS 36.213 [23].

#### ***npcch-Offset-SC-MTCH***

Fractional period offset of starting subframe for NPDCCH multicast search space for SC-MTCH, see TS 36.213 [23].

#### ***npcch-startSF-SC-MTCH***

Starting subframes configuration of the NPDCCH multicast search space for SC-MTCH, see TS 36.213 [23].

#### ***onDurationTimerSCPTM***

Timer for SC-MTCH reception in TS 36.321 [6]. Value in number of NPDCCH periods. Value pp1 corresponds to 1 NPDCCH period, pp2 corresponds to 2 NPDCCH periods and so on.

#### ***schedulingPeriodStartOffsetSCPTM***

*SCPTM-SchedulingCycle* and *SCPTM-SchedulingOffset* in TS 36.321 [6]. The value of *SCPTM-SchedulingCycle* is in number of sub-frames. Value sf10 corresponds to 10 sub-frames, sf20 corresponds to 20 sub-frames and so on. The value of *SCPTM-SchedulingOffset* is in number of sub-frames.

#### ***sc-mtch-CarrierConfig***

Downlink carrier that is used for SC-MTCH.

#### ***sc-mtch-NeighbourCell***

Indicates neighbour cells which also provide this service on SC-MTCH. The first bit is set to 1 if the service is provided on SC-MTCH in the first cell in *scptmNeighbourCellList*, otherwise it is set to 0. The second bit is set to 1 if the service is provided on SC-MTCH in the second cell in *scptmNeighbourCellList*, and so on. If this field is absent, the UE shall assume that this service is not available on SC-MTCH in any neighbour cell.

#### ***sc-mtch-SchedulingInfo***

DRX information for the SC-MTCH.

If this field is absent, DRX is not used for the SC-MTCH.

### – *SCPTM-NeighbourCellList-NB*

The IE *SCPTM-NeighbourCellList-NB* indicates a list of neighbour cells where ongoing MBMS sessions provided via SC-MRB in the current cells are also provided.

```
-- ASN1START

SCPTM-NeighbourCellList-NB-r14 ::= SEQUENCE (SIZE (1..maxNeighCell-SCPTM-NB-r14)) OF PCI-ARFCN-NB-
r14

PCI-ARFCN-NB-r14 ::= SEQUENCE {
 physCellId-r14
 carrierFreq-r14
}
 PhysCellId,
 CarrierFreq-NB-r13 OPTIONAL -- Need OP

}

-- ASN1STOP
```

#### *SCPTM-NeighbourCellList-NB field descriptions*

##### ***physCellId***

Physical Cell Identity of the neighbour cell.

##### ***carrierFreq***

Carrier frequency of the neighbour cell.

Absence of the IE means that the neighbour cell is on the same frequency as the current cell.

## 6.7.4 NB-IoT RRC multiplicity and type constraint values

### – Multiplicity and type constraint definitions

```
-- ASN1START

maxFreqANR-NB-r16 INTEGER ::= 2 -- Maximum number of NB-IOT carrier frequencies that can
 -- be configured or reported for ANR measurement
maxFreqEUTRA-NB-r16 INTEGER ::= 8 -- Maximum number of EUTRAN carrier frequencies that can
 -- be provided as assistance information for inter-RAT
 -- cell selection

```

### – End of NBIOT-RRC-Definitions

```
-- ASN1START

END

-- ASN1STOP
```

### 6.7.5 Direct Indication Information

Direct Indication information is transmitted on NPDCCH using P-RNTI but without associated *Paging-NB* message. Table 6.7.5-1 defines the Direct Indication information, see TS 36.212 [22], clause 6.4.3.3.

When bit n is set to 1, the UE shall behave as if the corresponding field is set in the *Paging-NB* message, see 5.3.2.3. Bit 1 is the least significant bit.

**Table 6.7.5-1: Direct Indication information**

Bit	Field in <i>Direct Indication information</i>
1	<i>systemInfoModification</i>
2	<i>systemInfoModification-eDRX</i>
3, 4, 5, 6, 7, 8	Not used, and shall be ignored by UE if received

## 7 Variables and constants

### 7.1 UE variables

NOTE: To facilitate the specification of the UE behavioural requirements, UE variables are represented using ASN.1. Unless explicitly specified otherwise, it is however up to UE implementation how to store the variables. The optionality of the IEs in ASN.1 is used only to indicate that the values may not always be available.

#### — *EUTRA-UE-Variables*

```

## – *VarLogMeasConfig*

The UE variable *VarLogMeasConfig* includes the configuration of the logging of measurements to be performed by the UE while in RRC\_IDLE, covering intra-frequency, inter-frequency, inter-RAT mobility and MBSFN related measurements. If MBSFN logging is configured, the UE performs logging of measurements while in both RRC\_IDLE and RRC\_CONNECTED. Otherwise, the UE performs logging of measurements only while in RRC\_IDLE.

### ***VarLogMeasConfig* UE variable**

```
-- ASN1START
```

```
VarLogMeasConfig-r10 ::= SEQUENCE {
 areaConfiguration-r10 OPTIONAL,
 loggingDuration-r10,
 loggingInterval-r10
}

VarLogMeasConfig-r11 ::= SEQUENCE {
 areaConfiguration-r10 OPTIONAL,
 areaConfiguration-v1130 OPTIONAL,
 LoggingDuration-r10,
 LoggingInterval-r10
}

VarLogMeasConfig-r12 ::= SEQUENCE {
 areaConfiguration-r10 OPTIONAL,
 areaConfiguration-v1130 OPTIONAL,
 LoggingDuration-r10,
 LoggingInterval-r10,
 TargetMBSFN-AreaList-r12 OPTIONAL
}

VarLogMeasConfig-r15 ::= SEQUENCE {
 areaConfiguration-r10 OPTIONAL,
 areaConfiguration-v1130 OPTIONAL,
 LoggingDuration-r10,
 LoggingInterval-r10,
 TargetMBSFN-AreaList-r12 OPTIONAL,

plmn-IdentityList-r11 PLMN-IdentityList3-r11,
absoluteTimeInfo-r10 AbsoluteTimeInfo-r10,
logMeasInfoList-r10 LogMeasInfoList2-r10,
sigLoggedMeasType-r18 ENUMERATED {true}
}

LogMeasInfoList2-r10 ::= SEQUENCE (SIZE (1..maxLogMeas-r10)) OF LogMeasInfo-r10
-- ASN1STOP

```

### **VarMeasConfig**

The UE variable *VarMeasConfig* includes the accumulated configuration of the measurements to be performed by the UE, covering intra-frequency, inter-frequency and inter-RAT mobility related measurements.

**NOTE:** The amount of measurement configuration information, which a UE is required to store, is specified in clause 11.1. If the number of frequencies configured for a particular RAT exceeds the minimum performance requirements specified in TS 36.133 [16], it is up to UE implementation which frequencies of that RAT are measured. If the total number of frequencies for all RATs provided to the UE in the measurement configuration exceeds the minimum performance requirements specified in TS 36.133 [16], it is up to UE implementation which frequencies/RATs are measured.

#### **VarMeasConfig UE variable**

```

-- ASN1START

VarMeasConfig ::= SEQUENCE {
-- Measurement identities
measIdList MeasIdToAddModList OPTIONAL,
measIdListExt-r12 MeasIdToAddModListExt-r12 OPTIONAL,
measIdList-v1310 MeasIdToAddModList-v1310 OPTIONAL,
measIdListExt-v1310 MeasIdToAddModListExt-v1310 OPTIONAL,
-- Measurement objects
measObjectList MeasObjectToAddModList OPTIONAL,
measObjectListExt-r13 MeasObjectToAddModListExt-r13 OPTIONAL,
measObjectList-v9e0 MeasObjectToAddModList-v9e0 OPTIONAL,
-- Reporting configurations
reportConfigList ReportConfigToAddModList OPTIONAL,
-- Other parameters
quantityConfig QuantityConfig OPTIONAL,
measScaleFactor-r12 MeasScaleFactor-r12 OPTIONAL,
s-Measure INTEGER (-140..-44) OPTIONAL,
speedStatePars CHOICE {
release NULL,
setup SEQUENCE {
mobilityStateParameters MobilityStateParameters,
timeToTrigger-SF SpeedStateScaleFactors
}
}
allowInterruptions-r11 BOOLEAN OPTIONAL,
}

-- ASN1STOP

```

### **VarMeasIdleConfig**

The UE variable *VarMeasIdleConfig* includes the configuration of the measurements to be performed by the UE while in RRC\_IDLE or RRC\_INACTIVE for E-UTRA inter-frequency and inter-RAT (i.e. NR) measurements.

### **VarMeasIdleConfig UE variable**

```
-- ASN1START

VarMeasIdleConfig-r15 ::= SEQUENCE {
 measIdleCarrierListEUTRA-r15 EUTRA-CarrierList-r15 OPTIONAL,
 measIdleDuration-r15 ENUMERATED {sec10, sec30, sec60, sec120,
 sec180, sec240, sec300}
}

VarMeasIdleConfig-r16 ::= SEQUENCE {
 measIdleCarrierListNR-r16 NR-CarrierList-r16 OPTIONAL,
 validityAreaList-r16 ValidityAreaList-r16 OPTIONAL
}

-- ASN1STOP
```

### **VarMeasIdleReport**

The UE variable *VarMeasIdleReport* includes the logged measurements information.

### **VarMeasIdleReport UE variable**

```
-- ASN1START

VarMeasIdleReport-r15 ::= SEQUENCE {
 measReportIdle-r15 MeasResultListIdle-r15
}

VarMeasIdleReport-r16 ::= SEQUENCE {
 measReportIdle-r16 MeasResultListExtIdle-r16 OPTIONAL,
 measReportIdleNR-r16 MeasResultListIdleNR-r16 OPTIONAL
}

-- ASN1STOP
```

### **VarMeasReportList**

The UE variable *VarMeasReportList* includes information about the measurements for which the triggering conditions have been met.

### **VarMeasReportList UE variable**

```
-- ASN1START

VarMeasReportList ::= SEQUENCE (SIZE (1..maxMeasId)) OF VarMeasReport
VarMeasReportList-r12 ::= SEQUENCE (SIZE (1..maxMeasId-r12)) OF VarMeasReport

VarMeasReport ::= SEQUENCE {
 -- List of measurement that have been triggered
 measId, MeasId,
 measId-v1250, MeasId-v1250 OPTIONAL,
 cellsTriggeredList, CellsTriggeredList OPTIONAL,
 csi-RS-TriggeredList-r12, CSI-RS-TriggeredList-r12 OPTIONAL,
 poolsTriggeredList-r14, Tx-ResourcePoolMeasList-r14 OPTIONAL,
 numberOfReportsSent, INTEGER
}

CellsTriggeredList ::= SEQUENCE (SIZE (1..maxCellMeas)) OF CHOICE {
 physCellIdEUTRA,
 physCellIdUTRA
 fdd
 tdd
 },
 physCellIdGERAN
 carrierFreq
 physCellId
},
physCellIdCDMA2000
wlan-Identifiers-r13
physCellIdNR-r15
SEQUENCE {
```

```

 carrierFreq
 physCellId
 rs-IndexList-r15
 }
}

CSI-RS-TriggeredList-r12 ::= SEQUENCE (SIZE (1..maxCSI-RS-Meas-r12)) OF MeasCSI-RS-Id-r12
SSB-IndexList-r15 ::= SEQUENCE (SIZE (1..maxRS-Index-r15)) OF RS-IndexNR-r15
-- ASN1STOP

```

### *VarMobilityHistoryReport*

The UE variable *VarMobilityHistoryReport* includes the mobility history information.

```

-- ASN1START
VarMobilityHistoryReport-r12 ::= VisitedCellInfoList-r12
-- ASN1STOP

```

### *VarPendingRnaUpdate*

The UE variable *VarPendingRnaUpdate* indicates whether there is a pending RNAU procedure or not. The setting of this BOOLEAN variable to TRUE means that there is a pending RANU procedure.

#### ***VarPendingRnaUpdate* UE variable**

```

-- ASN1START
VarPendingRnaUpdate-r15 ::= SEQUENCE {
 pendingRnaUpdate BOOLEAN
}
-- ASN1STOP

```

### *VarRLF-Report*

The UE variable *VarRLF-Report* includes the radio link failure information or handover failure information.

#### ***VarRLF-Report* UE variable**

```

-- ASN1START
VarRLF-Report-r10 ::= SEQUENCE {
 rlf-Report-r10 RLF-Report-r9,
 plmn-Identity-r10 PLMN-Identity
}
VarRLF-Report-r11 ::= SEQUENCE {
 rlf-Report-r10 RLF-Report-r9,
 plmn-IdentityList-r11 PLMN-IdentityList3-r11
}
-- ASN1STOP

```

### *VarShortINACTIVE-MAC-Input*

The UE variable *VarShortINACTIVE-MAC-Input* specifies the input used to generate the *shortResume-MAC-I* during RRC Connection Resume procedure for RRC\_INACTIVE.

#### ***VarShortINACTIVE-MAC-Input* UE variable**

```
-- ASN1START
```

```

VarShortINACTIVE-MAC-Input-r15 ::= SEQUENCE {
 cellIdentity-r15 CellIdentity,
 physCellId-r15 PhysCellId,
 c-RNTI-r15 C-RNTI
}
-- ASN1STOP

```

#### ***VarShortINACTIVE-MAC-Input field descriptions***

***cellIdentity***

An input variable used to calculate the *shortResume-MAC-I*. Set to CellIdentity included in *cellIdentity* (without suffix) in SIB1 of the current cell.

***c-RNTI***

Set to C-RNTI that the UE had in the PCell it was connected to prior to suspension of the RRC connection.

***physCellId***

Set to the physical cell identity of the PCell the UE was connected to prior to suspension of the RRC connection.

### – ***VarShortMAC-Input***

The UE variable *VarShortMAC-Input* specifies the input used to generate the shortMAC-I.

#### ***VarShortMAC-Input UE variable***

```

-- ASN1START

VarShortMAC-Input ::= SEQUENCE {
 cellIdentity CellIdentity,
 physCellId PhysCellId,
 c-RNTI C-RNTI
}
-- ASN1STOP

```

#### ***VarShortMAC-Input field descriptions***

***cellIdentity***

An input variable used to calculate the *shortMAC-I*. Set to CellIdentity included in *cellIdentity* (without suffix) in SIB1 of the current cell.

***c-RNTI***

Set to C-RNTI that the UE had in the PCell it was connected to prior to the failure.

***physCellId***

Set to the physical cell identity of the PCell the UE was connected to prior to the failure.

### – ***VarShortResumeMAC-Input***

The UE variable *VarShortResumeMAC-Input* specifies the input used to generate the *shortResumeMAC-I* during RRC Connection Resume procedure.

#### ***VarShortResumeMAC-Input UE variable***

```

-- ASN1START

VarShortResumeMAC-Input-r13 ::= SEQUENCE {
 cellIdentity-r13 CellIdentity,
 physCellId-r13 PhysCellId,
 c-RNTI-r13 C-RNTI,
 resumeDiscriminator-r13 BIT STRING(SIZE(1))
}
-- ASN1STOP

```

<b>VarShortResumeMAC-Input field descriptions</b>	
<b>cellIdentity</b>	An input variable used to calculate the <i>shortResumeMAC-I</i> . Set to CellIdentity included in <i>cellIdentity</i> (without suffix) in SIB1 of the current cell.
<b>c-RNTI</b>	Set to C-RNTI that the UE had in the PCell it was connected to prior to suspension of the RRC connection.
<b>physCellId</b>	Set to the physical cell identity of the PCell the UE was connected to prior to suspension of the RRC connection.
<b>resumeDiscriminator</b>	A constant that allows differentiation in the calculation of the MAC-I for <i>shortResumeMAC-I</i> The resumeDiscriminator is set to '1'

### – **VarWLAN-MobilityConfig**

The UE variable *VarWLAN-MobilityConfig* includes information about WLAN for access selection and mobility.

#### **VarWLAN-MobilityConfig UE variable**

```
-- ASN1START
VarWLAN-MobilityConfig ::= SEQUENCE {
 wlan-MobilitySet-r13 OPTIONAL,
 successReportRequested OPTIONAL,
 wlan-SuspendConfig-r14 OPTIONAL
}
-- ASN1STOP
```

#### **VarWLAN-MobilityConfig field descriptions**

##### **wlan-MobilitySet**

Indicates the WLAN mobility set configured.

##### **successReportRequested**

Indicates whether the UE shall report successful connection to WLAN. Applicable to LWA and LWIP.

### – **VarWLAN-Status**

The UE variable *VarWLAN-Status* includes information about the status of WLAN connection for LWA, RCLWI or LWIP.

#### **VarWLAN-Status UE variable**

```
-- ASN1START
VarWLAN-Status-r13 ::= SEQUENCE {
 status-r13 WLAN-Status-r13,
 status-r14 WLAN-Status-v1430 OPTIONAL
}
-- ASN1STOP
```

#### **VarWLAN-Status field descriptions**

##### **status**

Indicates the connection status to WLAN and causes for connection failures.

### – Multiplicity and type constraint definitions

This clause includes multiplicity and type constraints applicable (only) for UE variables.

```
-- ASN1START
maxLogMeas-r10 INTEGER ::= 4060-- Maximum number of logged measurement entries
 -- that can be stored by the UE
```

```
-- ASN1STOP
```

- End of *EUTRA-UE-Variables*

```
-- ASN1START
```

```
END
```

```
-- ASN1STOP
```

## 7.1a NB-IoT UE variables

**NOTE:** To facilitate the specification of the UE behavioural requirements, UE variables are represented using ASN.1. Unless explicitly specified otherwise, it is however up to UE implementation how to store the variables. The optionality of the IEs in ASN.1 is used only to indicate that the values may not always be available.

- *NBIOT-UE-Variables*

This ASN.1 segment is the start of the NB-IoT UE variable definitions.

```
-- ASN1START

NBIOT-UE-Variables DEFINITIONS AUTOMATIC TAGS ::=
BEGIN

IMPORTS
 CellGlobalIdEUTRA,
 maxFreq,
 PLMN-IdentityList3-r11

FROM EUTRA-RRC-Definitions
 VarShortMAC-Input,
 VarShortResumeMAC-Input-r13

FROM EUTRA-UE-Variables

 ANR-CarrierList-NB-r16,
 ANR-MeasResult-NB-r16,
 maxFreqANR-NB-r16,
 MeasResultServCell-NB-r14,
 NRSRP-Range-NB-r14,
 RLF-Report-NB-r16

FROM NBIOT-RRC-Definitions;

-- ASN1STOP
```

- *VarANR-MeasConfig-NB*

The UE variable *VarANR-MeasConfig-NB* includes the configuration of the measurements to be performed by the UE in RRC\_IDLE for ANR. The UE performs these measurements once while in RRC\_IDLE and only in the cell where it receives the measurement configuration.

### ***VarANR-MeasConfig-NB***

```
-- ASN1START
```

```
VarANR-MeasConfig-NB-r16 ::= SEQUENCE {
 anr-QualityThreshold-r16 NRSRP-Range-NB-r14,
 anr-CarrierList-r16 ANR-CarrierList-NB-r16
}
-- ASN1STOP
```

### *VarANR-MeasReport-NB*

The UE variable *VarANR-MeasReport-NB* includes the stored ANR measurements information.

#### ***VarANR-MeasReport-NB***

```
-- ASN1START

VarANR-MeasReport-NB-r16 ::= SEQUENCE {
 plmn-IdentityList-r16 PLMN-IdentityList3-r11,
 servCellIdentity-r16 CellGlobalIdEUTRA,
 measResultServCell-r16 MeasResultServCell-NB-r14,
 relativeTimeStamp-r16 INTEGER (0..95),
 measResultList-r16 SEQUENCE (SIZE (1..maxFreqANR-NB-r16)) OF ANR-MeasResult-NB-r16
}

-- ASN1STOP
```

### *VarRLF-Report-NB*

The UE variable *VarRLF-Report-NB* includes the radio link failure information.

#### ***VarRLF-Report-NB* UE variable**

```
-- ASN1START

VarRLF-Report-NB-r16 ::= SEQUENCE {
 rlf-Report-r16 RLF-Report-NB-r16,
 plmn-IdentityList-r16 PLMN-IdentityList3-r11
}

-- ASN1STOP
```

### *VarShortMAC-Input-NB*

The UE variable *VarShortMAC-Input-NB* specifies the input used to generate the shortMAC-I.

#### ***VarShortMAC-Input-NB* UE variable**

```
-- ASN1START

VarShortMAC-Input-NB-r13 ::= VarShortMAC-Input

-- ASN1STOP
```

### *VarShortResumeMAC-Input-NB*

The UE variable *VarShortResumeMAC-Input-NB* specifies the input used to generate the *shortResumeMAC-I* during RRC Connection Resume procedure.

#### ***VarShortResumeMAC-Input-NB* UE variable**

```
-- ASN1START

VarShortResumeMAC-Input-NB-r13 ::= VarShortResumeMAC-Input-r13

-- ASN1STOP
```

– End of *NBIOT-UE-Variables*

```
-- ASN1START
END
-- ASN1STOP
```

## 7.2 Counters

Counter	Reset	Incremented	When reaching max value

## 7.3 Timers

### 7.3.1 Timers (Informative)

Timer	Start	Stop	At expiry
T300 NOTE1	Transmission of <i>RRCConnectionRequest</i> or <i>RRCConnectionResumeRequest</i> or <i>RRCEarlyDataRequest</i>	Reception of <i>RRCConnectionSetup</i> , <i>RRCConnectionReject</i> or <i>RRCConnectionResume</i> or <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT, cell re-selection and upon abortion of connection establishment by upper layers	Perform the actions as specified in 5.3.3.6
T301 NOTE1	Transmission of <i>RRCConnectionReestablishmentRequest</i>	Reception of <i>RRCConnectionReestablishment</i> or <i>RRCConnectionReestablishmentReject</i> message as well as when the selected cell becomes unsuitable	Go to RRC_IDLE
T302	Reception of <i>RRCConnectionReject</i> while performing RRC connection establishment or reception of <i>RRCConnectionRelease</i> including <i>waitTime</i>	Upon entering RRC_CONNECTED and upon cell re-selection, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR, or upon reception of <i>RRCConnectionReject</i> message for E-UTRA/5GC.	Inform upper layers about barring alleviation as specified in 5.3.3.7
T303	Access barred while performing RRC connection establishment for mobile originating calls	Upon entering RRC_CONNECTED and upon cell re-selection, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Inform upper layers about barring alleviation as specified in 5.3.3.7
T304	Reception of <i>RRCConnectionReconfiguration</i> message including the <i>MobilityControl Info</i> or reception of <i>MobilityFromEUTRACommand</i> message including <i>CellChangeOrder</i> or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCConnectionReconfiguration</i> message including the <i>MobilityControl Info</i> .	Criterion for successful completion of handover within E-UTRA, handover to E-UTRA or cell change order is met (the criterion is specified in the target RAT in case of inter-RAT)	In case of cell change order from E-UTRA or intra E-UTRA handover, initiate the RRC connection re-establishment procedure; In case of handover to E-UTRA, perform the actions defined in the specifications applicable for the source RAT; If any DAPS bearer is configured and if there is no RLF in source PCell, initiate the failure information procedure.
T305	Access barred while performing RRC connection establishment for mobile originating signalling	Upon entering RRC_CONNECTED and upon cell re-selection, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Inform upper layers about barring alleviation as specified in 5.3.3.7

Timer	Start	Stop	At expiry
T306	Access barred while performing RRC connection establishment for mobile originating CS fallback.	Upon entering RRC_CONNECTED and upon cell re-selection, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Inform upper layers about barring alleviation as specified in 5.3.3.7
T307	Reception of <i>RRCConnectionReconfiguration</i> message including <i>MobilityControlInfoSCG</i>	Successful completion of random access on the PSCell, upon initiating re-establishment and upon SCG release	Initiate the SCG failure information procedure as specified in 5.6.13.
T308	Access barred due to ACDC while performing RRC connection establishment subject to ACDC	Upon entering RRC_CONNECTED and upon cell re-selection, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Inform upper layers about barring alleviation for ACDC as specified in 5.3.3.7
T309 NOTE1	When access attempt is barred at access barring check for an Access Category. The UE shall maintain one instance of this timer per Access Category.	Upon entering RRC_CONNECTED, upon cell (re)selection, upon reception of <i>RRCConnectionRelease</i> , upon change of PCell while in RRC_CONNECTED, or upon reception of <i>MobilityFromEUTRACCommand</i> .	Perform the actions as specified in 5.3.16.4.
T310 NOTE1 NOTE2	Upon detecting physical layer problems for the PCell i.e. upon receiving N310 consecutive out-of-sync indications from lower layers	Upon receiving N311 consecutive in-sync indications from lower layers for the PCell, upon triggering the handover procedure, upon initiating the connection re-establishment procedure, and upon initiating the MCG failure information procedure.	If security is not activated and the UE is not a NB-IoT UE that supports RRC connection re-establishment for the Control Plane CloT EPS/5GS optimisation: go to RRC_IDLE else: initiate the MCG failure information procedure as specified in 5.6.26 or the connection re-establishment procedure as specified in 5.3.7.
T311 NOTE1	Upon initiating the RRC connection re-establishment procedure	Selection of a suitable E-UTRA cell or a cell using another RAT.	Go to RRC_IDLE
T312 NOTE2	Upon triggering a measurement report for a measurement identity for which T312 has been configured and <i>useT312</i> has been set to true, while T310 is running	Upon receiving N311 consecutive in-sync indications from lower layers, upon triggering the handover procedure, upon initiating the connection re-establishment procedure, upon initiating the MCG failure information procedure, and upon the expiry of T310	Initiate the MCG failure information procedure as specified in 5.6.26 or the connection re-establishment procedure as specified in 5.3.7.
T313 NOTE2	Upon detecting physical layer problems for the PSCell i.e. upon receiving N313 consecutive out-of-sync indications from lower layers	Upon receiving N314 consecutive in-sync indications from lower layers for the PSCell, upon initiating the connection re-establishment procedure, upon SCG release and upon receiving <i>RRCConnectionReconfiguration</i> including <i>MobilityControlInfoSCG</i>	Inform E-UTRAN about the SCG radio link failure by initiating the SCG failure information procedure as specified in 5.6.13.

Timer	Start	Stop	At expiry
T314 NOTE2	Upon early detecting physical layer problems for the PCell i.e. upon receiving N310 consecutive "early-out-of-sync" indications from lower layers.	Upon receiving N311 consecutive in-sync indications from lower layers for the PCell, upon triggering the handover procedure and upon initiating the connection re-establishment procedure	Initiate the UE Assistance Information procedure to report early detection of physical layer problems in accordance with 5.6.10.
T315 NOTE2	Upon detecting physical layer improvements of the PCell i.e. upon receiving N311 consecutive "early-in-sync" indications from lower layers.	Upon receiving N310 consecutive "early-out-of-sync" indications from lower layers for the PCell.	Initiate the UE Assistance Information procedure to report detection of physical layer improvements in accordance with 5.6.10.
T316	Upon transmission of the <i>MCGFailureInformation</i> message	Upon receiving <i>RRCCConnectionRelease</i> , <i>RRCCConnectionReconfiguration</i> with <i>mobilityControlInfo</i> , <i>MobilityFromEUTRACCommand</i> , or upon initiaitng the re-establishment procedure,	Perform the actions as specified in 5.6.26.5.
T317 NOTE1	Start or restart from the subframe indicated by <i>epochTime</i> upon reception of <i>SystemInformationBlockType31</i> ( <i>SystemInformationBlockType31-NB</i> in NB-IoT), or upon reception of <i>RRCCConnectionReconfiguration</i> message for the target cell including <i>mobilityControlInfo</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCCConnectionReconfiguration</i> message for the target cell including <i>mobilityControlInfo</i> .	Stop T317, if it is running, for the source cell upon reception of <i>RRCCConnectionReconfiguration</i> message including <i>mobilityControlInfo</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCCConnectionReconfiguration</i> message including <i>mobilityControlInfo</i> .	Perform the actions as specified in 5.3.18.
T318 NOTE1	Upon starting acquisition of <i>SystemInformationBlockType31</i> ( <i>SystemInformationBlockType31-NB</i> in NB-IoT) in RRC_CONNECTED	Upon successful acquisition of <i>SystemInformationBlockType31</i> ( <i>SystemInformationBlockType31-NB</i> in NB-IoT) if broadcast, and optionally after successful acquisition of <i>SystemInformationBlockType33</i> ( <i>SystemInformationBlockType33-NB</i> in NB-IoT) if broadcast, in RRC_CONNECTED, as specified in 5.3.18.	If security is not activated and the UE is not a NB-IoT UE that supports RRC connection re-establishment for the Control Plane CloT EPS optimisation: go to RRC_IDLE else: initiate the connection re-establishment procedure as specified in 5.3.7.
T320	Upon receiving <i>t320</i> or upon cell (re)selection to E-UTRA from another RAT with validity time configured for dedicated priorities (in which case the remaining validity time is applied).	Upon entering RRC_CONNECTED, when PLMN selection is performed on request by NAS, when the UE enters RRC_IDLE from RRC_INACTIVE, or upon cell (re)selection to another RAT (in which case the timer is carried on to the other RAT), or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCCConnectionRelease</i> for UP-EDT or <i>RRCCConnectionRelease</i> for UP transmission using PUR.	Discard the cell reselection priority information provided by dedicated signalling.

Timer	Start	Stop	At expiry
T321	Upon receiving <i>measConfig</i> including a <i>reportConfig</i> with the <i>purpose</i> set to <i>reportCGI</i>	Upon acquiring the information needed to set all fields of <i>cellGlobalId</i> for the requested cell, upon receiving <i>measConfig</i> that includes removal of the <i>reportConfig</i> with the <i>purpose</i> set to <i>reportCGI</i> and upon detecting that a cell is not broadcasting SIB1.	Initiate the measurement reporting procedure, stop performing the related measurements and remove the corresponding <i>measId</i>
T322 NOTE1	Upon receiving <i>redirectedCarrierOffsetDedicated</i> included in <i>RedirectedCarrierInfo</i>	Upon entering RRC_CONNECTED, when PLMN selection is performed on request by NAS, or upon cell (re)selection to another frequency or RAT, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Release <i>redirectedCarrierOffsetDedicated</i> .
T323	Upon receiving <i>t323</i> .	Upon entering RRC_CONNECTED, when PLMN selection is performed on request by NAS, when the UE enters RRC_IDLE from RRC_INACTIVE, or upon cell (re)selection to another RAT, or upon reception of <i>RRCEarlyDataComplete</i> or <i>RRCConnectionRelease</i> for UP-EDT or <i>RRCConnectionRelease</i> for UP transmission using PUR.	Discard the <i>altFreqPriorities</i> provided by dedicated signalling. UE shall apply the cell reselection priority information broadcast in the system information via <i>cellReselectionPriority</i> and <i>cellReselectionSubPriority</i> .
T325	Timer (re)started upon receiving <i>RRCConnectionReject</i> message with <i>deprioritisationTimer</i> .		Stop deprioritisation of all frequencies or E-UTRA signalled by <i>RRCConnectionReject</i> .
T326 NOTE1	Upon entering RRC_CONNECTED, upon update to <i>NRSRP</i> <sub>Ref</sub> .	Upon leaving RRC_CONNECTED.	Stop performing connected mode neighbour cell measurement.
T330	Upon receiving <i>LoggedMeasurementConfiguration</i> message	Upon log volume exceeding the suitable UE memory, upon initiating the release of <i>LoggedMeasurementConfiguration</i> procedure	Perform the actions specified in 5.6.6.4
T331	Upon receiving <i>RRCConnectionRelease</i> message including <i>measIdleConfig</i> .	Upon receiving <i>RRCConnectionSetup</i> , <i>RRCConnectionResume</i> , <i>RRCConnectionRelease</i> with an idle/inactive measurement configuration or indication to release the configuration, if <i>validityArea</i> is configured, upon cell selection/reselection to a cell that does not belong to the <i>validityArea</i> (if configured), or upon reselecting to an inter-RAT cell.	Perform the actions specified in 5.6.20.3.
T340 NOTE2	Upon transmitting <i>UEAssistanceInformation</i> message with <i>powerPrefIndication</i> set to <i>normal</i>	Upon releasing <i>powerPrefIndication</i> during the connection re-establishment procedure	No action.

Timer	Start	Stop	At expiry
T341 NOTE2	Upon transmitting <i>UEAssistanceInformation</i> message with <i>bw-Preference</i> .	Upon resuming an RRC connection or upon releasing <i>bw-Preference</i> during the connection re-establishment procedure	No action.
T342 NOTE2	Upon transmitting <i>UEAssistanceInformation</i> message with <i>delayBudgetReport</i> .	Upon releasing <i>delayBudgetReportingConfig</i> during the connection re-establishment and connection resume procedures	No action.
T343 NOTE2	Upon transmitting <i>UEAssistanceInformation</i> message with <i>RLM-Report</i> including <i>earlyOutOfSync</i> .	Upon initiating the connection re-establishment procedure	No action.
T344 NOTE2	Upon transmitting <i>UEAssistanceInformation</i> message with <i>RLM-Report</i> including <i>earlyInSync</i> .	Upon initiating the connection re-establishment procedure	No action.
T345	Upon transmitting <i>UEAssistanceInformation</i> message with <i>overheatingAssistance</i>	Upon releasing <i>overheatingAssistance</i> during the connection re-establishment procedure, or connection resume procedure.	No action.
T346	Upon transmitting <i>UEAssistanceInformation</i> message with <i>scg-DeactivationPreference</i>	Upon releasing <i>scg-DeactivationPreferenceConfig</i> during the RRC connection establishment or re-establishment procedures, or upon reconfiguration of <i>scg-DeactivationPreferenceConfig</i> to <i>release</i> .	No action.
T350	Upon entering RRC_IDLE if <i>t350</i> has been received in <i>wlan-OffloadInfo</i> .	Upon entering RRC_CONNECTED, or upon cell reselection.	Perform the actions specified in 5.6.12.4.
T351	Reception of <i>RRCConnectionReconfiguration</i> message including the association <i>Timer</i> in <i>WLAN-MobilityConfig</i> .	Upon successful connection to WLAN, upon WLAN connection failure, upon leaving RRC_CONNECTED, upon triggering the handover procedure, or upon initiating the connection re-establishment procedure.	Perform WLAN Connection Status Reporting specified in 5.6.15.2.
T360	Upon performing the redistribution target selection as specified in TS 36.304 [4].	Upon entering RRC_CONNECTED, upon receiving a Paging message including <i>redistributionIndication</i> ; upon reselecting a cell not belonging to the redistribution target.	Stop considering a frequency or cell to be redistribution target, and perform the redistribution target selection if the condition specified in TS 36.304 [4] is met.
T370	Upon receiving <i>SL-DiscConfig</i> including a <i>discSysInfoToReportConfig</i> set to <i>setup</i> .	Upon initiating the transmission of <i>SidelinkUEInformation</i> including <i>discSysInfoReportFreqList</i> , upon receiving <i>SL-DiscConfig</i> including <i>discSysInfoToReportConfig</i> set to <i>release</i> , upon handover and re-establishment.	Release <i>discSysInfoToReportConfig</i> .
T380	Upon reception of <i>periodic-RNAU-timer</i> in <i>RRCConnectionRelease</i> .	Upon reception of <i>RRCConnectionResume</i> , <i>RRCConnectionRelease</i> or <i>RRCConnectionSetup</i> .	Initiate the RAN notification area update procedure

Timer	Start	Stop	At expiry
T390 NOTE1	Upon GNSS validity duration expiry if <i>ul-TransmissionExtensionEnabled</i> is configured.	Upon leaving RRC_CONNECTED, or reception of network triggered GNSS measurement.	Perform the actions as specified in 5.3.3.21.
NOTE1: Only the timers marked with "NOTE1" are applicable to NB-IoT. NOTE2: The behaviour as specified in 7.3.2 applies.			

### 7.3.2 Timer handling

When the UE applies zero value for a timer, the timer shall be started and immediately expire unless explicitly stated otherwise.

## 7.4 Constants

Constant	Usage
N310	Maximum number of consecutive "out-of-sync" or "early-out-of-sync" indications for the PCell received from lower layers
N311	Maximum number of consecutive "in-sync" or "early-in-sync" indications for the PCell received from lower layers
N313	Maximum number of consecutive "out-of-sync" indications for the PSCell received from lower layers
N314	Maximum number of consecutive "in-sync" indications for the PSCell received from lower layers

## 8 Protocol data unit abstract syntax

### 8.1 General

The RRC PDU contents in clause 6, clause 9.3.2 and clause 10 are described using abstract syntax notation one (ASN.1) as specified in ITU-T Rec. X.680 [13] and X.681 [14]. Transfer syntax for RRC PDUs is derived from their ASN.1 definitions by use of Packed Encoding Rules, unaligned as specified in ITU-T Rec. X.691 [15].

The following encoding rules apply in addition to what has been specified in X.691:

- When a bit string value is placed in a bit-field as specified in 15.6 to 15.11 in X.691, the leading bit of the bit string value shall be placed in the leading bit of the bit-field, and the trailing bit of the bit string value shall be placed in the trailing bit of the bit-field.

NOTE: The terms 'leading bit' and 'trailing bit' are defined in ITU-T Rec. X.680. When using the 'bstring' notation, the leading bit of the bit string value is on the left, and the trailing bit of the bit string value is on the right.

- When decoding types constrained with the ASN.1 Contents Constraint ("CONTAINING"), automatic decoding of the contained type should not be performed because errors in the decoding of the contained type should not cause the decoding of the entire RRC message PDU to fail. It is recommended that the decoder first decodes the outer PDU type that contains the OCTET STRING or BIT STRING with the Contents Constraint, and then decodes the contained type that is nested within the OCTET STRING or BIT STRING as a separate step.
- When decoding a) RRC message PDUs, b) BIT STRING constrained with a Contents Constraint, or c) OCTET STRING constrained with a Contents Constraint, PER decoders are required to never report an error if there are extraneous zero or non-zero bits at the end of the encoded RRC message PDU, BIT STRING or OCTET STRING.

## 8.2 Structure of encoded RRC messages

An RRC PDU, which is the bit string that is exchanged between peer entities/ across the radio interface contains the basic production as defined in X.691.

RRC PDUs shall be mapped to and from PDCP SDUs (in case of DCCH) or RLC SDUs (in case of PCCH, BCCH, BR-BCCH, CCCH or MCCH) upon transmission and reception as follows:

- when delivering an RRC PDU as an PDCP SDU to the PDCP layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the PDCP SDU and onwards; and
- when delivering an RRC PDU as an RLC SDU to the RLC layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the RLC SDU and onwards; and
- upon reception of an PDCP SDU from the PDCP layer, the first bit of the PDCP SDU shall represent the first bit of the RRC PDU and onwards; and
- upon reception of an RLC SDU from the RLC layer, the first bit of the RLC SDU shall represent the first bit of the RRC PDU and onwards.

## 8.3 Basic production

The 'basic production' is obtained by applying UNALIGNED PER to the abstract syntax value (the ASN.1 description) as specified in X.691. It always contains a multiple of 8 bits.

## 8.4 Extension

The following rules apply with respect to the use of protocol extensions:

- A transmitter compliant with this version of the specification shall, unless explicitly indicated otherwise on a PDU type basis, set the extension part empty. Transmitters compliant with a later version may send non-empty extensions;
- A transmitter compliant with this version of the specification shall set spare bits to zero;

## 8.5 Padding

If the encoded RRC message does not fill a transport block, the RRC layer shall add padding bits. This applies to PCCH, BCCH and BR-BCCH.

Padding bits shall be set to 0 and the number of padding bits is a multiple of 8.

**Figure 8.5-1: RRC level padding**

## 9 Specified and default radio configurations

Specified and default configurations are configurations of which the details are specified in the standard. Specified configurations are fixed while default configurations can be modified using dedicated signalling.

### 9.1 Specified configurations

#### 9.1.1 Logical channel configurations

##### 9.1.1.1 BCCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	TM		
MAC configuration	TM		

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

##### 9.1.1.2 CCCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	TM		

Name	Value	Semantics description	Ver
MAC configuration		Normal MAC headers are used	
Logical channel configuration			
<i>priority</i>	1	Highest priority	
<i>prioritisedBitRate</i>	infinity		
<i>bucketSizeDuration</i>	N/A		
<i>logicalChannelGroup</i>	0		
<i>logicalChannelSR-Mask-r9</i>	release		v920

### 9.1.1.3 PCCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	TM		
MAC configuration	TM		

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

### 9.1.1.4 MCCH and MTCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	UM		
<i>sn-FieldLength</i>	size5		
<i>t-Reordering</i>	0		

### 9.1.1.5 SBCCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	TM		
MAC configuration	TM		

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

### 9.1.1.6 STCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration			
discardTimer	Undefined	Up to UE implementation	
pdcp-SN-Size	16		
maxCID	15		
profiles			
t-Reordering (PDCP)	Undefined	Only used for V2X sidelink communication. Selected by the receiving UE, up to UE implementation	V1520
RLC configuration		Uni-directional UM RLC UM window size is set to 0	
		Uni-directional UM RLC UM window size is set to 0 for sidelink communication	v1440
<i>sn-FieldLength</i>	5		
logicalChannelIdentity	Undefined	Selected by the transmitting UE, up to UE implementation	
Logical channel configuration			
priority	Undefined	Selected by the transmitting UE, up to UE implementation	
prioritisedBitRate	Undefined	Selected by the transmitting UE, up to UE implementation	
bucketSizeDuration	Undefined	Selected by the transmitting UE, up to UE implementation	
logicalChannelGroup	3		
t-Reordering	Undefined	Only used for V2X sidelink communication. Selected by the receiving UE, up to UE implementation	v1440
MAC configuration			

### 9.1.1.7 SC-MCCH and SC-MTCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	UM		
<i>sn-FieldLength</i>	size5		
<i>t-Reordering</i>	0		

### 9.1.1.8 BR-BCCH configuration

Parameters

Name	Value	Semantics description	Ver
PDCP configuration	N/A		
RLC configuration	TM		
MAC configuration	TM		

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

## 9.1.2 SRB configurations

### 9.1.2.1 SRB1

Parameters

Name	Value	Semantics description	Ver
RLC configuration			
<i>logicalChannelIdentity</i>	1		

### 9.1.2.1a SRB1bis

Parameters

Name	Value	Semantics description	Ver
RLC configuration			
<i>logicalChannelIdentity</i>	3		

### 9.1.2.2 SRB2

Parameters

Name	Value	Semantics description	Ver
RLC configuration			
<i>logicalChannelIdentity</i>	2		

### 9.1.2.3 SRB4

Parameters

Name	Value	Semantics description	Ver
RLC configuration			
<i>logicalChannelIdentity</i>	4		

## 9.2 Default radio configurations

The following clauses only list default values for REL-8 parameters included in protocol version v8.5.0. For all fields introduced in a later protocol version, the default value is "released" unless explicitly specified otherwise. If UE is to apply default configuration while it is configured with some critically extended fields, the UE shall apply the original version with only default values. For the following fields, introduced in a protocol version later than v8.5.0, the default corresponds with "value not applicable":

- *codeBookSubsetRestriction-v920*;
- *pmi-RI-Report*;

NOTE 1: Value "N/A" indicates that the UE does not apply a specific value (i.e. upon switching to a default configuration, E-UTRAN can not assume the UE keeps the previously configured value). This implies that E-UTRAN needs to configure a value before invoking the related functionality.

NOTE 2: In general, the signalling should preferably support a "release" option for fields introduced after v8.5.0. The "value not applicable" should be used restrictively, mainly limited to fields which value is relevant only if another field is set to a value other than its default.

## 9.2.1 SRB configurations

### 9.2.1.1 SRB1

Parameters

Name	Value	NB-IoT	Semantics description	Ver
RLC configuration CHOICE	am	am		
<i>ul-RLC-Config</i>				
> <i>t-PollRetransmit</i>	ms45	ms25000		
> <i>pollPDU</i>	infinity	N/A		
> <i>pollByte</i>	infinity	N/A		
> <i>maxRetxThreshold</i>	t4	t4		
<i>dl-RLC-Config</i>				
> <i>t-Reordering</i>	ms35	released		
> <i>t-StatusProhibit</i>	ms0	N/A		
> <i>enableStatusReportSN-Gap</i>	N/A	disabled		
Logical channel configuration				
<i>priority</i>	1	1	Highest priority	
<i>prioritisedBitRate</i>	infinity	N/A		
<i>bucketSizeDuration</i>	N/A	N/A		
<i>logicalChannelGroup</i>	0	N/A		
<i>logicalChannelSR-Prohibit</i>	N/A	TRUE		

### 9.2.1.2 SRB2

Parameters

Name	Value	Semantics description	Ver
RLC configuration CHOICE	am		
<i>ul-RLC-Config</i>			
> <i>t-PollRetransmit</i>	ms45		
> <i>pollPDU</i>	infinity		
> <i>pollByte</i>	infinity		
> <i>maxRetxThreshold</i>	t4		
<i>dl-RLC-Config</i>			
> <i>t-Reordering</i>	ms35		
> <i>t-StatusProhibit</i>	ms0		
Logical channel configuration			

Name	Value	Semantics description	Ver
<i>priority</i>	3		
<i>prioritisedBitRate</i>	infinity		
<i>bucketSizeDuration</i>	N/A		
<i>logicalChannelGroup</i>	0		

## 9.2.2 Default MAC main configuration

Parameters

Name	Value	NB-IoT	Semantics description	Ver
MAC main configuration				
<i>maxHARQ-tx</i>	n5	N/A		
<i>periodicBSR-Timer</i>	infinity	pp8		
<i>retxBSR-Timer</i>	sf2560	infinity		
<i>ttiBundling</i>	FALSE	N/A		
<i>drx-Config</i>	release	N/A		
<i>phr-Config</i>	release	N/A		

## 9.2.3 Default semi-persistent scheduling configuration

SPS-Config > <i>sps-ConfigDL</i> > <i>sps-ConfigUL</i>	release release		
--------------------------------------------------------------	--------------------	--	--

## 9.2.4 Default physical channel configuration

Parameters (not applicable for NB-IoT)

Name	Value	Semantics description	Ver
<i>PDSCH-ConfigDedicated</i> > <i>p-a</i>	dB0		
<i>PUCCH-ConfigDedicated</i> > <i>tdd-AckNackFeedbackMode</i> > <i>ackNackRepetition</i>	bundling release	Only valid for TDD mode	
<i>PUSCH-ConfigDedicated</i> > <i>betaOffset-ACK-Index</i> > <i>betaOffset-RI-Index</i> > <i>betaOffset-CQI-Index</i>	10 12 15		

Name	Value	Semantics description	Ver
<i>UplinkPowerControlDedicated</i>			
> <i>p0-UE-PUSCH</i>	0		
> <i>deltaMCS-Enabled</i>	en0 (disabled)		
> <i>accumulationEnabled</i>	TRUE		
> <i>p0-UE-PUCCH</i>	0		
> <i>pSRS-Offset</i>	7		
> <i>filterCoefficient</i>	fc4		
<i>tpc-pdcch-ConfigPUCCH</i>	release		
<i>tpc-pdcch-ConfigPUSCH</i>	release		
<i>CQI-ReportConfig</i>			
> <i>CQI-ReportPeriodic</i>	release		
> <i>cqi-ReportModeAperiodic</i>	N/A		
> <i>nomPDSCH-RS-EPRE-Offset</i>	N/A		
<i>SoundingRS-UL-ConfigDedicated</i>	release		
<i>AntennaInfoDedicated</i>			
> <i>transmissionMode</i>	tm1, tm2	If the number of PBCH antenna ports is one, tm1 is used as default; otherwise tm2 is used as default	
> <i>codebookSubsetRestriction</i>	N/A		
> <i>ue-TxAntennaSelection</i>	release		
<i>SchedulingRequestConfig</i>	release		

Parameters applicable for NB-IoT

Name	Value	Semantics description	Ver
<i>NPUSCH-ConfigDedicated-NB</i>			
> <i>ack-NACK-NumRepetitions</i>	N/A		
> <i>npusch-AllSymbols</i>	TRUE		
<i>UplinkPowerControlDedicated</i>			
> <i>p0-UE-NPUSCH</i>	0		

## 9.2.5 Default values timers and constants

Parameters

Name	Value	Semantics description	Ver
t310	ms1000		
n310	n1		
t311	ms1000		
n311	n1		

## 9.3 Sidelink pre-configured parameters

### 9.3.1 Specified parameters

This clause only list parameters which value is specified in the standard.

#### Parameters

Name	Value	Semantics description	Ver
<i>preconfigSync</i> > <i>syncTxParameters</i> >> <i>alpha</i>	0		
<i>preconfigComm</i> > <i>sc-TxParameters</i> >> <i>alpha</i> > <i>dataTxParameters</i> >> <i>alpha</i>	0 0		
<i>v2x-CommPreconfigSync</i> > <i>syncTxParameters</i> >> <i>alpha</i>	0		
<i>v2x-CommTxPoolList</i> , <i>p2x-CommTxPoolList</i> > <i>dataTxParameters</i> >> <i>alpha</i>	0		

### 9.3.2 Pre-configurable parameters

This ASN.1 segment is the start of the E-UTRA definitions of pre-configured sidelink parameters.

NOTE 1: Upper layers are assumed to provide a set of pre-configured parameters that are valid at the current UE location if any, see TS 24.334 [69], clause 10.2.

-- ASN1STOP

<b><i>SL-Preconfiguration field descriptions</i></b>	
<b><i>carrierFreq</i></b>	Indicates the carrier frequency for out of coverage sidelink communication and sidelink discovery. In case of FDD it is uplink carrier frequency and the corresponding downlink frequency can be determined from the default TX-RX frequency separation defined in TS 36.101 [42], table 5.7.3-1.
<b><i>additionalSpectrumEmission</i></b>	The UE requirements related to IE <i>AdditionalSpectrumEmission</i> are defined in TS 36.101 [42], clause 6.2.4. If <i>additionalSpectrumEmissionExt-r14</i> is configured, the UE only considers <i>additionalSpectrumEmissionExt-r14</i> (and ignores <i>additionalSpectrumEmission-r12</i> ).
<b><i>commRxPoolList</i></b>	Indicates a list of reception pools for sidelink communication in addition to the resource pools indicated by <i>preconfigComm</i> .
<b><i>commTxPoolList</i></b>	Indicates a list of transmission pools for sidelink communication in addition to the first resource pool within <i>preconfigComm</i> .
<b><i>preconfigComm</i></b>	Indicates a list of resource pools. The first resource pool in the list is used for both reception and transmission of sidelink communication. The other resource pools, if present, are only used for reception of sidelink communication.
<b><i>syncRefDiffHyst</i></b>	Hysteresis when evaluating a SyncRef UE using relative comparison. Value <i>dB0</i> corresponds to 0 dB, <i>dB3</i> to 3 dB and so on, value <i>dBinf</i> corresponds to infinite dB.
<b><i>syncRefMinHyst</i></b>	Hysteresis when evaluating a SyncRef UE using absolute comparison. Value <i>dB0</i> corresponds to 0 dB, <i>dB3</i> to 3 dB and so on.

NOTE 1: The network may configure one or more of the reception only resource pools in *preconfigComm* to cover reception from in coverage UEs using scheduled resource allocation. For such a resource pool the network should set all bits of *subframeBitmap* to 1 and *offsetIndicator* to indicate the subframe immediately following the sidelink control information.

NOTE 2: The network should ensure that the resources defined by the first entry in *preconfigComm* (used for transmission by an out of coverage UE) do not overlap with those of the pool(s) covering scheduled transmissions by in coverage UEs. Furthermore, the network should ensure that for none of the entries in *preconfigComm* the resources defined by *sc-TF-ResourceConfig* overlap.

## — *SL-V2X-Preconfiguration*

The IE *SL-V2X-Preconfiguration* includes the sidelink pre-configured parameters used for V2X sidelink communication.

```

<b><i>SL-V2X-Preconfiguration</i> field descriptions</b>	
<b><i>adjacencyPSCCH-PSSCH</i></b>	Indicates whether a UE always transmits PSCCH and PSSCH in adjacent RBs (indicated by TRUE) or it may transmit PSCCH and PSSCH in non-adjacent RBs (indicated by FALSE). This parameter appears only when a pool is configured such that a UE transmits PSCCH and the associated PSSCH in the same subframe.
<b><i>anchorCarrierFreqList</i></b>	Indicates carrier frequencies which may include inter-carrier resource configuration for V2X sidelink communication.
<b><i>anchorCarrierFreqListNR</i></b>	Indicates NR carrier frequencies which may include inter-carrier resource configuration for V2X sidelink communication.
<b><i>cbr-PreconfigList</i></b>	Indicates the preconfigured list of CBR ranges and the list of PSSCH transmission configurations available to configure congestion control to the UE for V2X sidelink communication.
<b><i>cbr-pssch-TxConfigList</i></b>	Indicates the mapping between PPPPs, CBR ranges by using indexes of the entry in <i>cbr-RangeCommonConfigList</i> in <i>cbr-PreconfigList</i> , and PSSCH transmission parameters and CR limits by using indexes of the entry in <i>sl-CBR-PSSCH-TxConfigList</i> in <i>cbr-PreconfigList</i> .
<b><i>numSubchannel</i></b>	Indicates the number of subchannels in the corresponding resource pool.
<b><i>offsetDFN</i></b>	Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 0 corresponds to 0 milliseconds, value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on.
<b><i>resourceSelectionConfigP2X</i></b>	Indicates the allowed resource selection mechanism(s), i.e. partial sensing and/or random selection, for P2X related V2X sidelink communication.
<b><i>restrictResourceReservationPeriod</i></b>	If configured, the field <i>restrictResourceReservationPeriod</i> configured in <i>v2x-ResourceSelectionConfig</i> shall be ignored for transmission on this pool.
<b><i>sizeSubchannel</i></b>	Indicates the number of PRBs of each subchannel in the corresponding resource pool. The value n5 denotes 5 PRBs; n6 denotes 6 PRBs and so on. The values n5, n6, n10, n15, n20, n25, n50, n75 and n100 apply in the case of <i>adjacencyPSCCH-PSSCH</i> set to TRUE; the values n4, n5, n6, n8, n9, n10, n12, n15, n16, n18, n20, n30, n48, n72 and n96 apply in the case of <i>adjacencyPSCCH-PSSCH</i> set to FALSE.
<b><i>si-OffsetIndicator</i></b>	Indicates the offset of the first subframe of a resource pool within a SFN cycle. If absent, the resource pool starts from first subframe of SFN=0. This field is not applicable to V2X sidelink communication.
<b><i>si-Subframe</i></b>	Indicates the bitmap of the resource pool, which is defined by repeating the bitmap within a SFN cycle (see TS 36.213 [23]).
<b><i>startRB-Subchannel</i></b>	Indicates the lowest RB index of the subchannel with the lowest index.
<b><i>startRB-PSCCH-Pool</i></b>	Indicates the lowest RB index of the PSCCH pool.
<b><i>syncAllowed</i></b>	Indicates the allowed synchronization reference(s) which is (are) allowed to use the pre-configured resource pool.
<b><i>syncPriority</i></b>	Indicates the synchronization priority order. In case the UE does not detect any cell which configures synchronization configuration on the carrier frequency in <i>anchorCarrierFreqList</i> , if this field is set to <i>gnss</i> , the UE shall prioritize GNSS over the UE directly synchronized to eNB; if this field is set to <i>enb</i> , the UE shall prioritize the UE directly synchronized to eNB over GNSS.
<b><i>thresSL-TxPrioritization</i></b>	Indicates the threshold used to determine whether SL V2X transmission is prioritized over uplink transmission if they overlap in time (see TS 36.321 [6]).
<b><i>threshS-RSSI-CBR</i></b>	Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the CBR measurement, as specified in TS 36.214 [48]. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value n to (-112 + n*2) dBm, and so on.
<b><i>v2x-CommRxPoolList</i></b>	Indicates a list of reception pools for V2X sidelink communication.
<b><i>v2x-CommTxPoolList</i></b>	Indicates a list of transmission pools for V2X sidelink communication.
<b><i>v2x-ResourceSelectionConfig</i></b>	Indicates V2X sidelink communication configurations used for UE autonomous resource selection.

<b><i>SL-V2X-Preconfiguration field descriptions</i></b>	
<b><i>v2x-TxProfileList</i></b>	Indicates for each Tx profile the corresponding transmission format, used as specified in TS 36.321 [6], in order of increasing Tx profile pointer identities. For each entry, Value REL14 indicates that the UE shall use Release 14 compatible format (i.e. using MCS table in Table 8.6.1-1 with 64 QAM indices overridden by 16QAM in TS 36.213 [23] and not Rel-15 feature) to transmit the corresponding V2X packet. Value REL15 indicates that the UE shall use Release 15 format (i.e. using rate matching, TBS scaling, MCS table in Table 8.6.1 and, if applicable, the MCS indices supporting 64QAM in Table 8.6.1 and Table 14.1.1-2 in TS 36.213 [23]) to transmit the corresponding V2X packet. If <i>v2x-TxProfileList</i> is not configured by upper layers, the UE shall use Release 14 compatible format to transmit the corresponding V2X packet.
<b><i>zoneConfig</i></b>	Indicates zone configurations used for V2X sidelink communication in 5.10.13.2.
<b><i>zoneID</i></b>	Indicates the zone ID for which the UE shall use this resource pool as described in 5.10.13.2. The field is absent in <i>v2x-CommRxPoolList</i> and <i>p2x-CommTxPoolList</i> in <i>SL-V2X-PreconfigFreqInfo</i> .

## 10 Radio information related interactions between network nodes

### 10.1 General

This clause specifies RRC messages that are transferred between network nodes. These RRC messages may be transferred to or from the UE via another Radio Access Technology. Consequently, these messages have similar characteristics as the RRC messages that are transferred across the E-UTRA radio interface, i.e. the same transfer syntax and protocol extension mechanisms apply.

### 10.2 Inter-node RRC messages

#### 10.2.1 General

This clause specifies RRC messages that are sent either across the X2- or the S1-interface, either to or from the eNB, unless explicitly stated otherwise, i.e. a single 'logical channel' is used for all RRC messages transferred across network nodes. The information could originate from or be destined for another RAT.

#### – *EUTRA-InterNodeDefinitions*

This ASN.1 segment is the start of the E-UTRA inter-node PDU definitions.

## 10.2.2 Message definitions

- *HandoverCommand*

This message is used to transfer the handover command generated by the target eNB.

Direction: target eNB to source eNB/ source RAN

### ***HandoverCommand message***

```
-- ASN1START

HandoverCommand ::= SEQUENCE {
 criticalExtensions CHOICE {
 c1 CHOICE {
 handoverCommand-r8 HandoverCommand-r8-IEs,
 spare7 NULL,
 spare6 NULL, spare5 NULL, spare4 NULL,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
}

HandoverCommand-r8-IEs ::= SEQUENCE {
 handoverCommandMessage OCTET STRING (CONTAINING DL-DCCH-Message),
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

### ***HandoverCommand field descriptions***

#### ***handoverCommandMessage***

Contains the entire DL-DCCH-Message including the *RRCConnectionReconfiguration* message used to perform handover within E-UTRAN or handover to E-UTRAN, generated (entirely) by the target eNB.

NOTE: The source BSC, in case of inter-RAT handover from GERAN to E-UTRAN, expects that the HandoverCommand message includes DL-DCCH-Message only. Thus, criticalExtensionsFuture, spare1-spare7 and nonCriticalExtension should not be used regardless whether the source RAT is E-UTRAN, UTRAN or GERAN.

#### ***HandoverPreparationInformation***

This message is used to transfer the E-UTRA RRC information used by the target eNB or target ng-eNB during handover preparation or UE context retrieval, e.g. in case of resume or re-establishment, including UE capability information.

Direction: source eNB/ source RAN to target eNB or target ng-eNB

#### ***HandoverPreparationInformation* field descriptions**

***as-Config***

The radio resource configuration. Applicable in case of intra-E-UTRA handover, resume or re-establishment. If the target receives an incomplete *MeasConfig* and/or *RadioResourceConfigDedicated* in the *as-Config*, the target eNB may decide to apply the full configuration option based on the *ue-ConfigRelease*.

***as-Context***

Local E-UTRAN context required by the target eNB.

***makeBeforeBreakReq***

To request the target eNB to add the *makeBeforeBreak* indication in the *mobilityControlInfo* in case of intra-frequency handover.

***rrm-Config***

Local E-UTRAN context used depending on the target node's implementation, which is mainly used for the RRM purpose. May also be provided at inter-RAT handover from NR.

***sourceRB-ConfigIntra5GC***

NR radio bearer config used at intra5GC handover, resume or re-establishment, as defined by *RadioBearerConfig* IE in TS 38.331 [82].

***ue-ConfigRelease***

Indicates the RRC protocol release or version applicable for the current UE configuration. This could be used by target eNB to decide if the full configuration approach should be used. If this field is not present, the target assumes that the current UE configuration is based on the release 8 version of RRC protocol. NOTE 1.

***ue-RadioAccessCapabilityInfo***

For E-UTRA radio access capabilities, it is up to E-UTRA how the backward compatibility among *supportedBandCombinationReduced*, *supportedBandCombination* and *supportedBandCombinationAdd* is ensured. If *supportedBandCombinationReduced* and *supportedBandCombination*/*supportedBandCombinationAdd* are included into *ueCapabilityRAT-Container*, it can be assumed that the value of fields, *requestedBands*, *reducedIntNonContCombRequested* and *requestedCCsXL* are consistent with all supported band combination fields. NOTE 2

***ue-SupportedEARFCN***

Includes UE supported EARFCN of the handover target E-UTRA cell if the target E-UTRA cell belongs to multiple frequency bands.

NOTE 1: The source typically sets the *ue-ConfigRelease* to the release corresponding with the current dedicated radio configuration. The source may however also consider the common radio resource configuration e.g. in case interoperability problems would appear if the UE temporary continues extensions of this part of the configuration in a target PCell not supporting them.

NOTE 2: The following table indicates per source RAT whether RAT capabilities are included or not.

Source RAT	E-UTRA capabilites	UTRA capabilities	GERAN capabilities	MR DC capabilities	NR capabilities
UTRAN	Included	May be included, ignored by eNB if received	May be included	Excluded	Excluded
GERAN CS	Excluded	May be included, ignored by eNB if received	Included	Excluded	Excluded
GERAN PS	Excluded	May be included, ignored by eNB if received	Included	Excluded	Excluded
E-UTRAN	May be included if UE Radio Capability ID as specified in 23.502 [102] is used for the UE. Included otherwise.	May be included	May be included	May be included	May be included
NR	May be included if UE Radio Capability ID as specified in 23.502 [102] is used for the UE. Included otherwise.	Excluded	Excluded	May be included	May be included

Conditional presence	Explanation
HO	The field is mandatory present in case of handover or UE context retrieval, e.g. in case of resume or re-establishment within E-UTRA; otherwise the field is not present.
HO2	The field is optional present in case of handover or UE context retrieval, e.g. in case of resume or re-establishment within E-UTRA; otherwise the field is not present.
HO3	The field is optional present in case of handover from GERAN to E-UTRA, otherwise the field is not present.
HO4	The field is mandatory present in case of handover or UE context retrieval, e.g. in case of resume or re-establishment within E-UTRA/5GC and optional present in case of handover from NR to E-UTRA/5GC; otherwise the field is not present.
HO5	The field is optional present in case of handover within E-UTRA, or handover from NR to E-UTRA; otherwise the field is not present.

## SCG-Config

This message is used to transfer the SCG radio configuration generated by the SeNB.

Direction: Secondary eNB to master eNB

### SCG-Config message

```
-- ASN1START

```

### **SCG-Config field descriptions**

**scg-RadioConfig-r12**

Includes the change of the dedicated SCG configuration and, upon addition of an SCG cell, the common SCG configuration.

The SeNB only includes a new SCG cell in response to a request from MeNB, but may include release of an SCG cell release or release of the SCG part of an SCG/Split DRB without prior request from MeNB. The SeNB does not use this field to initiate release of the SCG.

## SCG-ConfigInfo

This message is used by MeNB to request the SeNB to perform certain actions e.g. to establish, modify or release an SCG, and it may include additional information e.g. to assist the SeNB with assigning the SCG configuration.

Direction: Master eNB to secondary eNB

### SCG-ConfigInfo field descriptions

***drb-ToAddModListSCG***

Includes DRBs the SeNB is requested to establish or modify (DRB type change).

***drb-ToReleaseListSCG***

Includes DRBs the SeNB is requested to release.

***makeBeforeBreakSCG-Req***

To request the target eNB to add the *makeBeforeBreakSCG* indication in the *mobilityControlInfoSCG* in case of intra-frequency SCG change.

***maxSCH-TB-BitsXL***

Indicates the maximum DL-SCH/UL-SCH TB bits that may be scheduled in a TTI. Specified as a percentage of the value defined for the applicable UE category.

***measGapConfig***

Includes the current measurement gap configuration.

***measResultListRSSI-SCG***

Includes RSSI measurement results of SCG (serving) cells

***measResultSTD***

Includes measurement results of UE SFN and Subframe Timing Difference between the PCell and the PSCell.

***measResultServCellListSCG***

Includes measurement results of SCG (serving) cells.

***radioResourceConfigDedMCG***

Includes the current dedicated MCG radio resource configuration.

***sCellIndex***

If *sCellIndex-r13* is present, *sCellIndex-r12* shall be ignored.

***sCellToAddModListMCG, sCellToAddModListMCG-Ext***

Includes the current MCG SCell configuration. Field *sCellToAddModListMCG* is used to add the first 4 SCells with *sCellIndex-r10* while *sCellToAddModListMCG-Ext* is used to add the rest.

***sCellToAddModListSCG, sCellToAddModListSCG-Ext***

Includes SCG cells the SeNB is requested to establish. Measurement results may be provided for these cells. Field *sCellToAddModListSCG* is used to add the first 4 SCells with *sCellIndex-r12* while *sCellToAddModListSCG-Ext* is used to add the rest.

***sCellToReleaseListSCG, sCellToReleaseListSCG-Ext***

Includes SCG cells the SeNB is requested to release.

***scg-RadioConfig***

Includes the current dedicated SCG configuration.

***scg-ConfigRestrictInfo***

Includes fields for which MeNB explicitly indicates the restriction to be observed by SeNB.

***servCellId***

If *servCellId-r13* is present, *servCellId-r12* shall be ignored.

***p-Max***

Cell specific value i.e. as broadcast by PCell.

Conditional presence	Explanation
<i>DRB-Setup</i>	The field is mandatory present in case DRB establishment is requested; otherwise the field is not present.
<i>SCellAdd</i>	The field is mandatory present in case SCG cell establishment is requested; otherwise the field is not present.
<i>SCellAdd2</i>	The field is optional present in case SCG cell establishment is requested; otherwise the field is not present.

### — UEPagingCoverageInformation

This message is used to transfer UE paging coverage information, covering both upload to and download from the EPC/5GC.

Direction: eNB to/from EPC, ng-eNB to/from 5GC

### ***UEPagingCoverageInformation message***

```
-- ASN1START
UEPagingCoverageInformation ::= SEQUENCE {
 criticalExtensions CHOICE {
 c1 CHOICE{
 uePagingCoverageInformation-r13 UEPagingCoverageInformation-r13-IEs,
 spare7 NULL,
 spare6 NULL, spare5 NULL, spare4 NULL,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE { }
 }
}

UEPagingCoverageInformation-r13-IEs ::= SEQUENCE {
 mpdcch-NumRepetition-r13 INTEGER (1..256) OPTIONAL,
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

#### ***UEPagingCoverageInformation field descriptions***

##### ***mpdcch-NumRepetition***

Number of repetitions for MPDCCH. The value is an estimate of the required number of repetitions for MPDCCH for paging.

### ***UERadioAccessCapabilityInformation***

This message is used to transfer UE radio access capability information, covering both upload to and download from the EPC/5GC.

Direction: eNB to/from EPC, ng-eNB to/from 5GC

### ***UERadioAccessCapabilityInformation message***

```
-- ASN1START
UERadioAccessCapabilityInformation ::= SEQUENCE {
 criticalExtensions CHOICE {
 c1 CHOICE{
 ueRadioAccessCapabilityInformation-r8 UERadioAccessCapabilityInformation-r8-IEs,
 spare7 NULL,
 spare6 NULL, spare5 NULL, spare4 NULL,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE { }
 }
}

UERadioAccessCapabilityInformation-r8-IEs ::= SEQUENCE {
 ue-RadioAccessCapabilityInfo OCTET STRING (CONTAINING UECapabilityInformation),
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

### ***UERadioAccessCapabilityInformation* field descriptions**

***ue-RadioAccessCapabilityInfo***

Including E-UTRA, GERAN, CDMA2000-1xRTT Bandclass, NR and MR-DC radio access capabilities (separated). UTRA radio access capabilities are not included. For E-UTRA radio access capabilities, it is up to E-UTRA how the backward compatibility among *supportedBandCombinationReduced*, *supportedBandCombination* and *supportedBandCombinationAdd* is ensured. If *supportedBandCombinationReduced* and *supportedBandCombination/supportedBandCombinationAdd* are included into *ueCapabilityRAT-Container*, it can be assumed that the value of fields, *requestedBands*, *reducedIntNonContCombRequested* and *requestedCCsXL* are consistent with all supported band combination fields.

- ***UERadioPagingInformation***

This message is used to transfer radio paging information, covering both upload to and download from the EPC/5GC.

Direction: eNB to/ from EPC, ng-eNB to/from 5GC

### ***UERadioPagingInformation* message**

```
-- ASN1START

UERadioPagingInformation ::= SEQUENCE {
 criticalExtensions CHOICE {
 c1 CHOICE {
 ueRadioPagingInformation-r12
 ueRadioPagingInformation-r12-IES,
 spare7 NULL,
 spare6 NULL, spare5 NULL, spare4 NULL,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
 }
}

UERadioPagingInformation-r12-IES ::= SEQUENCE {
 ue-RadioPagingInfo-r12 OCTET STRING (CONTAINING UE-RadioPagingInfo-r12),
 nonCriticalExtension OPTIONAL
}

UERadioPagingInformation-v1310-IES ::= SEQUENCE {
 supportedBandListEUTRAForPaging-r13 SEQUENCE (SIZE (1..maxBands)) OF FreqBandIndicator-r11
OPTIONAL,
 nonCriticalExtension UERadioPagingInformation-v1610-IES OPTIONAL
}

UERadioPagingInformation-v1610-IES ::= SEQUENCE {
 accessStratumRelease-r16 ENUMERATED {true}
 nonCriticalExtension SEQUENCE {}
}
-- ASN1STOP
```

### ***UERadioPagingInformation* field descriptions**

***accessStratumRelease***

Indicates that the UE supports reception of *accessType-r16* in the Paging message.

***supportedBandListEUTRAForPaging***

Indicates the UE supported frequency bands which is derived by the eNB from *UE-EUTRA-Capability*.

***ue-RadioPagingInfo***

The field is used to transfer UE capability information used for paging. The eNB generates the *ue-RadioPagingInfo* and the contained UE capability information is absent when not supported by the UE.

## 10.3 Inter-node RRC information element definitions

### — AS-Config

The AS-Config IE contains information about RRC configuration information in the source eNB which can be utilized by target eNB to determine the need to change the RRC configuration during the handover preparation phase. The information can also be used after the handover is successfully performed or during the RRC connection re-establishment or resume.

#### AS-Config information element

```
-- ASN1START

AS-Config ::= SEQUENCE {
 sourceMeasConfig MeasConfig,
 sourceRadioResourceConfig RadioResourceConfigDedicated,
 sourceSecurityAlgorithmConfig SecurityAlgorithmConfig,
 sourceUE-Identity C-RNTI,

}

-- ASN1STOP

```

**NOTE:** The *AS-Config* re-uses information elements primarily created to cover the radio interface signalling requirements. Consequently, the information elements may include some parameters that are not relevant for the target eNB e.g. the SFN as included in the *MasterInformationBlock*.

AS-Config field descriptions	
<b>antennaInfoCommon</b>	This field provides information about the number of antenna ports in the source PCell.
<b>p-MaxEUTRA</b>	Indicates the <i>p-MaxEUTRA</i> in the source PCell.
<b>scg-State</b>	Indicates that the SCG is deactivated.
<b>sourceOtherConfigSN-NR</b>	Other NR config set by SN (cell group, measurements) in case of (NG)EN-DC i.e. as defined by the <i>RRCReconfiguration</i> message in TS 38.331 [82].
<b>sourceRB-ConfigNR</b>	NR radio bearer config, as defined by <i>RadioBearerConfig</i> IE in TS 38.331 [82]. The field may e.g. be set by MN in case of (NG)EN-DC, by source eNB connected to 5GCN.
<b>sourceRB-ConfigSN-NR</b>	NR radio bearer config set by SN in case of (NG)EN-DC or of SN terminated RB without SCG, as defined by <i>RadioBearerConfig</i> IE in TS 38.331 [82].
<b>sourceDL-CarrierFreq</b>	Provides the parameter Downlink EARFCN in the source PCell, see TS 36.101 [42]. If the source eNB provides AS-Config-v9e0, it sets <i>sourceDL-CarrierFreq</i> (i.e. without suffix) to <i>maxEARFCN</i> .
<b>sourceLWA-Config</b>	LWA configuration in the source PCell when handover is triggered.
<b>sourceOtherConfig</b>	Provides other configuration in the source PCell.
<b>sourceMasterInformationBlock</b>	<i>MasterInformationBlock</i> transmitted in the source PCell.
<b>sourceMeasConfig</b>	Measurement configuration in the source cell. The measurement configuration for all measurements existing in the source eNB when handover is triggered shall be included. See 10.5.
<b>sourceRCLWI-Configuration</b>	RCLWI Configuration in the source PCell.
<b>sourceSL-CommConfig</b>	This field covers the sidelink communication configuration.
<b>sourceSL-DiscConfig</b>	This field covers the sidelink discovery configuration.
<b>sourceRadioResourceConfig</b>	Radio configuration in the source PCell. The radio resource configuration for all radio bearers existing in the source PCell when handover is triggered shall be included. See 10.5.
<b>sourceSCellConfigList</b>	Radio resource configuration (common and dedicated) of the SCells configured in the source eNB.
<b>sourceSCG-ConfiguredNR</b>	Value <i>true</i> indicates that the UE is configured with NR SCG in source configuration. The field is included only if <i>sourceOtherConfigSN-NR</i> is not included.
<b>sourceSecurityAlgorithmConfig</b>	This field provides the AS integrity protection (SRBs) and AS ciphering (SRBs and DRBs) algorithm configuration used in the source PCell.
<b>sourceSystemInformationBlockType1</b>	<i>SystemInformationBlockType1</i> (or <i>SystemInformationBlockType1-BR</i> ) transmitted in the source PCell.
<b>sourceSystemInformationBlockType2</b>	<i>SystemInformationBlockType2</i> transmitted in the source PCell.
<b>sourceSL-V2X-CommConfig</b>	Indicates the V2X sidelink communication related configurations configured in the source eNB.
<b>sourceWLAN-MeasResult</b>	WLAN measurement results in the source PCell when handover is triggered.
<b>tdm-PatternConfig</b>	Indicates the <i>tdm-PatternConfig</i> configured to the UE in the source PCell.
<b>tdm-PatternConfig2</b>	Indicates the <i>tdm-PatternConfig2</i> configured to the UE in the source PCell.

## – AS-Context

The IE AS-Context is used to transfer local E-UTRAN context required by the target eNB.

### AS-Context information element

```

-- ASN1START

AS-Context ::= SEQUENCE {
 reestablishmentInfo OPTIONAL -- Cond HO
}

AS-Context-v1130 ::= SEQUENCE {
 idc-Indication-r11 OCTET STRING (CONTAINING
 InDeviceCoexIndication-r11) OPTIONAL, -- Cond HO2

}

ConfigRestrictInfoDAPS-r16 ::= SEQUENCE {
 maxSCH-TB-BitsDL-r16 INTEGER (1..100) OPTIONAL, -- Cond HO2
 maxSCH-TB-BitsUL-r16 INTEGER (1..100) OPTIONAL, -- Cond HO2
}

ConfigRestrictInfoDAPS-v1630 ::= SEQUENCE {
 daps-PowerCoordinationInfo-r16 DAPS-PowerCoordinationInfo-r16 OPTIONAL -- Cond HO2
}

-- ASN1STOP

```

AS-Context field descriptions	
<b>idc-Indication</b>	Including information used for handling the IDC problems.
<b>maxSCH-TB-BitsXL</b>	Indicates the maximum DL-SCH/UL-SCH TB bits that may be scheduled in a TTI during DAPS HO. Specified as a percentage of the value defined for the applicable UE category.
<b>reestablishmentInfo</b>	Including information needed for the RRC connection re-establishment.
<b>sourceContextEN-DC</b>	(NG)EN-DC related context information, in particular regarding the UE capability coordination, as defined by the <i>ConfigRestrictInfoSCG</i> IE specified in TS 38.331 [82].
<b>selectedBandCombinationInfoEN-DC</b>	Including the <i>BandCombinationInfoSN</i> IE specified in TS 38.331 [82]. See NOTE 1.
<b>sidelinkUEInformationNR</b>	Including sidelink UE information as defined by the <i>SidelinkUEInformationNR</i> message specified in TS 38.331 [82].
<b>ueAssistanceInformation</b>	Including UE assistance information as defined by the <i>UEAssistanceInformation</i> message e.g. concerning power preference, overheating.
<b>ueAssistanceInformationNR</b>	Including sidelink UE assistance information as defined by the <i>UEAssistanceInformation</i> message specified in TS 38.331 [82].
<b>ueAssistanceInformationNR-SCG</b>	Includes for each UE assistance feature associated with the NR SCG as specified in TS 38.331 [82], the information last reported by the UE in the NR <i>UEAssistanceInformation</i> message for the NR SCG, if any.

Conditional presence	Explanation
<i>HO</i>	The field is mandatory present in case of handover within E-UTRA; otherwise the field is not present.
<i>HO2</i>	The field is optional present in case of handover within E-UTRA; otherwise the field is not present.
<i>HO3</i>	The field is optional present in case of handover within E-UTRA, or handover from NR to E-UTRA; otherwise the field is not present.

NOTE 1: If the field is present, it is used to help target MN to decide appropriate LTE band for SCell frequency measurement in case of inter-MN handover without SN change.

### – ReestablishmentInfo

The *ReestablishmentInfo* IE contains information needed for the RRC connection re-establishment.

#### ReestablishmentInfo information element

```
-- ASN1START

ReestablishmentInfo ::= SEQUENCE {
 sourcePhysCellId,
 targetCellShortMAC-I,
 additionalReestabInfoList
 OPTIONAL,
 ...
}

AdditionalReestabInfoList ::= SEQUENCE (SIZE (1..maxReestabInfo)) OF AdditionalReestabInfo

AdditionalReestabInfo ::= SEQUENCE{
 cellIdentity,
 Key-eNodeB-Star,
 shortMAC-I
}

Key-eNodeB-Star ::= BIT STRING (SIZE (256))

-- ASN1STOP
```

<b>ReestablishmentInfo field descriptions</b>	
<b>additionalRestabInfoList</b>	Contains a list of shortMAC-I and KeNB* for cells under control of the target eNB, required for potential re-establishment by the UE in these cells to succeed.
<b>Key-eNodeB-Star</b>	Parameter KeNB*: See TS 33.401 [32], clause 7.2.8.4. If the cell identified by <i>cellIdentity</i> belongs to multiple frequency bands, the source eNB selects the DL-EARFCN for the KeNB* calculation using the same logic as UE uses when selecting the DL-EARFCN in IDLE as defined in clause 6.2.2. This parameter is only used for X2 handover, and for S1 handover, it shall be ignored by target eNB.
<b>sourcePhyCellId</b>	The physical cell identity of the source PCell, used to determine the UE context in the target eNB at re-establishment.
<b>targetCellShortMAC-I</b>	The ShortMAC-I for the handover target PCell, in order for potential re-establishment to succeed.

## — RRM-Config

The *RRM-Config* IE contains information about UE specific RRM information before the handover which can be utilized by target eNB.

### **RRM-Config information element**

```
-- ASN1START

RRM-Config ::= SEQUENCE {
 ue-InactiveTime ENUMERATED {
 s1, s2, s3, s5, s7, s10, s15, s20,
 s25, s30, s40, s50, min1, min1s20c, min1s40,
 min2, min2s30, min3, min3s30, min4, min5, min6,
 min7, min8, min9, min10, min12, min14, min17, min20,
 min24, min28, min33, min38, min44, min50, hr1,
 hr1min30, hr2, hr2min30, hr3, hr3min30, hr4, hr5, hr6,
 hr8, hr10, hr13, hr16, hr20, day1, day1hr12, day2,
 day2hr12, day3, day4, day5, day7, day10, day14, day19,
 day24, day30, dayMoreThan30} OPTIONAL,
 ...
 [['candidateCellInfoList-r10' CandidateCellInfoList-r10 OPTIONAL
]],
 [['candidateCellInfoListNR-r15' MeasResultServFreqListNR-r15 OPTIONAL
]]
}

CandidateCellInfoList-r10 ::= SEQUENCE (SIZE (1..maxFreq)) OF CandidateCellInfo-r10

CandidateCellInfo-r10 ::= SEQUENCE {
 -- cellIdentification
 physCellId-r10 PhysCellId,
 dl-CarrierFreq-r10 ARFCN-ValueEUTRA,
 -- available measurement results
 rsrpResult-r10 RSRP-Range OPTIONAL,
 rsrqResult-r10 RSRQ-Range OPTIONAL,
 ...
 [['dl-CarrierFreq-v1090' ARFCN-ValueEUTRA-v9e0 OPTIONAL
]],
 [['rsrqResult-v1250' RSRQ-Range-v1250 OPTIONAL
]],
 [['rs-sinr-Result-r13' RS-SINR-Range-r13 OPTIONAL
]]
}

-- ASN1STOP
```

<b>RRM-Config field descriptions</b>	
<b>candidateCellInfoList</b>	A list of the best cells on each frequency for which measurement information was available, in order of decreasing RSRP.
<b>candidateCellInfoListNR</b>	A list of NR cells including serving cells and best neighbour cells on each SSB frequency, for which measurement results were available, and for each cell the best beams.
<b>dl-CarrierFreq</b>	The source includes <i>dl-CarrierFreq-v1090</i> if and only if <i>dl-CarrierFreq-r10</i> is set to <i>maxEARFCN</i> .
<b>ue-InactiveTime</b>	Duration while UE has not received or transmitted any user data. Thus the timer is still running in case e.g., UE measures the neighbour cells for the HO purpose. Value s1 corresponds to 1 second, s2 corresponds to 2 seconds and so on. Value min1 corresponds to 1 minute, value min1s20 corresponds to 1 minute and 20 seconds, value min1s40 corresponds to 1 minute and 40 seconds and so on. Value hr1 corresponds to 1 hour, hr1min30 corresponds to 1 hour and 30 minutes and so on.

## 10.4 Inter-node RRC multiplicity and type constraint values

- Multiplicity and type constraints definitions

```
-- ASN1START
maxReestabInfo INTEGER ::= 32 -- Maximum number of KeNB* and shortMAC-I forwarded
 -- at handover for re-establishment preparation
-- ASN1STOP
```

## 10.5 Mandatory information in AS-Config

The *AS-Config* transferred between source eNB and target-eNB shall include all IEs necessary to describe the AS context. The conditional presence in clause 6 is only applicable for eNB to UE communication.

The "need" or "cond" statements are not applied in case of sending the IEs from source eNB to target eNB. Some fields shall be included regardless of the "need" or "cond" e.g. *discardTimer*. The *AS-Config* re-uses information elements primarily created to cover the radio interface signalling requirements. The information elements may include some parameters that are not relevant for the target eNB e.g. the SFN as included in the *MasterInformationBlock*.

All the fields in the *AS-Config* as defined in 10.3 that are introduced after v9.2.0 and that are optional for eNB to UE communication shall be included, if the functionality is configured, except for the fields *sourceOtherConfigSN-NR* and *sourceRB-ConfigSN-NR* in *AS-ConfigNR*. The fields in the *AS-Config* that are defined before and including v9.2.0 shall be included as specified in the following.

Within the *sourceRadioResourceConfig*, *sourceMeasConfig* and *sourceOtherConfig*, the source eNB shall include fields that are optional for eNB to UE communication, if the functionality is configured unless explicitly specified otherwise in the following:

- in accordance with a condition that is explicitly stated to be applicable; or
- a default value is defined for the concerned field; and the configured value is the same as the default value that is defined; or

- the need of the field is OP and the current UE configuration corresponds with the behaviour defined for absence of the field;

The following fields, if the functionality is configured, are not mandatory for the source eNB to include in the *AS-Config* since delta signalling by the target eNB for these fields is not supported:

- *semiPersistSchedC-RNTI*
- *measGapConfig*

For the measurement configuration, a corresponding operation as 5.5.6.1 and 5.5.2.2a is executed by target eNB.

## 10.6 Inter-node NB-IoT messages

### 10.6.1 General

This clause specifies NB-IoT RRC messages that are sent either across the X2- or the S1-interface, either to or from the eNB, i.e. a single 'logical channel' is used for all NB-IoT RRC messages transferred across network nodes.

#### – *NB-IoT-InterNodeDefinitions*

This ASN.1 segment is the start of the NB-IoT inter-node PDU definitions.

```
-- ASN1START

#### ***HandoverPreparationInformation-NB field descriptions***

***as-Config***

The radio resource configuration.

***as-Context***

The local E-UTRAN context required by the target eNB.

***rrm-Config***

The local E-UTRAN context used depending on the target node's implementation, which is mainly used for the RRM purpose.

***ue-RadioAccessCapabilityInfo, ue-RadioAccessCapabilityInfoExt***

The NB-IoT UE Radio Access Capability Parameters, see TS 36.306 [5].

### ***UEPagingCoverageInformation-NB***

This message is used to transfer UE paging coverage information for NB-IoT, covering both upload to and download from the EPC/5GC.

Direction: eNB to/from EPC, ng-eNB to/from 5GC

#### ***UEPagingCoverageInformation-NB message***

```

-- ASN1START

UEPagingCoverageInformation-NB ::= SEQUENCE {

```

#### ***UERadioPagingInformation-NB field descriptions***

##### ***ue-RadioPagingInfo***

The field is used to transfer UE NB-IoT capability information used for paging. The eNB generates the *ue-RadioPagingInfo* and the contained UE capability information is absent when not supported by the UE.

## 10.7 Inter-node NB-IoT RRC information element definitions

### – *AS-Config-NB*

The *AS-Config-NB* IE contains information about NB-IoT RRC configuration information in the source eNB which can be utilized by target eNB.

#### ***AS-Config-NB information element***

```
-- ASN1START

AS-Config-NB ::= SEQUENCE {
 sourceRadioResourceConfig-r13 RadioResourceConfigDedicated-NB-r13,
 sourceSecurityAlgorithmConfig-r13 SecurityAlgorithmConfig,
 sourceUE-Identity-r13 C-RNTI,
 sourceDl-CarrierFreq-r13 CarrierFreq-NB-r13,
 ...
 [[sourceDL-CarrierFreq-v1550 CarrierFreq-NB-v1550 OPTIONAL -- Cond TDD
]]
}

-- ASN1STOP
```

<b>AS-Config-NB field descriptions</b>	
<b>sourceDL-CarrierFreq</b>	Provides the parameter Downlink EARFCN in the source PCell, see TS 36.101 [42].
<b>sourceRadioResourceConfig</b>	Radio configuration in the source PCell. The radio resource configuration for all radio bearers existing in the source PCell shall be included. See 10.9.
<b>sourceSecurityAlgorithmConfig</b>	This field provides the AS integrity protection (SRBs) and AS ciphering (SRBs and DRBs) algorithm configuration used in the source PCell.

Conditional presence	Explanation
TDD	The field is optionally present in case of TDD; otherwise the field is not present.

## – *AS-Context-NB*

The IE *AS-Context-NB* is used to transfer the UE context required by the target eNB.

### **AS-Context-NB information element**

```
-- ASN1START
AS-Context-NB ::= SEQUENCE {
 reestablishmentInfo-r13 OPTIONAL,
 ...
}
-- ASN1STOP
```

<b>AS-Context-NB field descriptions</b>	
<b>reestablishmentInfo</b>	Including information needed for the RRC connection re-establishment.

## – *ReestablishmentInfo-NB*

The *ReestablishmentInfo-NB* IE contains information needed for the RRC connection re-establishment.

### **ReestablishmentInfo-NB information element**

```
-- ASN1START
ReestablishmentInfo-NB ::= SEQUENCE {
 sourcePhysCellId-r13 OPTIONAL,
 targetCellShortMAC-I-r13 OPTIONAL,
 additionalReestabInfoList-r13 OPTIONAL,
 ...
}
-- ASN1STOP
```

<b>ReestablishmentInfo-NB field descriptions</b>	
<b>additionalReestabInfoList</b>	Contains a list of shortMAC-I and KeNB* for cells under control of the target eNB, required for potential re-establishment by the UE in these cells to succeed.
<b>sourcePhysCellId</b>	The physical cell identity of the source PCell, used to determine the UE context in the target eNB at re-establishment.
<b>targetCellShortMAC-I</b>	The ShortMAC-I for the target PCell, in order for potential re-establishment to succeed.

- ***RRM-Config-NB***

The *RRM-Config-NB* IE contains information about UE specific RRM information which can be utilized by target eNB.

#### ***RRM-Config-NB* information element**

```
-- ASN1START

RRM-Config-NB ::= SEQUENCE {
 ue-InactiveTime ENUMERATED {
 s1, s2, s3, s5, s7, s10, s15, s20,
 s25, s30, s40, s50, min1, min1s20, min1s40,
 min2, min2s30, min3, min3s30, min4, min5, min6,
 min7, min8, min9, min10, min12, min14, min17, min20,
 min24, min28, min33, min38, min44, min50, hr1,
 hr1min30, hr2, hr2min30, hr3, hr3min30, hr4, hr5, hr6,
 hr8, hr10, hr13, hr16, hr20, day1, day1hr12, day2,
 day2hr12, day3, day4, day5, day7, day10, day14, day19,
 day24, day30, dayMoreThan30} OPTIONAL,
 ...
}

-- ASN1STOP
```

#### ***RRM-Config-NB* field descriptions**

##### ***ue-InactiveTime***

Duration while UE has not received or transmitted any user data. Value s1 corresponds to 1 second, s2 corresponds to 2 seconds and so on. Value min1 corresponds to 1 minute, value min1s20 corresponds to 1 minute and 20 seconds, value min1s40 corresponds to 1 minute and 40 seconds and so on. Value hr1 corresponds to 1 hour, hr1min30 corresponds to 1 hour and 30 minutes and so on.

## 10.8 Inter-node RRC multiplicity and type constraint values

- Multiplicity and type constraints definitions
- End of *NB-IoT-InterNodeDefinitions*

```
-- ASN1START

END

-- ASN1STOP
```

## 10.9 Mandatory information in *AS-Config-NB*

The *AS-Config-NB* transferred between source eNB and target-eNB shall include all IEs necessary to describe the AS context. The conditional presence in clause 6 is only applicable for eNB to UE communication.

The "Need" or "Cond" statements are not applied in case of sending the IEs from source eNB to target eNB. Some information elements shall be included regardless of the "Need" or "Cond" e.g. *discardTimer*. The *AS-Config-NB* re-uses information elements primarily created to cover the radio interface signalling requirements.

Within the *sourceRadioResourceConfig*, the source eNB shall include fields that are optional for eNB to UE communication, if the functionality is configured unless explicitly specified otherwise in the following:

- in accordance with a condition that is explicitly stated to be applicable; or
- a default value is defined for the concerned field; and the configured value is the same as the default value that is defined; or

- the need of the field is OP and the current UE configuration corresponds with the behaviour defined for absence of the field;

## 11 UE capability related constraints and performance requirements

### 11.1 UE capability related constraints

The following table lists constraints regarding the UE capabilities that E-UTRAN is assumed to take into account.

Parameter	Description	Value	NB-IoT
#DRBs	The number of DRBs that a UE shall support	8, 15 NOTE2 NOTE3	(0, 1, 2) NOTE1
#RLC-AM	The number of RLC AM entities that a UE shall support	10, 17	(2, 3) NOTE1
#minCellperMeasObject EUTRA	The minimum number of neighbour cells (excluding exclude-listed cells) that a UE shall be able to store within a MeasObjectEUTRA. NOTE.	32	N/A
#minExcludedCellRangeperMeasObjectEUTRA	The minimum number of exclude-listed cell PCI ranges that a UE shall be able to store within a MeasObjectEUTRA	32	N/A
#minCellperMeasObject UTRA	The minimum number of neighbour cells that a UE shall be able to store within a MeasObjectUTRA. NOTE.	32	N/A
#minCellperMeasObject GERAN	The minimum number of neighbour cells that a UE shall be able to store within a measObjectGERAN. NOTE.	32	N/A
#minCellperMeasObject CDMA2000	The minimum number of neighbour cells that a UE shall be able to store within a measObjectCDMA2000. NOTE.	32	N/A
#minExcludedCellperMeasObjectNR	The minimum number of exclude-listed cells that a UE shall be able to store within a MeasObjectNR	32	N/A
#minCellTotal	The minimum number of neighbour cells (excluding exclude-listed cells) that UE shall be able to store in total in all measurement objects configured	256	N/A
NOTE:	In case of CGI reporting, the limit regarding the cells E-UTRAN can configure includes the cell for which the UE is requested to report CGI i.e. the amount of neighbour cells that can be included is at most (# minCellperMeasObjectRAT - 1), where RAT represents EUTRA/UTRA/GERAN/CDMA2000 respectively.		
NOTE 1:	#DRBs based on UE capability, #RLC-AM =#DRBs + 2.		
NOTE 2:	'15' applies when the UE supports <i>extendedNumberofDRBs-r15</i> . For one MAC entity, the maximum number of DRBs configured with PDCP duplication and with RLC entity(ies) associated with this MAC entity is 8.		
NOTE 3:	The requirement is applicable in EN-DC, NGEN-DC and LTE standalone.		

### 11.2 Processing delay requirements for RRC procedures

The UE performance requirements for RRC procedures are specified in the following tables, by means of a value N:

N = the number of 1ms subframes from the end of reception of the E-UTRAN -> UE message on the UE physical layer up to when the UE shall be ready for the reception of uplink grant for the UE -> E-UTRAN response message with no access delay other than the TTI-alignment (e.g. excluding delays caused by scheduling, the random access procedure or physical layer synchronisation).

NOTE: No processing delay requirements are specified for RN-specific procedures.

Figure 11.2-1: Illustration of RRC procedure delay

Table 11.2-1: UE performance requirements for RRC procedures for UEs other than NB-IoT UEs

Procedure title:	E-UTRAN -> UE	UE -> E-UTRAN	N	Notes
<b>RRC Connection Control Procedures</b>				
RRC connection establishment	<i>RRConnectionSetup or RRConnectionResume</i>	<i>RRConnectionSetupComplete or RRConnectionResumeComplete</i>	15 or 3	<p>N = 3 applies for the case of reception of <i>RRConnectionResume</i> if <i>reducedCP-LatencyEnabled</i> is configured, the UE supports reduced CP latency, and the RRC message only includes MAC and PHY (re-)configurations and does not include (re-)configurations of DRX, SPS, SCells, and MIMO. Further, the UL grant is sent using PDCCH DCI format 0 in common search space. In this scenario, the RRC procedure delay can extend beyond the reception of the UL grant, up to 7 ms.</p> <p>For other cases N = 15 applies.</p>
RRC connection release	<i>RRConnectionRelease</i>		NA	
RRC connection re-configuration (radio resource configuration, possibly including configuration of conditional reconfigurations)	<i>RRConnectionReconfiguration</i>	<i>RRConnectionReconfigurationComplete</i>	15	Same requirement is applicable regardless of the number of target candidates being configured, if conditional reconfigurations are included in the message,
RRC connection re-configuration (measurement configuration)	<i>RRConnectionReconfiguration</i>	<i>RRConnectionReconfigurationComplete</i>	15	
RRC connection re-configuration (intra-LTE mobility)	<i>RRConnectionReconfiguration</i>	<i>RRConnectionReconfigurationComplete</i>	15

## 11.3 Void

# Annex A (informative): Guidelines, mainly on use of ASN.1

## A.1 Introduction

The following clauses contain guidelines for the specification of RRC protocol data units (PDUs) with ASN.1.

## A.2 Procedural specification

### A.2.1 General principles

The procedural specification provides an overall high level description regarding the UE behaviour in a particular scenario.

It should be noted that most of the UE behaviour associated with the reception of a particular field is covered by the applicable parts of the PDU specification. The procedural specification may also include specific details of the UE behaviour upon reception of a field, but typically this should be done only for cases that are not easy to capture in the PDU clause e.g. general actions, more complicated actions depending on the value of multiple fields.

Likewise, the procedural specification need not specify the UE requirements regarding the setting of fields within the messages that are send to E-UTRAN i.e. this may also be covered by the PDU specification.

### A.2.2 More detailed aspects

The following more detailed conventions should be used:

- Bullets:
  - Capitals should be used in the same manner as in other parts of the procedural text i.e. in most cases no capital applies since the bullets are part of the sentence starting with 'The UE shall:'
  - All bullets, including the last one in a clause, should end with a semi-colon i.e. an ';'
- Conditions
  - Whenever multiple conditions apply, a semi-colon should be used at the end of each conditions with the exception of the last one, i.e. as in 'if cond1; or cond2:'

## A.3 PDU specification

### A.3.1 General principles

#### A.3.1.1 ASN.1 clauses

The RRC PDU contents are formally and completely described using abstract syntax notation (ASN.1), see X.680 [13], X.681 (02/2002) [14].

The complete ASN.1 code is divided into a number of ASN.1 clauses in the specifications. In order to facilitate the extraction of the complete ASN.1 code from the specification, each ASN.1 clause begins with a text paragraph consisting entirely of an *ASN.1 start tag*, which consists of a double hyphen followed by a single space and the text string "ASN1START" (in all upper case letters). Each ASN.1 clause ends with a text paragraph consisting entirely of an *ASN.1 stop tag*, which consists of a double hyphen followed by a single space and the text "ASN1STOP" (in all upper case letters):

-- ASN1START

-- ASN1STOP

The text paragraphs containing the ASN.1 start and stop tags should not contain any ASN.1 code significant for the complete description of the RRC PDU contents. The complete ASN.1 code may be extracted by copying all the text paragraphs between an ASN.1 start tag and the following ASN.1 stop tag in the order they appear, throughout the specification.

**NOTE:** A typical procedure for extraction of the complete ASN.1 code consists of a first step where the entire RRC PDU contents description (ultimately the entire specification) is saved into a plain text (ASCII) file format, followed by a second step where the actual extraction takes place, based on the occurrence of the ASN.1 start and stop tags.

### A.3.1.2 ASN.1 identifier naming conventions

The naming of identifiers (i.e., the ASN.1 field and type identifiers) should be based on the following guidelines:

- Message (PDU) identifiers should be ordinary mixed case without hyphenation. These identifiers, *e.g.*, the *RRConnectionModificationCommand*, should be used for reference in the procedure text. Abbreviated forms of these identifiers should not be used.
- Type identifiers other than PDU identifiers should be ordinary mixed case, with hyphenation used to set off acronyms only where an adjacent letter is a capital, *e.g.*, *EstablishmentCause*, *SelectedPLMN* (not *Selected-PLMN*, since the "d" in "Selected" is lowercase), *InitialUE-Identity* and *MeasSFN-SFN-TimeDifference*.
- Field identifiers shall start with a lowercase letter and use mixed case thereafter, *e.g.*, *establishmentCause*. If a field identifier begins with an acronym (which would normally be in upper case), the entire acronym is lowercase (*plmn-Identity*, not *pLMN-Identity*). The acronym is set off with a hyphen (*ue-Identity*, not *ueIdentity*), in order to facilitate a consistent search pattern with corresponding type identifiers.
- Identifiers that are likely to be keywords of some language, especially widely used languages, such as C++ or Java, should be avoided to the extent possible.
- Identifiers, other than PDU identifiers, longer than 25 characters should be avoided where possible. It is recommended to use abbreviations, which should be done in a consistent manner *i.e.* use 'Meas' instead of 'Measurement' for all occurrences. Examples of typical abbreviations are given in table A.3.1.2.1-1 below.
- *For future extension:* When an extension is introduced a suffix is added to the identifier of the concerned ASN.1 field and/ or type. A suffix of the form "-rX" is used, with X indicating the release, for ASN.1 fields or types introduced in a later release (*i.e.* a release later than the original/ first release of the protocol) as well as for ASN.1 fields or types for which a revision is introduced in a later release replacing a previous version, *e.g.*, *Foo-r9* for the Rel-9 version of the ASN.1 type *Foo*. A suffix of the form "-rXb" is used for the first revision of a field that it appears in the same release (X) as the original version of the field, "-rXc" for a second intra-release revision and so on. A suffix of the form "-vXYZ" is used for ASN.1 fields or types that only are an extension of a corresponding earlier field or type (see clause A.4), *e.g.*, *AnElement-v10b0* for the extension of the ASN.1 type *AnElement* introduced in version 10.11.0 of the specification. A number *0...9, 10, 11, etc.* is used to represent the first part of the version number, indicating the release of the protocol. Lower case letters *a, b, c, etc.* are used to represent the second (and third) part of the version number if they are greater than 9. In the procedural specification, in field descriptions as well as in headings suffices are not used, unless there is a clear need to distinguish the extension from the original field.
- More generally, in case there is a need to distinguish different variants of an ASN.1 field or IE, a suffix should be added at the end of the identifiers *e.g.* *MeasObjectUTRA*, *ConfigCommon*. When there is no particular need to distinguish the fields (*e.g.* because the field is included in different IEs), a common field identifier name may be used. This may be attractive *e.g.* in case the procedural specification is the same for the different variants.

**Table A.3.1.2-1: Examples of typical abbreviations used in ASN.1 identifiers**

<b>Abbreviation</b>	<b>Abbreviated word</b>
Comm	Communication
Conf	Confirmation
Config	Configuration
Disc	Discovery
DL	Downlink
Ext	Extension
Freq	Frequency
Id	Identity
Ind	Indication
Info	Information
Meas	Measurement
Neigh	Neighbour(ing)
Param(s)	Parameter(s)
Persist	Persistent
Phys	Physical
Proc	Process
Reestab	Reestablishment
Req	Request
Rx	Reception
Sched	Scheduling
Sync	Synchronisation
Thresh	Threshold
Tx/ Transm	Transmission
UL	Uplink

NOTE: The table A.3.1.2.1-1 is not exhaustive. Additional abbreviations may be used in ASN.1 identifiers when needed.

### A.3.1.3 Text references using ASN.1 identifiers

A text reference into the RRC PDU contents description from other parts of the specification is made using the ASN.1 field or type identifier of the referenced element. The ASN.1 field and type identifiers used in text references should be in the *italic font style*. The "do not check spelling and grammar" attribute in Word should be set. Quotation marks (i.e., " ") should not be used around the ASN.1 field or type identifier.

A reference to an RRC PDU type should be made using the corresponding ASN.1 type identifier followed by the word "message", e.g., a reference to the *RRCConnectionRelease* message.

A reference to a specific part of an RRC PDU, or to a specific part of any other ASN.1 type, should be made using the corresponding ASN.1 field identifier followed by the word "field", e.g., a reference to the *prioritisedBitRate* field in the example below.

```
-- /example/ ASN1START
LogicalChannelConfig ::= SEQUENCE {
 ul-SpecificParameters SEQUENCE {
 priority,
 prioritisedBitRate,
 bucketSizeDuration,
 logicalChannelGroup
 } OPTIONAL
}
-- ASN1STOP
```

NOTE: All the ASN.1 start tags in the ASN.1 clauses, used as examples in this annex to the specification, are deliberately distorted, in order not to include them when the ASN.1 description of the RRC PDU contents is extracted from the specification.

A reference to a specific type of information element should be made using the corresponding ASN.1 type identifier preceded by the acronym "IE", e.g., a reference to the IE *LogicalChannelConfig* in the example above.

References to a specific type of information element should only be used when those are generic, i.e., without regard to the particular context wherein the specific type of information element is used. If the reference is related to a particular context, e.g., an RRC PDU type (message) wherein the information element is used, the corresponding field identifier in that context should be used in the text reference.

A reference to a specific value of an ASN.1 field should be made using the corresponding ASN.1 value without using quotation marks around the ASN.1 value, e.g., 'if the *status* field is set to value *true*'.

### A.3.2 High-level message structure

Within each logical channel type, the associated RRC PDU (message) types are alternatives within a CHOICE, as shown in the example below.

```
-- /example/ ASN1START

DL-DCCH-Message ::= SEQUENCE {
 message DL-DCCH-MessageType
}

DL-DCCH-MessageType ::= CHOICE {
 c1 CHOICE {
 dlInformationTransfer DLInformationTransfer,
 handoverFromEUTRAPreparationRequest HandoverFromEUTRAPreparationRequest,
 mobilityFromEUTRACmd MobilityFromEUTRACmd,
 rrcConnectionReconfiguration RRCConnectionReconfiguration,
 rrcConnectionRelease RRCConnectionRelease,
 securityModeCommand SecurityModeCommand,
 ueCapabilityEnquiry UECapabilityEnquiry,
 spare1 NULL
 },
 messageClassExtension SEQUENCE {}
}

-- ASN1STOP
```

A nested two-level CHOICE structure is used, where the alternative PDU types are alternatives within the inner level *c1* CHOICE.

Spare alternatives (i.e., *spare1* in this case) may be included within the *c1* CHOICE to facilitate future extension. The number of such spare alternatives should not extend the total number of alternatives beyond an integer-power-of-two number of alternatives (i.e., eight in this case).

Further extension of the number of alternative PDU types is facilitated using the *messageClassExtension* alternative in the outer level CHOICE.

### A.3.3 Message definition

Each PDU (message) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

RRCConnectionReconfiguration ::= SEQUENCE {
 rrc-TransactionIdentifier RRC-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {
 rrcConnectionReconfiguration-r8 RRCConnectionReconfiguration-r8-IEs,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
}

RRCConnectionReconfiguration-r8-IEs ::= SEQUENCE {
 -- Enter the IEs here.
 ...
}

-- ASN1STOP
```

Hooks for *critical* and *non-critical* extension should normally be included in the PDU type specification. How these hooks are used is further described in clause A.4.

Critical extensions are characterised by a redefinition of the PDU contents and need to be governed by a mechanism for protocol version agreement between the encoder and the decoder of the PDU, such that the encoder is prevented from sending a critically extended version of the PDU type, which is not comprehended by the decoder.

Critical extension of a PDU type is facilitated by a two-level CHOICE structure, where the alternative PDU contents are alternatives within the inner level *c1* CHOICE. Spare alternatives (i.e., *spare3* down to *spare1* in this case) may be included within the *c1* CHOICE. The number of spare alternatives to be included in the original PDU specification should be decided case by case, based on the expected rate of critical extension in the future releases of the protocol.

Further critical extension, when the spare alternatives from the original specifications are used up, is facilitated using the *criticalExtensionsFuture* in the outer level CHOICE.

In PDU types where critical extension is not expected in the future releases of the protocol, the inner level *c1* CHOICE and the spare alternatives may be excluded, as shown in the example below.

```
-- /example/ ASN1START

RRCConnectionReconfigurationComplete ::= SEQUENCE {
 rrc-TransactionIdentifier RRC-TransactionIdentifier,
 criticalExtensions CHOICE {
 rrcConnectionReconfigurationComplete-r8
 RRCConnectionReconfigurationComplete-r8-IEs,
 criticalExtensionsFuture SEQUENCE {}
 }
}

RRCConnectionReconfigurationComplete-r8-IEs ::= SEQUENCE {
 -- Enter the IEs here. -- -- Cond condTag
 ...
}

-- ASN1STOP
```

Non-critical extensions are characterised by the addition of new information to the original specification of the PDU type. If not comprehended, a non-critical extension may be skipped by the decoder, whilst the decoder is still able to complete the decoding of the comprehended parts of the PDU contents.

Non-critical extensions at locations other than the end of the message or other than at the end of a field contained in a BIT or OCTET STRING are facilitated by use of the ASN.1 extension marker "...". The original specification of a PDU type should normally include the extension marker at the end of the sequence of information elements contained.

Non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING are facilitated by use of an empty sequence that is marked OPTIONAL e.g. as shown in the following example:

```
-- /example/ ASN1START

RRCMessage-r8-IEs ::= SEQUENCE {
 field1 InformationElement1,
 field2 InformationElement2,
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

The ASN.1 clause specifying the contents of a PDU type may be followed by a *field description* table where a further description of, e.g., the semantic properties of the fields may be included. The general format of this table is shown in the example below. The field description table is absent in case there are no fields for which further description needs to be provided e.g. because the PDU does not include any fields, or because an IE is defined for each field while there is nothing specific regarding the use of this IE that needs to be specified.

<b>%PDU-TypeIdentifier% field descriptions</b>
<b>%field identifier%</b> Field description.
<b>%field identifier%</b> Field description.

The field description table has one column. The header row shall contain the ASN.1 type identifier of the PDU type.

The following rows are used to provide field descriptions. Each row shall include a first paragraph with a *field identifier* (in **bold** and *italic* font style) referring to the part of the PDU to which it applies. The following paragraphs at the same row may include (in regular font style), e.g., semantic description, references to other specifications and/or specification of value units, which are relevant for the particular part of the PDU.

The parts of the PDU contents that do not require a field description shall be omitted from the field description table.

### A.3.4 Information elements

Each IE (information element) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

PRACH-ConfigSIB ::= SEQUENCE {
 rootSequenceIndex INTEGER (0..1023),
 prach-ConfigInfo PRACH-ConfigInfo
}

PRACH-Config ::= SEQUENCE {
 rootSequenceIndex INTEGER (0..1023),
 prach-ConfigInfo PRACH-ConfigInfo
} OPTIONAL -- Need ON

PRACH-ConfigInfo ::= SEQUENCE {
 prach-ConfigIndex ENUMERATED {ffs},
 highSpeedFlag ENUMERATED {ffs},
 zeroCorrelationZoneConfig ENUMERATED {ffs}
}

-- ASN1STOP
```

IEs should be introduced whenever there are multiple fields for which the same set of values apply. IEs may also be defined for other reasons e.g. to break down a ASN.1 definition in to smaller pieces.

A group of closely related IE type definitions, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in this example, are preferably placed together in a common ASN.1 clause. The IE type identifiers should in this case have a common base, defined as the *generic type identifier*. It may be complemented by a suffix to distinguish the different variants. The "*PRACH-Config*" is the generic type identifier in this example, and the "*SIB*" suffix is added to distinguish the variant. The clause heading and generic references to a group of closely related IEs defined in this way should use the generic type identifier.

The same principle should apply if a new version, or an extension version, of an existing IE is created for *critical* or *non-critical* extension of the protocol (see clause A.4). The new version, or the extension version, of the IE is included in the same ASN.1 clause defining the original. A suffix is added to the type identifier, using the naming conventions defined in clause A.3.1.2, indicating the release or version of the where the new version, or extension version, was introduced.

Local IE type definitions, like the IE *PRACH-ConfigInfo* in the example above, may be included in the ASN.1 clause and be referenced in the other IE types defined in the same ASN.1 clause. The use of locally defined IE types should be encouraged, as a tool to break up large and complex IE type definitions. It can improve the readability of the code. There may also be a benefit for the software implementation of the protocol end-points, as these IE types are typically provided by the ASN.1 compiler as independent data elements, to be used in the software implementation.

An IE type defined in a local context, like the IE *PRACH-ConfigInfo*, should not be referenced directly from other ASN.1 clauses in the RRC specification. An IE type which is referenced in more than one ASN.1 clause should be defined in a separate clause, with a separate heading and a separate ASN.1 clause (possibly as one in a set of closely

related IE types, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in the example above). Such IE types are also referred to as 'global IEs'.

NOTE: Referring to an IE type, that is defined as a local IE type in the context of another ASN.1 clause, does not generate an ASN.1 compilation error. Nevertheless, using a locally defined IE type in that way makes the IE type definition difficult to find, as it would not be visible at an outline level of the specification. It should be avoided.

The ASN.1 clause specifying the contents of one or more IE types, like in the example above, may be followed by a *field description* table, where a further description of, e.g., the semantic properties of the fields of the information elements may be included. This table may be absent, similar as indicated in clause A.3.3 for the specification of the PDU type. The general format of the *field description* table is the same as shown in clause A.3.3 for the specification of the PDU type.

### A.3.5 Fields with optional presence

A field with optional presence may be declared with the keyword DEFAULT. It identifies a default value to be assumed, if the sender does not include a value for that field in the encoding:

```
-- /example/ ASN1START

PreambleInfo ::= SEQUENCE {
 numberOfRA-Preambles INTEGER (1..64)
 ...
} DEFAULT 1,

-- ASN1STOP
```

Alternatively, a field with optional presence may be declared with the keyword OPTIONAL. It identifies a field for which a value can be omitted. The omission carries semantics, which is different from any normal value of the field:

```
-- /example/ ASN1START

PRACH-Config ::= SEQUENCE {
 rootSequenceIndex INTEGER (0..1023),
 prach-ConfigInfo PRACH-ConfigInfo
} OPTIONAL -- Need ON

-- ASN1STOP
```

The semantics of an optionally present field, in the case it is omitted, should be indicated at the end of the paragraph including the keyword OPTIONAL, using a short comment text with a need statement. The need statement includes the keyword "Need", followed by one of the predefined semantics tags (OP, ON or OR) defined in clause 6.1. If the semantics tag OP is used, the semantics of the absent field are further specified either in the field description table following the ASN.1 clause, or in procedure text.

The addition of OPTIONAL keywords for capability groups is based on the following guideline. If there is more than one field in the lower level IE, then OPTIONAL keyword is added at the group level. If there is only one field in the lower level IE, OPTIONAL keyword is not added at the group level.

### A.3.6 Fields with conditional presence

A field with conditional presence is declared with the keyword OPTIONAL. In addition, a short comment text shall be included at the end of the paragraph including the keyword OPTIONAL. The comment text includes the keyword "Cond", followed by a condition tag associated with the field ("UL" in this example):

```
-- /example/ ASN1START

LogicalChannelConfig ::= SEQUENCE {
 ul-SpecificParameters SEQUENCE {
 priority INTEGER (0),
 ...
 } OPTIONAL
} -- Cond UL

-- ASN1STOP
```

When conditionally present fields are included in an ASN.1 clause, the field description table after the ASN.1 clause shall be followed by a *conditional presence* table. The conditional presence table specifies the conditions for including the fields with conditional presence in the particular ASN.1 clause.

Conditional presence	Explanation
UL	<b>Specification of the conditions for including the field associated with the condition tag = "UL". Semantics in case of optional presence under certain conditions may also be specified.</b>

The conditional presence table has two columns. The first column (heading: "Conditional presence") contains the condition tag (in *italic* font style), which links the fields with a condition tag in the ASN.1 clause to an entry in the table. The second column (heading: "Explanation") contains a text specification of the conditions and requirements for the presence of the field. The second column may also include semantics, in case of an optional presence of the field, under certain conditions i.e. using the same predefined tags as defined for optional fields in A.3.5.

Conditional presence should primarily be used when presence of a field depends on the presence and/ or value of other fields within the same message. If the presence of a field depends on whether another feature/ function has been configured, while this function can be configured independently e.g. by another message and/ or at another point in time, the relation is best reflected by means of a statement in the field description table.

If the ASN.1 clause does not include any fields with conditional presence, the conditional presence table shall not be included.

Whenever a field is only applicable in specific cases e.g. TDD, use of conditional presence should be considered.

### A.3.7 Guidelines on use of lists with elements of SEQUENCE type

Where an information element has the form of a list (the SEQUENCE OF construct in ASN.1) with the type of the list elements being a SEQUENCE data type, an information element shall be defined for the list elements even if it would not otherwise be needed.

For example, a list of PLMN identities with reservation flags is defined as in the following example:

```
-- /example/ ASN1START
PLMN-IdentityInfoList ::= SEQUENCE (SIZE (1..6)) OF PLMN-IdentityInfo
PLMN-IdentityInfo ::= SEQUENCE {
 plmn-Identity,
 cellReservedForOperatorUse
}
-- ASN1STOP
```

rather than as in the following (bad) example, which may cause generated code to contain types with unpredictable names:

```
-- /bad example/ ASN1START
PLMN-IdentityList ::= SEQUENCE (SIZE (1..6)) OF SEQUENCE {
 plmn-Identity,
 cellReservedForOperatorUse
}
-- ASN1STOP
```

### A.3.8 Guidelines on use of parameterised type SetupRelease

The usage of the parameterised type *SetupRelease* is like a function call using an information element as parameter. I.e. to use it, an IE has to be defined that specifies the sequence of fields that apply for choice value *setup*. Let's take an example.

```
-- /example/ ASN1START
```

```

InformationElementA ::= SEQUENCE {
 field1
 field2
 release
 setup
 field2a
 field2b
 }
}

-- ASN1STOP

```

Using *SetupRelease* this example can be specified as follows:

```

-- /example/ ASN1START

InformationElementA ::= SEQUENCE {
 field1
 field2
 SetupRelease { InformationElement2 } OPTIONAL -- Need ON
}

InformationElement2 ::= SEQUENCE {
 field2a
 field2b
}
}

-- ASN1STOP

```

The two versions are equivalent in abstract syntax i.e. use of *SetupRelease* is like an editorial change.

## A.4 Extension of the PDU specifications

### A.4.1 General principles to ensure compatibility

It is essential that extension of the protocol does not affect interoperability i.e. it is essential that implementations based on different versions of the RRC protocol are able to interoperate. In particular, this requirement applies for the following kind of protocol extensions:

- Introduction of new PDU types (i.e. these should not cause unexpected behaviour or damage).
- Introduction of additional fields in an extensible PDUs (i.e. it should be possible to ignore uncomprehended extensions without affecting the handling of the other parts of the message).
- Introduction of additional values of an extensible field of PDUs. If used, the behaviour upon reception of an uncomprehended value should be defined.

It should be noted that the PDU extension mechanism may depend on the logical channel used to transfer the message e.g. for some PDUs an implementation may be aware of the protocol version of the peer in which case selective ignoring of extensions may not be required.

The non-critical extension mechanism is the primary mechanism for introducing protocol extensions i.e. the critical extension mechanism is used merely when there is a need to introduce a 'clean' message version. Such a need appears when the last message version includes a large number of non-critical extensions, which results in issues like readability, overhead associated with the extension markers. The critical extension mechanism may also be considered when it is complicated to accommodate the extensions by means of non-critical extension mechanisms.

### A.4.2 Critical extension of messages and fields

The mechanisms to critically extend a message are defined in A.3.3. There are both "outer branch" and "inner branch" mechanisms available. The "outer branch" consists of a CHOICE having the name *criticalExtensions*, with two values, *c1* and *criticalExtensionsFuture*. The *criticalExtensionsFuture* branch consists of an empty SEQUENCE, while the *c1* branch contains the "inner branch" mechanism.

The "inner branch" structure is a CHOICE with values of the form "*MessageName-rX-IEs*" (e.g., "*RRConnectionReconfiguration-r8-IEs*") or "spareX", with the spare values having type NULL. The "-rX-IEs" structures contain the *complete* structure of the message IEs for the appropriate release; i.e., the critical extension branch for the Rel-10 version of a message includes all Rel-8 and Rel-9 fields (that are not obviated in the later version), rather than containing only the additional Rel-10 fields.

The following guidelines may be used when deciding which mechanism to introduce for a particular message, i.e. only an 'outer branch', or an 'outer branch' in combination with an 'inner branch' including a certain number of spares:

- For certain messages, e.g. initial uplink messages, messages transmitted on a broadcast channel, critical extension may not be applicable.
- An outer branch may be sufficient for messages not including any fields.
- The number of spares within inner branch should reflect the likelihood that the message will be critically extended in future releases (since each release with a critical extension for the message consumes one of the spare values). The estimation of the critical extension likelihood may be based on the number, size and changeability of the fields included in the message.
- In messages where an inner branch extension mechanism is available, all spare values of the inner branch should be used before any critical extensions are added using the outer branch.

The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release

```
-- /example/ ASN1START -- Original release

RRCMessage ::= SEQUENCE {
 rrc-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {
 rrcMessage-r8 RRCMessage-r8-IEs,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
}

-- ASN1STOP
```

```
-- /example/ ASN1START -- Later release

RRCMessage ::= SEQUENCE {
 rrc-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE {
 rrcMessage-r8 RRCMessage-r8-IEs,
 rrcMessage-r10 RRCMessage-r10-IEs,
 rrcMessage-r11 RRCMessage-r11-IEs,
 rrcMessage-r14 RRCMessage-r14-IEs
 },
 later CHOICE {
 c2 CHOICE {
 rrcMessage-r16 RRCMessage-r16-IEs,
 spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
 }
}

-- ASN1STOP
```

It is important to note that critical extensions may also be used at the level of individual fields i.e. a field may be replaced by a critically extended version. When sending the extended version, the original version may also be included (e.g. original field is mandatory, EUTRAN is unaware if UE supports the extended version). In such cases, a UE supporting both versions may be required to ignore the original field. The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release

```
-- /example/ ASN1START -- Original release

RRCMessage ::= SEQUENCE {
 rrc-TransactionIdentifier,
 criticalExtensions CHOICE {
 c1 CHOICE{
 rrcMessage-r8 RRCMessage-r8-IEs,
 spare3 NULL, spare2 NULL, spare1 NULL
 },
 criticalExtensionsFuture SEQUENCE {}
 }
}

RRCMessage-rN-IEs ::= SEQUENCE {
 field1-rN ENUMERATED {
 value1, value2, value3, value4} OPTIONAL, -- Need ON
 field2-rN InformationElement2-rN OPTIONAL, -- Need ON
 nonCriticalExtension RRCConnectionReconfiguration-vMxy-IEs OPTIONAL
}

RRCConnectionReconfiguration-vMxy-IEs ::= SEQUENCE {
 field2-rM InformationElement2-rM OPTIONAL, -- Cond NoField2rN
 nonCriticalExtension SEQUENCE {} OPTIONAL
}

-- ASN1STOP
```

Conditional presence	Explanation
NoField2rN	The field is optionally present, need ON, if <i>field2-rN</i> is absent. Otherwise the field is not present

Finally, it is noted that a critical extension may be introduced in the same release as the one in which the original field was introduced e.g. to correct an essential ASN.1 error. In such cases a UE capability may be introduced, to assist E-UTRAN in deciding whether or not to use the critically extension.

## A.4.3 Non-critical extension of messages

### A.4.3.1 General principles

The mechanisms to extend a message in a non-critical manner are defined in A.3.3. W.r.t. the use of extension markers, the following additional guidelines apply:

- When further non-critical extensions are added to a message that has been critically extended, the inclusion of these non-critical extensions in earlier critical branches of the message should be avoided when possible.
- The extension marker ("...") is the primary non-critical extension mechanism that is used unless a length determinant is not required. Examples of cases where a length determinant is not required:
  - at the end of a message,
  - at the end of a structure contained in a BIT STRING or OCTET STRING
- When an extension marker is available, non-critical extensions are preferably placed at the location (e.g. the IE) where the concerned parameter belongs from a logical/ functional perspective (referred to as the '*default extension location*'')
- It is desirable to aggregate extensions of the same release or version of the specification into a group, which should be placed at the lowest possible level.
- In specific cases it may be preferable to place extensions elsewhere (referred to as the '*actual extension location*'') e.g. when it is possible to aggregate several extensions in a group. In such a case, the group should be placed at the lowest suitable level in the message.
- In case placement at the default extension location affects earlier critical branches of the message, locating the extension at a following higher level in the message should be considered.

- In case an extension is not placed at the default extension location, an IE should be defined. The IE's ASN.1 definition should be placed in the same ASN.1 clause as the default extension location. In case there are intermediate levels in-between the actual and the default extension location, an IE may be defined for each level. Intermediate levels are primarily introduced for readability and overview. Hence intermediate levels need not always be introduced e.g. they may not be needed when the default and the actual extension location are within the same ASN.1 clause.

#### A.4.3.2 Further guidelines

Further to the general principles defined in the previous clause, the following additional guidelines apply regarding the use of extension markers:

- Extension markers within SEQUENCE
  - Extension markers are primarily, but not exclusively, introduced at the higher nesting levels
  - Extension markers are introduced for a SEQUENCE comprising several fields as well as for information elements whose extension would result in complex structures without it (e.g. re-introducing another list)
  - Extension markers are introduced to make it possible to maintain important information structures e.g. parameters relevant for one particular RAT
  - Extension markers are also used for size critical messages (i.e. messages on BCCH, BR-BCCH, PCCH and CCCH), although introduced somewhat more carefully
  - The extension fields introduced (or frozen) in a specific version of the specification are grouped together using double brackets.
- Extension markers within ENUMERATED
  - Spare values are used until the number of values reaches the next power of 2, while the extension marker caters for extension beyond that limit
  - A suffix of the form "vXYZ" is used for the identifier of each new value, e.g. "value-vXYZ".
- Extension markers within CHOICE:
  - Extension markers are introduced when extension is foreseen and when comprehension is not required by the receiver i.e. behaviour is defined for the case where the receiver cannot comprehend the extended value (e.g. ignoring an optional CHOICE field). It should be noted that defining the behaviour of a receiver upon receiving a not comprehended choice value is not required if the sender is aware whether or not the receiver supports the extended value.
  - A suffix of the form "vXYZ" is used for the identifier of each new choice value, e.g. "choice-vXYZ".

Non-critical extensions at the end of a message/ of a field contained in an OCTET or BIT STRING:

- When a nonCriticalExtension is actually used, a "Need" statement should not be provided for the field, which always is a group including at least one extension and a field facilitating further possible extensions. For simplicity, it is recommended not to provide a "Need" statement when the field is not actually used either.

Further, more general, guidelines:

- In case a need statement is not provided for a group, a "Need" statement is provided for all individual extension fields within the group i.e. including for fields that are not marked as OPTIONAL. The latter is to clarify the action upon absence of the whole group.

#### A.4.3.3 Typical example of evolution of IE with local extensions

The following example illustrates the use of the extension marker for a number of elementary cases (sequence, enumerated, choice). The example also illustrates how the IE may be revised in case the critical extension mechanism is used.

**NOTE** In case there is a need to support further extensions of release n while the ASN.1 of release (n+1) has been frozen, without requiring the release n receiver to support decoding of release (n+1) extensions, more advanced mechanisms are needed e.g. including multiple extension markers.

```
-- /example/ ASN1START

InformationElement1 ::= SEQUENCE {
 field1 ENUMERATED {
 value1, value2, value3, value4-v880,
 ..., value5-v960 },
 field2 CHOICE {
 field2a BOOLEAN,
 field2b InformationElement2b,
 ...,
 field2c-v960 InformationElement2c-r9
 },
 ...,
 [['field3-r9 InformationElement3-r9 OPTIONAL -- Need OR
],
 ['field3-v9a0 InformationElement3-v9a0 OPTIONAL,
 field4-r9 InformationElement4 OPTIONAL -- Need OR
]
}

InformationElement1-r10 ::= SEQUENCE {
 field1 ENUMERATED {
 value1, value2, value3, value4-v880,
 value5-v960, value6-v1170, spare2, spare1, ... },
 field2 CHOICE {
 field2a BOOLEAN,
 field2b InformationElement2b,

-- ASN1STOP
```

Some remarks regarding the extensions of *InformationElement1* as shown in the above example:

- The *InformationElement1* is initially extended with a number of non-critical extensions. In release 10 however, a critical extension is introduced for the message using this IE. Consequently, a new version of the IE *InformationElement1* (i.e. *InformationElement1-r10*) is defined in which the earlier non-critical extensions are incorporated by means of a revision of the original field.
- The *value4-v880* is replacing a spare value defined in the original protocol version for *field1*. Likewise *value6-v1170* replaces *spare3* that was originally defined in the r10 version of *field1*
- Within the critically extended release 10 version of *InformationElement1*, the names of the original fields/ IEs are not changed, unless there is a real need to distinguish them from other fields/ IEs. E.g. the *field1* and *InformationElement4* were defined in the original protocol version (release 8) and hence not tagged. Moreover, the *field3-r9* is introduced in release 9 and not re-tagged; although, the *InformationElement3* is also critically extended and therefore tagged *InformationElement3-r10* in the release 10 version of *InformationElement1*.

#### A.4.3.4 Typical examples of non critical extension at the end of a message

The following example illustrates the use of non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING i.e. when an empty sequence is used.

```
-- /example/ ASN1START

RRCMessage-r8-IEs ::= SEQUENCE {
 field1 InformationElement1,
```

```

 field2
 field3
 nonCriticalExtension
}

RRCMessage-v860-IEs ::= SEQUENCE {
 field4-v860
 field5-v860
 nonCriticalExtension
}

RRCMessage-v940-IEs ::= SEQUENCE {
 field6-v940
 nonCriticalExtensions
}

-- ASN1STOP

```

InformationElement2,  
InformationElement3  
RRCMessage-v860-IEs  
OPTIONAL, -- Need ON  
OPTIONAL

OPTIONAL, -- Need OP  
OPTIONAL, -- Cond C54  
OPTIONAL

OPTIONAL, -- Need OR  
OPTIONAL

Some remarks regarding the extensions shown in the above example:

- The *InformationElement4* is introduced in the original version of the protocol (release 8) and hence no suffix is used.

#### A.4.3.5 Examples of non-critical extensions not placed at the default extension location

The following example illustrates the use of non-critical extensions in case an extension is not placed at the default extension location.

##### – ParentIE-WithEM

The IE *ParentIE-WithEM* is an example of a high level IE including the extension marker (EM). The root encoding of this IE includes two lower level IEs *ChildIE1-WithoutEM* and *ChildIE2-WithoutEM* which not include the extension marker. Consequently, non-critical extensions of the Child-IEs have to be included at the level of the Parent-IE.

The example illustrates how the two extension IEs *ChildIE1-WithoutEM-vNx0* and *ChildIE2-WithoutEM-vNx0* (both in release N) are used to connect non-critical extensions with a default extension location in the lower level IEs to the actual extension location in this IE.

##### **ParentIE-WithEM information element**

```

-- /example/ ASN1START

ParentIE-WithEM ::= SEQUENCE {
 -- Root encoding, including:
 childIE1-WithoutEM ChildIE1-WithoutEM OPTIONAL, -- Need ON
 childIE2-WithoutEM ChildIE2-WithoutEM OPTIONAL, -- Need ON
 ...
 [[childIE1-WithoutEM-vNx0 ChildIE1-WithoutEM-vNx0 OPTIONAL, -- Need ON
 childIE2-WithoutEM-vNx0 ChildIE2-WithoutEM-vNx0 OPTIONAL, -- Need ON
]]
}

-- ASN1STOP

```

Some remarks regarding the extensions shown in the above example:

- The fields *childIEx-WithoutEM-vNx0* may not really need to be optional (depends on what is defined at the next lower level).
- In general, especially when there are several nesting levels, fields should be marked as optional only when there is a clear reason.

## – *ChildIE1-WithoutEM*

The IE *ChildIE1-WithoutEM* is an example of a lower level IE, used to control certain radio configurations including a configurable feature which can be setup or released using the local IE *ChIE1-ConfigurableFeature*. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature. The example is based on the following assumptions:

- when initially configuring as well as when modifying the new field, the original fields of the configurable feature have to be provided also i.e. as if the extended ones were present within the setup branch of this feature.
- when the configurable feature is released, the new field should be released also.
- when omitting the original fields of the configurable feature the UE continues using the existing values (which is used to optimise the signalling for features that typically continue unchanged upon handover).
- when omitting the new field of the configurable feature the UE releases the existing values and discontinues the associated functionality (which may be used to support release of unsupported functionality upon handover to an eNB supporting an earlier protocol version).

The above assumptions, which affect the use of conditions and need codes, may not always apply. Hence, the example should not be re-used blindly.

### ***ChildIE1-WithoutEM* information elements**

```
-- /example/ ASN1START

ChildIE1-WithoutEM ::= SEQUENCE {
 -- Root encoding, including:
 chIE1-ConfigurableFeature ChIE1-ConfigurableFeature OPTIONAL -- Need ON
}

ChildIE1-WithoutEM-vNx0 ::= SEQUENCE {
 chIE1-ConfigurableFeature-vNx0 ChIE1-ConfigurableFeature-vNx0 OPTIONAL -- Cond ConfigF
}

ChIE1-ConfigurableFeature ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 -- Root encoding
 }
}

ChIE1-ConfigurableFeature-vNx0 ::= SEQUENCE {
 chIE1-NewField-rN INTEGER (0..31)
}

-- ASN1STOP
```

<b>Conditional presence</b>	<b>Explanation</b>
<i>ConfigF</i>	The field is optional present, need OR, in case of <i>chIE1-ConfigurableFeature</i> is included and set to "setup"; otherwise the field is not present and the UE shall delete any existing value for this field.

## – *ChildIE2-WithoutEM*

The IE *ChildIE2-WithoutEM* is an example of a lower level IE, typically used to control certain radio configurations. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature.

### ***ChildIE2-WithoutEM* information element**

```
-- /example/ ASN1START

ChildIE2-WithoutEM ::= CHOICE {
 release NULL,
 setup SEQUENCE {
 -- Root encoding
 }
}
```

```

}

ChildIE2-WithoutEM-vNx0 ::= SEQUENCE {
 chIE2-NewField-rN INTEGER (0..31)
} OPTIONAL -- Cond ConfigF
-- ASN1STOP

```

Conditional presence	Explanation
<i>ConfigF</i>	The field is optional present, need OR, in case of <i>chIE2-ConfigurableFeature</i> is included and set to "setup"; otherwise the field is not present and the UE shall delete any existing value for this field.

## A.5 Guidelines regarding inclusion of transaction identifiers in RRC messages

The following rules provide guidance on which messages should include a Transaction identifier

- 1: DL messages on CCCH that move UE to RRC\_IDLE should not include the RRC transaction identifier.
- 2: All network initiated DL messages by default should include the RRC transaction identifier.
- 3: All UL messages that are direct response to a DL message with an RRC Transaction identifier should include the RRC Transaction identifier.
- 4: All UL messages that require a direct DL response message should include an RRC transaction identifier.
- 5: All UL messages that are not in response to a DL message nor require a corresponding response from the network should not include the RRC Transaction identifier.

## A.6 Protection of RRC messages (informative)

The following list provides information which messages can be sent (unprotected) prior to security activation and which messages can be sent unprotected after security activation. Those messages indicated "-" in "P" column should never be sent unprotected by eNB or UE. Further requirements are defined in the procedural text.

P...Messages that can be sent (unprotected) prior to security activation

A - I...Messages that can be sent without integrity protection after security activation

A - C...Messages that can be sent unciphered after security activation

NA... Message can never be sent after security activation

## A.7 Miscellaneous

The following miscellaneous conventions should be used:

- References: Whenever another specification is referenced, the specification number and optionally the relevant clause, table or figure, should be indicated in addition to the pointer to the References clause e.g. as follows: 'see TS 36.212 [22, 5.3.3.1.6]'.
- UE capabilities: TS 36.306 [5] specifies that E-UTRAN should in general respect the UE's capabilities. Hence there is no need to include statement clarifying that E-UTRAN, when setting the value of a certain configuration field, shall respect the related UE capabilities unless there is a particular need e.g. particularly complicated cases.

## Annex B (normative): Release 8 and 9 AS feature handling

### B.1 Feature group indicators

This annex contains the definitions of the bits in fields *featureGroupIndicators* (in Table B.1-1) and *featureGroupIndRel9Add* (in Table B.1-1a).

In this release of the protocol, the UE shall include the fields *featureGroupIndicators* in the IE *UE-EUTRA-Capability* and *featureGroupIndRel9Add* in the IE *UE-EUTRA-Capability-v9a0*. All the functionalities defined within the field *featureGroupIndicators* defined in Table B.1-1 or Table B.1-1a are mandatory for the UE (with exceptions for category M1 and M2 UEs), if the related capability (frequency band, RAT, SR-VCC or Inter-RAT ANR) is also supported. For a specific indicator, if all functionalities for a feature group listed in Table B.1-1 have been implemented and tested, the UE shall set the indicator as one (1), else (i.e. if any one of the functionalities in a feature group listed in Table B.1-1 or Table B.1-1a, which have not been implemented or tested), the UE shall set the indicator as zero (0).

The UE shall set all indicators that correspond to RATs not supported by the UE as zero (0).

The UE shall set all indicators, which do not have a definition in Table B.1-1 or Table B.1-1a, as zero (0).

If the optional fields *featureGroupIndicators* or *featureGroupIndRel9Add* are not included by a UE of a future release, the network may assume that all features pertaining to the RATs supported by the UE, respectively listed in Table B.1-1 or Table B.1-1a and deployed in the network, have been implemented and tested by the UE.

In Table B.1-1, a 'VoLTE capable UE' corresponds to a UE which is IMS voice capable and a 'MCPTT capable UE' corresponds to a UE which supports MCPTT voice application as defined in TS 23.179 [73].

The indexing in Table B.1-1a starts from index 33, which is the leftmost bit in the field *featureGroupIndRel9Add*.

**Table B.1-1: Definitions of feature group indicators**

Index of indicator (bit number)	Definition (description of the supported functionality, if indicator set to one)	Notes	If indicated "Yes" the feature shall be implemented and successfully tested for this version of the specification	FDD/ TDD diff
1 (leftmost bit)	<ul style="list-style-type: none"> <li>- Intra-subframe frequency hopping for PUSCH scheduled by UL grant</li> <li>- DCI format 3a (TPC commands for PUCCH and PUSCH with single bit power adjustments)</li> <li>- Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-0 – UE selected subband CQI without PMI</li> <li>- Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-2 – UE selected subband CQI with multiple PMI</li> </ul>	<ul style="list-style-type: none"> <li>- set to 1 by category M1 and M2 UEs that have implemented and successfully tested "Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-0 – UE selected subband CQI without PMI"</li> </ul>		Yes
2	<ul style="list-style-type: none"> <li>- Simultaneous CQI and ACK/NACK on PUCCH, i.e. PUCCH format 2a and 2b</li> <li>- Absolute TPC command for PUSCH</li> <li>- Resource allocation type 1 for PDSCH</li> <li>- Periodic CQI/PMI/RI reporting on PUCCH: Mode 2-0 – UE selected subband CQI without PMI</li> <li>- Periodic CQI/PMI/RI reporting on PUCCH: Mode 2-1 – UE selected subband CQI with single PMI</li> </ul>	<ul style="list-style-type: none"> <li>- If a category M1 or M2 UE does not support this feature group, this bit shall be set to 0.</li> </ul>		Yes
3	<ul style="list-style-type: none"> <li>- 5bit RLC UM SN</li> <li>- 7bit PDCP SN</li> </ul>	<ul style="list-style-type: none"> <li>- can only be set to 1 if the UE has set bit number 7 to 1.</li> </ul>	Yes, if UE supports VoLTE, MCPTT, or both.	No

		Yes, if UE supports SRVCC to EUTRAN from GERAN.	
--	--	-------------------------------------------------	--

4	- Short DRX cycle	- can only be set to 1 if the UE has set bit number 5 to 1. - not supported by category M1 or M2 UE		Yes
5	- Long DRX cycle - DRX command MAC control element		Yes	No
6	- Prioritised bit rate		Yes	No
7	- RLC UM	- can only be set to 0 if the UE does neither support VoLTE nor MCPTT	Yes, if UE supports VoLTE, MCPTT, or both. Yes, if UE supports SRVCC to EUTRAN from GERAN.	No
8	- EUTRA RRC_CONNECTED to UTRA FDD or UTRA TDD CELL_DCH PS handover, if the UE supports either only UTRAN FDD or only UTRAN TDD  - EUTRA RRC_CONNECTED to UTRA FDD CELL_DCH PS handover, if the UE supports both UTRAN FDD and UTRAN TDD	- can only be set to 1 if the UE has set bit number 22 to 1	Yes (except for category M1 and M2 UEs) for FDD, if UE supports UTRA FDD.	Yes
9	- EUTRA RRC_CONNECTED to GERAN GSM_Dedicated handover	- related to SR-VCC - can only be set to 1 if the UE has set bit number 23 to 1	Yes (except for category M1 and M2 UEs), if UE supports SRVCC to EUTRAN from GERAN.	Yes
10	- EUTRA RRC_CONNECTED to GERAN (Packet_) Idle by Cell Change Order - EUTRA RRC_CONNECTED to GERAN (Packet_) Idle by Cell Change Order with NACC (Network Assisted Cell Change)			Yes
11	- EUTRA RRC_CONNECTED to CDMA2000 1xRTT CS Active handover	- related to SR-VCC - can only be set to 1 if the UE has sets bit number 24 to 1		Yes
12	- EUTRA RRC_CONNECTED to CDMA2000 HRPD Active handover	- can only be set to 1 if the UE has set bit number 26 to 1		Yes
13	- Inter-frequency handover (within FDD or TDD)	- can only be set to 1 if the UE has set bit number 25 to 1	Yes (except for category M1 and M2 UEs), unless UE only supports band 13	No
14	- Measurement reporting event: Event A4 – Neighbour > threshold - Measurement reporting event: Event A5 – Serving < threshold1 & Neighbour > threshold2		Yes (except for category M1 and M2 UEs)	No
15	- Measurement reporting event: Event B1 – Neighbour > threshold for UTRAN FDD or UTRAN TDD, if the UE supports either only UTRAN FDD or only UTRAN TDD and has set bit number 22 to 1  - Measurement reporting event: Event B1 – Neighbour > threshold for UTRAN FDD or UTRAN TDD, if the UE supports both UTRAN FDD and UTRAN TDD and has set bit number 22 or 39 to 1, respectively  - Measurement reporting event: Event B1 – Neighbour > threshold for GERAN, 1xRTT or HRPD, if the UE has set bit number 23, 24 or 26 to 1, respectively	- can only be set to 1 if the UE has set at least one of the bit number 22, 23, 24, 26 or 39 to 1. - even if the UE sets bits 41, it shall still set bit 15 to 1 if measurement reporting event B1 is tested for all RATs supported by UE - If a category M1 or M2 UE does not support this feature group, this bit shall be set to 0.	Yes for FDD, if UE supports only UTRAN FDD and does not support UTRAN TDD or GERAN or 1xRTT or HRPD	Yes

16	<ul style="list-style-type: none"> <li>- Intra-frequency periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i></li> <li>- Inter-frequency periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i>, if the UE has set bit number 25 to 1</li> <li>- Inter-RAT periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i> for UTRAN FDD or UTRAN TDD, if the UE supports either only UTRAN FDD or only UTRAN TDD and has set bit number 22 to 1</li> <li>- Inter-RAT periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i> for UTRAN FDD or UTRAN TDD, if the UE supports both UTRAN FDD and UTRAN TDD and has set bit number 22 or 39 to 1, respectively</li> <li>- Inter-RAT periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i> for GERAN, 1xRTT or HRPD, if the UE has set bit number 23, 24 or 26 to 1, respectively.</li> </ul> <p>NOTE: Event triggered periodical reporting (i.e., with <i>triggerType</i> set to <i>event</i> and with <i>reportAmount</i> &gt; 1) is a mandatory functionality of event triggered reporting and therefore not the subject of this bit.</p>	<ul style="list-style-type: none"> <li>- If a category M1 or M2 UE does not support this feature group, this bit shall be set to 0.</li> </ul>	Yes	No
17	<p>Intra-frequency ANR features (including the case of (NG)EN-DC wherein MN and SN have the same DRX cycle and on-duration configured by MN completely contains on-duration configured by SN) including:</p> <ul style="list-style-type: none"> <li>- Intra-frequency periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportStrongestCells</i></li> <li>- Intra-frequency periodical measurement reporting where <i>triggerType</i> is set to <i>periodical</i> and <i>purpose</i> is set to <i>reportCGI</i>.</li> </ul>	<ul style="list-style-type: none"> <li>- can only be set to 1 if the UE has set bit number 5 to 1.</li> <li>- If a category M1 or M2 UE does not support this feature group, this bit shall be set to 0.</li> </ul>	Yes	No

NOTE: The column FDD/ TDD diff indicates if the UE is allowed to signal different values for FDD and TDD. Annex E specifies for which TDD and FDD serving cells a UE supporting TDD/FDD CA shall support a feature for which it indicates support within the FGI signalling.

### Clarification for mobility from EUTRAN and inter-frequency handover within EUTRAN

There are several feature groups related to mobility from E-UTRAN and inter-frequency handover within EUTRAN. The description of these features is based on the assumption that we have 5 main "functions" related to mobility from E-UTRAN:

- A. Support of measurements and cell reselection procedure in idle mode
- B. Support of RRC release with redirection procedure in connected mode
- C. Support of Network Assisted Cell Change in connected mode
- D. Support of measurements and reporting in connected mode
- E. Support of handover procedure in connected mode

All functions can be applied for mobility to Inter-frequency to EUTRAN, GERAN, UTRAN, CDMA2000 HRPD and CDMA2000 1xRTT except for function C) which is only applicable for mobility to GERAN. Table B.1-2 below summarises the mobility functions that are supported based on the UE capability signaling (band support) and the setting of the feature group support indicators.

**Table B.1-2: Mobility from E-UTRAN**

Feature	GERAN	UTRAN	HRPD	1xRTT	EUTRAN
A. Measurements and cell reselection procedure in E-UTRA idle mode	Supported if GERAN band support is indicated	Supported if UTRAN band support is indicated	Supported if CDMA2000 HRPD band support is indicated	Supported if CDMA2000 1xRTT band support is indicated	Supported fc supported bands
B. RRC release with blind redirection procedure in E-UTRA connected mode	Supported if GERAN band support is indicated	Supported if UTRAN band support is indicated	Supported if CDMA2000 HRPD band support is indicated	Supported if CDMA2000 1xRTT band support is indicated	Supported fc supported bands
C. Cell Change Order (with or without) Network Assisted Cell Change) in E-UTRA connected mode	Group 10	N.A.	N.A.	N.A.	N.A.
D. Inter-frequency/RAT measurements, reporting and measurement reporting event B2 (for inter-RAT) in E-UTRA connected mode	Group 23	Group 22/39	Group 26	Group 24	Group 25
E. Inter-frequency/RAT handover procedure in E-UTRA connected mode	Group 9 (GSM_connected handover) Separate UE capability bit defined in TS 36.306 [5] for PS handover	Group 8/38 (PS handover) or Group 27/40 (SRVCC handover)	Group 12	Group 11	Group 13 (within FDD TDD) Group 30 (between FC and TDD)

In case measurements and reporting function is not supported by UE, the network may still issue the mobility procedures redirection (B) and CCO (C) in a blind fashion.

## B.2 CSG support

In this release of the protocol, it is mandatory for the UE to support a minimum set of CSG functionality consisting of:

- Identifying whether a cell is CSG or not;
- Ignoring CSG cells in cell selection/reselection.

Additional CSG functionality in AS, i.e. the requirement to detect and camp on CSG cells when the "Permitted CSG list" is available or when manual CSG selection is triggered by the user, are related to the corresponding NAS features. This additional AS functionality consists of:

- Manual CSG selection;
- Autonomous CSG search;
- Implicit priority handling for cell reselection with CSG cells.

It is possible that this additional CSG functionality in AS is not supported or tested in early UE implementations.

Note that since the above AS features relate to idle mode operations, the capability support is not signalled to the network. For these reasons, no "feature group indicator" is assigned to this feature to indicate early support in Rel-8.

## Annex C (normative):Release 10 AS feature handling

### C.1 Feature group indicators

This annex contains the definitions of the bits in field *featureGroupIndRel10*.

In this release of the protocol, the UE shall include the field *featureGroupIndRel10* in the IE *UE-EUTRA-Capability-v1020-IEs*. All the functionalities defined within the field *featureGroupIndRel10* defined in Table C.1-1 are mandatory for the UE, if the related capability (spatial multiplexing in UL, PDSCH transmission mode 9, carrier aggregation, handover to EUTRA, or RAT) is also supported. For a specific indicator, if all functionalities for a feature group listed in Table C.1-1 have been implemented and tested, the UE shall set the indicator as one (1), else (i.e. if any one of the functionalities in a feature group listed in Table C.1-1 have not been implemented or tested), the UE shall set the indicator as zero (0).

The UE shall set all indicators that correspond to RATs not supported by the UE as zero (0).

The UE shall set all indicators, which do not have a definition in Table C.1-1, as zero (0).

If the optional field *featureGroupIndRel10* is not included by a UE of a future release, the network may assume that all features, listed in Table C.1-1 and deployed in the network, have been implemented and tested by the UE.

The indexing in Table C.1-1 starts from index 101, which is the leftmost bit in the field *featureGroupIndRel10*.

**Table C.1-1: Definitions of feature group indicators**

Index of indicator	Definition (description of the supported functionality, if indicator set to one)	Notes	If indicated "Yes" the feature shall be implemented and successfully tested for this version of the specification	FDD/TDD diff
101 (leftmost bit)	- DMRS with OCC (orthogonal cover code) and SGH (sequence group hopping) disabling	- if the UE supports two or more layers for spatial multiplexing in UL, this bit shall be set to 1. - If a category 0 or 1bis UE does not support this feature, this bit shall be set to 0.		No
102	- Trigger type 1 SRS (aperiodic SRS) transmission (Up to X ports)  NOTE: X = number of supported layers on given band			Yes
103	- PDSCH transmission mode 9 when up to 4 CSI reference signal ports are configured and when not operating in CE mode	- for Category 8 UEs, this bit shall be set to 1. - for Category 11 and higher UEs, this bit shall be set to 1.  - for DL Category 11 and higher UEs (except for DL Category 13), this bit shall be set to 1.	Yes for the UE categories listed in the column "Notes"	Yes

104	- PDSCH transmission mode 9 for TDD when 8 CSI reference signal ports are configured and when not operating in CE mode	<ul style="list-style-type: none"> <li>- if the UE does not support TDD, this bit is irrelevant, and shall be set to 0.</li> <li>- this bit is not applicable to FDD (capability signalling exists for FDD for this feature).</li> <li>- for Category 8 UEs, this bit shall be set to 1.</li> <li>- for Category 11 and higher UEs, this bit shall be set to 1.</li> <li>- for DL Category 11 and higher UEs (except for DL Category 13), this bit shall be set to 1.</li> </ul>	Yes for TDD, for the UE categories listed in the column "Notes"	No
105	<ul style="list-style-type: none"> <li>- Periodic CQI/PMI/RI reporting on PUCCH: Mode 2-0 – UE selected subband CQI without PMI, when PDSCH transmission mode 9 is configured</li> <li>- Periodic CQI/PMI/RI reporting on PUCCH: Mode 2-1 – UE selected subband CQI with single PMI, when PDSCH transmission mode 9 and up to 4 CSI reference signal ports are configured</li> </ul>	<ul style="list-style-type: none"> <li>- this bit can be set to 1 only if indices 2 (Table B.1-1) and 103 are set to 1.</li> <li>- For UEs capable of TDD-FDD CA, this bit can be set to 1 for both FDD and TDD if index 2 is set to 1 for both FDD and TDD, and index 103 is set to 1 for at least one of FDD and TDD duplex modes.</li> </ul>		Yes

106	<ul style="list-style-type: none"> <li>- Periodic CQI/PMI/RI/PTI reporting on PUCCH: Mode 2-1 – UE selected subband CQI with single PMI, when PDSCH transmission mode 9 and 8 CSI reference signal ports are configured</li> </ul>	<ul style="list-style-type: none"> <li>- this bit can be set to 1 only if the UE supports PDSCH transmission mode 9 with 8 CSI reference signal ports (i.e., for TDD, if index 104 is set to 1, and for FDD, if <math>tm9-With-8Tx-FDD-r10</math> is set to 'supported') and if index 2 (Table B.1-1) is set to 1.</li> <li>- For UEs capable of TDD-FDD CA, this bit can be set to 1 for both FDD and TDD if at least one of index 104 and <math>tm9-With-8Tx-FDD-r10</math> is set to 1/'supported', and if index 2 is set to 1 for both FDD and TDD.</li> </ul>		Yes
107	<ul style="list-style-type: none"> <li>- Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-0 – UE selected subband CQI without PMI, when PDSCH transmission mode 9 is configured</li> <li>- Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-2 – UE selected subband CQI with multiple PMI, when PDSCH transmission mode 9 and up to 4 CSI reference signal ports are configured</li> </ul>	<ul style="list-style-type: none"> <li>- this bit can be set to 1 only if indices 1 (Table B.1-1) and 103 are set to 1.</li> <li>- For UEs capable of TDD-FDD CA, this bit can be set to 1 for both FDD and TDD if index 1 is set to 1 for both FDD and TDD, and index 103 is set to 1 for at least one of FDD and TDD duplex modes.</li> </ul>		Yes
108	<ul style="list-style-type: none"> <li>- Aperiodic CQI/PMI/RI reporting on PUSCH: Mode 2-2 – UE selected subband CQI with multiple PMI, when PDSCH transmission mode 9 and 8 CSI reference signal ports are configured</li> </ul>	<ul style="list-style-type: none"> <li>- this bit can be set to 1 only if the UE supports PDSCH transmission mode 9 with 8 CSI reference signal ports (i.e., for TDD, if index 104 is set to 1, and for FDD, if <math>tm9-With-8Tx-FDD-r10</math> is set to 'supported') and if index 1 (Table B.1-1) is set to 1.</li> <li>- For UEs capable of TDD-FDD CA, this bit can be set to 1 for both FDD and TDD if at least one of index 104 and <math>tm9-With-8Tx-FDD-r10</math> is set to 1/'supported', and if index 1 is set to 1 for both FDD and TDD.</li> </ul>		Yes

NOTE: The column FDD/ TDD diff indicates if the UE is allowed to signal different values for FDD and TDD. Annex E specifies for which TDD and FDD serving cells a UE supporting TDD/FDD CA shall support a feature for which it indicates support within the FGI signalling.

## Annex D (informative): Descriptive background information

### D.1 Signalling of Multiple Frequency Band Indicators (Multiple FBI)

#### D.1.1 Mapping between frequency band indicator and multiple frequency band indicator

This clause describes the use of the Multiple Frequency Band Indicator (MFBI) lists and the E-UTRA frequency bands in *SystemInformationBlockType1* by means of an example as shown in Figure D.1.1-1. In this example:

- E-UTRAN cell belongs to band B90 and also bands B6, B7, B91, and B92.
- The *freqBandIndicatorPriority* field is not present in *SystemInformationBlockType1*.
- E-UTRAN uses B64 to indicate the presence of B90 in *freqBandIndicator-v9e0*.
- For the MFBI list of this cell, E-UTRAN uses B64 in *MultiBandInfoList* to indicate the position and priority of the bands in *MultiBandInfoList-v9e0*.
- The UE, after reading *SystemInformationBlockType1*, generates an MFBI list with priority of B91, B6, B92, and B7. If the UE supports the frequency band in the *freqBandIndicator-v9e0* IE it applies that frequency band. Otherwise, the UE applies the first listed band in the MFBI list which it supports.

**Figure D.1.1-1: Mapping of frequency bands to *MultiBandInfoList*/*MultiBandInfoList-v9e0***

#### D.1.2 Mapping between inter-frequency neighbour list and multiple frequency band indicator

This clause describes the use of the Multiple Frequency Band Indicator (MFBI) lists and the E-UTRA frequencies signalled in *SystemInformationBlockType5* by means of an example as shown in Figure D.1.2-1. In this example:

- E-UTRAN includes 4 frequencies (EARFCNs): the bands associated with f1 and f4 belong to bands lower than 64; the bands associated with f2 and f3 belong to bands larger than 64. The reserved EARFCN value of 65535 is used to indicate the presence of *ARFCN-ValueEUTRA-v9e0*.

- The band associated with f1 has two overlapping bands, B1 and B2 (lower than 64); the band associated with f2 has one overlapping band, B91; the band associated with f3 has four overlapping bands B3, B4, B92, and B93; and the band associated with f4 does not have overlapping bands.
- E-UTRAN includes 4 lists in both *interFreqCarrierFreqList-v8h0* and *interFreqCarrierFreqList-v9e0* and ensure the order of the lists is matching. Each list corresponds to one EARFCN and contains up to 8 bands. The first list corresponds to f1, the second list corresponds to f2, and so on. The grey lists mean not including *MultiBandInfoList* or *MultiBandInfoList-v9e0*, i.e. the corresponding EARFCN does not have any overlapping frequency bands in *MultiBandInfoList* or *MultiBandInfoList-v9e0*.

**Figure D.1.2-1: Mapping of EARFCNs to MultiBandInfoList/MultiBandInfoList-v9e0**

### D.1.3 Mapping between UTRA FDD frequency list and multiple frequency band indicator

This clause describes the use of the Multiple Frequency Band Indicator (MFBI) lists and the UTRA FDD frequencies signalled in *SystemInformationBlockType6* by means of an example as shown in Figure D.1.3-1. In this example:

- E-UTRAN includes 4 UTRA FDD frequencies (UARFCNs).
- The bands associated with f1 and f4 have no overlapping bands. The band associated with f2 has two overlapping bands, B1 and B2. The band associated with f3 has one overlapping band, B3.
- E-UTRAN includes 4 lists in *carrierFreqListUTRA-FDD-v8h0* with the first and fourth entry not including *MultiBandInfoList*.

Figure D.1.3-1: Mapping of UARFCNs to *MultiBandInfoList*

## Annex E (normative): TDD/FDD differentiation of FGIs/capabilities in TDD-FDD CA

Annex E specifies for which TDD and FDD serving cells a UE supporting TDD/FDD CA shall support a feature/capability for which it indicates support within the FGI/capability signalling.

A UE that indicates support for TDD/ FDD CA:

- For the fields for which the UE is allowed to indicate different support for FDD and TDD, the UE shall support the feature on the PCell and/or SCell(s), as specified in tables E-1, E-2 and E-3 in accordance to the following rules:
  - PCell: the UE shall support the feature for the PCell, if the UE indicates support of the feature for the PCell duplex mode;
  - SCell: the UE shall support the feature for SCell(s), if the UE indicates support of the feature for the SCell duplex mode;
  - Per serving cell: the UE shall support the feature for a serving cell if the UE indicates support of the feature for the serving cell's duplex mode;
  - All serving cells: UE shall support the feature if the UE indicates support of the feature for both TDD and FDD duplex modes;
- For the fields where the UE is not allowed to indicate different support for FDD and TDD, the UE shall support the feature for PCell and SCell(s) if the UE indicates support of the feature via the common FGI/capability bit.

## Annex F (normative): UE requirements on ASN.1 comprehension

This clause specifies UE requirements regarding the ASN.1 transfer syntax support i.e. the ASN.1 definitions to be comprehended by the UE.

A UE that indicates release X in field *accessStratumRelease* shall comprehend the entire transfer syntax (ASN.1) of release X, in particular at least the first version upon ASN.1 freeze. The UE is however not required to support dedicated signalling related transfer syntax associated with optional features it does not support.

In case a UE that indicates release X in field *accessStratumRelease* supports a feature specified in release X+ N (i.e. early UE implementation) additional requirements apply.

### Critical extensions (dedicated signaling)

If the early implemented feature involves one or more critical extensions (i.e. case of dedicated signaling), the UE shall comprehend the parts of the transfer syntax (ASN.1) of release X+ N that are related to the feature implemented early. This in particular concerns the ASN.1 parts related to configuration of the feature. The UE obviously also has to support the ASN.1 parts related to indicating support of the feature (in UE capabilities).

If configuration of an early implemented feature introduced in release X+ N involves a message or field that has been critically extended, the UE shall support configuration of all features supported by the UE that are associated with sub-fields of this critical extension. Apart from the early implemented feature(s), the UE need however not support functionality beyond what is defined in the release the UE indicates in access stratum release.

Let's consider the example of a UE indicating value X in field *accessStratumRelease* that supports the features associated with fields A1, A3 and A5 of *InformationElementA* (see ASN.1 below). The feature implemented early is associated with field A5, and can only be configured by the -rX+N version of *InformationElementA*. In such case, the UE should support configuration of the features associated with fields A1, A3 and A5 by the -rX+N version of *InformationElementA*. If however one of the features was modified, e.g. the feature associated with *fieldA3*, E-UTRAN should assume the UE only supports the feature according to the release it indicated in field *accessStratumRelease* (X). I.e. UE is neither required to support the additional code-point (*n80-vX+N0*) nor the additional sub-field (*fieldA3a*).

```

InformationElementA-rX ::= SEQUENCE {
 fieldA1-rX
 fieldA2-rX
 fieldA3-rX
}
InformationElementA-rX+N ::= SEQUENCE {
 fieldA1-rX+N
 fieldA2-rX+N
 fieldA3-rX+N
 fieldA4-rX+N
 fieldA5-rX+N
}
InformationElementA3-rX+N ::= SEQUENCE {
 fieldA1a-rX+N
 fieldA2a-rX+N
 fieldA3a-rX+N
}

```

<b>InformationElementA-rX</b> ::=      SEQUENCE {         fieldA1-rX         fieldA2-rX         fieldA3-rX     }	<b>InformationElementA-rX+N</b> ::=     SEQUENCE {         fieldA1-rX+N         fieldA2-rX+N         fieldA3-rX+N         fieldA4-rX+N         fieldA5-rX+N     }	<b>InformationElementA3-rX+N</b> ::=   SEQUENCE {         fieldA1a-rX+N         fieldA2a-rX+N         fieldA3a-rX+N     }	
			OPTIONAL, -- Need ON
			OPTIONAL, -- Need OR
			OPTIONAL, -- Need OR
			OPTIONAL, -- Need ON
			OPTIONAL, -- Need OR
			OPTIONAL, -- Need OR
			OPTIONAL, -- Need OR
			OPTIONAL, -- Need OR

### Non-critical extensions (broadcast signaling)

If the early implemented feature involves one or more non-critical extensions in broadcast signaling (i.e. system information), the UE shall comprehend the parts of the transfer syntax (ASN.1) of release X+ N that are related to the feature implemented early. The SIB(s) containing the release X+ N fields related to the early implemented features may also include other extensions concerning releases from X upto X+N. The UE shall comprehend such intermediate fields (but again is not required to support the functionality associated with these intermediate fields, in case this concerns optional features not supported by the UE).

---

## Annex G (normative): List of CRs Containing Early Implementable Features and Corrections

This annex lists the Change Requests (CRs) whose changes may be implemented by a UE of an earlier release than which the CR was approved in (i.e. CRs that contain on their coversheets the sentence "Implementation of this CR from Rel-N will not cause interoperability issues").

**Table G-1: List of CRs Containing Early Implementable Features and Corrections**

TDoc Number (RP-xxxxxx): CR Title	CR Number(s)	CR Revision Number(s)	Earliest Implementable Release	Additional Information
RP-181233: Successful acknowledgement of RRConnectionRelease for BL and CE UE	3324	1	Release 13	<i>RRConnectionRelease</i> message, for which the poll bit is not set, can be considered successfully acknowledged when UE has sent HARQ ACK feedback.
RP-182674: CR for T312 on LTE HetNet mobility	3506	5	Release 12	Remove T312 in leaving condition for event trigger.
RP-182671: Corrections on paging monitoring and SI acquisition in RRC_CONNECTED for BL UEs and UEs in CE	3647	2	Release 13	
RP-190548: Update description of ack-NACK-NumRepetitions	3899	2	Release 13	
RP-190548: Corrections of NB-IoT Access Barring	3900	2	Release 13	
RP-191382: SI update notification and access barring in NB-IoT	4020	2	Release 13	
RP-192195 : Correction on handling of SCell(s) during Make Before Break handover	3986	3	Release 14	
RP-192940: Stop using redirectedCarrierOffsetDedicated after reselection to another frequency	4144	1	Release 14	
RP-200338: Corrections to T312 and Discovery Signals measurement	4198	1	Release 12	
RP-200367: Correction on H1 and H2 events	4103	2	Release 15	
RP-201166: Allowing PDCP version change without handover	4262	2	Release 15	
RP-201166: upperLayerIndication enhancements	4266	3	Release 15	
RP-201192: Relaxed serving cell measurement for UEs using WUS	4344	-	Release 15	
RP-202780: Corrections to the field descriptions for TDD/FDD capability differentiation, and to nMaxResource value range	4389	5	Release 12	The CR corrects multiple UE capability field descriptions introduced in various releases, the changes are early implementable back to the release in which the corresponding capability was introduced.
RP-202789: Correction on uac-AC1-SelectAssistInfo	4488	2	Release 15	
RP-211481: Clarification on the initiation of RNA update	4651	1	Release 15	
RP-212596: Distinguishing support of extended band n77	4723	2	Release 15	
RP-220472: Introduction of carrier specific NRSRP thresholds for NPRACH resource selection	4777	1	Release 14	
RP-221738: Distinguishing support of band n77 restrictions in Canada	4799	2	Release 15	

RP-232570: Addition of extended number range for NS value	4917	6	Release 16	
RP-233884: Correction to flightPathInfoAvailable when connected to 5GC	4959	2	Release 15	
RP-233883: Protection against improper reselection to GERAN/UTRAN [RESELECTION_TO_GSM_AND_UTRAN]	4971	1	Release 15	
NOTE 1: In case a CR has mirror CR(s), the mirror CR(s) are not listed.				
NOTE 2: The Additional Information column briefly describes the content of a CR in cases where the CR title may not be descriptive enough. If the CR title is descriptive enough, then the Additional Information column may be left blank.

	RP-95	RP-220508	4750	2	B	Introduction of new bands and bandwidth allocation for LTE-based 5G terrestrial broadcast	17.0.0
	RP-95	RP-220837	4752	-	B	Introduction of event-based trigger for LTE MDT logging [LTE-Event-MDT]	17.0.0
	RP-95	RP-220837	4755	1	B	Introduction of MINT [MINT]	17.0.0
	RP-95	RP-220837	4756	1	B	On introducing height information reporting in MDT reports [LTE-Height-MDT]	17.0.0
	RP-95	RP-220472	4759	1	F	Correction on PO determination for UE in inactive state	17.0.0
	RP-95	RP-220507	4760	1	B	Introduction of NB-IoT/eMTC Enhancements	17.0.0
	RP-95	RP-220479	4762	2	B	Introduction of R17 PositioningEnh in LTE RRC spec	17.0.0
	RP-95	RP-220495	4763	1	B	Introducing support of UP IP for EPC connected architectures using NR PDCP	17.0.0
	RP-95	RP-220488	4769	1	B	Introduction of MUSIM for LTE	17.0.0
	RP-95	RP-220509	4771	1	B	Support of Non-Terrestrial Network in NB-IoT and eMTC	17.0.0
	RP-95	RP-220485	4774	1	B	Introduction of further multi-RAT dual-connectivity enhancements	17.0.0
	RP-95	RP-220475	4778	-	B	UE capabilities for the support of NR 71GHz	17.0.0
	RP-95	RP-220508	4780	-	B	UE capabilities for new bands and bandwidth allocation for LTE-based 5G terrestrial broadcast	17.0.0
06/2022	RP-96	RP-221758	4781	2	F	Introduction of UE capability for Rel-17 sidelink	17.1.0
	RP-96	RP-221712	4783	-	A	Correction on per-FS capability	17.1.0
	RP-96	RP-221738	4794	1	F	Corrections on the general ASN.1 issues	17.1.0
	RP-96	RP-221737	4798	1	B	Addition of missing functionalities and corrections to support of Non-Terrestrial Network in NB-IoT and eMTC	17.1.0
	RP-96	RP-221738	4799	2	C	Distinguishing support of band n77 restrictions in Canada [n77 Canada]	17.1.0
	RP-96	RP-221757	4803	1	F	Corrections to R17 NB-IoT/eMTC Enhancements	17.1.0
	RP-96	RP-221714	4806	1	A	Correction to application layer measurement and reporting	17.1.0
	RP-96	RP-221730	4808	1	F	Corrections on MUSIM in LTE	17.1.0
	RP-96	RP-221738	4810	1	B	Introducing single-bit approach for MINT [MINT]	17.1.0
	RP-96	RP-221728	4813	2	F	Corrections for further MRDC enhancements	17.1.0
	RP-96	RP-221715	4820	2	F	Overheating assistance info for FR2-2 in (NG)EN-DC - RIL E801	17.1.0
	RP-96	RP-221738	4821	1	B	Introduction of gNB ID length reporting in the NR CGI report [gNB_ID_Length]	17.1.0
	RP-96	RP-221730	4822	-	F	Correction on UE behavior for NAS-based busy indication in RRC_INACTIVE	17.1.0
	RP-96	RP-221738	4823	-	C	Support of CHO with SCG configuration - 36331 [CHOwithDCkept]	17.1.0
	RP-96	RP-221758	4824	-	F	Introduction of capability filter for Rel-17 sidelink	17.1.0
	RP-96	RP-221758	4826	-	C	Introduction of uplink RRC Segmentation capability	17.1.0
09/2022	RP-97	RP-222522	4832	1	F	Miscellaneous corrections to TS 36.331 for IoT NTN	17.2.0
	RP-97	RP-222517	4837	1	A	Clarification on schedulingInfoList in NB-IoT	17.2.0
	RP-97	RP-222518	4846	1	A	Corrections on CHO recovery	17.2.0
	RP-97	RP-222516	4850	-	A	Correction on NR serving frequency results reporting for event-triggered measurement (R17)	17.2.0
	RP-97	RP-222521	4855	1	A	Correction of overheating for NR SCG	17.2.0
	RP-97	RP-222528	4859	-	F	Clarification on NR sidelink relay related configuration	17.2.0
	RP-97	RP-222519	4862	1	A	Miscellaneous changes collected by Rapporteur	17.2.0
	RP-97	RP-222519	4865	2	A	SPS deactivation upon carrier reconfiguration	17.2.0
	RP-97	RP-222522	4866	1	F	Correction on npusch-MCS field description	17.2.0
	RP-97	RP-222522	4867	3	F	Corrections for further MR-DC enhancements	17.2.0
	RP-97	RP-222525	4869	3	F	MeasConfig corrections for above 71 GHz operation	17.2.0
	RP-97	RP-222521	4871	-	A	Correction on mpsPriorityIndication	17.2.0
12/2022	RP-98	RP-223414	4878	2	F	Correction to disasterRoamingFromAnyPLMN [MINT]	17.3.0
	RP-98	RP-223409	4884	2	F	Miscellaneous corrections to TS 36.331 for IoT NTN	17.3.0
	RP-98	RP-223408	4887	-	A	Correction on inclusion of reconnectCellId (36.331)	17.3.0
	RP-98	RP-223414	4889	-	F	Correction on ue-ConfigRelease	17.3.0
	RP-98	RP-223404	4896	-	A	Clarification on p-maxNR	17.3.0
	RP-98	RP-223405	4899	-	F	Support of Multiple CSI Subframe Sets on CQI-ReportPeriodicScell	17.3.0
03/2023	RP-99	RP-230696	4900	2	F	Miscellaneous corrections to TS 36.331 for IoT NTN	17.4.0
	RP-99	RP-230688	4903	-	F	CR to 36.331 on NPUSCH-ConfigDedicated-NB-v1700	17.4.0
	RP-99	RP-230696	4908	-	F	Correction on handling of T317 timer during HO	17.4.0
	RP-99	RP-230687	4910	2	A	Corrections in TS 36.331 on IFRI handling by IAB-MT for eIAB	17.4.0
	RP-99	RP-230687	4912	2	A	Introduction of cell-specific offset for inter-RAT measurement in LTE for NR neighbors [CIO-IRAT-HO-ToNR]	17.4.0
	RP-99	RP-230687	4915	1	A	Correction on UL RRC segmentation processing delay requirements	17.4.0
	RP-99	RP-230696	4919	-	F	Correction for T317 in the Timers table	17.4.0
06/2023	RP-100	RP-231412	4920	3	F	Correction on scg-State in RRConnectionReconfiguration including the mobilityControlInfo	17.5.0
	RP-100	RP-231417	4928	4	F	CR to 36.331 on T317 and T318	17.5.0
	RP-100	RP-231417	4930	5	F	Alignment of NPRACH preamble descriptions with RAN1 specification for IoT-NTN parameters	17.5.0
	RP-100	RP-231417	4933	1	F	Correction on definition of ta-Report	17.5.0
	RP-100	RP-231412	4935	3	F	Correction on QoE configuration release	17.5.0
	RP-100	RP-231417	4936	-	F	IoT NTN RRC Correction on PUCCH TX duration	17.5.0
09/2023	RP-101	RP-232570	4917	6	F	Addition of extended number range for NS value	17.6.0

	RP-101	RP-232568	4937	3	F	Clarify the reference point for timing info in SIB16-(NB) and DLInformationTransfer in IoT NTN	17.6.0
	RP-101	RP-232566	4940	1	A	Correction to NS-value utilization	17.6.0
	RP-101	RP-232568	4945	2	F	Miscellaneous RRC corrections for IoT NTN	17.6.0
	RP-101	RP-232568	4952	1	F	RRC Correction on including GNSS validity duration and dedicated SIB31	17.6.0
	RP-101	RP-232567	4954	1	A	Redirection with MPS correction for resume cause	17.6.0
	RP-101	RP-232565	4958	-	A	Correction on location configuration for WLAN and BT for SON and MDT features	17.6.0
12/2023	RP-102	RP-233885	4966	1	A	Corrections to inter-node RRC messages for 5GC	17.7.0
	RP-102	RP-233890	4968	1	F	Introduction of UE capability for inter-RAT NR FR2 measurements without measurement gap	17.7.0
	RP-102	RP-233887	4972	1	F	Correction on SIB31 signalling only in NTN cell	17.7.0
	RP-102	RP-233887	4975	-	F	Clarification on ul-SyncValidityDuration in SIB31	17.7.0
	RP-102	RP-233887	4978	1	F	Corrections to SystemInformationBlockType31 for IoT NTN	17.7.0
	RP-102	RP-233888	4979	2	F	Correction on transmission of SSR Assistance Data based on BDS B1C	17.7.0
12/2023	RP-102	RP-233915	4929	6	B	Introduction of measurements without gap with interruption	18.0.0
	RP-102	RP-233883	4931	4	B	GNSS LOS/NLOS posSIB broadcast assistance information [GNSS LOS/NLOS]	18.0.0
	RP-102	RP-233883	4955	2	C	SSR Satellite PCV Residuals [Rel18PCV]	18.0.0
	RP-102	RP-233884	4959	2	F	Correction to flightPathInfoAvailable when connected to 5GC	18.0.0
	RP-102	RP-233891	4964	1	B	Introduction of IoT NTN enhancements	18.0.0
	RP-102	RP-233892	4967	1	B	Introduction of Enhanced LTE Support for UAV (Uncrewed Aerial Vehicles)	18.0.0
	RP-102	RP-233883	4970	1	B	Network support and clarification of redirection to 3G [REDIRECTION to 3G]	18.0.0
	RP-102	RP-233883	4971	1	B	Protection against improper reselection to GERAN/UTRAN [RESELECTION_TO_GSM_AND_UTRAN]	18.0.0
	RP-102	RP-233909	4973	1	B	CR to 36331 for introducing SON/MDT features in Rel-18	18.0.0
	RP-102	RP-233909	4974	-	B	CR to 36.331 for UE capability for R18 SONMDT	18.0.0
03/2024	RP-103	RP-240654	4985	-	A	Removal of references to unknown RAN4 specification	18.1.0
	RP-103	RP-240651	4988	1	F	Correction on Event A3, A4 and A5 for LTE CHO	18.1.0
	RP-103	RP-240674	4989	1	F	Corrections to TS 36.331 for R18 SONMDT	18.1.0
	RP-103	RP-240660	4990	1	F	Corrections to IOT NTN	18.1.0
	RP-103	RP-240683	4991	1	B	Lower MSD capability for EN-DC	18.1.0
	RP-103	RP-240661	4992	1	F	Corrections for Enhanced LTE Support for UAV (Uncrewed Aerial Vehicles)	18.1.0
	RP-103	RP-240704	4993	1	B	Introduction of mIAB Inter-RAT cell reselection enhancements for 36.331 [TEI18_MIAB_IRAT]	18.1.0
	RP-103	RP-240652	4997	3	A	Correction on UE location information in NB-IoT RLF report	18.1.0
