| <b>powerRampingStep</b>                      | Power ramping steps for PRACH (see TS 38.321 [3], 5.1.3). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>prach-ConfigurationFrameOffset-IAB</b>    | Frame offset for ROs defined in the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>prach-ConfigurationIndex</b>              | PRACH configuration index. For <i>prach-ConfigurationIndex</i> configured under <i>beamFailureRecoveryConfig</i> , the <i>prach-ConfigurationIndex</i> can only correspond to the short preamble format, (see TS 38.211 [16], clause 6.3.3.2). If the field <i>prach-ConfigurationIndex-v1610</i> is present, the UE shall ignore the value provided in <i>prach-ConfigurationIndex</i> (without suffix).                                                                                                                                                                                                                                                                                                             |
| <b>prach-ConfigurationPeriodScaling-IAB</b>  | Scaling factor to extend the periodicity of the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. Value scf1 corresponds to scaling factor of 1 and so on. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>prach-ConfigurationSOffset-IAB</b>        | Subframe/Slot offset for ROs defined in the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>preambleReceivedTargetPower</b>           | The target power level at the network receiver side (see TS 38.213 [13], clause 7.4, TS 38.321 [3], clauses 5.1.2, 5.1.3). Only multiples of 2 dBm may be chosen (e.g. -202, -200, -198, ...). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>preambleTransMax</b>                      | Max number of RA preamble transmission performed before declaring a failure (see TS 38.321 [3], clauses 5.1.4, 5.1.5). The UE shall ignore this field in case <i>rach-ConfigGeneric</i> is included within an <i>EarlyUL-SyncConfig</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ra-ResponseWindow</b>                     | Msg2 (RAR) window length in number of slots. The network configures a value lower than or equal to 10 ms when Msg2 is transmitted in licensed spectrum and a value lower than or equal to 40 ms when Msg2 is transmitted with shared spectrum channel access (see TS 38.321 [3], clause 5.1.4). UE ignores the field if included in <i>SCellConfig</i> . If <i>ra-ResponseWindow-v1610</i> or <i>ra-ResponseWindow-v1700</i> is signalled, UE shall ignore the <i>ra-ResponseWindow</i> (without suffix). The field <i>ra-ResponseWindow-v1700</i> is applicable to SCS 480 kHz and SCS 960 kHz. The UE shall ignore this field in case <i>rach-ConfigGeneric</i> is included within an <i>EarlyUL-SyncConfig</i> IE. |
| <b>zeroCorrelationZoneConfig</b>             | N-CS configuration, see Table 6.3.3.1-5 in TS 38.211 [16].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## – *RACH-ConfigGenericTwoStepRA*

The IE *RACH-ConfigGenericTwoStepRA* is used to specify the 2-step random access type parameters.

| <b>RACH-ConfigGenericTwoStepRA field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msgA-PreamblePowerRampingStep</b>                  | Power ramping steps for msgA PRACH. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . If the field is absent in other cases, UE shall use the value of <i>powerRampingStep</i> in <i>RACH-ConfigGeneric</i> in the configured BWP (see TS 38.321 [3], 5.1.3). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreamblePowerRampingStep</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.              |
| <b>msgA-PreambleReceivedTargetPower</b>               | The target power level at the network receiver side (see TS 38.213 [13], clause 7.1.1 and TS 38.321 [3], clause 5.1.1). Only multiples of 2 dBm may be chosen (e.g -202, -200, -198, ...). If the field is absent, UE shall use the value of <i>preambleReceivedTargetPower</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreambleReceivedTargetPower</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.                                                                                                                                                      |
| <b>msgA-PRACH-ConfigurationIndex</b>                  | Cell-specific PRACH configuration index for 2-step RA type. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ), the UE shall use the value of corresponding 4-step random access parameter in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . If the value is in the range of 256 to 262, the field <i>prach-ConfigurationIndex-v1610</i> should be considered configured (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA. |
| <b>msgA-RO-FDM</b>                                    | The number of msgA PRACH transmission occasions Frequency-Division Multiplexed in one time instance. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ), UE shall use value of <i>msg1-FDM</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the value of <i>msg1-FDM</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.                                                                                         |
| <b>msgA-RO-FrequencyStart</b>                         | Offset of lowest PRACH transmissions occasion in frequency domain with respect to PRB 0. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ), UE shall use value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clauses 5.3.2 and 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.                                                                    |
| <b>msgA-ZeroCorrelationZoneConfig</b>                 | N-CS configuration for msgA preamble, see Table 6.3.3.1-5 in TS 38.211 [16]. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . If the field is absent in other cases, UE shall use value <i>zeroCorrelationZoneConfig</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.                                                                                                                                                                                                                                                            |
| <b>msgB-ResponseWindow</b>                            | MsgB monitoring window length in number of slots. The network configures a value lower than or equal to 40ms (see TS 38.321 [3], clause 5.1.1). The network does not configure <i>msgB-ResponseWindow-r16</i> simultaneously with <i>msgB-ResponseWindow-v1700</i> , and if both fields are absent, the UE uses the value of <i>msgB-ResponseWindow</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>preambleTransMax</b>                               | Max number of RA preamble transmission performed before declaring a failure (see TS 38.321 [3], clauses 5.1.4, 5.1.5). If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . If the field is absent in other cases, UE shall use the value of <i>preambleTransMax</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>preambleTransMax</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.                                                                                                    |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b><i>cnAssociation</i></b>                                           | Indicates if the bearer is associated with the <i>eps-bearerIdentity</i> (when connected to EPC) or <i>sdap-Config</i> (when connected to 5GC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>daps-Config</i></b>                                             | Indicates that the bearer is configured as DAPS bearer. The network does not include this field in an <i>RRCReconfiguration</i> message contained within a <i>LTM-Config</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>drb-Identity</i></b>                                            | In case of DC, the DRB identity is unique within the scope of the UE, i.e. an MCG DRB cannot use the same value as a split DRB. For a split DRB the same identity is used for the MCG and SCG parts/indirect path of the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>eps-BearerIdentity</i></b>                                      | The EPS bearer ID determines the EPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>mbs-SessionId</i></b>                                           | Indicates which multicast MBS session the bearer is associated with.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mrB-Identity</i></b>                                            | Identification of the multicast MRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mrB-IdentityNew</i></b>                                         | New identity of the multicast MRB when <i>mrB-Identity</i> needs to be changed, e.g. as a result of a handover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>n3c-BearerAssociated</i></b>                                    | Indicates that the radio bearer is associated with the N3C indirect path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>reestablishPDCP</i></b>                                         | Indicates that PDCP should be re-established. Network sets this to <i>true</i> whenever the security key used for this radio bearer changes. Key change could for example be due to termination point change for the bearer, reconfiguration with sync, resuming an RRC connection, or the first reconfiguration after reestablishment. It is also applicable for LTE procedures when NR PDCP is configured. Network doesn't include this field for DRB if the bearer is configured as DAPS bearer, if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE, or if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE |
| <b><i>recoverPDCP</i></b>                                             | Indicates that PDCP should perform recovery according to TS 38.323 [5]. Network doesn't include this field if the bearer is configured as DAPS bearer, if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE, or if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE.                                                                                                                                                                                                                                                                                                                                             |
| <b><i>sdap-Config</i></b>                                             | The SDAP configuration determines how to map QoS flows to DRBs when NR or E-UTRA connects to the 5GC and presence/absence of UL/DL SDAP headers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b><i>RadioBearerConfig</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>securityConfig</i></b>                       | Indicates the security algorithm and key to use for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included after AS security has been activated, the UE shall continue to use the currently configured <i>keyToUse</i> and security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . The field is not included when configuring SRB1 before AS security is activated. |
| <b><i>srB3-ToRelease</i></b>                       | Release SRB3. SRB3 release can only be done over SRB1 and only at SCG release and reconfiguration with sync.                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>SecurityConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>keyToUse</b>                          | Indicates if the bearers configured with the list in this IE <i>RadioBearerConfig</i> are using the master key or the secondary key for deriving ciphering and/or integrity protection keys. For MR-DC, network should not configure SRB1 and SRB2 with secondary key and SRB3 with the master key. When the field is not included, the UE shall continue to use the currently configured <i>keyToUse</i> for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . |
| <b>securityAlgorithmConfig</b>           | Indicates the security algorithm for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included, the UE shall continue to use the currently configured security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> .                                                                                                                                                        |

| <b>SRB-ToAddMod field descriptions</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>discardOnPDCP</b>                                        | Indicates that PDCP should discard stored SDU and PDU according to TS 38.323 [5]. Network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE which is received within a MCG <i>RRCReconfiguration</i> message via SRB1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>reestablishPDCP</b>                                      | Indicates that PDCP should be re-established. Network sets this to <i>true</i> whenever the security key used for this radio bearer changes. Key change could for example be due to reconfiguration with sync, for SRB2 when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR, the network does not set this field to <i>true</i> . For LTE SRBs using NR PDCP, it could be for handover, RRC connection reestablishment or resume. Network doesn't include this field if any DAPS bearer is configured or if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE. For SRB3, network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE. |
| <b>srb-Identity, srb-Identity-v1700, srb-Identity-v1800</b> | Value 1 is applicable for SRB1 only. Value 2 is applicable for SRB2 only. Value 3 is applicable for SRB3 only. Value 4 is applicable for SRB4 only. Value 5 is applicable for SRB5 only. If <i>srb-Identity-v1700</i> or <i>srb-Identity-v1800</i> is received for an SRB, the UE shall ignore <i>srb-Identity</i> (i.e. without suffix) for this SRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>additionalPCI</b>                                | Indicates the physical cell IDs (PCI) of the SSBs in the <i>failureDetectionSet2</i> . If <i>candidateBeamRS-List2</i> is configured in IE <i>BeamFailureRecoveryRSConfig</i> the field indicates the physical cell IDs (PCI) of the SSBs in the <i>candidateBeamRS-List2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>beamFailureDetectionTimer</b>                    | Timer for beam failure detection (see TS 38.321 [3], clause 5.17). See also the <i>BeamFailureRecoveryConfig</i> IE. Value in number of "Q <sub>out,LR</sub> reporting periods of Beam Failure Detection" Reference Signal (see TS 38.213 [13], clause 6). Value <i>pbfd1</i> corresponds to 1 Q <sub>out,LR</sub> reporting period of Beam Failure Detection Reference Signal, value <i>pbfd2</i> corresponds to 2 Q <sub>out,LR</sub> reporting periods of Beam Failure Detection Reference Signal and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>beamFailureInstanceMaxCount</b>                  | This field determines after how many beam failure events the UE triggers beam failure recovery (see TS 38.321 [3], clause 5.17). Value <i>n1</i> corresponds to 1 beam failure instance, value <i>n2</i> corresponds to 2 beam failure instances and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>failureDetectionResourcesToAddModList</b>        | A list of reference signals for detecting beam failure and/or cell level radio link failure (RLF). The limits of the reference signals that the network can configure are specified in TS 38.213 [13], table 5-1. The network configures at most two detectionResources per BWP for the purpose <i>beamFailure</i> or <i>both</i> . If no RSs are provided for the purpose of beam failure detection, the UE performs beam monitoring based on the activated TCI-State for PDCCH as described in TS 38.213 [13], clause 6. If no RSs are provided in this list for the purpose of RLF detection, the UE performs Cell-RLM based on the activated TCI-State of PDCCH as described in TS 38.213 [13], clause 5. The network ensures that the UE has a suitable set of reference signals for performing cell-RLM. If <i>failureDetectionSet1-r17</i> and <i>failureDetectionSet2-r17</i> are present, the <i>purpose</i> of <i>RadioLinkMonitoringRS</i> in <i>failureDetectionResourcesToAddModList</i> only can be set to <i>rlf</i> .                                                   |
| <b>failureDetectionSet1, failureDetectionSet2</b>   | Configures parameters for beamfailure detection towards beam failure detection resources configured in the set. If additional PCIs are configured using <i>additionalPCI-ToAddModList</i> for the serving cell, each RS in one set can be associated only with one PCI. Network always configures the <i>failureDetectionSet1</i> and <i>failureDetectionSet2</i> together. <i>failureDetectionSetN</i> is present if and only if <i>candidateBeamRS-List2-r17</i> is configured. When a <i>failureDetectionSetN</i> is present, after the reconfiguration, the UE shall consider all the reference signals for this failure detection set as activated if at most <i>maxBFD-RS-resourcesPerSetPerBWP-r17</i> reference signals are configured for each failure detection set, otherwise the UE shall consider all the reference signals in this failure detection set as deactivated. If <i>bfdResourcesToAddModList-r17</i> in <i>failureDetectionSetN</i> is not present, the UE determines the RS(es) in each <i>failureDetectionSetN</i> as described in TS 38.213 [13], clause 6. |

| <b>RadioLinkMonitoringRS field descriptions</b> |                                                                                                                                                                                                                                       |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>detectionResource</b>                        | A reference signal that the UE shall use for radio link monitoring or beam failure detection (depending on the indicated <i>purpose</i> ). Only periodic 1-port CSI-RS can be configured on SCell for beam failure detection purpose. |
| <b>purpose</b>                                  | Determines whether the UE shall monitor the associated reference signal for the purpose of cell- and/or beam failure detection. For SCell, network only configures the value to <i>beamFailure</i> .                                  |

### — RadioLinkMonitoringRS-Id

The IE *RadioLinkMonitoringRS-Id* is used to identify one *RadioLinkMonitoringRS*.

#### **RadioLinkMonitoringRS-Id information element**

```
-- ASN1START
-- TAG-RADIOLINKMONITORINGRS-ID-START
```

RadioLinkMonitoringRS-Id ::= **INTEGER** ( 0 .. maxNrofFailureDetectionResources-1 )

```
-- TAG-RADIOLINKMONITORINGRS-ID-STOP
-- ASN1STOP
```

## *RAN-AreaCode*

The IE *RAN-AreaCode* is used to identify a RAN area within the scope of a tracking area.

### ***RAN-AreaCode* information element**

```
-- ASN1START

| <b>bitmaps</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |  |  |
| Indicates rate matching pattern by a pair of bitmaps <i>resourceBlocks</i> and <i>symbolsInResourceBlock</i> to define the rate match pattern within one or two slots, and a third bitmap <i>periodicityAndPattern</i> to define the repetition pattern with which the pattern defined by the above bitmap pair occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |  |  |
| <b>controlResourceSet</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |  |
| This ControlResourceSet is used as a PDSCH rate matching pattern, i.e., PDSCH reception rate matches around it. In frequency domain, the resource is determined by the frequency domain resource of the CORESET with the corresponding CORESET ID. Time domain resource is determined by the parameters of the associated search space of the CORESET.<br>If the field <i>controlResourceSetId-r16</i> is present, UE shall ignore the <i>controlResourceSetId</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |  |  |
| <b>periodicityAndPattern</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |  |
| A time domain repetition pattern at which the pattern defined by <i>symbolsInResourceBlock</i> and <i>resourceBlocks</i> recurs. This slot pattern repeats itself continuously. Absence of this field indicates the value <i>n1</i> (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |  |
| <b>resourceBlocks</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |  |  |
| A resource block level bitmap in the frequency domain. A bit in the bitmap set to 1 indicates that the UE shall apply rate matching in the corresponding resource block in accordance with the <i>symbolsInResourceBlock</i> bitmap. If used as cell-level rate matching pattern, the bitmap identifies "common resource blocks (CRB)". If used for MBS broadcast CFR, the bitmap identifies "physical resource blocks" inside the MBS broadcast CFR. If used as BWP-level rate matching pattern, the bitmap identifies "physical resource blocks" inside the BWP or MBS multicast CFR. The first/ leftmost bit corresponds to resource block 0, and so on (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |
| <b>subcarrierSpacing</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |  |  |
| The SubcarrierSpacing for this resource pattern. If the field is absent, the UE applies the SCS of the associated BWP. | A symbol level bitmap in time domain. It indicates with a bit set to true that the UE shall rate match around the corresponding symbol. This pattern recurs (in time domain) with the configured <i>periodicityAndPattern</i> (see TS 38.214 [19], clause 5.1.4.1).<br>For <i>oneSlot</i> , if ECP is configured, the first 12 bits represent the symbols within the slot and the last two bits within the bitstring are ignored by the UE; Otherwise, the 14 bits represent the symbols within the slot.<br>For <i>twoSlots</i> , if ECP is configured, the first 12 bits represent the symbols within the first slot and the next 12 bits represent the symbols in the second slot and the last four bits within the bit string are ignored by the UE; Otherwise, the first 14 bits represent the symbols within the first slot and the next 14 bits represent the symbols in the second slot.<br>For the bits representing symbols in a slot, the most significant bit of the bit string represents the first symbol in the slot and the second most significant bit represents the second symbol in the slot and so on. |  |  |  |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CellLevel            | The field is mandatory present if the <i>RateMatchPattern</i> is defined on cell level. The field is absent when the <i>RateMatchPattern</i> is defined on BWP level or defined for MBS broadcast CFR. If the <i>RateMatchPattern</i> is defined on BWP level, the UE applies the SCS of the BWP and if <i>RateMatchPattern</i> is defined for MBS broadcast CFR, the UE applies the SCS of the initial BWP or RedCap-specific initial BWP (if configured) for (e)RedCap UEs. |

### – *RateMatchPatternId*

The IE *RateMatchPatternId* identifies one *RateMatchPattern* (see TS 38.214 [19], clause 5.1.4.1).

#### ***RateMatchPatternId* information element**

```
-- ASN1START
-- TAG-RATEMATCHPATTERNID-START

RateMatchPatternId ::= INTEGER (0..maxNrofRateMatchPatterns-1)

-- TAG-RATEMATCHPATTERNID-STOP
-- ASN1STOP
```

### – *RateMatchPatternLTE-CRS*

The IE *RateMatchPatternLTE-CRS* is used to configure a pattern to rate match around LTE CRS. See TS 38.214 [19], clause 5.1.4.2.

#### ***RateMatchPatternLTE-CRS* information element**

```
-- ASN1START
-- TAG-RATEMATCHPATTERNLTE-CRS-START

RateMatchPatternLTE-CRS ::= SEQUENCE {
 carrierFreqDL INTEGER (0..16383),
 carrierBandwidthDL ENUMERATED {n6, n15, n25, n50, n75, n100, spare2, spare1},
 mbsfn-SubframeConfigList EUTRA-MBSFN-SubframeConfigList
 nrofCRS-Ports ENUMERATED {n1, n2, n4},
 v-Shift ENUMERATED {n0, n1, n2, n3, n4, n5}
}

LTE-CRS-PatternList-r16 ::= SEQUENCE (SIZE (1..maxLTE-CRS-Patterns-r16)) OF RateMatchPatternLTE-CRS

-- TAG-RATEMATCHPATTERNLTE-CRS-STOP
-- ASN1STOP
```

| <b><i>RateMatchPatternLTE-CRS</i></b> field descriptions |                                                                                                  |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b><i>carrierBandwidthDL</i></b>                         | BW of the LTE carrier in number of PRBs (see TS 38.214 [19], clause 5.1.4.2).                    |
| <b><i>carrierFreqDL</i></b>                              | Center of the LTE carrier (see TS 38.214 [19], clause 5.1.4.2).                                  |
| <b><i>mbsfnSubframeConfigList</i></b>                    | LTE MBSFN subframe configuration (see TS 38.214 [19], clause 5.1.4.2).                           |
| <b><i>nrofCRS-Ports</i></b>                              | Number of LTE CRS antenna port to rate-match around (see TS 38.214 [19], clause 5.1.4.2).        |
| <b><i>v-Shift</i></b>                                    | Shifting value v-shift in LTE to rate match around LTE CRS (see TS 38.214 [19], clause 5.1.4.2). |

### – *ReferenceConfiguration*

The IE *ReferenceConfiguration* is used provide a configuration that is common, within the same cell group, to all configured non-complete candidate configurations.

#### ***ReferenceConfiguration*** information element

```
-- ASN1START
-- TAG-REFERENCECONFIGURATION-START
```

```
ReferenceConfiguration-r18 ::= OCTET STRING (CONTAINING RRConfiguration)
```

```
-- TAG-REFERENCECONFIGURATION-STOP
-- ASN1STOP
```

### – *ReferenceLocation*

The IE *ReferenceLocation* contains location information used as a reference location. The value of the field is same as *Ellipsoid-Point* defined in TS37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.

#### ***ReferenceLocation*** information element

```
-- ASN1START
-- TAG-REFERENCELOCATION-START
```

```
ReferenceLocation-r17 ::= OCTET STRING
```

```
-- TAG-REFERENCELOCATION-STOP
-- ASN1STOP
```

- *ReferenceTimeInfo*

The IE *ReferenceTimeInfo* contains timing information for 5G internal system clock used for, e.g., time stamping, see TS 23.501 [32], clause 5.27.1.2.

### ***ReferenceTimeInfo* information element**

```
-- ASN1START
-- TAG-REFERENCETIMEINFO-START

ReferenceTimeInfo-r16 ::= SEQUENCE {
 time-r16
 uncertainty-r16
 timeInfoType-r16
 referenceSFN-r16
}
 ReferenceTime-r16,
 INTEGER (0..32767) OPTIONAL, -- Need S
 ENUMERATED {localClock} OPTIONAL, -- Need S
 INTEGER (0..1023) OPTIONAL -- Cond RefTime

ReferenceTime-r16 ::= SEQUENCE {
 refDays-r16
 refSeconds-r16
 refMilliSeconds-r16
 refTenNanoSeconds-r16
}
 INTEGER (0..72999),
 INTEGER (0..86399),
 INTEGER (0..999),
 INTEGER (0..99999)

-- TAG-REFERENCETIMEINFO-STOP

| <b>referenceSFN</b>                         | This field indicates the reference SFN corresponding to the reference time information. If <i>referenceTimeInfo</i> field is received in <i>DLInformationTransfer</i> message, this field indicates the SFN of PCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>time</b>                                 | <p>This field indicates time reference with 10ns granularity. If included in <i>DLInformationTransfer</i> and if UE-side TA PDC is de-activated, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. If included in <i>DLInformationTransfer</i> and if UE is requested to transmit UE Rx-Tx time difference measurement, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. Otherwise, the indicated time is referenced at the network, i.e., without compensating for RF propagation delay. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE.</p> <p>The indicated time in 10ns unit from the origin is <math>\text{refDays} * 86400 * 1000 * 100000 + \text{refSeconds} * 1000 * 100000 + \text{refMilliSeconds} * 100000 + \text{refTenNanoSeconds}</math>. The <i>refDays</i> field specifies the sequential number of days (with day count starting at 0) from the origin of the <i>time</i> field.</p> <p>If the <i>referenceTimeInfo</i> field is received in <i>DLInformationTransfer</i> message, the <i>time</i> field indicates the <i>time</i> at the ending boundary of the system frame indicated by <i>referenceSFN</i>. The UE considers this frame (indicated by <i>referenceSFN</i>) to be the frame which is nearest to the frame where the message is received (which can be either in the past or in the future).</p> <p>If the <i>referenceTimeInfo</i> field is received in <i>SIB9</i>, the <i>time</i> field indicates the time at the SFN boundary at or immediately after the ending boundary of the SI-window in which <i>SIB9</i> is transmitted.</p> <p>If <i>referenceTimeInfo</i> field is received in <i>SIB9</i>, this field is excluded when determining changes in system information, i.e. changes of time should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p> <p>NOTE: The estimated time in an NTN-cell may be less accurate than the estimated time in a TN-cell.</p> |
| <b>timeInfoType</b>                         | If <i>timeInfoType</i> is not included, the <i>time</i> indicates the GPS time and the origin of the <i>time</i> field is 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time). If <i>timeInfoType</i> is set to <i>localClock</i> , the origin of the <i>time</i> is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>uncertainty</b>                          | This field indicates the uncertainty of the reference time information provided by the <i>time</i> field. The uncertainty is 25ns multiplied by this field. If this field is absent, the uncertainty is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Conditional Presence | Explanation                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>RefTime</i>       | The field is mandatory present if <i>referenceTimeInfo</i> is included in <i>DLInformationTransfer</i> message; otherwise the field is absent. |

## – *RejectWaitTime*

The IE *RejectWaitTime* is used to provide the value in seconds for timer T302.

### ***RejectWaitTime* information element**

```
-- ASN1START
-- TAG-REJECTWAITTIME-START

RejectWaitTime ::= INTEGER (1..16)

-- TAG-REJECTWAITTIME-STOP
-- ASN1STOP
```

- *RepetitionSchemeConfig*

The IE *RepetitionSchemeConfig* is used to configure the UE with repetition schemes as specified in TS 38.214 [19] clause 5.1.

### ***RepetitionSchemeConfig* information element**

```
-- ASN1START
-- TAG-REPETITIONSCHEMECONFIG-START

RepetitionSchemeConfig-r16 ::= CHOICE {

```

| <b><i>RepetitionSchemeConfig</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>fdm-TDM</i></b>                                   | Configures UE with a repetition scheme among <i>fdmSchemeA</i> , <i>fdmSchemeB</i> and <i>tdmSchemeA</i> as specified in clause 5.1 of TS 38.214 [19]. The network does not set this field to <i>release</i> . Upon reception of this field in <i>RepetitionSchemeConfig-r16</i> , the UE shall release <i>slotBased</i> if previously configured in the same instance of <i>RepetitionSchemeConfig-r16</i> .                                          |
| <b><i>sequenceOffsetForRV</i></b>                       | For slot-based repetition scheme, selected RV sequence is applied to transmission occasions associated to the first TCI state. The RV sequence associated to the second TCI state is determined by a RV offset from that selected RV sequence.                                                                                                                                                                                                         |
| <b><i>slotBased</i></b>                                 | Configures UE with slot-based repetition scheme. Network always configures this field when the parameter <i>repetitionNumber</i> is present in IE <i>PDSCH-TimeDomainResourceAllocationList</i> . The network does not set this field to <i>release</i> . Upon reception of this field in <i>RepetitionSchemeConfig-r16</i> , the UE shall release <i>fdm-TDM</i> if previously configured in the same instance of <i>RepetitionSchemeConfig-r16</i> . |
| <b><i>startingSymbolOffsetK</i></b>                     | The starting symbol of the second transmission occasion has K symbol offset relative to the last symbol of the first transmission occasion. When UE is configured with <i>tdmSchemeA</i> , the parameter <i>startingSymbolOffsetK</i> is present, otherwise absent.                                                                                                                                                                                    |
| <b><i>tciMapping</i></b>                                | Enables TCI state mapping method to PDSCH transmission occasions.                                                                                                                                                                                                                                                                                                                                                                                      |

## – *ReportConfigId*

The IE *ReportConfigId* is used to identify a measurement reporting configuration.

### ***ReportConfigId* information element**

```
-- ASN1START
-- TAG-REPORTCONFIGID-START
ReportConfigId ::= INTEGER (1..maxReportConfigId)
-- TAG-REPORTCONFIGID-STOP
-- ASN1STOP
```

## – *ReportConfigInterRAT*

The IE *ReportConfigInterRAT* specifies criteria for triggering of an inter-RAT measurement reporting event, or an L2 U2N relay measurement reporting event. The inter-RAT measurement reporting events for E-UTRA and UTRA-FDD are labelled BN with N equal to 1, 2 and so on. The measurement reporting events for L2 U2N relay UE are labelled YN with N equal to 1, 2 and so on, and Z1.

Event B1: Neighbour becomes better than absolute threshold;

Event B2: PCell becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2;

Event Y1: PCell becomes worse than absolute threshold1 AND candidate L2 U2N Relay UE becomes better than another absolute threshold2;

Event Y2: Candidate L2 U2N Relay UE becomes better than absolute threshold;

Event Z1: Serving L2 U2N Relay UE becomes worse than absolute threshold1 AND candidate L2 U2N Relay UE becomes better than another absolute threshold2;

| <b>b2-Threshold1</b>                                 | NR threshold to be used in inter RAT measurement report triggering condition for event B2.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>bN-ThresholdEUTRA</b>                             | E-UTRA threshold value associated with the selected trigger quantity (RSRP, RSRQ, SINR) to be used in inter RAT measurement report triggering condition for event number bN. In the same <i>eventB2</i> , the network configures the same CHOICE name ( <i>rsrp</i> , <i>rsrq</i> or <i>sinr</i> ) for the <i>MeasTriggerQuantity</i> of the <i>b2-Threshold1</i> and for the <i>MeasTriggerQuantityEUTRA</i> of the <i>b2-Threshold2EUTRA</i> .                                     |
| <b>eventId</b>                                       | Choice of inter RAT event triggered reporting criteria.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>maxReportCells</b>                                | Max number of non-serving cells/candidate L2 U2N Relay UEs to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>reportAmount</b>                                  | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types                                                                                                                                                                                                                                                                                                                                                                     |
| <b>reportOnLeave</b>                                 | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in <i>cellsTriggeredList</i> or for a L2 U2N Relay UE in <i>relaysTriggeredList</i> , as specified in 5.5.4.1.                                                                                                                                                                                                                                       |
| <b>reportQuantity, reportQuantityUTRA-FDD</b>        | The cell measurement quantities to be included in the measurement report. If the field <i>eventB1-UTRA-FDD</i> or <i>eventB2-UTRA-FDD</i> is present, the UE shall ignore the value(s) provided in <i>reportQuantity</i> .                                                                                                                                                                                                                                                           |
| <b>reportQuantityRelay</b>                           | The L2 U2N Relay UE measurement quantity to be included in measuremet report.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>timeToTrigger</b>                                 | Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>bN-ThresholdUTRA-FDD</b>                          | UTRA-FDD threshold value associated with the selected trigger quantity (RSCP, EcN0) to be used in inter RAT measurement report triggering condition for event number bN.<br><i>utra-FDD-RSCP</i> corresponds to CPICH_RSCP in TS 25.133 [46] for FDD. <i>utra-FDD-EcN0</i> corresponds to CPICH_Ec/No in TS 25.133 [46] for FDD.<br>For <i>utra-FDD-RSCP</i> : The actual value is field value – 115 dBm.<br>For <i>utra-FDD-EcN0</i> : The actual value is (field value – 49)/2 dB. |
| <b>y1-Threshold1</b>                                 | NR threshold to be used in measurement report triggering condition for event Y1.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>y1-Threshold2-Relay</b>                           | L2 U2N Relay threshold value associated with the selected trigger quantity (i.e. RSRP) to be used in measurement report triggering condition for event Y1.                                                                                                                                                                                                                                                                                                                           |
| <b>y2-Threshold-Relay</b>                            | L2 U2N Relay threshold value associated with the selected trigger quantity (i.e. RSRP) to be used in measurement report triggering condition for event Y2.                                                                                                                                                                                                                                                                                                                           |
| <b>z1-Threshold1-Relay</b>                           | L2 U2N Relay threshold value associated with the selected trigger quantity (i.e. SL-RSRP and/or SD-RSRP) to be used in measurement report triggering condition for serving Relay UE in event Z1. If the field sd-RSRP is not included, the UE considers it to be equal to sl-RSRP.                                                                                                                                                                                                   |
| <b>z1-Threshold2-Relay</b>                           | L2 U2N Relay threshold value associated with the selected trigger quantity (i.e. SD-RSRP) to be used in measurement report triggering condition for candidate Relay UE in event Z1.                                                                                                                                                                                                                                                                                                  |

| <i>PeriodicalReportConfigInterRAT</i> field descriptions |                                                                                                                                                                                                       |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxReportCells</b>                                    | Max number of non-serving cells/candidate L2 U2N Relay UEs to include in the measurement report.                                                                                                      |
| <b>reportAmount</b>                                      | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types                                                                                      |
| <b>reportQuantity, reportQuantityUTRA-FDD</b>            | The cell measurement quantities to be included in the measurement report. If the field <i>reportQuantityUTRA-FDD</i> is present, the UE shall ignore the value(s) provided in <i>reportQuantity</i> . |

| <i>CellIndividualOffsetList-EUTRA</i> field descriptions |                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierFreq</b>                                       | Indicates the EUTRA frequency for which <i>cellIndividualOffset</i> is applicable. If the field is not configured, the EUTRA frequency indicated by <i>carrierFreq</i> within the <i>MeasObjectEUTRA</i> of the <i>measID</i> associated with this <i>ReportConfigInterRAT</i> applies. |
| <b>cellIndividualOffset</b>                              | Cell individual offsets applicable to a specific measurement event. If this field is present, the UE, for the same cell, shall ignore the cell individual offset configured within the <i>MeasObjectEUTRA</i> of the <i>measID</i> associated with this <i>ReportConfigInterRAT</i> .   |
| <b>physCellId</b>                                        | Physical cell identity of a E-UTRAN cell in the cell list.                                                                                                                                                                                                                              |

## – *ReportConfigNR*

The IE *ReportConfigNR* specifies criteria for triggering of an NR measurement reporting event or of a CHO, CPA or CPC event or of an L2 U2N relay measurement reporting event. For events labelled AN with N equal to 1, 2 and so on, measurement reporting events and CHO, CPA or CPC events are based on cell measurement results, which can either be derived based on SS/PBCH block or CSI-RS.

Event A1: Serving becomes better than absolute threshold;

Event A2: Serving becomes worse than absolute threshold;

Event A3: Neighbour becomes amount of offset better than PCell/PSCell;

Event A4: Neighbour becomes better than absolute threshold;

Event A5: PCell/PSCell becomes worse than absolute threshold1 AND Neighbour/SCell becomes better than another absolute threshold2;

Event A6: Neighbour becomes amount of offset better than SCell;

Event D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* becomes shorter than configured threshold *distanceThreshFromReference2*;

Event D2: Distance between UE and the serving cell moving reference location determined based on *movingReferenceLocation* and its corresponding satellite ephemeris and epoch time broadcast in *SIB19* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location determined based on *referenceLocation* and its corresponding satellite ephemeris and epoch time for the neighbor cell provided in the associated *MeasObjectNR* becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent A3: Conditional reconfiguration candidate becomes amount of offset better than PCell/PSCell;

CondEvent A4: Conditional reconfiguration candidate becomes better than absolute threshold where *condEventA4* can also be used for current PSCell (i.e., in case it is configured as candidate PSCell for CondEvent A4 evaluation) for CHO with candidate SCG(s) case;

CondEvent A5: PCell/PSCell becomes worse than absolute threshold1 AND Conditional reconfiguration candidate becomes better than another absolute threshold2;

CondEvent D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* of conditional reconfiguration candidate becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent D2: Distance between UE and the serving cell moving reference location determined based on *movingReferenceLocation* and its corresponding satellite ephemeris and epoch time broadcast in *SIB19* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location determined based on *referenceLocation* and its corresponding satellite ephemeris and epoch time for the conditional reconfiguration candidate provided in the associated *MeasObjectNR* becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent T1: Time measured at UE becomes more than configured threshold *t1-Threshold* but is less than *t1-Threshold + duration*;

Event X1: Serving L2 U2N Relay UE becomes worse than absolute threshold1 AND NR Cell becomes better than another absolute threshold2;

Event X2: Serving L2 U2N Relay UE becomes worse than absolute threshold;

For event I1, measurement reporting event is based on CLI measurement results, which can either be derived based on SRS-RSRP or CLI-RSSI.

Event I1: Interference becomes higher than absolute threshold;

The reporting events concerning Aerial UE altitude are labelled HN with N equal to 1 and 2. Additionally, the reporting events concerning Aerial UE altitude and the neighboring cell measurements simultaneously are labelled AMHN with M equal to 3, 4, 5 and N equal to 1, 2.

Event H1: Aerial UE altitude becomes higher than a threshold;

Event H2: Aerial UE altitude becomes lower than a threshold;

Event A3H1: Neighbour becomes offset better than SpCell and the Aerial UE altitude becomes higher than a threshold;

Event A3H2: Neighbour becomes offset better than SpCell and the Aerial UE altitude becomes lower than a threshold;

Event A4H1: Neighbour becomes better than threshold1 and the Aerial UE altitude becomes higher than a threshold2;

Event A4H2: Neighbour becomes better than threshold1 and the Aerial UE altitude becomes lower than a threshold2;

Event A5H1: SpCell becomes worse than threshold1 and neighbour becomes better than threshold2 and the Aerial UE altitude becomes higher than a threshold3;

Event A5H2: SpCell becomes worse than threshold1 and neighbour becomes better than threshold2 and the Aerial UE altitude becomes lower than a threshold3.

| <b>a3-Offset</b>                                                  | Offset value(s) to be used in NR conditional reconfiguration triggering condition for cond event a3. The actual value is field value * 0.5 dB.                                                                                                                                                                                                                                                                                                                                                       |
| <b>a4-Threshold</b>                                               | Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR conditional reconfiguration triggering condition for cond event a4.                                                                                                                                                                                                                                                                                    |
| <b>a5-Threshold1/a5-Threshold2</b>                                | Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR conditional reconfiguration triggering condition for cond event a5. In the same <i>condEventA5</i> , the network configures the same quantity for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> .                                                                      |
| <b>condEventId</b>                                                | Choice of NR conditional reconfiguration event triggered criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>distanceThreshFromReference1, distanceThreshFromReference2</b> | Distance from a fixed reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> for <i>condEventD1</i> . Distance from a moving reference location determined by the UE based on the serving cell <i>movingReferenceLocation</i> broadcast in <i>SIB19</i> or <i>referenceLocation</i> and the corresponding epoch time and satellite ephemeris configured within the <i>MeasObjectNR</i> associated to the event for <i>condEventD2</i> . Each step represents 50m. |
| <b>duration</b>                                                   | This field is used for defining the leaving condition T1-2 for conditional HO event <i>condEventT1</i> . Each step represents 100ms.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>nesEvent</b>                                                   | Indicates the event is a NES-specific CHO event and the event is only considered to be satisfied if indication from lower layers is received indicating the applicability of NES-specific CHO event and the related entry condition(s) is fulfilled. This field can only be configured for <i>condEventA3</i> , <i>condEventA4</i> or <i>condEventA5</i> . This field cannot be configured for CPAC.                                                                                                 |
| <b>referenceLocation1, referenceLocation2</b>                     | The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to candidate target cell.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>t1-Threshold</b>                                               | The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900).                                                                                                                                                                                                                                                                                                        |
| <b>timeToTrigger</b>                                              | Time during which specific criteria for the event needs to be met in order to execute the conditional reconfiguration evaluation.                                                                                                                                                                                                                                                                                                                                                                    |

| <i>ReportConfigNR</i> field descriptions |                                                                                                                                                                                                     |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportType</b>                        | Type of the configured measurement report. In MR-DC, network does not configure report of type <i>reportCGI</i> using SRB3. The <i>condTriggerConfig</i> is used for CHO, CPA or CPC configuration. |

| <i>ReportCGI</i> field descriptions                                                                                                                                                                                                           |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b><i>useAutonomousGaps</i></b><br>Indicates whether or not the UE is allowed to use autonomous gaps in acquiring system information from the NR neighbour cell. When the field is included, the UE applies the corresponding value for T321. |  |

| <b><i>EventTriggerConfig</i></b> field descriptions                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>a3-Offset/a6-Offset</i></b>                                        | Offset value(s) to be used in NR measurement report triggering condition for event a3/a6. The actual value is field value * 0.5 dB.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>aN-ThresholdM</i></b>                                              | Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR measurement report triggering condition for event number aN. If multiple thresholds are defined for event number aN, the thresholds are differentiated by M. In the same <i>eventA5</i> , <i>eventA5H1</i> , <i>eventA5H2</i> , the network configures the same quantity for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> . |
| <b><i>channelOccupancyThreshold</i></b>                                  | RSSI threshold which is used for channel occupancy evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>coarseLocationRequest</i></b>                                      | This field is used to request UE to report coarse location information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>distanceThreshFromReference1, distanceThreshFromReference2</i></b> | Distance from a fixed reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> for <i>eventD1</i> . Distance from a moving reference location determined by the UE based on the serving cell <i>movingReferenceLocation</i> broadcast in <i>SIB19</i> or <i>referenceLocation</i> and the corresponding epoch time and satellite ephemeris configured within the <i>MeasObjectNR</i> associated to the event for <i>eventD2</i> . Each step represents 50m.                                                               |
| <b><i>eventId</i></b>                                                    | Choice of NR event triggered reporting criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>eventXN-SD-Threshold</i></b>                                       | Indicates the SD-RSRP threshold value for the serving L2 U2N Relay UE in event XN (N equals 1 or 2). If this field is not included, the UE considers the SD-RSRP threshold value equals to the one indicated by <i>x1-Threshold1-Relay</i> / <i>x2-Threshold-Relay</i> .                                                                                                                                                                                                                                                                                   |
| <b><i>includeAltitudeUE</i></b>                                          | This field is used to request UE to report altitude information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>maxNrofRS-IndexesToReport</i></b>                                  | Max number of RS indexes to include in the measurement report for A1-A6 events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>maxReportCells</i></b>                                             | Max number of non-serving cells to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>numberOfTriggeringCells</i></b>                                    | Indicates the number of cells detected that are required to fulfill an event for a measurement report to be triggered. This field is applicable only for the events concerning neighbor cells, i.e. <i>eventA3</i> , <i>eventA4</i> , <i>eventA5</i> , <i>eventA3H1</i> , <i>eventA3H2</i> , <i>eventA4H1</i> , <i>eventA4H2</i> , <i>eventA5H1</i> , <i>eventA5H2</i> .                                                                                                                                                                                   |
| <b><i>referenceLocation1, referenceLocation2</i></b>                     | The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to neighbour cell.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>reportAddNeighMeas</i></b>                                         | Indicates that the UE shall include the best neighbour cells per serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>reportAmount</i></b>                                               | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>reportOnBestCellChange</i></b>                                     | Indicates whether the UE shall only send measurement report if the measured best cell (when configured to <i>n1</i> ) or two best cells (when configured to <i>n2</i> ) have changed. In this release of the specification, this field is applicable only for the events concerning neighbor cells. This field can only be configured when the value of the field <i>reportAmount</i> is set to any other value than <i>r1</i> .                                                                                                                           |
| <b><i>reportOnLeave</i></b>                                              | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in <i>cellsTriggeredList</i> or for a L2 U2N Relay UE in <i>relaysTriggeredList</i> , as specified in 5.5.4.1.                                                                                                                                                                                                                                                                                                             |
|                                                                          | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met if configured in <i>eventD1</i> , <i>eventD2</i> , <i>eventH1</i> , <i>eventH2</i> as specified in 5.5.4.1.                                                                                                                                                                                                                                                                                                                           |
| <b><i>reportQuantityCell</i></b>                                         | The cell measurement quantities to be included in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportQuantityRS-Indexes</b>          | Indicates which measurement information per RS index the UE shall include in the measurement report.                                                                                                                                                                                                                                                                                                                                                            |
| <b>simulMultiTriggerSingleMeasReport</b> | Indicates when multiple events with the same eventID satisfy the measurement report triggering condition(s), whether to consider only the event with the smallest value between the altitude of the UE and the configured altitude threshold.                                                                                                                                                                                                                   |
| <b>timeToTrigger</b>                     | Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                                                                                                                                                                                                                                                                                                                                                     |
| <b>useAllowedCellList</b>                | Indicates whether only the cells included in the allow-list of the associated measObject are applicable as specified in 5.5.4.1.                                                                                                                                                                                                                                                                                                                                |
| <b>useT312</b>                           | If value TRUE is configured, the UE shall use the timer T312 with the value t312 as specified in the corresponding measObjectNR. If value FALSE is configured, the timer T312 is considered as disabled. Network configures value TRUE only if reportType is set to eventTriggered.                                                                                                                                                                             |
| <b>xN-ThresholdM</b>                     | Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR measurement report triggering condition for event xN. If multiple thresholds are defined for event number xN, the thresholds are differentiated by M. x1-Threshold1 and x2-Threshold indicates the threshold value for the serving L2 U2N Relay UE, x1-Threshold2 indicates the threshold value for the NR Cells. |

| <b>CLI-EventTriggerConfig field descriptions</b> |                                                                                                                                                                                                                        |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>i1-Threshold</b>                              | Threshold value associated to the selected trigger quantity (e.g. SRS-RSRP, CLI-RSSI) to be used in CLI measurement report triggering condition for event i1.                                                          |
| <b>eventId</b>                                   | Choice of CLI event triggered reporting criteria.                                                                                                                                                                      |
| <b>maxReportCLI</b>                              | Max number of CLI measurement resource to include in the measurement report.                                                                                                                                           |
| <b>reportAmount</b>                              | Number of measurement reports.                                                                                                                                                                                         |
| <b>reportOnLeave</b>                             | Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a CLI measurement resource in srsTriggeredList or rssiTriggeredList, as specified in 5.5.4.1. |
| <b>timeToTrigger</b>                             | Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                                                                                                            |

| <b>CLI-PeriodicalReportConfig field descriptions</b> |                                                                              |
|------------------------------------------------------|------------------------------------------------------------------------------|
| <b>maxReportCLI</b>                                  | Max number of CLI measurement resource to include in the measurement report. |
| <b>reportAmount</b>                                  | Number of measurement reports.                                               |
| <b>reportQuantityCLI</b>                             | The CLI measurement quantities to be included in the measurement report.     |

| <i>PeriodicalReportConfig</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>coarseLocationRequest</b>                     | This field is used to request UE to report coarse location information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>maxNrofRS-IndexesToReport</b>                 | Max number of RS indexes to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>maxReportCells</b>                            | Max number of non-serving cells to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>reportAddNeighMeas</b>                        | Indicates that the UE shall include the best neighbour cells per serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>reportAmount</b>                              | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>reportQuantityCell</b>                        | The cell measurement quantities to be included in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>reportQuantityRS-Indexes</b>                  | Indicates which measurement information per RS index the UE shall include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ul-DelayValueConfig</b>                       | Indicates that the UE shall perform the actual UL PDCP Packet Average Delay measurement per DRB as specified in TS 38.314 [53] and the UE shall ignore the fields <i>reportQuantityCell</i> and <i>maxReportCells</i> . The applicable values for the corresponding <i>reportInterval</i> are (one of the) {ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, ms20480, ms40960, min1,min6, min12, min30}. The <i>reportInterval</i> indicates the periodicity for performing and reporting of UL PDCP Packet Average Delay per DRB measurement as specified in TS 38.314 [53]. |
| <b>ul-ExcessDelayConfig</b>                      | Indicates that the UE shall perform the actual UL PDCP Excess Packet Delay per DRB measurement as specified in TS 38.314 [53] and the UE shall ignore the fields <i>reportQuantityCell</i> and <i>maxReportCells</i> . The applicable values for the corresponding <i>reportInterval</i> are (one of the) {ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, ms20480, ms40960, min1,min6, min12, min30}. The <i>reportInterval</i> indicates the periodicity for performing and reporting of UL PDCP Excess Packet Delay per DRB measurement as specified in TS 38.314 [53].   |
| <b>useAllowedCellList</b>                        | Indicates whether only the cells included in the allow-list of the associated measObject are applicable as specified in 5.5.4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <i>ReportSFTD-NR</i> field descriptions |                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellForWhichToReportSFTD</b>         | Indicates the target NR neighbour cells for SFTD measurement between PCell and NR neighbour cells.                                                                                                                                                                                                     |
| <b>drx-SFTD-NeighMeas</b>               | Indicates that the UE shall use available idle periods (i.e. DRX off periods) for the SFTD measurement in NR standalone. The network only includes <i>drx-SFTD-NeighMeas</i> field when <i>reptSFTD-NeighMeas</i> is set to true.                                                                      |
| <b>reportSFTD-Meas</b>                  | Indicates whether UE is required to perform SFTD measurement between PCell and NR PSCell in NR-DC.                                                                                                                                                                                                     |
| <b>reportSFTD-NeighMeas</b>             | Indicates whether UE is required to perform SFTD measurement between PCell and NR neighbour cells in NR standalone. The network does not include this field if <i>reportSFTD-Meas</i> is set to true.                                                                                                  |
| <b>reportRSRP</b>                       | Indicates whether UE is required to include RSRP result of NR PSCell or NR neighbour cells in SFTD measurement result, derived based on SSB. If it is set to true, the network should ensure that <i>ssb-ConfigMobility</i> is included in the measurement object for NR PSCell or NR neighbour cells. |

| <i>RxTxPeriodical</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportAmount</b>                      | This field indicates the number of UE Rx-Tx time difference measurement reports. If configured to <i>r1</i> , the network does not configure <i>rxTxReportInterval</i> and only one measurement is reported. If configured to <i>infinity</i> , UE periodically reports measurements according to the periodicity configured by <i>rxTxReportInterval</i> . |
| <b>rxTxReportInterval</b>                | This field indicates the measurement reporting periodicity of UE Rx-Tx time difference.                                                                                                                                                                                                                                                                     |

| other field descriptions   |                                                    |
|----------------------------|----------------------------------------------------|
| <b>MeasTriggerQuantity</b> | SINR is applicable only for CONNECTED mode events. |

| <i>ReportOnScellActivation</i> field descriptions |                                                                                                                                                  |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rsType</b>                                     | Indicates which RS is used to provide the measurement result. Only value <i>ssb</i> can be set in this release.                                  |
| <b>reportQuantityRS-Indexes</b>                   | Indicates which measurement information per RS index is used to sort the reported measurement results and is included in the measurement report. |
| <b>maxNrofRS-IndexesToReport</b>                  | Max number of RS indexes to include in the measurement report.                                                                                   |
| <b>includeBeamMeasurements</b>                    | Indicates whether to include the measurement result per RS index in the measurement report.                                                      |

| <i>CellIndividualOffsetList</i> field descriptions |                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIndividualOffset</b>                        | Cell individual offsets applicable to a specific measurement event. If this field is present, the UE, for the same cell, shall ignore the cell individual offset configured within the <i>MeasObjectNR</i> of the <i>measID</i> associated with this <i>ReportConfigNR</i> .                    |
| <b>physCellId</b>                                  | Physical cell identity of a cell in the cell list.                                                                                                                                                                                                                                              |
| <b>ssbFrequency</b>                                | Indicates the NR frequency of SS for which <i>cellIndividualOffset</i> is applicable. If the field is not configured, the NR frequency of SS indicated by <i>ssbFrequency</i> indicated within the <i>MeasObjectNR</i> of the <i>measID</i> associated with this <i>ReportConfigNR</i> applies. |

## – *ReportConfigNR-SL*

The IE *ReportConfigNR-SL* specifies criteria for triggering of a CBR measurement reporting event for NR sidelink communication/discovery. Measurement reporting events are based on CBR measurement results on the corresponding transmission resource pools. These events are labelled CN with N equal to 1 and 2.

Event C1: CBR of NR sidelink communication/discovery is above a threshold;

Event C2: CBR of NR sidelink communication/discovery is below a threshold;

***ReportConfigNR-SL*** field descriptions***reportType***

Type of the configured CBR measurement report for NR sidelink communication/discovery.

| <i>EventTriggerConfigNR-SL</i> field descriptions |                                                                                                                                           |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cN-Threshold</b>                               | Threshold used for events C1 and C2 specified in clauses 5.5.4.11 and 5.5.4.12, respectively.                                             |
| <b>eventId</b>                                    | Choice of NR event triggered reporting criteria.                                                                                          |
| <b>reportAmount</b>                               | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types.                         |
| <b>reportQuantity</b>                             | The sidelink measurement quantities to be included in the measurement report. In this release, this is set as the CBR measurement result. |
| <b>timeToTrigger</b>                              | Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                               |

| <i>PeriodicalReportConfigNR-SL</i> field descriptions |                                                                                                                                           |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportAmount</b>                                   | Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types.                         |
| <b>reportQuantity</b>                                 | The sidelink measurement quantities to be included in the measurement report. In this release, this is set as the CBR measurement result. |

- ***ReportConfigToAddModList***

The IE *ReportConfigToAddModList* concerns a list of reporting configurations to add or modify.

#### **ReportConfigToAddModList information element**

```
-- ASN1START
-- TAG-REPORTCONFIGTOADDMODLIST-START

ReportConfigToAddModList ::= SEQUENCE (SIZE (1..maxReportConfigId)) OF ReportConfigToAddMod

ReportConfigToAddMod ::= SEQUENCE {
 reportConfigId,
 reportConfig
 reportConfigNR
 ReportConfigNR,
 ...
 reportConfigInterRAT
 ReportConfigInterRAT,
 reportConfigNR-SL-r16
 ReportConfigNR-SL-r16
}
}

-- TAG-REPORTCONFIGTOADDMODLIST-STOP
-- ASN1STOP
```

- ***ReportInterval***

The IE *ReportInterval* indicates the interval between periodical reports. The *ReportInterval* is applicable if the UE performs periodical reporting (i.e. when *reportAmount* exceeds 1) when *reportType* is set to either *eventTriggered*, *periodical*, *cli-EventTriggered* or *cli-Periodical*. Value *ms120* corresponds to 120 ms, value *ms240* corresponds to 240 ms and so on, while value *min1* corresponds to 1 min, *min6* corresponds to 6 min and so on.

#### ***ReportInterval* information element**

```
-- ASN1START
-- TAG-REPORTINTERVAL-START

ReportInterval ::= ENUMERATED {ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, ms20480, ms40960,
 min1,min6, min12, min30 }

-- TAG-REPORTINTERVAL-STOP
-- ASN1STOP
```

- ***ReselectionThreshold***

The IE *ReselectionThreshold* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = field value \* 2 [dB].

#### ***ReselectionThreshold* information element**

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLD-START

ReselectionThreshold ::= INTEGER (0..31)

-- TAG-RESELECTIONTHRESHOLD-STOP
-- ASN1STOP
```

- ***ReselectionThresholdQ***

The IE *ReselectionThresholdQ* is used to indicate a quality level threshold for cell reselection. Actual value of threshold = field value [dB].

#### ***ReselectionThresholdQ* information element**

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLDQ-START

ReselectionThresholdQ ::= INTEGER (0..31)

-- TAG-RESELECTIONTHRESHOLDQ-STOP
-- ASN1STOP
```

## – *ResumeCause*

The IE *ResumeCause* is used to indicate the resume cause in *RRCResumeRequest*, *RRCResumeRequest1* and *UEAssistanceInformation*.

### **ResumeCause information element**

```
-- ASN1START
-- TAG-RESUMECAUSE-START

ResumeCause ::= ENUMERATED {emergency, highPriorityAccess, mt-Access, mo-Signalling,
 mo-Data, mo-VoiceCall, mo-VideoCall, mo-SMS, rna-Update, mps-PriorityAccess,
 mcs-PriorityAccess, mt-SDT-v1810, srs-PosConfigOrActivationReq-v1800, spare3, spare2, spare1}

-- TAG-RESUMECAUSE-STOP
-- ASN1STOP
```

## – *RLC-BearerConfig*

The IE *RLC-BearerConfig* is used to configure an RLC entity, a corresponding logical channel in MAC and the linking to a PDCP entity (served radio bearer).

### **RLC-BearerConfig information element**

```
-- ASN1START
-- TAG-RLC-BEARERCONFIG-START

RLC-BearerConfig ::= SEQUENCE {
 logicalChannelIdentity,
 servedRadioBearer
 CHOICE {
 SRB-Identity,
 DRB-Identity
 }
 reestablishRLC
 rlc-Config
 mac-LogicalChannelConfig
 ...
 [
 rlc-Config-v1610
],

| <b><i>isPTM-Entity</i></b>                                                    | If configured, indicates that the RLC entity is used for PTM reception. When the field is absent the RLC entity is used for PTP transmission/reception.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>logicalChannelIdentity</i></b>                                          | ID used commonly for the MAC logical channel and for the RLC bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>logicalChannelIdentityExt</i></b>                                       | Extended logical channel ID used commonly for the MAC logical channel and for the RLC bearer for PTM reception. If this field is configured, the UE shall ignore <i>logicalChannelIdentity</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>reestablishRLC</i></b>                                                  | Indicates that RLC should be re-established. Network sets this to <i>true</i> at least whenever the security key used for the radio bearer associated with this RLC entity changes. For SRB2, multicast MRBs and DRBs, unless full configuration is used, it is also set to <i>true</i> during the resumption of the RRC connection or the first reconfiguration after reestablishment. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment, the network does not set this field to <i>true</i> . The network does not include this field if <i>servedRadioBearer</i> is set to <i>drb-Identity</i> and the <i>RLC-BearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE. For DRBs, network doesn't include this field if the <i>RLC-BearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE. Network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE which is received within a MCG <i>RRCReconfiguration</i> message via SRB1. |
| <b><i>rlc-Config</i></b>                                                      | Determines the RLC mode (UM, AM) and provides corresponding parameters. RLC mode reconfiguration can only be performed by DRB/multicast MRB release/addition or full configuration. The network may configure <i>rlc-Config-v1610</i> only when <i>rlc-Config</i> (without suffix) is set to <i>am</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>servedMBS-RadioBearer</i></b>                                           | Associates the RLC Bearer with a multicast MRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedMBS-RadioBearer</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>servedRadioBearer, servedRadioBearerSRB4, servedRadioBearerSRB5</i></b> | Associates the RLC Bearer with an SRB or a DRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedRadioBearer</i> . Furthermore, the UE shall advertise and deliver uplink PDCP PDUs of the uplink PDCP entity of the <i>servedRadioBearer</i> to the uplink RLC entity of this RLC bearer unless the uplink scheduling restrictions ( <i>moreThanOneRLC</i> in <i>PDCP-Config</i> and the restrictions in <i>LogicalChannelConfig</i> ) forbid it to do so.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LCH-Setup</i>         | This field is mandatory present upon creation of a new logical channel for a DRB or a multicast MRB or SRB4 or SRB5. This field is optionally present, Need S, upon creation of a new logical channel for an SRB except SRB4 and SRB5. It is optionally present, Need M, otherwise.                                                                       |
| <i>LCH-SetupModMRB</i>   | This field is optionally present upon creation of a new logical channel for PTM reception for a multicast MRB. If this field is included upon creation of a new logical channel for PTM reception for a multicast MRB, it shall be present when modifying this logical channel. The field is absent for logical channels configured for an SRB and a DRB. |
| <i>LCH-SetupOnly</i>     | This field is mandatory present upon creation of a new logical channel for a DRB or an SRB ( <i>servedRadioBearer</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                  |
| <i>LCH-SetupOnlyMRB</i>  | This field is mandatory present upon creation of a new logical channel for a multicast MRB and upon modification of <i>MRB-Identity</i> of the served MRB. It is absent, Need M otherwise.                                                                                                                                                                |
| <i>LCH-SetupOnlySRB4</i> | This field is mandatory present upon creation of a new logical channel for SRB4 ( <i>servedRadioBearerSRB4</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                         |
| <i>LCH-SetupOnlySRB5</i> | This field is mandatory present upon creation of a new logical channel for SRB5 ( <i>servedRadioBearerSRB5</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                         |

## – *RLC-Config*

The IE *RLC-Config* is used to specify the RLC configuration of SRBs, multicast MRBs and DRBs.

| <b>RLC-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxRetxThreshold</b>              | Parameter for RLC AM in TS 38.322 [4]. Value <i>t1</i> corresponds to 1 retransmission, value <i>t2</i> corresponds to 2 retransmissions and so on.                                                                                                                                                                                                                                          |
| <b>pollByte</b>                      | Parameter for RLC AM in TS 38.322 [4]. Value <i>kB25</i> corresponds to 25 kBytes, value <i>kB50</i> corresponds to 50 kBytes and so on. <i>infinity</i> corresponds to an infinite amount of kBytes.                                                                                                                                                                                        |
| <b>pollPDU</b>                       | Parameter for RLC AM in TS 38.322 [4]. Value <i>p4</i> corresponds to 4 PDUs, value <i>p8</i> corresponds to 8 PDUs and so on. <i>infinity</i> corresponds to an infinite number of PDUs.                                                                                                                                                                                                    |
| <b>sn-FieldLength</b>                | Indicates the RLC SN field size, see TS 38.322 [4], in bits. Value <i>size6</i> means 6 bits, value <i>size12</i> means 12 bits, value <i>size18</i> means 18 bits. The value of <i>sn-FieldLength</i> of an RLC entity for the DRB/multicast MRB shall be changed only using reconfiguration with sync. The network configures only value <i>size12</i> in <i>SN-FieldLengthAM</i> for SRB. |
| <b>t-PollRetransmit</b>              | Timer for RLC AM in TS 38.322 [4], in milliseconds. Value <i>ms5</i> means 5 ms, value <i>ms10</i> means 10 ms and so on.                                                                                                                                                                                                                                                                    |
| <b>t-Reassembly, t-ReassemblyExt</b> | Timer for reassembly in TS 38.322 [4], in milliseconds. Value <i>ms0</i> means 0 ms, value <i>ms5</i> means 5 ms and so on. If <i>t-ReassemblyExt-r17</i> is configured, the UE shall ignore <i>t-Reassembly</i> (without suffix).                                                                                                                                                           |
| <b>t-StatusProhibit</b>              | Timer for status reporting in TS 38.322 [4], in milliseconds. Value <i>ms0</i> means 0 ms, value <i>ms5</i> means 5 ms and so on. If <i>t-StatusProhibit-v1610</i> is present, the UE shall ignore <i>t-StatusProhibit</i> (without suffix).                                                                                                                                                 |

| Conditional Presence | Explanation                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Reestab              | The field is mandatory present at RLC bearer setup. It is optionally present, need M, at RLC re-establishment. Otherwise it is absent. Need M. |

## – *RLF-TimersAndConstants*

The IE *RLF-TimersAndConstants* is used to configure UE specific timers and constants.

### ***RLF-TimersAndConstants* information element**

```
-- ASN1START
-- TAG-RLF-TIMERSANDCONSTANTS-START

RLF-TimersAndConstants ::= SEQUENCE {
 t310 ENUMERATED {ms0, ms50, ms100, ms200, ms500, ms1000, ms2000, ms4000, ms6000},

 n311 ENUMERATED {n1, n2, n3, n4, n5, n6, n8, n10},
 ...
 [[
 t311 ENUMERATED {ms1000, ms3000, ms5000, ms10000, ms15000, ms20000, ms30000}
]]
}

-- TAG-RLF-TIMERSANDCONSTANTS-STOP
-- ASN1STOP
```

| <b><i>RLF-TimersAndConstants</i> field descriptions</b> |                                                                                                                             |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b><i>n3xy</i></b>                                      | Constants are described in clause 7.3. Value <i>n1</i> corresponds to 1, value <i>n2</i> corresponds to 2 and so on.        |
| <b><i>t3xy</i></b>                                      | Timers are described in clause 7.1. Value <i>ms0</i> corresponds to 0 ms, value <i>ms50</i> corresponds to 50 ms and so on. |

### — *RNTI-Value*

The IE *RNTI-Value* represents a Radio Network Temporary Identity.

#### ***RNTI-Value* information element**

```
-- ASN1START
-- TAG-RNTI-VALUE-START

RNTI-Value ::= INTEGER (0..65535)

-- TAG-RNTI-VALUE-STOP
-- ASN1STOP
```

### — *RSRP-Range*

The IE *RSRP-Range* specifies the value range used in RSRP measurements and thresholds. For measurements, integer value for RSRP measurements is according to Table 10.1.6.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 156) dBm, except for the IE value 127, in which case the actual value is infinity.

#### ***RSRP-Range* information element**

```
-- ASN1START
-- TAG-RSRP-RANGE-START

RSRP-Range ::= INTEGER(0..127)

-- TAG-RSRP-RANGE-STOP
-- ASN1STOP
```

### — *RSRQ-Range*

The IE *RSRQ-Range* specifies the value range used in RSRQ measurements and thresholds. For measurements, integer value for RSRQ measurements is according to Table 10.1.11.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 87) / 2 dB.

#### ***RSRQ-Range* information element**

```
-- ASN1START
```

```
-- TAG-RSRQ-RANGE-START
RSRQ-Range ::= INTEGER(0..127)
-- TAG-RSRQ-RANGE-STOP
-- ASN1STOP
```

### *RSSI-Range*

The IE *RSSI-Range* specifies the value range used in RSSI measurements and thresholds for NR operation with shared spectrum channel access. The integer value for RSSI measurements is according to Table 10.1.34.3-1 in TS 38.133 [14].

#### ***RSSI-Range* information element**

```
-- ASN1START
-- TAG-RSSI-RANGE-START
RSSI-Range-r16 ::= INTEGER(0..76)
-- TAG-RSSI-RANGE-STOP
-- ASN1STOP
```

### *RxTxTimeDiff*

The IE *RxTxTimeDiff* contains the Rx-Tx time difference measurement at either the UE or the gNB.

#### ***RxTxTimeDiff* information element**

```
-- ASN1START
-- TAG-RXTXTIMEDIFF-START
RxTxTimeDiff-r17 ::= SEQUENCE {
 result-k5-r17 INTEGER (0..61565) OPTIONAL, -- Need N
 ...
}
-- TAG-RXTXTIMEDIFF-STOP
-- ASN1STOP
```

| <b><i>RxTxTimeDiff</i> field descriptions</b> |                                                                                                                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>result-k5</b>                              | This field indicates the Rx-Tx time difference measurement, see TS 38.215 [9], clause 10.1.25.3.1 of TS 38.133 [14] for UE Rx-Tx time difference and clause 13.2.1 of TS 38.133 [14] for gNB Rx-Tx time difference. |

- ***SCellActivationRS-Config***

The IE *SCellActivationRS-Config* is used to configure a Reference Signal for fast activation of the SCell where the IE is included (see TS 38.214 [19], clause 5.2.1.5.3. Usage of an *SCellActivationRS-Config* is indicated by including its *scellActivationRS-Id* in the Enhanced SCell activation MAC CE (see TS 38.321 [3] clause 6.1.3.55).

#### ***SCellActivationRS-Config* information element**

```
-- ASN1START
-- TAG-SCELLACTIVATIONRS-CONFIG-START

SCellActivationRS-Config-r17 ::= SEQUENCE {
 scellActivationRS-Id-r17 SCellActivationRS-ConfigId-r17,
 resourceSet-r17 NZP-CSI-RS-ResourceSetId,
 gapBetweenBursts-r17 INTEGER (2..31) OPTIONAL, -- Need R

-- ASN1STOP
```

| <b><i>SCellActivationRS-Config</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gapBetweenBursts</b>                                   | When this field is present, there are two bursts and it indicates the gap between the two bursts in number of slots. When this field is absent, there is a single burst.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>qcl-Info</b>                                           | Reference to TCI-State for providing the QCL source and QCL type for each NZP-CSI-RS-Resource listed in <i>nzp-CSI-RS-Resources</i> of the <i>NZP-CSI-RS-ResourceSet</i> indicated by <i>resourceSet</i> (see TS 38.214 [19], clause 5.1.6.1.1.1). <i>TCI-StateId</i> refers to the <i>TCI-State</i> which has this value for <i>tci-StateId</i> and is defined in <i>tci-StatesToAddModList</i> or <i>dl-OrJointTCI-StateList</i> in the <i>PDSCH-Config</i> included in the <i>BWP-Downlink</i> of this serving cell indicated by <i>firstActiveDownlinkBWP-Id</i> in the <i>ServingCellConfig</i> in which this IE is included. |
| <b>resourceSet</b>                                        | <i>nzp-CSI-ResourceSetId</i> of the <i>NZP-CSI-RS-ResourceSet</i> of this serving cell used as resource configuration for one or two bursts for SCell activation. This NZP-CSI-RS-ResourceSet consists of four NZP CSI-RS resources in two consecutive slots with two NZP CSI-RS resources in each slot (see TS 38.214 [19], clause 5.1.6.1.1.1). The CSI-RS associated with this NZP-CSI-RS-ResourceSet are located in the BWP addressed by <i>firstActiveDownlinkBWP-Id</i> .                                                                                                                                                    |

- ***SCellActivationRS-ConfigId***

The IE *SCellActivationRS-ConfigId* is used to identify one *SCellActivationRS-Config*.

#### ***SCellActivationRS-ConfigId* information element**

```
-- ASN1START
-- TAG-SCELLACTIVATIONRS-CONFIGID-START

SCellActivationRS-ConfigId-r17 ::= INTEGER (1.. maxNrofSCellActRS-r17)

-- TAG-SCELLACTIVATIONRS-CONFIGID-STOP
```

-- ASN1STOP

## - ***SCellIndex***

The IE *SCellIndex* concerns a short identity, used to identify an SCell. The value range is shared across the Cell Groups.

### ***SCellIndex* information element**

```
-- ASN1START
-- TAG-SCELLINDEX-START

SCellIndex ::= INTEGER (1..31)

-- TAG-SCELLINDEX-STOP
-- ASN1STOP
```

## - ***SchedulingRequestConfig***

The IE *SchedulingRequestConfig* is used to configure the parameters, for the dedicated scheduling request (SR) resources.

### ***SchedulingRequestConfig* information element**

```
-- ASN1START
-- TAG-SCHEDULINGREQUESTCONFIG-START

SchedulingRequestConfig ::= SEQUENCE {
 schedulingRequestToAddModList SEQUENCE (SIZE (1..maxNrofSR-ConfigPerCellGroup)) OF SchedulingRequestToAddMod

| <b>phy-PriorityIndex</b>                                  | Indicates whether this scheduling request resource is <i>high</i> or <i>low</i> priority in PHY prioritization/multiplexing handling (see TS 38.213 [13], clause 9.2.4). Value <i>p0</i> indicates low priority and value <i>p1</i> indicates high priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>resource</b>                                           | ID of the PUCCH resource in which the UE shall send the scheduling request. The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> of the same UL BWP and serving cell as this <i>SchedulingRequestResourceConfig</i> . The network configures a <i>PUCCH-Resource</i> of <i>PUCCH-format0</i> or <i>PUCCH-format1</i> (other formats not supported) (see TS 38.213 [13], clause 9.2.4)                                                                                                                                                                                                                                                                                                                                                          |
| <b>schedulingRequestId</b>                                | The ID of the <i>SchedulingRequestConfig</i> that uses this scheduling request resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- *SchedulingRequestResourceId*

The IE *SchedulingRequestResourceId* is used to identify scheduling request resources on PUCCH.

#### **SchedulingRequestResourceId information element**

```
-- ASN1START
-- TAG-SCHEDULINGREQUESTRESOURCEID-START

SchedulingRequestResourceId ::= INTEGER (1..maxNrofSR-Resources)

-- TAG-SCHEDULINGREQUESTRESOURCEID-STOP
-- ASN1STOP
```

- *ScramblingId*

The IE *ScramblingID* is used for scrambling channels and reference signals.

***ScramblingId* information element**

```
-- ASN1START
-- TAG-SCRAMBLINGID-START

ScramblingId ::= INTEGER(0..1023)

-- TAG-SCRAMBLINGID-STOP
-- ASN1STOP
```

***SCS-SpecificCarrier***

The IE *SCS-SpecificCarrier* provides parameters determining the location and width of the actual carrier or the carrier bandwidth. It is defined specifically for a numerology (subcarrier spacing (SCS)) and in relation (frequency offset) to Point A.

***SCS-SpecificCarrier* information element**

```
-- ASN1START
-- TAG-SCS-SPECIFICCARRIER-START

SCS-SpecificCarrier ::= SEQUENCE {
 offsetToCarrier INTEGER (0..2199),
 subcarrierSpacing SubcarrierSpacing,
 carrierBandwidth INTEGER (1..maxNrofPhysicalResourceBlocks),
 ...
 [
 txDirectCurrentLocation INTEGER (0..4095)
 OPTIONAL
 -- Need S
]
}

-- TAG-SCS-SPECIFICCARRIER-STOP

| <b>SCS-SpecificCarrier field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierBandwidth</b>                       | Width of this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier) (see TS 38.211 [16], clause 4.4.2). For the case that 12PRB/20 PRB transmission bandwidth is used as specified in TS 38.101-1 [15], TS 38.211[16] and TS 38.213[13], the network shall configure the <i>carrierBandwidth</i> to 15 PRB (for the 12 PRB case) and 25 PRB (for the 20 PRB case) respectively and the UE shall use 12PRB/20 PRB as the transmission bandwidth respectively.                                                           |
| <b>offsetToCarrier</b>                        | Offset in frequency domain between Point A (lowest subcarrier of common RB 0) and the lowest usable subcarrier on this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier). The maximum value corresponds to 275*8-1. See TS 38.211 [16], clause 4.4.2.                                                                                                                                                                                                                                                              |
| <b>txDirectCurrentLocation</b>                | Indicates the downlink Tx Direct Current location for the carrier. A value in the range 0..3299 indicates the subcarrier index within the carrier. The values in the value range 3301..4095 are reserved and ignored by the UE. If this field is absent for downlink within <i>ServingCellConfigCommon</i> and <i>ServingCellConfigCommonSIB</i> , the UE assumes the default value of 3300 (i.e. "Outside the carrier"). (see TS 38.211 [16], clause 4.4.2). Network does not configure this field via <i>ServingCellConfig</i> or for uplink carriers. |
| <b>subcarrierSpacing</b>                      | Subcarrier spacing of this carrier. It is used to convert the offsetToCarrier into an actual frequency.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                 |

## – SDAP-Config

The IE *SDAP-Config* is used to set the configurable SDAP parameters for a data radio bearer. All configured instances of SDAP-Config with the same value of pdu-Session correspond to the same SDAP entity as specified in TS 37.324 [24].

### SDAP-Config information element

```
-- ASN1START
-- TAG-SDAP-CONFIG-START

SDAP-Config ::=
SEQUENCE {

```

| <b>SDAP-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>defaultDRB</b>                     | Indicates whether or not this is the default DRB for this PDU session. Among all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> , this field shall be set to <i>true</i> in at most one instance of <i>SDAP-Config</i> and to <i>false</i> in all other instances.                                                                                                                                                                                                              |
| <b>mappedQoS-FlowsToAdd</b>           | Indicates the list of QFIs of UL QoS flows of the PDU session to be additionally mapped to this DRB. A QFI value can be included at most once in all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> . For QoS flow remapping, the QFI value of the remapped QoS flow is only included in <i>mappedQoS-FlowsToAdd</i> in <i>sdap-Config</i> corresponding to the new DRB and not included in <i>mappedQoS-FlowsToRelease</i> in <i>sdap-Config</i> corresponding to the old DRB. |
| <b>mappedQoS-FlowsToRelease</b>       | Indicates the list of QFIs of QoS flows of the PDU session to be released from existing QoS flow to DRB mapping of this DRB.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>pdu-Session</b>                    | Identity of the PDU session whose QoS flows are mapped to the DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>sdap-HeaderUL</b>                  | Indicates whether or not a SDAP header is present for UL data on this DRB. The field cannot be changed after a DRB is established. The network sets this field to <i>present</i> if the field <i>defaultDRB</i> is set to <i>true</i> .                                                                                                                                                                                                                                                                               |
| <b>sdap-HeaderDL</b>                  | Indicates whether or not a SDAP header is present for DL data on this DRB. The field cannot be changed after a DRB is established.                                                                                                                                                                                                                                                                                                                                                                                    |

## – *SearchSpace*

The IE *SearchSpace* defines how/where to search for PDCCH candidates. Each search space is associated with one *ControlResourceSet*. For a scheduled SCell in the case of cross carrier scheduling, except for *nrofCandidates*, all the optional fields are absent (regardless of their presence conditions). For a scheduled SpCell in the case of the cross carrier scheduling, if the search space is linked to another search space in the scheduling SCell, all the optional fields of this search space in the scheduled SpCell are absent (regardless of their presence conditions) except for *nrofCandidates*.

| <b>SearchSpace field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>common</b>                         | Configures this search space as common search space (CSS) and DCI formats to monitor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>controlResourceSetId</b>           | The CORESET applicable for this SearchSpace. Value 0 identifies the common CORESET#0 configured in MIB and in <i>ServingCellConfigCommon</i> . Values 1..maxNrofControlResourceSets-1 identify CORESETS configured in System Information or by dedicated signalling. The CORESETS with non-zero controlResourceSetId are configured in the same BWP as this SearchSpace except commonControlResourceSetExt which is configured by SIB20. If the field controlResourceSetId-r16 is present, UE shall ignore the controlResourceSetId (without suffix). |
| <b>dummy1, dummy2</b>                 | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>dci-Format0-0-AndFormat1-0</b>     | If configured, the UE monitors the DCI formats 0_0 and 1_0 according to TS 38.213 [13], clause 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>dci-Format2-0</b>                  | If configured, UE monitors the DCI format 2_0 according to TS 38.213 [13], clause 10.1, 11.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>dci-Format2-1</b>                  | If configured, UE monitors the DCI format 2_1 according to TS 38.213 [13], clause 10.1, 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>dci-Format2-2</b>                  | If configured, UE monitors the DCI format 2_2 according to TS 38.213 [13], clause 10.1, 11.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>freqMonitorLocations</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Defines an association of the search space to multiple monitoring locations in the frequency domain and indicates whether the pattern configured in the associated CORESET is replicated to a specific RB set, see TS 38.213, clause 10.1. Each bit in the bitmap corresponds to one RB set, and the leftmost (most significant) bit corresponds to RB set 0 in the BWP. A bit set to 1 indicates that a frequency domain resource allocation replicated from the pattern configured in the associated CORESET is mapped to the RB set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

***monitoringSlotPeriodicityAndOffset***

Slots for PDCCH Monitoring configured as periodicity and offset.

For SCS 15, 30, 60, and 120 kHz and if the UE is configured to monitor:

- DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable.
- DCI format 2\_0, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213 [13], clause 10).
- DCI format 2\_4, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8' and 'sl10' are applicable.

For SCS 480 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40', 'sl64', and 'sl80' are applicable.
- DCI format 2\_1, only the values 'sl4', 'sl8', and 'sl16' are applicable.
- DCI format 2\_4, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40' are applicable.

For SCS 960 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80', 'sl128', and 'sl160' are applicable.
- DCI format 2\_1, only the values 'sl8', 'sl16', and 'sl32' are applicable.
- DCI format 2\_4, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80' are applicable.

For SCS 480 kHz and SCS 960 kHz, and the configured periodicity and offset are restricted to be an integer multiple of L slots, where L is the configured length of the bitmap provided by *monitoringSlotsWithinSlotGroup-r17*, i.e. for a given periodicity, the offset has a range of {0, L, 2\*L, ..., L\*FLOOR(1/L\*(periodicity-1))}.

For IAB-MT, If the IAB-MT is configured to monitor DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable. If the IAB-MT is configured to monitor DCI format 2\_0 or DCI format 2\_5, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213, clause 10).

If *monitoringSlotPeriodicityAndOffset-v1710* is present, any previously configured *monitoringSlotPeriodicityAndOffset* is released, and if *monitoringSlotPeriodicityAndOffset* is present, any previously configured *monitoringSlotPeriodicityAndOffset-v1710* is released.

***monitoringSlotsWithinSlotGroup***

Indicates which slot(s) within a slot group are configured for multi-slot PDCCH monitoring. The first (leftmost, most significant) bit represents the first slot in the slot group, the second bit represents the second slot in the slot group, and so on. A bit set to '1' indicates that the corresponding slot is configured for multi-slot PDCCH monitoring (see TS 38.213 [13], clause 10). The number of slots for multi-slot PDCCH monitoring is configured according to clause 10 in TS 38.213 [13].

***monitoringSymbolsWithinSlot***

The first symbol(s) for PDCCH monitoring in the slots configured for (multi-slot) PDCCH monitoring (see *monitoringSlotPeriodicityAndOffset* and *duration*). The most significant (left) bit represents the first OFDM in a slot, and the second most significant (left) bit represents the second OFDM symbol in a slot and so on. The bit(s) set to one identify the first OFDM symbol(s) of the control resource set within a slot. If the cyclic prefix of the BWP is set to extended CP, the last two bits within the bit string shall be ignored by the UE or IAB-MT.

For DCI format 2\_0, the first one symbol applies if the *duration* of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

For IAB-MT: For DCI format 2\_0 or DCI format 2\_5, the first one symbol applies if the duration of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

***nrofCandidates-CI***

The number of PDCCH candidates specifically for format 2-4 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 10.1). In this release of the specification, only value *n1* is valid.

***nrofCandidates-PEI***

The number of PDCCH candidates specifically for format 2-7 for the configured aggregation level.

***nrofCandidates-SFI***

The number of PDCCH candidates specifically for format 2-0 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 11.1.1). For a search space configured with *freqMonitorLocations-r16*, only value 'n1' is valid.

***nrofCandidates***

Number of PDCCH candidates per aggregation level. The number of candidates and aggregation levels configured here applies to all formats unless a particular value is specified or a format-specific value is provided (see inside *searchSpaceType*). If configured in the *SearchSpace* of a cross carrier scheduled cell, this field determines the number of candidates and aggregation levels to be used on the linked scheduling cell (see TS 38.213 [13], clause 10).

***searchSpaceGroupIdList-r16, searchSpaceGroupIdList-r17***

List of search space group IDs which the search space is associated with. The network configures at most 2 search space groups per BWP where the group ID is either 0 or 1 if *searchSpaceGroupIdList-r16* is included. The network configures at most 3 search space groups per BWP where the group ID is either 0, 1 or 2 if *searchSpaceGroupIdList-r17* is included. And if *searchSpaceGroupIdList-r17* is included, *searchSpaceGroupIdList-r16* is ignored.

***searchSpaceId***

Identity of the search space. *SearchSpaceId* = 0 identifies the *searchSpaceZero* configured via PBCH (MIB) or *ServingCellConfigCommon* and may hence not be used in the *SearchSpace* IE. The *searchSpaceId* is unique among the BWPs of a Serving Cell. In case of cross carrier scheduling, search spaces with the same *searchSpaceId* in scheduled cell and scheduling cell are linked to each other. The UE applies the search space for the scheduled cell only if the DL BWPs in which the linked search spaces are configured in scheduling cell and scheduled cell are both active.

For an IAB-MT, the search space defines how/where to search for PDCCH candidates for an IAB-MT where each search space is associated with one *ControlResearchSet* and for a scheduled cell in the case of cross carrier scheduling, except for *nrofCandidates*, all the optional fields are absent.

***SearchSpaceLinkingId***

This parameter is used to link two search spaces of same type in the same BWP. If two search spaces have the same *SearchSpaceLinkingId* UE assumes these search spaces are linked to PDCCH repetition REF. When PDCCH repetition is monitored in two linked search space (SS) sets, the UE does not expect a third monitored SS set to be linked with any of the two linked SS sets. The two linked SS sets have the same SS set type (USS/CSS). The two linked SS sets have the same DCI formats to monitor. For intra-slot PDCCH repetition: The two SS sets should have the same periodicity and offset (*monitoringSlotPeriodicityAndOffset*), and the same duration. For linking monitoring occasions across the two SS sets that exist in the same slot: The two SS sets have the same number of monitoring occasions within a slot and n-th monitoring occasion of one SS set is linked to n-th monitoring occasion of the other SS set. The following SS sets cannot be linked with another SS set for PDCCH repetition: SS set 0, *searchSpaceSIB1*, *searchSpaceOtherSystemInformation*, *pagingSearchSpace*, *ra-SearchSpace*, *searchSpaceMCCH*, *searchSpaceMTCH*, *peiSearchSpace*, and *sdt-SearchSpace*. SS set configured by *recoverySearchSpaceId* cannot be linked to another SS set for PDCCH repetition. When a scheduled serving cell is configured to be cross-carrier scheduled by a scheduling serving cell, two PDCCH candidates (with the same AL and candidate index associated with the scheduled serving cell) are linked only if the corresponding two SS sets in the scheduling serving cell are linked and two SS sets in the scheduled serving cell with the same SS set IDs are also linked.

This parameter is not applicable to search space configured with *dci-FormatsSL* for monitoring format 3-0 or format 3-1 or for monitoring formats 3-0 and format 3-1.

This parameter is not applicable to search space configured with *dci-FormatsSL-PRS* for monitoring format 3-2 or for monitoring formats 3-0 and 3-2 or for monitoring formats 3-0 and 3-1 and 3-2 or for monitoring formats 3-1 and 3-2.

***searchSpaceType***

Indicates whether this is a common search space (present) or a UE specific search space as well as DCI formats to monitor for.

***ue-Specific***

Configures this search space as UE specific search space (USS). The UE monitors the DCI format with CRC scrambled by C-RNTI, CS-RNTI (if configured), and SP-CSI-RNTI (if configured)

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## – *SearchSpaceId*

The IE *SearchSpaceId* is used to identify Search Spaces. The ID space is used across the BWPs of a Serving Cell. The search space with the *SearchSpaceId* = 0 identifies the search space configured via PBCH (MIB) and in *ServingCellConfigCommon* (*searchSpaceZero*). The number of Search Spaces per BWP is limited to 10 including the common and UE specific Search Spaces.

### ***SearchSpaceId* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEID-START

SearchSpaceId ::= INTEGER (0..maxNrofSearchSpaces-1)

-- TAG-SEARCHSPACEID-STOP
-- ASN1STOP
```

## – *SearchSpaceZero*

The IE *SearchSpaceZero* is used to configure SearchSpace#0 of the initial BWP (see TS 38.213 [13], clause 13).

### ***SearchSpaceZero* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEZERO-START
```

```
SearchSpaceZero ::= INTEGER (0..15)
-- TAG-SEARCHSPACEZERO-STOP
-- ASN1STOP
```

## - ***SecurityAlgorithmConfig***

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm and AS ciphering algorithm for SRBs and DRBs.

### ***SecurityAlgorithmConfig* information element**

```
-- ASN1START
-- TAG-SECURITYALGORITHMCONFIG-START

SecurityAlgorithmConfig ::= SEQUENCE {
 cipheringAlgorithm,
 integrityProtAlgorithm
 OPTIONAL, -- Need R
 ...
}

IntegrityProtAlgorithm ::= ENUMERATED {
 nia0, nia1, nia2, nia3, spare4, spare3,
 spare2, spare1, ...}

CipheringAlgorithm ::= ENUMERATED {
 nea0, nea1, nea2, nea3, spare4, spare3,
 spare2, spare1, ...}

-- TAG-SECURITYALGORITHMCONFIG-STOP
-- ASN1STOP
```

| <b><i>SecurityAlgorithmConfig</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cipheringAlgorithm</i></b>                         | Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nea0-nea3</i> are identical to the LTE algorithms <i>eea0-3</i> . The algorithms configured for all bearers using master key shall be the same, and the algorithms configured for all bearers using secondary key, if any, shall be the same. If UE is connected to E-UTRA/EPC, this field indicates the ciphering algorithm to be used for RBs configured with NR PDCP, as specified in TS 33.501 [11].                                                                                                                                                                                                                                                                                                            |
| <b><i>integrityProtAlgorithm</i></b>                     | Indicates the integrity protection algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nia0-nia3</i> are identical to the E-UTRA algorithms <i>eia0-3</i> . The algorithms configured for all bearers using master key shall be the same and the algorithms configured for all bearers using secondary key, if any, shall be the same. The network does not configure <i>nia0</i> except for unauthenticated emergency sessions for unauthenticated UEs in LSM (limited service mode). If UE is connected to E-UTRA/EPC, this field indicates the integrity protection algorithm to be used for SRBs configured with NR PDCP as specified in TS 33.501 [11], and DRBs configured with integrity protection as specified in TS 33.401 [30]. The network does not configure <i>nia0</i> for SRB3. |

- ***SelectedPSCellForCHO-WithSCG***

The IE *SelectedPSCellForCHO-WithSCG* is used to indicate the information of the selected target PSCell to target MN at execution of a conditional reconfiguration for CHO with candidate SCG(s).

#### ***SelectedPSCellForCHO-WithSCG* information element**

```
-- ASN1START
-- TAG-SELECTEDPSCELLFORCHO-WITHSCG-START

SelectedPSCellForCHO-WithSCG-r18 ::= SEQUENCE {
 ssbFrequency-r18 ARFCN-ValueNR,
 physCellId-r18 PhysCellId
}

-- TAG-SELECTEDPSCELLFORCHO-WITHSCG-STOP
-- ASN1STOP
```

- ***SemiStaticChannelAccessConfig***

The IE *SemiStaticChannelAccessConfig* is used to configure channel access parameters when the network is operating in semi-static channel access mode (see clause 4.3 in TS 37.213 [48]).

#### ***SemiStaticChannelAccessConfig* information element**

```
-- ASN1START
-- TAG-SEMISTATICCHANNELACCESSCONFIG-START

SemiStaticChannelAccessConfig-r16 ::= SEQUENCE {
 period-r16 ENUMERATED {ms1, ms2, ms2dot5, ms4, ms5, ms10}
}

-- TAG-SEMISTATICCHANNELACCESSCONFIG-STOP

|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>periodUE</i></b>                                           | Indicates the period of a channel occupancy that the UE can initiate as described in TS 37.213 [48], clause 4.3. Value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, value ms2dot5 corresponds to 2.5 ms, and so on.                                                                                                                                                                                                                                                                                |
| <b><i>offsetUE</i></b>                                           | Indicates the number of symbols from the beginning of the even indexed radio frame to the start of the first period within that radio frame that the UE can initiate a channel occupancy (see TS 37.213 [48], clause 4.3), based on the smallest SCS among the configured SCSs in the serving cell. The offset duration indicated by this field is less than the period duration indicated by <i>periodUE</i> . The maximum value is 139, 279 and 559 for 15, 30 and 60 kHz subcarrier spacing, respectively. |

***Sensor-LocationInfo***

The IE *Sensor-LocationInfo* is used by the UE to provide sensor information.

***Sensor-LocationInfo* information element**

```
-- ASN1START
-- TAG-SENSORLOCATIONINFO-START

Sensor-LocationInfo-r16 ::= SEQUENCE {
 sensor-MeasurementInformation-r16 OCTET STRING OPTIONAL,
 sensor-MotionInformation-r16 OCTET STRING OPTIONAL,
 ...
}

-- TAG-SENSORLOCATIONINFO-STOP
-- ASN1STOP
```

| <b>Sensor-LocationInfo field descriptions</b> |                                                                                                                                                                                                      |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sensor-MeasurementInformation</b>          | This field provides barometric pressure measurements as <i>Sensor-MeasurementInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. |
| <b>sensor-MotionInformation</b>               | This field provides motion sensor measurements as <i>Sensor-MotionInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.            |

- *ServingCellAndBWP-Id*

The IE *ServingCellAndBWP-Id* is used to indicate a serving cell and an uplink or a downlink BWP.

#### ***ServingCellAndBWP-Id* information element**

```
-- ASN1START
-- TAG-SERVINGCELLANDBWP-ID-START

ServingCellAndBWP-Id-r17 ::= SEQUENCE {
 servingcell-r17 ServCellIndex,
 bwp-r17 BWP-Id
}

-- TAG-SERVINGCELLANDBWP-ID-STOP
-- ASN1STOP
```

- *ServCellIndex*

The IE *ServCellIndex* concerns a short identity, used to uniquely identify a serving cell (i.e. the PCell, the PSCell or an SCell) across the cell groups. Value 0 applies for the PCell, while the *SCellIndex* that has previously been assigned applies for SCells.

#### ***ServCellIndex* information element**

```
-- ASN1START
-- TAG-SERVCELLINDEX-START

ServCellIndex ::= INTEGER (0 .. maxNrofServingCells -1)

-- TAG-SERVCELLINDEX-STOP
-- ASN1STOP
```

## — *ServingCellConfig*

The IE *ServingCellConfig* is used to configure (add or modify) the UE with a serving cell, which may be the SpCell or an SCell of an MCG or SCG. The parameters herein are mostly UE specific but partly also cell specific (e.g. in additionally configured bandwidth parts). Reconfiguration between a PUCCH and PUCCHless SCell is only supported using an SCell release and add.

|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absenceOfAnyOtherTechnology</i></b>            | Presence of this field indicates absence on a long term basis (e.g. by level of regulation) of any other technology sharing the carrier; absence of this field indicates the potential presence of any other technology sharing the carrier, as specified in TS 37.213 [48] clauses 4.2.1 and 4.2.3.    |
| <b><i>energyDetectionConfig</i></b>                  | Indicates whether to use the <i>maxEnergyDetectionThreshold</i> or the <i>energyDetectionThresholdOffset</i> (see TS 37.213 [48], clause 4.2.3).                                                                                                                                                        |
| <b><i>energyDetectionThresholdOffset</i></b>         | Indicates the offset to the default maximum energy detection threshold value. Unit in dB. Value -13 corresponds to -13dB, value -12 corresponds to -12dB, and so on (i.e. in steps of 1dB) as specified in TS 37.213 [48], clause 4.2.3.                                                                |
| <b><i>maxEnergyDetectionThreshold</i></b>            | Indicates the absolute maximum energy detection threshold value. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm) as specified in TS 37.213 [48], clause 4.2.3.                                                                       |
| <b><i>ul-toDL-COT-SharingED-Threshold</i></b>        | Maximum energy detection threshold that the UE should use to share channel occupancy with gNB for DL transmission as specified in TS 37.213 [48], clause 4.1.3 for downlink channel access and clause 4.2.3 for uplink channel access. This field is not applicable in semi-static channel access mode. |

| <b>additionalTDDConfig-perPCIToAddModList</b>                     | List of TDD-UL-DL configurations for the additional PCIs. When the network releases an additional PCI of a serving cell, the network also explicitly releases the associated TDD-UL-DL configuration for the additional PCI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>bwp-InactivityTimer</b>                                        | The duration in ms after which the UE falls back to the default Bandwidth Part (see TS 38.321 [3], clause 5.15). When the network releases the timer configuration, the UE stops the timer without switching to the default BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ca-SlotOffset</b>                                              | Slot offset between the primary cell (PCell/PSCell) and the SCell in unaligned frame boundary with slot alignment and partial SFN alignment inter-band CA. Based on this field, the UE determines the time offset of the SCell as specified in clause 4.5 of TS 38.211 [16]. The granularity of this field is determined by the reference SCS for the slot offset (i.e. the maximum of PCell/PSCell lowest SCS among all the configured SCSs in DL/UL SCS-SpecificCarrierList in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> and this serving cell's lowest SCS among all the configured SCSs in DL/UL SCS-SpecificCarrierList in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> ). The Network configures at most single non-zero offset duration in ms (independent on SCS) among CCs in the unaligned CA configuration. If the field is absent, the UE applies the value of 0. The slot offset value can only be changed with SCell release and add. |
| <b>cbg-TxDiffTBsProcessingType1, cbg-TxDiffTBsProcessingType2</b> | Indicates whether processing types 1 and 2 based CBG based operation is enabled according to Rel-16 UE capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cellDTX-DRX-Config</b>                                         | Used to configure cell DTX/DRX for the serving cell, as specified in TS 38.321 [3]. A maximum of two cell DTX/DRX patterns can be configured per MAC entity for different serving cells. The two configured patterns are aligned, that the start and slot offset are common and the periodicity of one pattern is an integer multiple of the other. Cell DTX is configured only when connected mode DRX is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>cellDTX-DRX-L1activation</b>                                   | Indicates whether this serving cell has enabled L1 signaling based on DCI 2_9 for dynamic activation/deactivation of cell DTX/DRX configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>cjt-Scheme-PDSCH</b>                                           | This field is used to configure CJT Tx scheme <i>cjtSchemeA</i> or <i>cjtSchemeB</i> for PDSCH reception, see TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>channelAccessConfig</b>                                        | List of parameters used for access procedures of operation with shared spectrum channel access (see TS 37.213 [48]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>channelAccessMode2</b>                                         | If present, this field indicates that the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE does not apply these channel access procedures. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.<br>Overwrites the corresponding field in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> for this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>crossCarrierSchedulingConfig</b>                               | Indicates whether this serving cell is cross-carrier scheduled by another serving cell or whether it cross-carrier schedules another serving cell. If the field <i>other</i> is configured for an SpCell (i.e., the SpCell is cross-carrier scheduled by another serving cell), the SpCell can be additionally scheduled by the PDCCH on the SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>crossCarrierSchedulingConfigRelease</b>                        | If this field is included, the UE shall release the cross carrier scheduling configuration configured by <i>crossCarrierSchedulingConfig</i> . The network may only include either <i>crossCarrierSchedulingConfigRelease</i> or <i>crossCarrierSchedulingConfig</i> at a time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>crs-RateMatch-PerCORESETPoolIndex</b>                          | Indicates how UE performs rate matching when both <i>Ite-CRS-PatternList1-r16</i> and <i>Ite-CRS-PatternList2-r16</i> are configured or when both <i>Ite-CRS-PatternList3-r18</i> and <i>Ite-CRS-PatternList4-r18</i> are configured as specified in TS 38.214 [19], clause 5.1.4.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-RS-ValidationWithDCI</b>                                   | Indicates how the UE performs periodic and semi-persistent CSI-RS reception in a slot. The presence of this field indicates that the UE uses DCI detection to validate whether to receive CSI-RS (see TS 38.213 [13], clause 11.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| The initial bandwidth part is referred to by BWP-Id = 0. ID of the downlink bandwidth part to be used upon expiry of the BWP inactivity timer. This field is UE specific. When the field is absent the UE uses the initial BWP as default BWP. (see TS 38.213 [13], clause 12 and TS 38.321 [3], clause 5.15).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>directionalCollisionHandling</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD CA with same SCS as specified in TS 38.213 [13], clause 11.1. The half-duplex operation only applies within the same frequency range and cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| The network only configures this field for TDD serving cells that are using the same SCS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>directionalCollisionHandling-DC</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| For the IAB-MT, it indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD NR-DC with same SCS within same cell group or cross different cell groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in <i>scs-SpecificCarrierList</i> in <i>DownlinkConfigCommon</i> / <i>DownlinkConfigCommonSIB</i> . Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is an (e)RedCap UE and needs to autonomously switch to its initial downlink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial downlink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial downlink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active downlink bandwidth part in subsequent bandwidth part switch operations. |

| If configured for an SpCell, this field contains the ID of the DL BWP to be activated or to be used for RLM, BFD and measurements if included in an <i>RRCReconfiguration</i> message contained in an NR or E-UTRA RRC message indicating that the SCG is deactivated, upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch. If the field is absent for the PSCell at SCG deactivation, the UE considers the previously activated DL BWP as the BWP to be used for RLM, BFD and measurements. If the field is absent for the PSCell at SCG activation, the DL BWP to be activated is the DL BWP previously to be used for RLM, BFD and measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| If configured for an SCell, this field contains the ID of the downlink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by BWP-Id = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Upon reconfiguration with <i>reconfigurationWithSync</i> , the network sets the <i>firstActiveDownlinkBWP-Id</i> and <i>firstActiveUplinkBWP-Id</i> to the same value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

***initialDownlinkBWP***

The dedicated (UE-specific) configuration for the initial downlink bandwidth-part (i.e., DL BWP#0). If any of the optional IEs are configured within this IE, the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1

***intraCellGuardBandsDL-List, intraCellGuardBandsUL-List***

List of intra-cell guard bands in a serving cell for operation with shared spectrum channel access in FR1. If not configured, the guard bands are defined according to 38.101-1 [15], see TS 38.214 [19], clause 7. For operation in licensed spectrum, this field is absent, and no UE action is required.

***Ite-CRS-PatternList1***

A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The network does not configure this field and *Ite-CRS-ToMatchAround* simultaneously.

***Ite-CRS-PatternList2***

A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH scheduled with a DCI detected on a CORESET with CORESETPoolIndex configured with 1. This list is configured only if CORESETPoolIndex configured with 1. The first LTE CRS pattern in this list shall be fully overlapping in frequency with the first LTE CRS pattern in *Ite-CRS-PatternList1*, The second LTE CRS pattern in this list shall be fully overlapping in frequency with the second LTE CRS pattern in *Ite-CRS-PatternList1*, and so on. Network configures this field only if the field *Ite-CRS-ToMatchAround* is not configured and there is at least one ControlResourceSet in one DL BWP of this serving cell with *coresetPoolIndex* set to 1.

***Ite-CRS-PatternList3***

A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The network does not configure this field and *Ite-CRS-ToMatchAround*, or this field and *Ite-CRS-PatternList1*, or this field and *Ite-CRS-PatternList2* simultaneously.

***Ite-CRS-PatternList4***

A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The first LTE CRS pattern in this list shall be fully overlapping in frequency with the first LTE CRS pattern in *Ite-CRS-PatternList3*. The second LTE CRS pattern in this list shall be fully overlapping in frequency with the second LTE CRS pattern in *Ite-CRS-PatternList3*, and so on. Network configures this field only if the field *Ite-CRS-ToMatchAround* is not configured and the field *Ite-CRS-PatternList3* is configured.

***Ite-CRS-ToMatchAround***

Parameters to determine an LTE CRS pattern that the UE shall rate match around.

***Ite-NeighCellsCRS-AssistInfoList***

A list of LTE neighbour cells configuration information which is used to assist the UE to perform CRS interference mitigation (CRS-IM) in scenarios with overlapping spectrum for LTE and NR (see TS 38.101-4 [59]). If the field is included, it replaces any previous list, i.e. all the entries of the list are replaced and each of the *LTE-NeighCellsCRS-AssistInfo* entries is considered to be newly created and the conditions and Need codes for setup of the entry apply.

***Ite-NeighCellsCRS-Assumptions***

If the field is not configured, the following default network configuration assumptions are valid for all LTE neighbour cells for the purpose of CRS interference mitigation (CRS-IM) in scenarios with overlapping spectrum for LTE and NR (see TS 38.101-4 [59]).

- The CRS port number is the same as the one indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell.
- The CRS port number is 4 if *RateMatchPatternLTE-CRS* is not configured for the serving cell.
- The channel bandwidth and centre frequency are the same as the ones indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell.
- The MBSFN configuration is the same as the one indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell. If *RateMatchPatternLTE-CRS* is not configured for the serving cell, MBSFN subframe is not configured.
- Network-based CRS interference mitigation (i.e., CRS muting), as in *crs-IntfMitigConfig* specified in TS 36.331 [10], is not enabled.

If the field is configured (i.e. false) and *LTE-NeighCellsCRS-AssistInfoList* is configured, the configuration provided in *LTE-NeighCellsCRS-AssistInfoList* overrides the default network configuration assumptions.

If the field is configured (i.e. false) and *LTE-NeighCellsCRS-AssistInfoList* is not configured, it is up to the UE implementation whether to apply CRS-IM operation.

***mc-DCI-SetOfCellsToAddModList***

List of up to N (N<=4) configurations of set(s) of cells for multi-cell PDSCH/PUSCH scheduling from the serving cell, where N is reported as UE capability and up to 4 sets of cells can be configured per PUCCH group. When this field is configured to a SCell, PCell cannot be included in either *ScheduledCellListDCI-1-3* or *ScheduledCellListDCI-0-3*.

***mc-DCI-SetOfCellsToReleaseList***

List of cell set configurations to release.

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>multiPDSCH-PerSlotType1-CB</i></b>              | Configures the UE behaviour for Type1 codebook HARQ ACK generation regarding the number of PDSCHs per slot on a serving cell as specified in TS 38.213 [13], clause 9.1.2.1.<br>When this parameter is configured and set to <i>disabled</i> for a serving cell, the network does not schedule UE with more than one PDSCH in a slot on the serving cell if HARQ-ACKs of any two PDSCHs in the slot on the serving cell are supposed to be reported on one PUCCH resource in the same PUCCH slot. If two <i>coresetPoolIndex</i> values are configured, the number of received PDSCHs is per <i>coresetPoolIndex</i> value per slot for a serving cell. If the UE generates two HARQ-ACK codebooks for two priorities, the number of received PDSCHs is per priority per slot for a serving cell. If <i>fdmed-ReceptionMulticast</i> is configured, the number of received PDSCHs is per traffic type (unicast / multicast) per slot for a serving cell. |
| <b><i>nr-dL-PRS-PDC-Info</i></b>                      | Configures the DL PRS for propagation delay compensation. When configured, the UE measures the UE Rx-Tx time difference based on the reference signals configured in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>nrofHARQ-BundlingGroups</i></b>                 | Indicates the number of HARQ bundling groups for type2 HARQ-ACK codebook.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>pathlossReferenceLinking</i></b>                | Indicates whether UE shall apply as pathloss reference either the downlink of SpCell (PCell for MCG or PSCell for SCG) or of SCell that corresponds with this uplink (see TS 38.213 [13], clause 7).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>pdcch-CandidateReceptionWithCRS-Overlap</i></b> | Presence of this field indicates the UE shall monitor PDCCH candidates that overlap with LTE CRS RE(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>pdsch-ServingCellConfig</i></b>                 | PDSCH related parameters that are not BWP-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>positionInDCI-cellIDTRX</i></b>                 | The starting bit position of an information block of DCI format 2_9 for this serving cell (see TS 38.212 [17], clause 7.3.1.3.10).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>rateMatchPatternToAddModList</i></b>            | Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology. See TS 38.214 [19], clause 5.1.4.1. If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration shall be the same, including the set of RBs/REs indicated by the patterns for the rate matching around, and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].                                                                                                                                                                                                         |
| <b><i>sCellDeactivationTimer</i></b>                  | SCell deactivation timer in TS 38.321 [3]. If the field is absent, the UE applies the value infinity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>sfnSchemePDCCH</i></b>                          | This parameter is used to configure single frequency network scheme for PDCCH: sfnSchemeA or sfnSchemeB as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>sfnSchemePDSCH</i></b>                          | This parameter is used to configure single frequency network scheme for PDSCH: sfnSchemeA or sfnSchemeB as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured. The network does not configure this parameter and <i>repetitionSchemeConfig</i> in <i>PDSCH-Config</i> simultaneously in the same serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>semiStaticChannelAccessConfigUE</i></b>         | When this field is configured and when <i>channelAccessMode-r16</i> (see IE <i>ServingCellConfigCommon</i> and IE <i>ServingCellConfigCommonSIB</i> ) is configured to <i>semiStatic</i> , the UE operates in semi-static channel access mode and can initiate a channel occupancy periodically (see TS 37.213 [48], Clause 4.3).<br>The period can be configured independently from period configured in <i>SemiStaticChannelAccessConfig-r16</i> if the UE indicates the corresponding capability. Otherwise, the periodicity configured by <i>periodUE-r17</i> is an integer multiple of or an integer factor of the periodicity indicated by <i>period</i> in <i>SemiStaticChannelAccessConfig-r16</i> .                                                                                                                                                                                                                                             |

***servingCellIMO***

*measObjectId* of the *MeasObjectNR* in *MeasConfig* which is associated to the serving cell. If the serving cell is associated with SSB, the following relationship applies between the corresponding *MeasObjectNR* and *frequencyInfoDL* in *ServingCellConfigCommon/ServingCellConfigCommonSIB* of the serving cell: if *ssbFrequency* is configured, its value is the same as the *absoluteFrequencySSB* and if *csi-rs-ResourceConfigMobility* is configured, the value of its *subcarrierSpacing* is present in one entry of the *scs-SpecificCarrierList*, *csi-RS-CellListMobility* includes an entry corresponding to the serving cell (with *cellId* equal to *physCellId* in *ServingCellConfigCommon*) and the frequency range indicated by the *csi-rs-MeasurementBW* of the entry in *csi-RS-CellListMobility* is included in the frequency range indicated by in the entry of the *scs-SpecificCarrierList*. If the serving cell is not associated with SSB (i.e. SSB-less SCell), the carrier frequency indicated by *ssbFrequency* of the corresponding *MeasObjectNR*, if configured, is within the frequency range indicated by any entry of the *scs-SpecificCarrierList*.

***supplementaryUplink***

Network may configure this field only when *supplementaryUplinkConfig* is configured in *ServingCellConfigCommon* or *supplementaryUplink* is configured in *ServingCellConfigCommonSIB*.

***supplementaryUplinkRelease***

If this field is included, the UE shall release the uplink configuration configured by *supplementaryUplink*. The network only includes either *supplementaryUplinkRelease* or *supplementaryUplink* at a time.

***tag1d***

Timing Advance Group ID, as specified in TS 38.321 [3], which this cell or set of TCI-States of this cell are associated with.

***tag2***

This field is used to indicate the second TAG information for the serving cell, it is optionally configured in a serving cell if and only if the serving cell is configured with more than one value for the *coresetPoolIndex*.

***tci-ActivatedConfig***

If configured for an SCell, or if configured for the PSCell when the SCG is being activated upon the reception of the containing message, the UE shall consider the TCI states provided in this field as the activated TCI states for PDCCH/PDSCH reception on this serving cell.

If configured for the PSCell when the SCG is indicated as deactivated in the containing message:

- the UE shall consider the TCI states provided in this field as the TCI states to be activated for PDCCH/PDSCH reception upon a later SCG activation in which *tci-ActivatedConfig* is absent

- if *bfd-and-RLM* is configured and no RS is configured in *RadioLinkMonitoringConfig* for RLM, respectively for BFD, the UE shall use the TCI states provided in this field for PDCCH as RS for RLM, respectively for BFD.

When this field is absent for the PSCell and the SCG is being deactivated:

- the UE shall consider the previously activated TCI states as the TCI states to be activated for PDCCH/PDSCH reception upon a later SCG activation in which *tci-ActivatedConfig* is absent

- if *bfd-and-RLM* is configured and no RS is configured in *RadioLinkMonitoringConfig* for RLM, respectively for BFD, the UE shall use the previously activated TCI states for PDCCH as RS for RLM, respectively for BFD.

***tdd-UL-DL-ConfigurationDedicated-IAB-MT***

Resource configuration per IAB-MT D/U/F overrides all symbols (with a limitation that effectively only flexible symbols can be overwritten in Rel-16) per slot over the number of slots as provided by *TDD-UL-DL ConfigurationCommon*.

***unifiedTCI-StateType***

Indicates the unified TCI state type the UE is configured for this serving cell. The value *separate* means this serving cell is configured with *dl-OrJointTCI-StateList* for DL TCI state and *ul-TCI-StateList* for UL TCI state. The value *joint* means this serving cell is configured with *dl-OrJointTCI-StateList* for joint TCI state for UL and DL operation.

***uplinkConfig***

Network may configure this field only when *uplinkConfigCommon* is configured in *ServingCellConfigCommon* or *ServingCellConfigCommonSIB*. Addition or release of this field can only be done upon SCell addition or release (respectively).

***uplink-PowerControlToAddModList***

Configures UL power control parameters for PUSCH, PUCCH and SRS when field *unifiedTCI-StateType* is configured for this serving cell.

| <b>Tag2 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>n-TimingAdvanceOffset2</b>  | The <i>N_TA-Offset2</i> to be applied for PDCCH order CFRA towards the active <i>additionalPCI</i> as specified in TS 38.133 [14] clause 7.1.1 and for all uplink transmissions on this serving cell associated to <i>tag2</i> as specified in TS 38.213 [13] clause 4.2. This field is always present if <i>SSB-MTC-AdditionalPCI</i> is configured. It is absent otherwise. If absent, the <i>N_TA-Offset</i> is applied for all uplink transmissions on this serving cell associated to <i>tag2</i> . |
| <b>tag2-flag</b>               | If this field is set to true, the <i>tag2-Id</i> is associated to value 0 and <i>tag-Id</i> is associated to value 1 of field TI bit in RAR, fallbackRAR and in the absolute TAC MAC CE, see TS 38.321 [3]. Otherwise, the <i>tag2-Id</i> is associated to value 1 and <i>tag-Id</i> is associated to value 0 of field TI bit in RAR, fallbackRAR and in the absolute TAC MAC CE, see TS 38.321 [3].                                                                                                     |
| <b>tag2-Id</b>                 | Timing Advance Group ID, as specified in TS 38.321 [3], which this cell or set of TCI-States of this cell are associated with.                                                                                                                                                                                                                                                                                                                                                                           |

| <b><i>UplinkConfig</i></b> field descriptions                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>carrierSwitching</i></b>                                                                          | Includes parameters for configuration of carrier based SRS switching (see TS 38.214 [19], clause 6.2.1.3).                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>enableDefaultBeamPL-ForPUSCH0-0, enableDefaultBeamPL-ForPUCCH, enableDefaultBeamPL-ForSRS</i></b> | When the parameter is present, UE derives the spatial relation and the corresponding pathloss reference Rs as specified in 38.213, clauses 7.1.1, 7.2.1, 7.3.1 and 9.2.2. The network only configures these parameters for FR2.                                                                                                                                                                                                                                                                     |
| <b><i>enablePL-RS-UpdateForPUSCH-SRS</i></b>                                                            | When this parameter is present, the Rel-16 feature of MAC CE based pathloss RS updates for PUSCH/SRS is enabled. Network only configures this parameter when the UE is configured with <i>sri-PUSCH-PowerControl</i> . If this field is not configured, network configures at most 4 pathloss RS resources for PUSCH/PUCCH/SRS transmissions per BWP, not including pathloss RS resources for SRS transmissions for positioning. (See TS 38.213 [13], clause 7).                                    |
| <b><i>enablePL-RS-UpdateForType1CG-PUSCH</i></b>                                                        | When this parameter is present, the Rel-18 feature of MAC CE based pathloss RS updates for Type 1 CG-PUSCH is enabled. The network only configures this parameter, when the parameter <i>enablePL-RS-UpdateForPUSCH-SRS</i> is configured. (See TS 38.213 [13], clause 7).                                                                                                                                                                                                                          |
| <b><i>firstActiveUplinkBWP-Id</i></b>                                                                   | If configured for an SpCell, this field contains the ID of the UL BWP to be activated upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch.<br>If configured for an SCell, this field contains the ID of the uplink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by <i>BandwidthPartId</i> = 0.                                                                          |
| <b><i>initialUplinkBWP</i></b>                                                                          | The dedicated (UE-specific) configuration for the initial uplink bandwidth-part (i.e. UL BWP#0). If any of the optional IEs are configured within this IE as part of the IE <i>uplinkConfig</i> , the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1 |
| <b><i>moreThanOneNackOnlyMode</i></b>                                                                   | Indicates the mode of NACK-only feedback in the PUCCH transmission, as specified in TS 38.213 [13], clause 18. If multicast CFR is not configured, this field is not included. Otherwise, if the field is absent, UE uses mode 1 for multicast CFR.                                                                                                                                                                                                                                                 |
| <b><i>mpr-PowerBoost-FR2</i></b>                                                                        | Indicates whether UE is allowed to boost uplink transmission power by suspending in-band emission (IBE) requirements as specified in TS 38.101-2 [39]. Network only configures this field for FR2 serving cells.                                                                                                                                                                                                                                                                                    |
| <b><i>powerBoostPi2BPSK</i></b>                                                                         | If this field is set to <i>true</i> , the UE determines the maximum output power for PUCCH/PUSCH transmissions that use pi/2 BPSK modulation according to TS 38.101-1 [15] /TS 38.101-5 [75], clause 6.2.4. The network ensures that <i>powerBoostPi2BPSK</i> and <i>powerBoostPi2BPSK-r18</i> are not configured at the same time for a UE.                                                                                                                                                        |
| <b><i>powerBoostQPSK</i></b>                                                                            | If this field is set to <i>true</i> , the UE determines the maximum output power for PUSCH transmissions that use QPSK modulation according to TS 38.101-1 [15], clause 6.2.4.                                                                                                                                                                                                                                                                                                                      |
| <b><i>pusch-ServingCellConfig</i></b>                                                                   | PUSCH related parameters that are not BWP-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>srs-PosTx-Hopping</i></b>                                                                         | Contains configuration related to the SRS for Positioning with frequency hopping for RRC_CONNECTED state.                                                                                                                                                                                                                                                                                                                                                                                           |

In case of TDD uplink- and downlink BWP with the same <i>bandwidthPartId</i> are considered as a BWP pair and must have the same center frequency.                                                                                                                                                                                                                                                                               |
| <b><i>uplinkBWP-ToReleaseList</i></b>                                                                   | The additional bandwidth parts for uplink to be released.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

***uplinkChannelBW-PerSCS-List***

A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in *scs-SpecificCarrierList* in *UplinkConfigCommon* / *UplinkConfigCommonSIB*. Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is an (e)RedCap UE and needs to autonomously switch to its initial uplink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial uplink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial uplink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active uplink bandwidth part in subsequent bandwidth part switch operations.

***uplinkTxSwitchingPeriodLocation***

Indicates whether the location of UL Tx switching period is configured in this uplink carrier in case of inter-band UL CA, SUL, or (NG)EN-DC, as specified in TS 38.101-1 [15] and TS 38.101-3 [34].

In case of (NG)EN-DC, network always configures this field to TRUE for NR carrier (i.e. with (NG)EN-DC, the UL switching period always occurs on the NR carrier).

In case of inter-band UL CA or SUL, for dynamic uplink Tx switching between 2 bands with 2 uplink carriers or 3 uplink carriers as defined in TS 38.101-1 [15], network configures this field to TRUE for the uplink carrier(s) on one band and configures this field to FALSE for the uplink carrier(s) on the other band. This field is set to the same value for the carriers on the same band.

***uplinkTxSwitchingCarrier***

Indicates that the configured carrier is carrier1 or carrier2 for dynamic uplink Tx switching, as defined in TS 38.101-1 [15] and TS 38.101-3 [34]. In case of (NG)EN-DC, network always configures the NR carrier as carrier 2.

In case of inter-band UL CA or SUL, for dynamic uplink Tx switching between 2 bands with 2 uplink carriers or 3 uplink carriers as defined in TS 38.101-1 [15], network configures the uplink carrier(s) on one band as carrier1 and the uplink carrier(s) on the other band as carrier2. This field is set to the same value for the carriers on the same band.

**DormantBWP-Config field descriptions*****dormancyGroupWithinActiveTime***

This field contains the ID of an SCell group for Dormancy within active time, to which this SCell belongs. The use of the Dormancy within active time for SCell groups is specified in TS 38.213 [13].

***dormancyGroupOutsideActiveTime***

This field contains the ID of an SCell group for Dormancy outside active time, to which this SCell belongs. The use of the Dormancy outside active time for SCell groups is specified in TS 38.213 [13].

***dormantBWP-Id***

This field contains the ID of the downlink bandwidth part to be used as dormant BWP. If this field is configured, its value is different from *defaultDownlinkBWP-Id*, and at least one of the *withinActiveTimeConfig* and *outsideActiveTimeConfig* should be configured.

***firstOutsideActiveTimeBWP-Id***

This field contains the ID of the downlink bandwidth part to be activated when receiving a DCI indication for SCell dormancy outside active time.

***firstWithinActiveTimeBWP-Id***

This field contains the ID of the downlink bandwidth part to be activated when receiving a DCI indication for SCell dormancy within active time.

***outsideActiveTimeConfig***

This field contains the configuration to be used for SCell dormancy outside active time, as specified in TS 38.213 [13]. The field can only be configured when the cell group the SCell belongs to is configured with *dcp-Config*.

***withinActiveTimeConfig***

This field contains the configuration to be used for SCell dormancy within active time, as specified in TS 38.213 [13].

| <i>GuardBand</i> field descriptions |                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------|
| <b><i>startCRB</i></b>              | Indicates the starting RB of the guard band.                                                |
| <b><i>nrofCRB</i></b>               | Indicates the length of the guard band in RBs. When set to 0, zero-size guard band is used. |

| <b><i>tpmi-DCI0-3</i></b>          | Configure the indication type for precoding information and number of layers field in DCI format 0_3 (See TS 38.212 [17], clause 7.3.1.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>ZP-CSI-DCI-1-3</i></b>       | Configure each row of the joint ZP-CSI-RS trigger table for DL scheduling via DCI format 1_3, where index for a cell points to a corresponding ZP-CSI-RS trigger applicable for DCI format 1_1, and the order of ZP-CSI-RS trigger index in each row refers the order of cells in <i>scheduledCellListDCI-1-3</i> (i.e., first index is for the first cell in <i>scheduledCellListDCI-1-3</i> , that are configured with aperiodic-ZP-CSI-RS-ResourceSetsToAddModList on at least one DL BWP and so on), the number of entries in a row of <i>ZP-CSI-DCI-1-3</i> should be the same as the number of cells, that are configured with aperiodic-ZP-CSI-RS-ResourceSetsToAddModList on at least one DL BWP, included in <i>scheduledCellListDCI-1-3</i> , and entries for co-scheduled cells in a row of <i>ZP-CSI-DCI-1-3</i> are interpreted based on the BWPs of co-scheduled cells on which the UE operates based on the BWP indicator field of DCI format 1_3 (see TS 38.212 [17], clause 7.3.1.2.4 and TS 38.213 [13], clause 12). |
| <b><i>zp-CSI-RSListDCI-1-3</i></b> | Configure joint ZP-CSI-RS trigger table for DL scheduling via DCI format 1_3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

NOTE 1: If the dedicated part of initial UL/DL BWP configuration is absent, the initial BWP can be used but with some limitations. For example, changing to another BWP requires *RRCReconfiguration* since DCI format 1\_0 doesn't support DCI-based switching.

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>2TA-TDD-Only</i>            | The field is optionally present, Need N, for a TDD cell, in the <i>mimoParam-v1850</i> if <i>additionalPCI-ToAddModList</i> is present in <i>ServingCellConfig</i> and if <i>tag2</i> is present in <i>ServingCellConfig</i> . It is absent otherwise.                                                                                                                          |
| <i>AsyncCA</i>                 | This field is mandatory present for SCells whose slot offset between the SpCell is not 0. Otherwise it is absent, Need S.                                                                                                                                                                                                                                                       |
| <i>MeasObject</i>              | This field is mandatory present for the SpCell if the UE has a <i>measConfig</i> , and it is optionally present, Need M, for SCells. For (e)RedCap UEs, this field is optionally present, Need M. For SSB-less SCell(s), this field is not present if <i>intraF-NeighMeasForSCellWithoutSSB</i> is not supported by the UE, otherwise this field is optionally present, Need M. |
| <i>SCellOnly</i>               | This field is optionally present, Need R, for SCells. It is absent otherwise.                                                                                                                                                                                                                                                                                                   |
| <i>ServingCellWithoutPUCCH</i> | This field is optionally present, Need S, for SCells except PUCCH SCells. It is absent otherwise.                                                                                                                                                                                                                                                                               |
| <i>SyncAndCellAdd</i>          | This field is mandatory present for a SpCell upon reconfiguration with <i>reconfigurationWithSync</i> and upon <i>RRCSetup/RRCResume</i> . The field is optionally present for an SpCell, Need N, upon reconfiguration without <i>reconfigurationWithSync</i> . The field is mandatory present for an SCell upon addition, and absent for SCell in other cases, Need M.         |
| <i>TCI_ActivatedConfig</i>     | This field is optional Need N for SCells if <i>sCellState</i> is configured, otherwise it is absent. This field is optional Need S for the PSCell when the SCG is indicated as deactivated or is being activated, otherwise it is absent. This field is absent for the PCell.                                                                                                   |
| <i>TDD</i>                     | This field is optionally present, Need R, for TDD cells. It is absent otherwise.                                                                                                                                                                                                                                                                                                |
| <i>TDD_IAB</i>                 | For IAB-MT, this field is optionally present, Need R, for TDD cells. It is absent otherwise.                                                                                                                                                                                                                                                                                    |
| <i>TypeDCI0-3</i>              | This field is mandatory present if <i>ScheduledCellListDCI-0-3</i> is configured, otherwise it is absent, Need R.                                                                                                                                                                                                                                                               |
| <i>TypeDCI1-3</i>              | This field is mandatory present if <i>ScheduledCellListDCI-1-3</i> is configured, otherwise it is absent, Need R.                                                                                                                                                                                                                                                               |

- *ServingCellConfigCommon*

The IE *ServingCellConfigCommon* is used to configure cell specific parameters of a UE's serving cell. The IE contains parameters which a UE would typically acquire from SSB, MIB or SIBs when accessing the cell from IDLE. With this IE, the network provides this information in dedicated signalling when configuring a UE with a SCells or with an additional cell group (SCG). It also provides it for SpCells (MCG and SCG) upon reconfiguration with sync.

| <b>ServingCellConfigCommon field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessMode</b>                          | If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                          |
| <b>channelAccessMode2</b>                         | If present, the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>dmrs-TypeA-Position</b>                        | Position of (first) DM-RS for downlink (see TS 38.211 [16], clause 7.4.1.1.1) and uplink (TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>downlinkConfigCommon</b>                       | The common downlink configuration of the serving cell, including the frequency information configuration and the initial downlink BWP common configuration. The parameters provided herein should match the parameters configured by MIB and SIB1 (if provided) of the serving cell, with the exception of <i>controlResourceSetZero</i> and <i>searchSpaceZero</i> which can be configured in <i>ServingCellConfigCommon</i> even if MIB indicates that they are absent.                                                                                                                                                                                                                                                                         |
| <b>discoveryBurstWindowLength</b>                 | Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-r17</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>featurePriorities</b>                          | Indicates priorities for features, such as (e)RedCap, Slicing, SDT, MSG1-Repetitions, and MSG3-Repetitions for Coverage Enhancements. These priorities are used to determine which <i>FeatureCombinationPreambles</i> the UE shall use when a feature maps to more than one <i>FeatureCombinationPreambles</i> , as specified in TS 38.321 [3]. A lower value means a higher priority. The network does not signal the same priority for more than one feature. The network signals a priority for all feature that map to at least one <i>FeatureCombinationPreambles</i> .                                                                                                                                                                      |
| <b>longBitmap</b>                                 | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>lte-CRS-ToMatchAround</b>                      | Parameters to determine an LTE CRS pattern that the UE shall rate match around.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>mediumBitmap</b>                               | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>n-TimingAdvanceOffset</b>                      | The N_TA-Offset to be applied for all uplink transmissions on this serving cell if <i>n-TimingAdvanceOffset2</i> is not configured. If <i>tag2</i> is configured for this serving cell, this field is to be applied to all uplink transmissions associated to <i>tag-id</i> configured for this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2/table 7.1C.2-4.                                                                                                                                                                                                                                                            |
| <b>ra-ChannelAccess</b>                           | If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>rateMatchPatternToAddModList</b>               | Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology (see TS 38.214 [19], clause 5.1.4.1). If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19]. |
| <b>shortBitmap</b>                                | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ss-PBCH-BlockPower</b>                         | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ssb-periodicityServingCell</b>                 | The SSB periodicity in ms for the rate matching purpose. If the field is absent, the UE applies the value ms5. (see TS 38.213 [13], clause 4.1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>ssb-PositionQCL</b>               | Indicates the QCL relation between SSB positions for this serving cell as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ssb-PositionsInBurst</b>          | <p>For operation in licensed spectrum, indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i>.</p> <p>For operation with shared spectrum channel access, the UE assumes that one or more SS/PBCH blocks indicated by <i>ssb-PositionsInBurst</i> may be transmitted within the discovery burst transmission window and have candidate SS/PBCH blocks indexes corresponding to SS/PBCH block indexes provided by <i>ssb-PositionsInBurst</i> (see TS 38.213 [13], clause 4.1). If the k-th bit of <i>ssb-PositionsInBurst</i> is set to 1, the UE assumes that one or more SS/PBCH blocks within the discovery burst transmission window with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k – 1 may be transmitted; if the kt-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k &gt; <i>ssb-PositionQCL</i> and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i>. For operation with shared spectrum channel access in FR1, only <i>mediumBitmap</i> is used, and for FR2-2, <i>longBitmap</i> is used.</p> |
| <b>ssbSubcarrierSpacing</b>          | Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>supplementaryUplinkConfig</b>     | The network configures this field only if <i>uplinkConfigCommon</i> is configured. If this field is absent, the UE shall release the <i>supplementaryUplinkConfig</i> and the <i>supplementaryUplink</i> configured in <i>ServingCellConfig</i> of this serving cell, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>tdd-UL-DL-ConfigurationCommon</b> | A cell-specific TDD UL/DL configuration, see TS 38.213 [13], clause 11.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Conditional Presence        | Explanation                                                                                                                                                                                            |

|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessMode</b>                             | If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>channelAccessMode2</b>                            | If present, this field indicates that the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>discoveryBurstWindowLength</b>                    | Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-v1700</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>enhancedMeasurementNGSO</b>                       | If the field is present and UE supports the enhanced cell reselection requirements for NTN NGSO in RRC_IDLE/RRC_INACTIVE, the UE shall apply the enhanced cell reselection requirements for NTN NGSO as specified in TS 38.133 [14], clauses 4.2C.2.3 and 4.2C.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>groupPresence</b>                                 | This field is present when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to the SS/PBCH index 0-7, the second bit corresponds to SS/PBCH block 8-15, and so on. Value 0 in the bitmap indicates that the SSBs according to <i>inOneGroup</i> are absent. Value 1 indicates that the SS/PBCH blocks are transmitted in accordance with <i>inOneGroup</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>inOneGroup</b>                                    | When maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1, only the 4 leftmost bits are valid; the UE ignores the 4 rightmost bits. When maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1, all 8 bits are valid. The first/ leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. When maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1, all 8 bit are valid; The first/ leftmost bit corresponds to the first SS/PBCH block index in the group (i.e., to SSB index 0, 8, and so on); the second bit corresponds to the second SS/PBCH block index in the group (i.e., to SSB index 1, 9, and so on), and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>n-TimingAdvanceOffset</b>                         | The N_TA-Offset to be applied for random access on this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2/table 7.1C.2-4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ra-ChannelAccess</b>                              | If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ssb-PositionsInBurst</b>                          | Time domain positions of the transmitted SS-blocks in an SS-burst as defined in TS 38.213 [13], clause 4.1.<br>For operation with shared spectrum channel access in FR1, only <i>inOneGroup</i> is used and the UE interprets this field same as <i>mediumBitmap</i> in <i>ServingCellConfigCommon</i> .<br>The UE assumes that a bit in <i>inOneGroup</i> at position $k > N_{SSB}^{QCL}$ is 0, where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, the m-th bit in <i>groupPresence</i> is set to 0 for $m > N_{SSB}^{QCL}/8$ , where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                       |
| <b>ss-PBCH-BlockPower</b>                            | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Conditional Presence   | Explanation                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FR2-Only</i>        | This field is mandatory present for an FR2 carrier frequency. It is absent otherwise and UE releases any configured value.                    |
| <i>SharedSpectrum</i>  | This field is mandatory present if this cell operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.            |
| <i>SharedSpectrum2</i> | This field is optionally present if this cell operates with shared spectrum channel access in FR2-2, Need R. Otherwise, it is absent, Need R. |
| <i>TDD</i>             | The field is optionally present, Need R, for TDD cells; otherwise it is absent.                                                               |

- ***ShortI-RNTI-Value***

The IE *ShortI-RNTI-Value* is used to identify the suspended UE context of a UE in RRC\_INACTIVE using fewer bits compared to I-RNTI-Value.

#### ***ShortI-RNTI-Value* information element**

```
-- ASN1START
-- TAG-SHORTI-RNTI-VALUE-START

ShortI-RNTI-Value ::= BIT STRING (SIZE(24))

-- TAG-SHORTI-RNTI-VALUE-STOP
-- ASN1STOP
```

- ***ShortMAC-I***

The IE *ShortMAC-I* is used to identify and verify the UE at RRC connection re-establishment. The 16 least significant bits of the MAC-I calculated using the AS security configuration of the source PCell, as specified in 5.3.7.4.

#### ***ShortMAC-I* information element**

```
-- ASN1START
-- TAG-SHORTMAC-I-START

ShortMAC-I ::= BIT STRING (SIZE (16))

-- TAG-SHORTMAC-I-STOP
-- ASN1STOP
```

- ***SINR-Range***

The IE *SINR-Range* specifies the value range used in SINR measurements and thresholds. For measurements, integer value for SINR measurements is according to Table 10.1.16.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 46) / 2 dB.

#### ***SINR-Range* information element**

```
-- ASN1START
-- TAG-SINR-RANGE-START

SINR-Range ::= INTEGER(0..127)

-- TAG-SINR-RANGE-STOP
-- ASN1STOP
```

- *SI-RequestConfig*

The IE *SI-RequestConfig* contains configuration for Msg1 based SI request without Msg1 repetition. For the random access parameters (e.g. *prach-RootSequenceIndex*, *msg1-SubcarrierSpacing*, etc.) not configured in *SI-RequestConfig*, the UE applies the parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP unless otherwise specified.

#### ***SI-RequestConfig* information element**

```
-- ASN1START
-- TAG-SI-REQUESTCONFIG-START

SI-RequestConfig ::= SEQUENCE {
 rach-OccasionsSI
 rach-ConfigSI
 ssb-perRACH-Occasion
}
si-RequestPeriod
si-RequestResources
}

SI-RequestResources ::= SEQUENCE {
 ra-PreambleStartIndex
 ra-AssociationPeriodIndex
 ra(ssb)-OccasionMaskIndex
}

-- TAG-SI-REQUESTCONFIG-STOP
-- ASN1STOP
```

```

| <b><i>rach-OccasionsSI</i></b>                    | Configuration of dedicated RACH Occasions for SI. If the field is absent, the UE uses the corresponding parameters configured in <i>rach-ConfigCommon</i> corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>si-RequestPeriod</i></b>                    | Periodicity of the <i>SI-Request</i> configuration in number of association periods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>si-RequestResources</i></b>                 | If there is only one entry in the list, the configuration is used for all SI messages for which <i>si-BroadcastStatus</i> or <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> . Otherwise: <ul style="list-style-type: none"> <li>- If <i>si-SchedulingInfo-v1700</i> is not present and the <i>SI-RequestConfig</i> is used for on-demand SI request in <i>SI-SchedulingInfo</i> or <i>PosSI-SchedulingInfo</i>, the 1<sup>st</sup> entry in the list corresponds to the first SI message in <i>schedulingInfoList</i> or <i>posSchedulingInfoList</i> for which <i>si-BroadcastStatus</i> or <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i>, 2<sup>nd</sup> entry in the list corresponds to the second SI message in <i>schedulingInfoList</i> or <i>posSchedulingInfoList</i> for which <i>si-BroadcastStatus</i> or <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> and so on.</li> <li>- If <i>si-SchedulingInfo-v1700</i> is present and <i>SI-RequestConfig</i> is configured in <i>SI-SchedulingInfo</i> for on-demand SI request, the UE generates a list of concatenated SI messages by appending the SI messages containing type1 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> to the SI messages configured by <i>schedulingInfoList</i> in <i>si-SchedulingInfo</i>. The 1<sup>st</sup> entry in the list corresponds to the first SI message for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i>, 2<sup>nd</sup> entry in the list corresponds to the second SI message for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> and so on.</li> <li>- If <i>si-SchedulingInfo-v1700</i> is present and <i>SI-RequestConfig</i> is configured in <i>PosSI-SchedulingInfo</i> for on-demand SI request, the UE generates a list of concatenated SI messages by appending the SI messages containing type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> to the SI messages configured by <i>posSchedulingInfoList</i> in <i>posSI-SchedulingInfo</i>. The 1<sup>st</sup> entry in the list corresponds to the first SI message for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i>, 2<sup>nd</sup> entry in the list corresponds to the second SI message for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> and so on.</li> </ul> Change of <i>si-RequestResources</i> should not result in system information change notification. |

| <b><i>SI-RequestResources</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ra-AssociationPeriodIndex</i></b>              | Index of the association period in the <i>si-RequestPeriod</i> in which the UE can send the SI request for SI message(s) corresponding to this <i>SI-RequestResources</i> , using the preambles indicated by <i>ra-PreambleStartIndex</i> and rach occasions indicated by <i>ra-ssb-OccasionMaskIndex</i> . |
| <b><i>ra-PreambleStartIndex</i></b>                  | If N SSBs are associated with a RACH occasion, where N >= 1, for the i-th SSB (i=0, ..., N-1) the preamble with preamble index = <i>ra-PreambleStartIndex</i> + i is used for SI request; For N < 1, the preamble with preamble index = <i>ra-PreambleStartIndex</i> is used for SI request.                |

### — *SI-RequestConfigRepetition*

The IE *SI-RequestConfigRepetition* contains configuration for Msg1 based SI request with Msg1 repetition. For the random access parameters (e.g. *prach-RootSequenceIndex*, *msg1-SubcarrierSpacing* and *msg1-RepetitionTimeOffsetROGroup*, etc.) not configured in *SI-RequestConfigRepetition*, the UE applies the parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP unless otherwise specified.

| <b>SchedulingInfo field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>areaScope</b>                         | Indicates that a SIB is area specific. If the field is absent, the SIB is cell specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>si-BroadcastStatus</b>                | Indicates if the SI message is being broadcasted or not. Change of <i>si-BroadcastStatus</i> should not result in system information change notifications in Short Message transmitted with P-RNTI over DCI (see clause 6.5). The value of the indication is valid until the end of the BCCH modification period when set to <i>broadcasting</i> . When <i>SIB19</i> is scheduled in an NTN cell, the <i>si-BroadcastStatus</i> for the mapped <i>SIB19</i> is set to <i>broadcasting</i> . When <i>SIB22</i> is scheduled in an ATG cell, the <i>si-broadcastStatus</i> for the mapped <i>SIB22</i> is set to <i>broadcasting</i> . |
| <b>si-Periodicity</b>                    | Periodicity of the SI-message in radio frames. Value <i>rf8</i> corresponds to 8 radio frames, value <i>rf16</i> corresponds to 16 radio frames, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>SI-SchedulingInfo field descriptions</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dummy</b>                                   | This field is not used in this specification. If received, it is ignored by the UE.                                                                                                                                                                                                                                                                                                                                                    |
| <b>schedulingInfoList, schedulingInfoList2</b> | List of scheduling information for SI messages. If <i>si-SchedulingInfo-v1700</i> is present, the network ensures that the total number of SI messages in the list of concatenated SI messages configured by <i>schedulingInfoList</i> in <i>si-SchedulingInfo</i> and SI messages containing type1 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> does not exceed the limit of <i>maxSI-Message</i> . |
| <b>si-RequestConfig</b>                        | Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                                                                     |
| <b>si-RequestConfigMSG1-Repetition</b>         | Configuration of Msg1 repetition resources on NUL that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                                                                                                                                              |
| <b>si-RequestConfigRedCap</b>                  | Configuration of Msg1 resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                        |
| <b>si-RequestConfigRedCap-MSG1-Repetition</b>  | Configuration of Msg1 repetition resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                                                                                                        |
| <b>si-RequestConfigSUL</b>                     | Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                                                                     |
| <b>si-RequestConfigSUL-MSG1-Repetition</b>     | Configuration of Msg1 repetition resources on SUL that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                                                                                                                                              |
| <b>si-WindowLength</b>                         | The length of the SI scheduling window. Value <i>s5</i> corresponds to 5 slots, value <i>s10</i> corresponds to 10 slots and so on. The network always configures <i>si-WindowLength</i> to be shorter than or equal to the <i>si-Periodicity</i> . The values <i>s2560-v1710</i> and <i>s5120-v1710</i> are only applicable for SCS 480 kHz.                                                                                          |
| <b>systemInformationAreaID</b>                 | Indicates the system information area that the cell belongs to, if any. Any SIB with <i>areaScope</i> within the SI is considered to belong to this <i>systemInformationAreaID</i> . The <i>systemInformationAreaID</i> is unique within a PLMN/SNPN.                                                                                                                                                                                  |

| <b>SchedulingInfo2 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>encrypted</b>                          | The presence of this field indicates that the pos-sib-type is encrypted as specified in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>gnss-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific GNSS. Indicates a specific GNSS (see also TS 37.355 [49])                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>posSibType</b>                         | The posSIBs as defined in TS 37.355 [49] mapped to SI for scheduling using <i>schedulingInfoList2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sbas-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific SBAS. Indicates a specific SBAS (see also TS 37.355 [49]).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>si-WindowPosition</b>                  | This field indicates the SI window position of the associated SI-message. The network provides <i>si-WindowPosition</i> in an ascending order, i.e. <i>si-WindowPosition</i> in the subsequent entry in <i>schedulingInfoList2</i> has always value higher than in the previous entry of <i>schedulingInfoList2</i> . The network configures this field in a way that ensures that SI messages scheduled by <i>schedulingInfoList</i> and/or <i>posSchedulingInfoList</i> do not overlap with SI messages scheduled by <i>schedulingInfoList2</i> . |
| <b>sib-MappingInfo</b>                    | Indicates which SIBs or posSIBs are contained in the SI message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>sibType</b>                            | The type of SIB(s) mapped to SI for scheduling using <i>schedulingInfoList2</i> . Value <i>type1</i> indicates SIBs and value <i>type2</i> indicates posSIBs.                                                                                                                                                                                                                                                                                                                                                                                       |

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GNSS-ID-SBAS</b>  | The field is mandatory present if <i>gnss-id</i> is set to <i>sbas</i> . It is absent otherwise.                                                                                                                                                                                                                                                             |
| <b>MSG-1</b>         | The field is optionally present, Need R, if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.                                                                                      |
| <b>SIB-TYPE</b>      | The field is mandatory present if the SIB type is different from <i>SIB6</i> , <i>SIB7</i> or <i>SIB8</i> . For <i>SIB6</i> , <i>SIB7</i> and <i>SIB8</i> it is absent.                                                                                                                                                                                      |
| <b>NonPosSIB</b>     | The field is mandatory present if the SIB type is <i>type1</i> . For <i>type2</i> it is absent.                                                                                                                                                                                                                                                              |
| <b>SUL-MSG-1</b>     | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise. |
| <b>REDCAP-MSG-1</b>  | The field is optionally present, Need R, if <i>initialUplinkBWP-RedCap</i> is configured in <i>UplinkConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.  |

## — SK-Counter

The IE *SK-Counter* is a counter used upon initial configuration of SN security for NR-DC and NE-DC, as well as upon refresh of  $S-K_{gNB}$  or  $S-K_{eNB}$  based on the current or newly derived  $K_{gNB}$  during RRC Resume or RRC Reconfiguration, as defined in TS 33.501 [11].

-- ASN1START

-- TAG-SKCOUNTER-START

SK-Counter ::= INTEGER (0 .. 65535)

-- TAG-SKCOUNTER-STOP

-- ASN1STOP

- *SlotFormatCombinationsPerCell*

The IE *SlotFormatCombinationsPerCell* is used to configure the SlotFormatCombinations applicable for one serving cell (see TS 38.213 [13], clause 11.1.1).

#### ***SlotFormatCombinationsPerCell* information element**

```
-- ASN1START
-- TAG-SLOTFORMATCOMBINATIONSPERCELL-START

SlotFormatCombinationsPerCell ::= SEQUENCE {
 servingCellId ServCellIndex,
 subcarrierSpacing SubcarrierSpacing,
 subcarrierSpacing2 SubcarrierSpacing
 OPTIONAL, -- Need R
 slotFormatCombinations SEQUENCE (SIZE (1..maxNrofSlotFormatCombinationsPerSet)) OF SlotFormatCombination
 OPTIONAL, -- Need M
 positionInDCI INTEGER(0..maxSFI-DCI-PayloadSize-1)
 OPTIONAL, -- Need M
 ...
 [[
 enableConfiguredUL-r16 ENUMERATED {enabled}
 OPTIONAL -- Need R
]]
}

SlotFormatCombination ::= SEQUENCE {
 slotFormatCombinationId,
 slotFormats
}
SlotFormatCombinationId ::= INTEGER (0..maxNrofSlotFormatCombinationsPerSet-1)

-- TAG-SLOTFORMATCOMBINATIONSPERCELL-STOP
-- ASN1STOP
```

#### ***SlotFormatCombination* field descriptions**

***slotFormatCombinationId***

This ID is used in the DCI payload to dynamically select this *SlotFormatCombination* (see TS 38.213 [13], clause 11.1.1).

***slotFormats***

Slot formats that occur in consecutive slots in time domain order as listed here (see TS 38.213 [13], clause 11.1.1 and TS 38.213 [13], clause 14 for IAB-MT).

| <b><i>SlotFormatCombinationsPerCell</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>enableConfiguredUL</i></b>                               | If configured, the UE is allowed to transmit uplink signals/channels (SRS, PUCCH, CG-PUSCH) in the set of symbols of the slot when the UE does not detect a DCI format 2_0 providing a slot format for the set of symbols (see TS 38.213 [13], 11.1.1). This field is applicable only if <i>cg-RetransmissionTimer-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>positionInDCI</i></b>                                    | The (starting) position (bit) of the slotFormatCombinationId (SFI-Index) for this serving cell (servingCellId) within the DCI payload (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>servingCellId</i></b>                                    | The ID of the serving cell for which the slotFormatCombinations are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>slotFormatCombinations</i></b>                           | A list with <i>SlotFormatCombinations</i> . Each <i>SlotFormatCombination</i> comprises of one or more <i>SlotFormats</i> (see TS 38.211 [16], clause 4.3.2). The total number of <i>slotFormats</i> in the <i>slotFormatCombinations</i> list does not exceed 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>subcarrierSpacing2</i></b>                               | Reference subcarrier spacing for a Slot Format Combination on an FDD or SUL cell (see TS 38.213 [13], clause 11.1.1). For FDD, <i>subcarrierSpacing</i> (SFI-scs) is the reference SCS for DL BWP and <i>subcarrierSpacing2</i> (SFI-scs2) is the reference SCS for UL BWP. For SUL, <i>subcarrierSpacing</i> (SFI-scs) is the reference SCS for non-SUL carrier and <i>subcarrierSpacing2</i> (SFI-scs2) is the reference SCS for SUL carrier. The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications. |
| <b><i>subcarrierSpacing</i></b>                                | Reference subcarrier spacing for this Slot Format Combination. The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                              |

## – *SlotFormatIndicator*

The IE *SlotFormatIndicator* is used to configure monitoring a Group-Common-PDCCH for Slot-Format-Indicators (SFI).

| <b>availableRB-SetsToAddModList</b>                                     | A list of <i>AvailableRB-SetsPerCell</i> objects (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>co-DurationsPerCellToAddModList</b>                                  | A list of <i>CO-DurationsPerCell</i> objects. If not configured, the UE uses the slot format indicator (SFI), if available, to determine the channel occupancy duration (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>co-DurationsPerCellToReleaseList</b>                                 | A list of <i>CO-DurationsPerCell</i> objects to be released. An entry created using <i>co-DurationsPerCellToAddModList-r16</i> or <i>co-DurationsPerCellToAddModList-r17</i> can be deleted using <i>co-DurationsPerCellToReleaseList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>dci-PayloadSize</b>                                                  | Total length of the DCI payload scrambled with SFI-RNTI (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sfi-RNTI</b>                                                         | RNTI used for SFI on the given cell (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>slotFormatCombToAddModList</b>                                       | A list of SlotFormatCombinations for the UE's serving cells (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>switchTriggerToAddModList, switchTriggerToAddModListSizeExt</b>      | A list of <i>SearchSpaceSwitchTrigger</i> objects. Each <i>SearchSpaceSwitchTrigger</i> object provides position in DCI of the bit field indicating search space switching flag for a serving cell or, if <i>cellGroupsForSwitchList</i> is configured, group of serving cells (see TS 38.213 [13], clause 10.4). If <i>cellGroupsForSwitchList</i> is configured, only one of the cells belonging to the same cell group is added/modified, and the configuration applies to all cells belonging to the <i>cellGroupsForSwitchList</i> (see TS 38.213 [13], clause 10.4). The network configures more than 4 <i>SearchSpaceSwitchTrigger</i> objects only if <i>cellGroupsForSwitchList</i> is not configured. The UE shall consider entries in <i>switchTriggerToAddModList</i> and in <i>switchTriggerToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> can be modified using <i>switchTriggerToAddModListSizeExt</i> and vice-versa. |
| <b>switchTriggerToReleaseModList, switchTriggerToReleaseListSizeExt</b> | A list of <i>SearchSpaceSwitchTriggers</i> to be released. If <i>cellGroupsForSwitchList</i> is configured, the <i>SearchSpaceSwitchTrigger</i> is released for all serving cells belonging to the same <i>CellGroupForSwitch</i> . The UE shall consider entries in <i>switchTriggerToReleaseList</i> and in <i>switchTriggerToReleaseListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> or <i>switchTriggerToAddModListSizeExt</i> can be deleted using <i>switchTriggerToReleaseList</i> or <i>switchTriggerToReleaseListSizeExt</i> .                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>AvailableRB-SetsPerCell field descriptions</b> |                                                                                                                                                          |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionInDCI</b>                              | The (starting) position of the bits within DCI payload indicating the availability of the RB sets of a serving cell (see TS 38.213 [13], clause 11.1.1). |
| <b>servingCellId</b>                              | The ID of the serving cell for which the configuration is applicable.                                                                                    |

| <i>CO-DurationsPerCell</i> field descriptions |                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>co-DurationList</i></b>                 | A list of Channel Occupancy duration in symbols.<br>The maximum duration that can be configured for the following SCS: <ul style="list-style-type: none"> <li>- 15 kHz: 280.</li> <li>- 30 kHz: 560.</li> <li>- 60 kHz: 1120.</li> <li>- 120 kHz: 560.</li> <li>- 480 kHz: 2240.</li> <li>- 960 kHz: 4480.</li> </ul> |
| <b><i>positionInDCI</i></b>                   | Position in DCI of the bit field indicating Channel Occupancy duration for UE's serving cells (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                    |
| <b><i>servingCellId</i></b>                   | The ID of the serving cell for which the configuration is applicable.                                                                                                                                                                                                                                                 |
| <b><i>subcarrierSpacing</i></b>               | Reference subcarrier spacing for the list of Channel Occupancy durations (see TS 38.213 [13], clause 11.1.1).<br>Only the following values are applicable depending on the used frequency range:<br>FR1: 15, 30, or 60 kHz<br>FR2-2: 120, 480, or 960 kHz                                                             |

| <i>SearchSpaceSwitchTrigger</i> field descriptions |                                                                                                                                                                                          |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>positionInDCI</i></b>                        | The position of the bit within DCI payload containing a search space switching flag (see TS 38.213 [13], clause 11.1.1).                                                                 |
| <b><i>servingCellId</i></b>                        | The ID of the serving cell for which the configuration is applicable or the group of serving cells as indicated by <i>CellGroupsForSwitch-r16</i> containing this <i>servingCellId</i> . |

## — S-NSSAI

The IE S-NSSAI (*Single Network Slice Selection Assistance Information*) identifies a Network Slice end to end and comprises a slice/service type and a slice differentiator, see TS 23.003 [21].

### S-NSSAI information element

```
-- ASN1START
-- TAG-S-NSSAI-START

S-NSSAI ::= CHOICE{
 sst,
 sst-SD
}
-- TAG-S-NSSAI-STOP
-- ASN1STOP
```

| <b>S-NSSAI field descriptions</b> |                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------|
| <b>sst</b>                        | Indicates the S-NSSAI consisting of Slice/Service Type, see TS 23.003 [21].                          |
| <b>sst-SD</b>                     | Indicates the S-NSSAI consisting of Slice/Service Type and Slice Differentiator, see TS 23.003 [21]. |

## – *SpeedStateScaleFactors*

The IE *SpeedStateScaleFactors* concerns factors, to be applied when the UE is in medium or high speed state, used for scaling a mobility control related parameter.

### ***SpeedStateScaleFactors* information element**

```
-- ASN1START
-- TAG-SPEEDSTATESCALEFACTORS-START

SpeedStateScaleFactors ::= SEQUENCE {
 sf-Medium ENUMERATED {oDot25, oDot5, oDot75, 1Dot0},
 sf-High ENUMERATED {oDot25, oDot5, oDot75, 1Dot0}
}
-- TAG-SPEEDSTATESCALEFACTORS-STOP
-- ASN1STOP
```

| <b><i>SpeedStateScaleFactors</i> field descriptions</b> |                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sf-High</b>                                          | The concerned mobility control related parameter is multiplied with this factor if the UE is in High Mobility state as defined in TS 38.304 [20]. Value <i>oDot25</i> corresponds to 0.25, value <i>oDot5</i> corresponds to 0.5, <i>oDot75</i> corresponds to 0.75 and so on.          |
| <b>sf-Medium</b>                                        | The concerned mobility control related parameter is multiplied with this factor if the UE is in Medium Mobility state as defined in TS 38.304 [20]. Value <i>oDot25</i> corresponds to 0.25, value <i>oDot5</i> corresponds to 0.5, value <i>oDot75</i> corresponds to 0.75, and so on. |

## – *SPS-Config*

The IE *SPS-Config* is used to configure downlink semi-persistent transmission. Multiple Downlink SPS configurations may be configured in one BWP of a serving cell.

### ***SPS-Config* information element**

```

| <b>harq-CodebookID</b>               | Indicates the HARQ-ACK codebook index for the corresponding HARQ-ACK codebook for SPS PDSCH and ACK for SPS PDSCH release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>harq-ProcID-Offset</b>            | Indicates the offset used in deriving the HARQ process IDs, see TS 38.321 [3], clause 5.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>mcs-Table</b>                     | Indicates the MCS table the UE shall use for DL SPS (see TS 38.214 [19], clause 5.1.3.1). If present, the UE shall use the MCS table of low-SE 64QAM table indicated in Table 5.1.3.1-3 of TS 38.214 [19]. If this field is absent and field mcs-table in PDSCH-Config is set to 'qam256' and the activating DCI is of format 1_1, the UE applies the 256QAM table indicated in Table 5.1.3.1-2 of TS 38.214 [19]. If this field is absent and the field <i>mcs-Table-r17</i> in <i>PDSCH-Config</i> is set to 'qam1024' and the activating DCI is format 1_1, the UE applies the 1024QAM table indicated in Table 5.1.3.1-4 of TS 38.214 [19]. Otherwise, the UE applies the non-low-SE 64QAM table indicated in Table 5.1.3.1-1 of TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>n1PUCCH-AN</b>                    | HARQ resource for PUCCH for DL SPS. The network configures the resource either as format0 or format1. The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>n1PUCCH-AN-PUCCHsSCell</b>        | HARQ resource for PUCCH on PUCCH switching SCell (sSCell) for DL SPS. The network configures the resource either as format 0 or format 1. The actual PUCCH-Resource is configured in PUCCH-Config of the PUCCH sSCell and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>nrofHARQ-Processes</b>            | Number of configured HARQ processes for SPS DL (see TS 38.321 [3], clause 5.8.1). If UE is configured with <i>nrofHARQ-Processes-v1710</i> UE shall ignore <i>nrofHARQ-Processes</i> ( <i>without suffix</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>pdsch-AggregationFactor</b>       | Number of repetitions for SPS PDSCH (see TS 38.214 [19], clause 5.1.2.1). When the field is absent, the UE applies the value 1 for MBS multicast data and the <i>pdsch-AggregationFactor</i> in <i>pdsch-Config</i> for other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>periodicity</b>                   | Periodicity for DL SPS (see TS 38.214 [19] and TS 38.321 [3], clause 5.8.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>periodicityExt</b>                | This field is used to calculate the periodicity for DL SPS (see TS 38.214 [19] and see TS 38.321 [3], clause 5.8.1). If this field is present, the field <i>periodicity</i> is ignored.<br>The following periodicities are supported depending on the configured subcarrier spacing [ms]:<br>15 kHz: <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 640.<br>30 kHz: 0.5 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 1280.<br>60 kHz with normal CP: 0.25 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 2560.<br>60 kHz with ECP: 0.25 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 2560.<br>120 kHz: 0.125 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 5120.<br>480 kHz: 0.03125 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 20480.<br>960 kHz: 0.015625 x <i>periodicityExt</i> , where <i>periodicityExt</i> has a value between 1 and 40960.<br><i>periodicityExt-r17</i> is only applicable for SCS 480 kHz and 960 kHz. |
| <b>sps-ConfigIndex</b>               | Indicates the index of one of multiple SPS configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>sps-HARQ-Deferral</b>             | Indicates the maximum number of slots or subslots the transmission of DL SPS HARQ-ACK in a slot or subslot can be deferred (see TS 38.213 [13], clause 9.2.5.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Conditional Presence | Explanation                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SPS-List</i>      | The field is mandatory present when included in <i>sps-ConfigToAddModList-r16</i> or <i>sps-ConfigMulticastToAddModList-r17</i> , otherwise the field is absent. |

- ***SPS-ConfigIndex***

The IE *SPS-ConfigIndex* is used to indicate the index of one of multiple DL SPS configurations in one BWP.

#### ***SPS-ConfigIndex* information element**

```
-- ASN1START
-- TAG-SPS-CONFIGINDEX-START

SPS-ConfigIndex-r16 ::= INTEGER (0.. maxNrofSPS-Config-1-r16)

-- TAG-SPS-CONFIGINDEX-STOP
-- ASN1STOP
```

- ***SPS-PUCCH-AN***

The IE *SPS-PUCCH-AN* is used to indicate a PUCCH resource for HARQ ACK and configure the corresponding maximum payload size for the PUCCH resource.

#### ***SPS-PUCCH-AN* information element**

```
-- ASN1START
-- TAG-SPS-PUCCH-AN-START

SPS-PUCCH-AN-r16 ::= SEQUENCE {
 sps-PUCCH-AN-ResourceID-r16 PUCCH-ResourceId,
 maxPayloadSize-r16 OPTIONAL -- Need R
}
maxPayloadSize-r16 ::= INTEGER (4..256)

-- TAG-SPS-PUCCH-AN-STOP
-- ASN1STOP
```

| <b><i>SPS-PUCCH-AN</i> field descriptions</b> |                                                                             |
|-----------------------------------------------|-----------------------------------------------------------------------------|
| <b><i>maxPayloadSize</i></b>                  | Indicates the maximum payload size for the corresponding PUCCH resource ID. |
| <b><i>sps-PUCCH-AN-ResourceID</i></b>         | Indicates the PUCCH resource ID                                             |

- ***SPS-PUCCH-AN-List***

The IE *SPS-PUCCH-AN-List* is used to configure the list of PUCCH resources per HARQ ACK codebook

#### ***SPS-PUCCH-AN-List* information element**

```
-- ASN1START
```

```
-- TAG-SPS-PUCCH-AN-LIST-START
SPS-PUCCH-AN-List-r16 ::= SEQUENCE (SIZE(1..4)) OF SPS-PUCCH-AN-r16
-- TAG-SPS-PUCCH-AN-LIST-STOP
-- ASN1STOP
```

## - *SRB-Identity*

The IE *SRB-Identity* is used to identify a Signalling Radio Bearer (SRB) used by a UE.

### **SRB-Identity information element**

```
-- ASN1START
-- TAG-SRB-IDENTITY-START

SRB-Identity ::= INTEGER (1..3)
SRB-Identity-v1700 ::= INTEGER (4)
SRB-Identity-v1800 ::= INTEGER (5)

-- TAG-SRB-IDENTITY-STOP
-- ASN1STOP
```

## - *SRS-CarrierSwitching*

The IE *SRS-CarrierSwitching* is used to configure SRS carrier switching when PUSCH is not configured or to configure independent SRS power control from that of PUSCH.

### **SRS-CarrierSwitching information element**

```
-- ASN1START
-- TAG-SRS-CARRIERSWITCHING-START

SRS-CarrierSwitching ::= SEQUENCE {
 srs-SwitchFromServCellIndex OPTIONAL, -- Need M
 srs-SwitchFromCarrier OPTIONAL, -- Need M
 srs-TPC-PDCCH-Group CHOICE {
 typeA SEQUENCE (SIZE (1..32)) OF SRS-TPC-PDCCH-Config,
 typeB SRS-TPC-PDCCH-Config
 }
 monitoringCells SEQUENCE (SIZE (1..maxNrofServingCells)) OF ServCellIndex
 ...
}

SRS-TPC-PDCCH-Config ::= SEQUENCE {
 srs-CC-SetIndexlist OPTIONAL -- Need M
 SEQUENCE (SIZE(1..4)) OF SRS-CC-SetIndex
}
```

```

}

SRS-CC-SetIndex ::= SEQUENCE {
 cc-SetIndex INTEGER (0..3) OPTIONAL, -- Need M
 cc-IndexInOneCC-Set INTEGER (0..7) OPTIONAL, -- Need M
}

-- TAG-SRS-CARRIERSWITCHING-STOP
-- ASN1STOP

```

| <b>SRS-CC-SetIndex field descriptions</b> |                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cc-IndexInOneCC-Set</b>                | Indicates the CC index in one CC set for Type A (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network always includes this field when the <i>srs-TPC-PDCCH-Group</i> is set to <i>typeA</i> .                                                                                   |
| <b>cc-SetIndex</b>                        | Indicates the CC set index for Type A associated (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network always includes this field when the <i>srs-TPC-PDCCH-Group</i> is set to <i>typeA</i> . The network does not configure this field to 3 in this release of specification. |

| <b>SRS-CarrierSwitching field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>monitoringCells</b>                         | A set of serving cells for monitoring PDCCH conveying SRS DCI format with CRC scrambled by TPC-SRS-RNTI (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4).                                                                                                                                                                                                                                                                                                                                                       |
| <b>srs-SwitchFromCarrier</b>                   | The UE ignores this field in case of independent SRS power control from that of PUSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>srs-SwitchFromServCellIndex</b>             | Indicates the serving cell whose UL transmission may be interrupted during SRS transmission on a PUSCH-less SCell. During SRS transmission on a PUSCH-less SCell, the UE may temporarily suspend the UL transmission on a serving cell with PUSCH in the same CG to allow the PUSCH-less SCell to transmit SRS. (see TS 38.214 [19], clause 6.2.1.3).                                                                                                                                                                   |
| <b>srs-TPC-PDCCH-Group</b>                     | Network configures the UE with either typeA-SRS-TPC-PDCCH-Group or typeB-SRS-TPC-PDCCH-Group, if any.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>typeA</b>                                   | Type A trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4). In this release, the network configures at most one entry (the first entry) of <i>typeA</i> , and the first entry corresponds to the serving cell in which the <i>SRS-CarrierSwitching</i> field is configured. SRS carrier switching to SUL carrier is not supported in this version of the specification. |
| <b>typeB</b>                                   | Type B trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4).                                                                                                                                                                                                                                                                                                             |

| <b>SRS-TPC-PDCCH-Config field descriptions</b> |                                                                                                                                                                              |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>srs-CC-SetIndexlist</b>                     | A list of pairs of [cc-SetIndex; cc-IndexInOneCC-Set] (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network does not configure this field for <i>typeB</i> . |

## — SRS-Config

The IE SRS-Config is used to configure sounding reference signal transmissions. The configuration defines a list of SRS-Resources, a list of SRS-PosResources, a list of SRS-PosResourceSets and a list of SRS-ResourceSets. Each resource set defines a set of SRS-Resources or SRS-PosResources. The network triggers the transmission of the set of SRS-Resources or SRS-PosResources using a configured aperiodicSRS-ResourceTrigger (L1 DCI). The network does not configure SRS specific power control parameters *alpha* (without suffix) or *pathlossReferenceRS* if *unifiedTCI-StateType* is configured for the serving cell.

| <b>cyclicShift-n2</b>                                       | Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cyclicShift-n4</b>                                       | Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cyclicShift-n8</b>                                       | Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>combOffsetHopping</b>                                    | Configures UE with comb offset hopping. The <i>hoppingId</i> is used to initialize pseudo random comb offset hopping. If UE is configured with both comb offset and cyclic shift hopping, only one <i>hoppingId</i> is configured. The <i>hoppingWithRepetition</i> configures time-domain hopping behavior for repetition factor R>1. The <i>hoppingSubset</i> indicates a set of comb offset by a bit string (see clause 6.4.1.4.3 of TS 38.211 [16]). The <i>i</i> -th bit in the bit string is set to 1 to indicate the $s_{coh}^{SRS}(t) = i - 1$ , where <i>t</i> is determined by its ordinary position among the positive bits in bit string, i.e., if the <i>i</i> -th bit is a first positive bit, <i>t</i> =0; if the <i>i</i> -th bit is a second positive bit, <i>t</i> =1, and so on.                                                                                                            |
| <b>cyclicShiftHopping</b>                                   | Configures UE with cyclic shift hopping. The <i>hoppingId</i> is used to initialize pseudo random cyclic shift hopping. If UE is configured with both comb offset and cyclic shift hopping, only one <i>hoppingId</i> is configured. The <i>hoppingFinerGranularity</i> enables finer granular hopping, see TS 38.211 [16], clause 6.4.1.4.2. If <i>hoppingSubset</i> is configured, <i>hoppingFinerGranularity</i> is not configured. The <i>hoppingSubset</i> indicates a set of cyclic shift by a bit string (see clause 6.4.1.4.2 of TS 38.211 [16]). The <i>i</i> -th bit in the bit string is set to 1 to indicate the $s_{csh}^{SRS}(t) = i - 1$ , where <i>t</i> is determined by its ordinary position among the positive bits in bit string, i.e., if the <i>i</i> -th bit is a first positive bit, <i>t</i> =0; if the <i>i</i> -th bit is a second positive bit, <i>t</i> =1, and so on.           |
| <b>enableStartRBHopping</b>                                 | When this RRC parameter is configured, start RB location hopping is enabled for partial frequency sounding in different SRS frequency hopping periods for periodic/semi-persistent/aperiodic SRS as described in clause 6.4.1.4 in TS 38.211.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>freqHopping</b>                                          | Includes parameters capturing SRS frequency hopping (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, the network always configures this field such that <i>b-hop</i> > <i>b-SRS</i> . For SRS for positioning configuration in multiple cells, the value of this field applies to all cells in the validity area. <i>c-SRS</i> Indicates the maximum bandwidth per hop. When <i>TxHoppingConfig</i> is configured the valid values for <i>c-SRS</i> are such that the maximum bandwidth is: 104 PRBs, 48 PRBs, 132 PRBs, 64 PRBs, for 15,30,60,120 KHz respectively. The same value for <i>c-SRS</i> is configured for all the hops when <i>TxHoppingConfig</i> is configured.                                                                                                                                                                                                                |
| <b>groupOrSequenceHopping</b>                               | Parameter(s) for configuring group or sequence hopping (see TS 38.211 [16], clause 6.4.1.4.2). For CLI SRS-RSRP measurement, the network always configures this parameter to 'neither'. For SRS for positioning configuration in multiple cells, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>nrofSRS-Ports</b>                                        | Number of ports. For CLI SRS-RSRP measurement, the network always configures this parameter to 'port1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>nrofSRS-Ports-n8</b>                                     | Number of ports if the number of antenna ports is 8. The value 'ports8' configures UE with 8 antenna ports and the value 'ports8tdm' configures the UE with 8 antenna ports which are partitioned into 2 subsets with each subset having 4 different ports, and the subsets are mapped to different OFDM symbols, see TS 38.211 [16], clause 6.4.1.4.2. If <i>comboOffsetHopping-r18</i> or <i>cyclicShiftHopping-r18</i> is configured, this field is not set to <i>ports8tdm</i> . If this field is present UE ignores the field <i>nrofSRS-Ports</i> .                                                                                                                                                                                                                                                                                                                                                      |
| <b>periodicityAndOffset-p, periodicityAndOffset-p-Ext</b>   | Periodicity and slot offset for this SRS resource. All values are in "number of slots". Value <i>s1/1</i> corresponds to a periodicity of 1 slot, value <i>s1/2</i> corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots. For periodicity <i>s1/1</i> the offset is 0 slots (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, <i>s1/280</i> and <i>s1/2560</i> cannot be configured. For SRS-PosResource, values <i>s1/20480</i> , <i>s1/40960</i> and <i>s1/81920</i> cannot be configured for SCS=15kHz, values <i>s1/40960</i> and <i>s1/81920</i> cannot be configured for SCS=30kHz, and value <i>s1/81920</i> cannot be configured for SCS=60kHz except when periodicity of 20480ms is configured. When <i>periodicityAndOffset-p-Ext</i> is present, <i>periodicityAndOffset-p</i> shall be ignored by the UE. |
| <b>periodicityAndOffset-sp, periodicityAndOffset-sp-Ext</b> | Periodicity and slot offset for this SRS resource. All values are in "number of slots". Value <i>s1/1</i> corresponds to a periodicity of 1 slot, value <i>s1/2</i> corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots. For periodicity <i>s1/1</i> the offset is 0 slots (see TS 38.214 [19], clause 6.2.1). For SRS-PosResource, values <i>s1/20480</i> , <i>s1/40960</i> and <i>s1/81920</i> cannot be configured for SCS=15kHz, values <i>s1/40960</i> and <i>s1/81920</i> cannot be configured for SCS=30kHz, and value <i>s1/81920</i> cannot be configured for SCS=60kHz. When <i>periodicityAndOffset-sp-Ext</i> is present, <i>periodicityAndOffset-sp</i> shall be ignored by the UE.                                                                                                                                     |

***ptrs-PortIndex***

The PTRS port index for this SRS resource for non-codebook based UL MIMO. This is only applicable when the corresponding *PTRS-UplinkConfig* is set to CP-OFDM. The *ptrs-PortIndex* configured here must be smaller than the *maxNrofPorts* configured in the *PTRS-UplinkConfig* (see TS 38.214 [19], clause 6.2.3.1). This parameter is not applicable to CLI SRS-RSRP measurement.

***resourceMapping***

OFDM symbol location of the SRS resource within a slot including *nrofSymbols* (number of OFDM symbols), *startPosition* (value 0 refers to the last symbol, value 1 refers to the second last symbol, and so on) and *repetitionFactor* (see TS 38.214 [19], clause 6.2.1 and TS 38.211 [16], clause 6.4.1.4). The configured SRS resource does not exceed the slot boundary. If *resourceMapping-r16* is signalled, UE shall ignore the *resourceMapping* (without suffix). If *resourceMapping-r17* is signalled, *resourceMapping-r16* is not signalled and the UE shall ignore the *resourceMapping* (without suffix) and only the values of *nrofSymbols* which are integer multiples of the configured *repetitionFactor* can be configured. The network can only signal *repetitionFactor-v1730* if *resourceMapping-r17* is signalled. When *repetitionFactor-v1730* is signalled, the UE shall ignore *repetitionFactor-r17*. For CLI SRS-RSRP measurement, the network always configures *nrofSymbols* and *repetitionFactor* to 'n1'. If *srs-PosRRC-InactiveValidityAreaPreConfigList* or *srs-PosRRC-InactiveValidityAreaNonPreConfig* is configured, the value of this field applies to all cells in the validity area. *nrofSymbols* is same for all the hops when *TxHoppingConfig* is configured.

***resourceType***

Periodicity and offset for semi-persistent and periodic SRS resource, or slot offset for aperiodic SRS resource for positioning (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, only 'periodic' is applicable for *resourceType*. If *srs-PosRRC-InactiveValidityAreaPreConfigList* or *srs-PosRRC-InactiveValidityAreaNonPreConfig* is configured, the value of this field applies to all cells in the validity area.

***sequenceId***

Sequence ID used to initialize pseudo random group and sequence hopping (see TS 38.214 [19], clause 6.2.1). If *srs-PosRRC-InactiveValidityAreaPreConfigList* or *srs-PosRRC-InactiveValidityAreaNonPreConfig* is configured, the value of this field applies to all cells in the validity area.

***slotOffset***

An offset in number of slots between the triggering DCI and the actual transmission of this SRS-PosResource. If the field is absent the UE applies no offset (value 0).

***spatialRelationInfo***

Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS (see TS 38.214 [19], clause 6.2.1). This parameter is not applicable to CLI SRS-RSRP measurement. This field is not configured if *unifiedTCI-StateType* is configured for the serving cell.

***spatialRelationInfo-PDC***

Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS/DL-PRS-PDC (see TS 38.214 [19], clause 6.2.1). The field is present in case of *resourceType=periodic* and *usagePDC-r17=true* in the SRS-ResourceSet, otherwise the field is absent.

***spatialRelationInfoPos***

Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS/DL-PRS (see TS 38.214 [19], clause 6.2.1). If the IE *srs-Resourceld-Ext* is present, the IE *srs-Resourceld* in *spatialRelationInfoPos* represents the index from 0 to 63. Otherwise the IE *srs-Resourceld* in *spatialRelationInfoPos* represents the index from 0 to 31. If the SRS for positioning is configured for RRC\_INACTIVE state, the *srs-Resourceld* and *csi-RS-IndexServing* are not included in this field.

***srs-PosPeriodicConfigHyperSFN-Index***

Indicates even or odd hyper SFN in which the SRS for positioning is transmitted for the periodicity value of 20480m. If this field is not configured, the UE assumes that SRS for positioning periodicity longer than one Hyper SFN is not configured.

***srs-RequestDCI-0-2***

Indicate the number of bits for "SRS request" in DCI format 0\_2. When the field is absent, then the value of 0 bit for "SRS request" in DCI format 0\_2 is applied. If the parameter *srs-RequestDCI-0-2* is configured to value 1, 1 bit is used to indicate one of the first two rows of Table 7.3.1.1.2-24 in TS 38.212 [17] for triggered aperiodic SRS resource set. If the value 2 is configured, 2 bits are used to indicate one of the rows of Table 7.3.1.1.2-24 in TS 38.212 [17]. When UE is configured with *supplementaryUplink*, an extra bit (the first bit of the SRS request field) is used for the non-SUL/SUL indication.

***srs-RequestDCI-1-2***

Indicate the number of bits for "SRS request" in DCI format 1\_2. When the field is absent, then the value of 0 bit for "SRS request" in DCI format 1\_2 is applied. When the UE is configured with *supplementaryUplink*, an extra bit (the first bit of the SRS request field) is used for the non-SUL/SUL indication (see TS 38.214 [19], clause 6.1.1.2).

***srs-ResourceSetToAddModListDCI-0-2***

List of SRS resource set to be added or modified for DCI format 0\_2 (see TS 38.212 [17], clause 7.3.1).

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| List of SRS resource set to be released for DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>srs-TCI-State</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Configuration of either a UL TCI state or a joint TCI state for the SRS resource. In case of <i>UL TCI-State</i> , refers to the TCI state defined in <i>ul-TCI-StateList</i> in the <i>BWP-UplinkDedicated</i> where the <i>SRS-Config</i> is configured. In case of joint TCI state, refers to a TCI state defined in <i>dl-OrJointTCI-StateList</i> in <i>pdsch-Config</i> of the <i>BWP-DownlinkDedicated</i> and serving cell indicated by <i>cellAndBWP</i> . This field is absent when the SRS resource is in an <i>SRS-ResourceSet</i> configured with <i>followUnifiedTCI-StateSRS-r17</i> or <i>applyIndicatedTCI-State</i> , or when the field <i>unifiedTCI-StateType</i> is not configured to the serving cell which the SRS resource is located in. |
| <b>startRBIndexAndFreqScalingFactor</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Configures the UE with the startRBIndex and freqScalingFactor for partial frequency sounding as described in Clause 6.4.1.4 in TS 38.211. The startRBIndexForFScaling2 gives the startRBIndex when freqScalingFactor is 2 and the startRBIndexForFScaling4 gives the startRBIndex when FreqScalingFactor is 4                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>transmissionComb, transmissionComb-n2, transmissionComb-n4, transmissionComb-n8</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Comb value (2 or 4 or 8) and comb offset (0..combValue-1) (see TS 38.214 [19], clause 6.2.1). If network configures field <i>transmissionComb-n8</i> , the UE ignores <i>transmissionComb</i> . If <i>srs-PosRRC-InactiveValidityAreaPreConfig</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                                                                                        |

| <b>SRS-ResourceSet, SRS-PosResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>alpha</b>                                                  | alpha value for SRS power control (see TS 38.213 [13], clause 7.3). When the field is absent the UE applies the value 1. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                               |
| <b>aperiodicSRS-ResourceTriggerList</b>                       | An additional list of DCI "code points" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6). When the field is not included during a reconfiguration of <i>SRS-ResourceSet</i> of <i>resourceType</i> set to <i>aperiodic</i> , UE maintains this value based on the Need M; that is, this list is not considered as an extension of <i>aperiodicSRS-ResourceTrigger</i> for purpose of applying the general rule for extended list in clause 6.1.3. |
| <b>aperiodicSRS-ResourceTrigger</b>                           | The DCI "code point" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6).                                                                                                                                                                                                                                                                                                                                                                            |
| <b>applyIndicatedTCI-State</b>                                | This field indicates, for an SRS-ResourceSet, if UE applies the first or the second "indicated" UL only TCI or joint TCI as specified in TS 38.214 [19], clause 6.2.1.                                                                                                                                                                                                                                                                                                                                                |
| <b>associatedCSI-RS</b>                                       | ID of CSI-RS resource associated with this SRS resource set in non-codebook based operation (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>availableSlotOffsetList</b>                                | Indicates a list of up to four different available slot offset values from slot n+k to the slot where the aperiodic SRS resource set is transmitted, where slot n is the slot with the triggering DCI, and k is the <i>slotOffset</i> (without suffix) as described in clause 6.2.1 of TS 38.214 [19].                                                                                                                                                                                                                |
| <b>csi-RS</b>                                                 | ID of CSI-RS resource associated with this SRS resource set (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>dl-PRS</b>                                                 | This field indicates a PRS configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>followUnifiedTCI-StateSRS</b>                              | When set to enabled, for SRS resource Set, the UE applies the "indicated" UL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5. This parameter may be configured for aperiodic SRS for BM or SRS of any time-domain behavior for codebook, non-codebook, and antenna switching.                                                                                                                                                                                                                      |
| <b>p0</b>                                                     | P0 value for SRS power control. The value is in dBm. Only even values (step size 2) are allowed (see TS 38.213 [13], clause 7.3). If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                      |
| <b>pathlossReferenceRS</b>                                    | A reference signal (e.g. a CSI-RS config or a SS block) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>pathlossReferenceRS-PoS</b>                                | A reference signal (e.g. a SS block or a DL-PRS config) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>pathlossReferenceRSList</b>                                | Multiple candidate pathloss reference RS(s) for SRS power control, where one candidate RS can be mapped to SRS Resource Set via MAC CE (clause 6.1.3.27 in TS 38.321 [3]). The network can only configure this field if <i>pathlossReferenceRS</i> is not configured in the same <i>SRS-ResourceSet</i> .                                                                                                                                                                                                             |
| <b>resourceType</b>                                           | Time domain behavior of SRS resource configuration, see TS 38.214 [19], clause 6.2.1. The network configures SRS resources in the same resource set with the same time domain behavior on periodic, aperiodic and semi-persistent SRS. The aperiodic SRS is not applicable for the UE in RRC_INACTIVE. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                 |
| <b>slotOffset</b>                                             | An offset in number of slots between the triggering DCI and the actual transmission of this <i>SRS-ResourceSet</i> . If the field is absent the UE applies no offset (value 0).                                                                                                                                                                                                                                                                                                                                       |
| <b>srs-PowerControlAdjustmentStates</b>                       | Indicates whether <i>hsrs,c(i) = fc(i,1)</i> or <i>hsrs,c(i) = fc(i,2)</i> (if twoPUSCH-PC-AdjustmentStates are configured) or separate close loop is configured for SRS. This parameter is applicable only for UEs on which UE also transmits PUSCH. If absent or release, the UE applies the value <i>sameAs-Fci1</i> (see TS 38.213 [13], clause 7.3).                                                                                                                                                             |

**srs-ResourceIdList, srs-PosResourceIdList**

The IDs of the SRS-Resources/SRS-PosResource used in this SRS-ResourceSet/SRS-PosResourceSet. If this SRS-ResourceSet is configured with usage set to codebook, the srs-ResourceIdList contains at most 2 entries. If this SRS-ResourceSet is configured with usage set to nonCodebook, the srs-ResourceIdList contains at most 4 entries. If srs-PosRRC-InactiveValidityAreaPreConfigList or srs-PosRRC-InactiveValidityAreaNonPreConfig is configured, srs-PosResourceIdList is commonly configured across cells within the validity area.

**srs-ResourceSetId, srs-PosResourceSetId**

The ID of this resource set. It is unique in the context of the BWP in which the parent SRS-Config is defined. If srs-PosRRC-InactiveValidityAreaPreConfigList or srs-PosRRC-InactiveValidityAreaNonPreConfig is configured, srs-PosResourceSetId is commonly configured across cells within the validity area.

**ssb-IndexServing**

Indicates SSB index belonging to a serving cell where the SRS is configured.

**ssb-Ncell**

This field indicates a SSB configuration from neighboring cell.

**usage**

Indicates if the SRS resource set is used for beam management, codebook based or non-codebook based transmission or antenna switching. See TS 38.214 [19], clause 6.2.1. Reconfiguration between codebook based and non-codebook based transmission is not supported.

**usagePDC**

If configured, it indicates that this SRS resource set is used for propagation delay compensation. The field can be present in only one SRS-ResourceSet.

**SRS-SpatialRelationInfoPos field descriptions****csi-RS-IndexServing**

Indicates CSI-RS index belonging to a serving cell.

**dl-PRS**

This field indicates a PRS configuration.

**resourceSelection**

Indicates whether the configured SRS spatial relation resource is a SRS-Resource or SRS-PosResource.

**servingCellId**

The serving Cell ID of the source SSB, CSI-RS, or SRS for the spatial relation of the target SRS resource. If this field is absent the SSB, the CSI-RS, or the SRS is from the same serving cell where the SRS is configured.

**ssb-IndexServing**

Indicates SSB index belonging to a serving cell.

**ssb-Ncell**

This field indicates a SSB configuration from neighboring cell.

**SSB-InfoNCell field descriptions****physicalCellId**

This field specifies the physical cell ID of the neighbour cell or NCD-SSB of the serving cell for which SSB configuration is provided.

**ssb-IndexNcell**

This field specifies the index of the SSB for a neighbour cell or NCD-SSB of the serving cell. See TS 38.213 [13]. If this field is absent, the UE determines the ssb-IndexNcell of the physicalCellId based on its SSB measurement from the cell.

**ssb-Configuration**

This field specifies the full configuration of the SSB. If this field is absent, the UE obtains the configuration for the SSB from nr-SSB-Config received as part of DL-PRS assistance data in LPP, see TS 37.355 [49], by looking up the corresponding SSB configuration using the field physicalCellId.

| <b><i>DL-PRS-Info</i> field descriptions</b> |                                                                                                                                                                                                                             |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dl-PRS-ID</i></b>                      | This field specifies the UE specific TRP ID (see TS 37.355 [49]) for which PRS configuration is provided.                                                                                                                   |
| <b><i>dl-PRS-ResourceSetId</i></b>           | This field specifies the PRS-ResourceSet ID of a PRS resourceSet.                                                                                                                                                           |
| <b><i>dl-PRS-ResourceId</i></b>              | This field specifies the PRS-Resource ID of a PRS resource. If this field is absent, the UE determines the <i>dl-PRS-ResourceID</i> based on its PRS measurement from the TRP (see TS 37.355 [49]) and DL-PRS Resource Set. |

| <b><i>SSB-Configuration</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>halfFrameIndex</i></b>                       | Indicates whether SSB is in the first half or the second half of the frame. Value zero indicates the first half and value 1 indicates the second half.                                                                                                                                                                                                                                                                 |
| <b><i>integerSubframeOffset</i></b>                | Indicates the subframe boundary offset of the cell in which SSB is transmitted.                                                                                                                                                                                                                                                                                                                                        |
| <b><i>sfn0-Offset</i></b>                          | Indicates the time offset of the SFN0 slot 0 for the cell with respect to SFN0 slot 0 of serving cell.                                                                                                                                                                                                                                                                                                                 |
| <b><i>sfn-Offset</i></b>                           | Specifies the SFN offset between the cell in which SSB is transmitted and serving cell. The offset corresponds to the number of full radio frames counted from the beginning of a radio frame #0 of serving cell to the beginning of the closest subsequent radio frame #0 of the cell in which SSB is transmitted.                                                                                                    |
| <b><i>sfn-SSB-Offset</i></b>                       | Indicates the SFN offset of the transmitted SSB relative to the start of the SSB period. Value 0 indicates that the SSB is transmitted in the first system frame, value 1 indicates that SSB is transmitted in the second system frame and so on. The network configures this field according to the field <i>ssb-Periodicity</i> such that the indicated system frame does not exceed the configured SSB periodicity. |
| <b><i>ssb-Freq</i></b>                             | Indicates the frequency of the SSB.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>ss-PBCH-BlockPower</i></b>                   | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                        |
| <b><i>ssb-Periodicity</i></b>                      | Indicates the periodicity of the SSB. If the field is absent, the UE applies the value ms5. (see TS 38.213 [13], clause 4.1)                                                                                                                                                                                                                                                                                           |
| <b><i>ssbSubcarrierSpacing</i></b>                 | Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                           |

| <b><i>TxHoppingConfig</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>numberOfHops</i></b>                       | This field specifies the number of hops. Value 1 indicates one hop, value 2 indicates two hops and so on.                                                                                                                                                                                                      |
| <b><i>overlapValue</i></b>                       | This field specifies the overlap during SRS transmission in terms of number of <i>resource blocks</i> . Value <i>zeroRB</i> implies 0 RB, value <i>oneRB</i> corresponds to 1 RB, value <i>twoRB</i> corresponds to 2 RBs and so on. The same value for the <i>overlapValue</i> is configured to all the hops. |
| <b><i>slotOffsetForRemainingHopsList</i></b>     | This field specifies the starting slot offset and starting symbol for the SRS resource with tx hopping for different resource types (aperiodic, semi-persistent or periodic SRS transmission). Each hop is configured with the same periodicity.                                                               |

| Conditional Presence    | Explanation                                                                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>DLorJointTCI-SRS</i> | The field is mandatory present if srs-DLorJointTCI-State is configured, otherwise it is absent Need R.                                                   |
| <i>FollowUTCi</i>       | The field is optionally present, Need R, if the field <i>followUnifiedTCI-StateSRS</i> is present. Otherwise, it is absent.                              |
| <i>NonCodebook</i>      | This field is optionally present, Need M, in case of non-codebook based transmission, otherwise the field is absent.                                     |
| <i>Pathloss</i>         | The field is mandatory present if the IE <i>SSB-InfoNcell</i> is included in <i>pathlossReferenceRS-Pos</i> ; otherwise it is optionally present, Need R |
| <i>Setup</i>            | This field is mandatory present upon configuration of SRS-ResourceSet or SRS-Resource and optionally present, Need M, otherwise.                         |

## – *SRS-PosTx-Hopping*

The IE *SRS-PosTx-Hopping* specifies the frequency hopping configuration for SRS for Positioning transmission.

### ***SRS-PosTx-Hopping*** information element

 -- ASN1STOP

| <b>SRS-PosTx-Hopping field descriptions</b>  |                                                                                                                                                                                                                                  |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bwp</b>                                   | For RRC_CONNECTED state, indicates the frequency region outside of active BWP for SRS for positioning frequency hopping. For RRC_INACTIVE state indicates the BWP configuration for SRS for Positioning during the RRC_INACTIVE. |
| <b>inactivePosSRS-RSRP-ChangeThreshold</b>   | RSRP threshold for the increase/decrease of RSRP for time alignment validation as specified in TS 38.321 [3].                                                                                                                    |
| <b>inactivePosSRS-TimeAlignmentTimer</b>     | TAT value for SRS for positioning transmission during RRC_INACTIVE state as specified in TS 38.321 [3]. The network always configures this field when <i>srs-PosRRC-Inactive</i> is configured.                                  |
| <b>srs-PosConfig</b>                         | Provides the SRS Configuration to be used for frequency hopping.                                                                                                                                                                 |
| <b>srs-PosUplinkTransmissionWindowConfig</b> | UL time window for UL SRS for positioning with Tx hopping configured to be periodic with configurable starting SFN, slot and symbol number, periodicity, duration.                                                               |

| <b>SRS-PosUplinkTransmissionWindowConfig field descriptions</b> |                                                                                                                                                                |
|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>duration</b>                                                 | Indicates the duration of the uplink SRS for positioning transmission window with frequency hopping. Value s1 indicates 1 slot, s2 indicates 2 slot and so on. |
| <b>periodicityAndOffset</b>                                     | Indicates the Periodicity and slot offset for uplink SRS for positioning transmission window occurrence with frequency hopping.                                |
| <b>startSFN</b>                                                 | Indicates the starting SFN of the uplink SRS for positioning transmission window with frequency hopping.                                                       |

## – *SRS-PosResourceSetLinkedForAggBW*

The IE *SRS-PosResourceSetLinkedForAggBW* provides the SRS Positioning Resource Sets that are linked for bandwidth aggregation across two or three component carriers.

### **SRS-PosResourceSetLinkedForAggBW information element**

| <b>SRS-PosResourceSetLinkedForAggBW field descriptions</b> |                                                                                                                                                                                                                   |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>freqInfo</b>                                            | Indicates the SRS Positioning Resource set carrier frequency that is linked for bandwidth aggregation.                                                                                                            |
| <b>scs-SpecificCarrier</b>                                 | A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A and to be used for SRS for positioning bandwidth aggregation. |
| <b>servingCellAndBWP-Id</b>                                | Provides the serving cell and BWP config for SRS for positioning transmission using aggregated bandwidth in RRC_CONNECTED state.                                                                                  |
| <b>srs-LinkedConfig</b>                                    | Provides the linked bandwidth aggregation configuration for RRC_CONNECTED or RRC_INACTIVE state for the SRS for positioning transmission.                                                                         |
| <b>srs-PosResourceSetLinked</b>                            | Indicates the SRS Positioning Resource set that is linked for bandwidth aggregation.                                                                                                                              |

## – **SRS-RSRP-Range**

The IE **SRS-RSRP-Range** specifies the value range used in SRS-RSRP measurements and thresholds. The integer value for SRS-RSRP measurements is according to Table 10.1.22.1.2-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value –140) dBm, except for the IE value 98, in which case the actual value is infinity.

### **SRS-RSRP-Range information element**

```

-- ASN1START
-- TAG-SRS-RSRP-RANGE-START

SRS-RSRP-Range-r16 ::= INTEGER(0..98)

-- TAG-SRS-RSRP-RANGE-STOP
-- ASN1STOP

```

## – **SRS-TPC-CommandConfig**

The IE **SRS-TPC-CommandConfig** is used to configure the UE for extracting TPC commands for SRS from a group-TPC messages on DCI.

### **SRS-TPC-CommandConfig information element**

```

-- ASN1START
-- TAG-SRS-TPC-COMMANDCONFIG-START

```

```

SRS-TPC-CommandConfig ::= SEQUENCE {
 startingBitOfFormat2-3 INTEGER (1..31)
 fieldTypeFormat2-3 INTEGER (0..1)
 ...
 [[
 startingBitOfFormat2-3SUL INTEGER (1..31)
]]
}

-- TAG-SRS-TPC-COMMANDCONFIG-STOP
-- ASN1STOP

```

| <b>SRS-TPC-CommandConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fieldTypeFormat2-3</b>                       | The type of a field within the group DCI with SRS request fields (optional), which indicates how many bits in the field are for SRS request (0 or 2). Note that for Type A, there is a common SRS request field for all SCells in the set, but each SCell has its own TPC command bits. See TS 38.212 [17] clause 7.3.1 and , TS 38.213 [13], clause 11.4. |
| <b>startingBitOfFormat2-3</b>                   | The starting bit position of a block within the group DCI with SRS request fields (optional) and TPC commands. The value 1 of the field corresponds to the first/left most bit of format2-3. The value 2 of the field corresponds to the second bit format2-3, and so on (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 11.4).               |
| <b>startingBitOfFormat2-3SUL</b>                | The starting bit position of a block within the group DCI with SRS request fields (optional) and TPC commands for SUL carrier (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 11.4).                                                                                                                                                          |

### – **SSB-Index**

The IE **SSB-Index** identifies an SS-Block within an SS-Burst. See TS 38.213 [13], clause 4.1.

#### **SSB-Index information element**

```

-- ASN1START
-- TAG-SSB-INDEX-START

SSB-Index ::= INTEGER (0..maxNrofSSBs-1)

-- TAG-SSB-INDEX-STOP
-- ASN1STOP

```

### – **SSB-MTC**

The IE **SSB-MTC** is used to configure measurement timing configurations, i.e., timing occasions at which the UE measures SSBs.

**SSB-MTC information element**

```

-- ASN1START
-- TAG-SSB-MTC-START

|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>duration</b>                    | Duration of the measurement window in which to receive SS/PBCH blocks. It is given in number of subframes (see TS 38.213 [13], clause 4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pci-List</b>                    | PCIs that follow this SMTC, used for IAB-node discovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>periodicityAndOffset</b>        | Periodicity and offset of the measurement window in which to receive SS/PBCH blocks, see 5.5.2.10. Periodicity and offset are given in number of subframes.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ssb-ToMeasure</b>               | The set of SS blocks to be measured within the SMTC measurement duration. The first/leftmost bit corresponds to SS block index 0, the second bit corresponds to SS block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS block is not to be measured while value 1 indicates that the corresponding SS block is to be measured (see TS 38.215 [9]). When the field is not configured the IAB-MT measures on all SS blocks. Regardless of the value of this field, SS blocks outside of the applicable smtc are not to be measured. See TS 38.215 [9] clause 5.1.1. |

| <b>SSB-MTC4 field descriptions</b> |                                                                                                                            |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>pci-List</b>                    | PCIs that follow this SMTC.                                                                                                |
| <b>offset</b>                      | Offset of the measurement window in which to receive SS/PBCH blocks, see 5.5.2.10. Offset is given in number of subframes. |

| <b>SSB-MTC-AdditionalPCI field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalPCI</b>                            | PCI of the additional SSB different from serving cell PCI.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>periodicity</b>                              | Periodicity of the SS/PBCH blocks, see 5.5.2.10. Periodicity is given in number of subframes.                                                                                                                                                                                                                                                                                                                                                    |
| <b>ssb-PositionsInBurst</b>                     | Indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>ss-PBCH-BlockPower</b>                       | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                  |

### – *SSB-PositionQCL-Relation*

The IE *SSB-PositionQCL-Relation* is used to indicate the QCL relationship between SSB positions on the frequency indicated by *ssbFrequency* (see TS 38.213 [13], clause 4.1) for operation with shared spectrum channel access. Value n1 corresponds to 1, value n2 corresponds to 2 and so on.

#### **SSB-PositionQCL-Relation information element**

```
-- ASN1START
-- TAG-SSB-POSITIONQCL-RELATION-START

SSB-PositionQCL-Relation-r16 ::= ENUMERATED {n1,n2,n4,n8}

SSB-PositionQCL-Relation-r17 ::= ENUMERATED {n32, n64}

-- TAG-SSB-POSITIONQCL-RELATION-STOP
-- ASN1STOP
```

### – *SSB-ToMeasure*

The IE *SSB-ToMeasure* is used to configure a pattern of SSBs. For operation with shared spectrum channel access in FR1, only *mediumBitmap* is used, and for FR2-2, *longBitmap* is used.

#### **SSB-ToMeasure information element**

```
-- ASN1START
-- TAG-SSB-TOMEASURE-START

SSB-ToMeasure ::= CHOICE {
 shortBitmap
 mediumBitmap
 longBitmap
}
```

-- TAG-SSB-TOMEASURE-STOP  
 -- ASN1STOP

| <b>SSB-ToMeasure field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>longBitmap</b>                       | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMT measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to (k-1) may be transmitted; if the k-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted.                                                                                                                                                                                                                                                                                                                                          |
| <b>mediumBitmap</b>                     | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMT measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k - 1 may be transmitted; if the kt-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k > ssb-PositionQCL-Common and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. If ssb-PositionQCL is configured with a value smaller than ssb-PositionQCL-Common, only the leftmost K bits (K = ssb-PositionQCL) are applicable for the corresponding cell. |
| <b>shortBitmap</b>                      | Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## – *SS-RSSI-Measurement*

The IE *SS-RSSI-Measurement* is used to configure RSSI measurements based on synchronization reference signals.

### **SS-RSSI-Measurement information element**

-- ASN1START  
 -- TAG-SS-RSSI-MEASUREMENT-START

```
SS-RSSI-Measurement ::= SEQUENCE {
 measurementSlots
 endSymbol
}
```

-- TAG-SS-RSSI-MEASUREMENT-STOP  
 -- ASN1STOP

| <b>SS-RSSI-Measurement field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>endSymbol</b>                              | Within a slot that is configured for RSSI measurements (see <i>measurementSlots</i> ) the UE measures the RSSI from symbol 0 to symbol <i>endSymbol</i> . This field identifies the entry in Table 5.1.3-1 in TS 38.215 [9], which determines the actual end symbol.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measurementSlots</b>                       | Indicates the slots in which the UE can perform RSSI measurements. The length of the BIT STRING is equal to the number of slots in the configured SMTC window (determined by the duration and by the subcarrierSpacing). The first (left-most / most significant) bit in the bitmap corresponds to the first slot in the SMTC window, the second bit in the bitmap corresponds to the second slot in the SMTC window, and so on. The UE measures in slots for which the corresponding bit in the bitmap is set to 1. In case this field is configured for a SCell with <i>ca-SlotOffset-r16</i> , the bits in the bitmap corresponds to the slots that are fully contained in the SMTC window. |

## – *SubcarrierSpacing*

The IE *SubcarrierSpacing* determines the subcarrier spacing. Restrictions applicable for certain frequencies, channels or signals are clarified in the fields that use this IE.

### **SubcarrierSpacing information element**

```
-- ASN1START
-- TAG-SUBCARRIERSPACING-START

SubcarrierSpacing ::= ENUMERATED {kHz15, kHz30, kHz60, kHz120, kHz240, kHz480-v1700, kHz960-v1700, spare1}

-- TAG-SUBCARRIERSPACING-STOP
-- ASN1STOP
```

## – *TAG-Config*

The IE *TAG-Config* is used to configure parameters for a time-alignment group.

### **TAG-Config information element**

```
-- ASN1START
-- TAG-TAG-CONFIG-START

TAG-Config ::= SEQUENCE {
 tag-ToReleaseList
 tag-ToAddModList
}
 SEQUENCE {
 SIZE (1..maxNrofTAGs)) OF TAG-Id
 SIZE (1..maxNrofTAGs)) OF TAG
 }
OPTIONAL, -- Need N
OPTIONAL, -- Need N

TAG ::= SEQUENCE {
 tag-Id,
 timeAlignmentTimer,
 ...
}
 INTEGER (0..maxNrofTAGs-1)
```

-- TAG-TAG-CONFIG-STOP  
-- ASN1STOP

| <b>TAG field descriptions</b> |                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tagId</b>                  | Indicates the TAG of the SpCell or an SCell, see TS 38.321 [3]. Uniquely identifies the TAG within the scope of a Cell Group (i.e. MCG or SCG). |
| <b>timeAlignmentTimer</b>     | The <i>timeAlignmentTimer</i> for TAG with ID <i>tagId</i> , as specified in TS 38.321 [3].                                                     |

## - *TAR-Config*

The IE *TAR-Config* is used to configure Timing Advance reporting in non-terrestrial networks and ATG network.

### **TAR-Config information element**

```
-- ASN1START
-- TAG-TAR-CONFIG-START

TAR-Config-r17 ::=
 offsetThresholdTA-r17
 SEQUENCE {
 ENUMERATED {ms0dot5, ms1, ms2, ms3, ms4, ms5, ms6 ,ms7, ms8, ms9, ms10, ms11, ms12,
 ms13, ms14, ms15, spare13, spare12, spare11, spare10, spare9, spare8, spare7,
 spare6, spare5, spare4, spare3, spare2, spare1} OPTIONAL, -- Need R
 ENUMERATED {enabled} OPTIONAL, -- Need R
 ...
 }
 timingAdvanceSR-r17
 SEQUENCE {
 INTEGER (1..56) OPTIONAL, -- Need R
 ENUMERATED {enabled} OPTIONAL, -- Need R
 ...
 }

TAR-Config-r18 ::=
 offsetThresholdTA-r18
 SEQUENCE {
 ENUMERATED {enabled} OPTIONAL, -- Need R
 }
 timingAdvanceSR-r18
 SEQUENCE {
 ENUMERATED {enabled} OPTIONAL, -- Need R
 ...
 }

-- TAG-TAR-CONFIG-STOP
-- ASN1STOP
```

| <b>TAR-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>offsetThresholdTA</b>             | Offset for TA reporting as specified in TS 38.321 [3]. Network only configures this parameter for MCG. For <i>offsetThresholdTA-r17</i> , value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms1</i> corresponds to 1 ms, and so on.<br>Network only configures <i>offsetThresholdTA-r18</i> for ATG, which is in unit of symbols based on the subcarrier spacing of the BWP indicated by <i>firstActiveDownlinkBWP-Id</i> if received in the same RRC message, otherwise, it is based on the subcarrier spacing of the active DL BWP of the PCell when <i>offsetThresholdTA-r18</i> is received. Once configured, the value of TA offset threshold does not change autonomously by the UE with BWP switching. |
| <b>timingAdvancesR</b>               | Used to configure whether a Timing Advance report may trigger a Scheduling Request as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- ***TCI-ActivatedConfig***

The IE *TCI-ActivatedConfig* is used to provide activated TCI states for PDSCH and/or PDCCH of the PSCell or of an SCell.

#### ***TCI-ActivatedConfig* information element**

```
-- ASN1START
-- TAG-TCI-ACTIVATEDCONFIG-START

TCI-ActivatedConfig-r17 ::= SEQUENCE {
 pdcch-TCI-r17 SEQUENCE (SIZE (1..5)) OF TCI-StateId,
 pdsch-TCI-r17 BIT STRING (SIZE (1..maxNrofTCI-States))
}

-- TAG-TCI-ACTIVATEDCONFIG-STOP
-- ASN1STOP
```

| <b><i>TCI-ActivatedConfig</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>pdcch-TCI</i></b>                              | Indicates the TCI state for PDCCH for each configured CORESET of the DL BWP to be activated at SCell activation, to be activated for the PSCell at SCG activation and/or to be used for BFD, RLM and measurements while the SCG is deactivated. The list includes exactly as many entries as CORESETs configured in this BWP, ordered by increasing values of <i>ControlResourceSet-Id</i> , i.e. the first entry indicates the TCI state for the configured CORESET with the lowest <i>ControlResourceset-Id</i> value, the second value indicates the TCI states for the configured CORESET with the second lowest <i>ControlResourceset-Id</i> value, and so on. |
| <b><i>pdsch-TCI</i></b>                              | Indicates TCI states for PDSCH reception at SCell addition/activation or of the PSCell at SCG activation. This field indicates activated TCI state(s) for this BWP ordered by increasing values of <i>TCI-StateId</i> , i.e. the first bit indicates the activation state of the TCI state with the lowest <i>TCI-StateId</i> value, the second value indicates the activation status of the TCI state with the second lowest <i>TCI-StateId</i> value, and so on. A bit set to 0 indicates that the corresponding TCI state is deactivated, a bit set to 1 indicates that the TCI state is activated.                                                              |

- ***TCI-State***

The IE *TCI-State* associates one or two DL reference signals with a corresponding quasi-colocation (QCL) type.

#### ***TCI-State* information element**

```
-- ASN1START
-- TAG-TCI-STATE-START

TCI-State ::= SEQUENCE {
 tci-StateId,
 qcl-Type1,
 qcl-Type2
 ...
 [
 additionalPCI-r17
 pathlossReferenceRS-Id-r17
 ul-powerControl-r17
]

| <b><i>QCL-Info</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bwp-Id</i></b>                      | The DL BWP which the RS is located in. If the field is absent, the RS is located in the DL BWP in which the <i>TCI-State</i> is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>cell</i></b>                        | The UE's serving cell in which the <i>referenceSignal</i> is configured. If the field is absent, the <i>referenceSignal</i> is configured in the serving cell in which the <i>TCI-State</i> is applied by the UE. The RS can be located on a serving cell other than the serving cell for which the <i>TCI-State</i> is applied by the UE only if the <i>qcl-Type</i> is configured as <i>typeC</i> or <i>typeD</i> . If the <i>referenceSignal</i> is set to <i>csi-rs</i> and <i>unifiedTCI-StateType</i> is configured, either both <i>cell</i> and <i>bwp-Id</i> are present or both <i>cell</i> and <i>bwp-Id</i> are absent. See TS 38.214 [19] clause 5.1.5. |
| <b><i>referenceSignal</i></b>             | Reference signal with which quasi-collocation information is provided as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>qcl-Type</i></b>                    | QCL type as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>TCI-State field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalPCI</b>                | Indicates the physical cell IDs (PCI) of the SSBs when <i>referenceSignal</i> is configured as SSB for both QCL-Type1 and QCL-Type2. In case the <i>cell</i> is present, the <i>additionalPCI</i> refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell indicated by the field <i>cell</i> . Otherwise, it refers to a PCI value configured in a list <i>additionalPCI-ToAddModList</i> configured in the serving cell where the <i>TCI-State</i> is applied by the UE. When this field is present the <i>cell</i> for <i>qcl-Type1</i> and <i>qcl-Type2</i> is configured with same value, if present.                                           |
| <b>pathlossReferenceRS-Id</b>       | The ID of the reference signal (e.g. a CSI-RS or an SS block) used for PUSCH, PUCCH and SRS path loss estimation. This field refers to an element in the list configured using <i>pathlossReferenceRSToAddModList</i> in the serving cell and UL BWP where the TCI State is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>qcl-Type1, qcl-Type2</b>         | QCL information for the TCI state as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>tag-Id-ptr</b>                   | It indicates the TAG that is associated with this TCI state, value n0 means the TCI state associate with the TAG indicated by <i>tag-Id</i> , value n1 means this TCI state associated with the TAG indicated by <i>tag2-Id</i> . The <i>tag-Id-ptr</i> refers to the TAG of the serving cell where the TCI state is applied.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>tci-StateId</b>                  | ID number of the TCI state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ul-PowerControl</b>              | Configures power control parameters for PUCCH, PUSCH and SRS for this TCI state. The field is present here only if <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of this serving cell. This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the serving cell where the <i>dl-OrJointTCI-StateToAddModList</i> is configured. For each serving cell, <i>ul-powerControl</i> is either configured in each <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in each DL BWP, or it is not configured in any <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in any DL BWP. |

| Conditional Presence    | Explanation                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>2TA</i>              | This field is mandatory present if <i>tag2</i> is present for the serving cell and the serving cell is configured with <i>unifiedTCI-StateType</i> set to <i>'joint'</i> . It is absent, Need R, otherwise.                                                            |
| <i>CSI-RS-Indicated</i> | This field is mandatory present if <i>csi-rs</i> is included and <i>unifiedTCI-StateType</i> is not configured. This field is optionally present, Need R, if <i>csi-rs</i> is included and <i>unifiedTCI-StateType</i> is configured. Otherwise, it is absent, Need R. |
| <i>JointTCI</i>         | This field is optionally present, Need R, if this serving cell is configured with <i>unifiedTCI-StateType</i> set to ' <i>'joint'</i> '. It is absent, Need R, otherwise.                                                                                              |
| <i>JointTCI1</i>        | This field is mandatory present, if this serving cell is configured with <i>unifiedTCI-StateType</i> set to ' <i>'joint'</i> '. It is absent, Need R, otherwise.                                                                                                       |

### – *TCI-StateId*

The IE *TCI-StateId* is used to identify one *TCI-State* configuration.

#### **TCI-StateId** information element

```
-- ASN1START
-- TAG-TCI-STATEID-START

TCI-StateId ::= INTEGER (0 .. maxNrofTCI-States-1)

|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalPCI</b>                   | Indicates the physical cell IDs (PCI) of the SSBs when <i>referenceSignal</i> is configured as SSB. In case the <i>servingCellId</i> is present, the <i>additionalPCI</i> refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell indicated by the field <i>servingCellId</i> . Otherwise, it refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell where the <i>ul-TCI-StateList</i> is applied by the UE.                                                                                                                                                                     |
| <b>bwp-Id</b>                          | The DL BWP which the CSI-RS is located in or UL BWP where the SRS is located in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>servingCellId</b>                   | The UE's serving cell in which the <i>referenceSignal</i> is configured. If the field is absent, the <i>referenceSignal</i> is configured in the serving cell in which the <i>TCI-UL-State</i> is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pathlossReferenceRS-Id</b>          | The ID of the reference Signal (e.g. a CSI-RS or a SS block) used for PUSCH, PUCCH and SRS path loss estimation. This field refers to an element in the list configured using <i>pathlossReferenceRSToAddModList</i> in the serving cell and UL BWP where the UL TCI State is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>tag-Id-ptr</b>                      | It indicates the TAG that is associated with this TCI state, value n0 means the TCI state associate with the TAG indicated by <i>tag-Id</i> , value n1 means this TCI state associated with the TAG indicated by <i>tag2-Id</i> . The <i>tag-Id-ptr</i> refers to the TAG of the serving cell where the TCI state is applied.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ul-powerControl</b>                 | Configures power control parameters for PUCCH, PUSCH and SRS for this TCI state. The field is present here only if <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of this serving cell. This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the serving cell where the <i>ul-TCI-ToAddModList</i> is configured. For each serving cell, <i>ul-powerControl</i> is either configured in each <i>TCI-UL-State</i> configured or referred to in <i>ul-OrJointTCI-StateList</i> in each UL BWP, or it is not configured in any <i>TCI-UL-State</i> configured or referred to in <i>ul-OrJointTCI-StateList</i> in any UL BWP. |

| Conditional Presence         | Explanation                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>2TA</i>                   | This field is mandatory present if <i>tag2</i> is present for the serving cell. It is absent, Need R, otherwise.            |
| <i>CSI-RSorSRS-Indicated</i> | This field is mandatory present if <i>referenceSignal</i> is set to <i>csi-RS-index</i> or to <i>srs</i> , absent otherwise |
| <i>Mandatory</i>             | The field is mandatory present.                                                                                             |

## – *TCI-UL-StateId*

The IE *TCI-UL-StateId* is used to identify one *TCI-UL-State* configuration.

### **TCI-UL-StateId information element**

```
-- ASN1START
-- TAG-TCI-UL-STATEID-START
```

```
TCI-UL-StateId-r17 ::= INTEGER (0 .. maxUL-TCI-1-r17)

-- TAG-TCI-UL-STATEID-STOP
-- ASN1STOP
```

– ***TDD-UL-DL-ConfigCommon***

The IE *TDD-UL-DL-ConfigCommon* determines the cell specific Uplink/Downlink TDD configuration.

***TDD-UL-DL-ConfigCommon* information element**

```
-- ASN1START
-- TAG-TDD-UL-DL-CONFIGCOMMON-START

TDD-UL-DL-ConfigCommon ::= SEQUENCE {
 referenceSubcarrierSpacing,
 pattern1,
 pattern2,
 ...
}

TDD-UL-DL-Pattern ::= SEQUENCE {
 dl-UL-TransmissionPeriodicity,
 nrofDownlinkSlots,
 nrofDownlinkSymbols,
 nrofUplinkSlots,
 nrofUplinkSymbols,
 ...
 [
 dl-UL-TransmissionPeriodicity-v1530
]
}

-- TAG-TDD-UL-DL-CONFIGCOMMON-STOP
-- ASN1STOP
```

***TDD-UL-DL-ConfigCommon* field descriptions**

***referenceSubcarrierSpacing***

Reference SCS used to determine the time domain boundaries in the UL-DL pattern which must be common across all subcarrier specific carriers, i.e., independent of the actual subcarrier spacing using for data transmission.

Only the following values are applicable depending on the used frequency:

FR1: 15, 30, or 60 kHz

FR2-1: 60 or 120 kHz

FR2-2: 120, 480, or 960 kHz

The network configures a not larger than any SCS of configured BWPs for the serving cell. The network or *SL-PreconfigGeneral* configures a not larger than the SCS of (pre-)configured SL BWP. See TS 38.213 [13], clause 11.1.

| <b>TDD-UL-DL-Pattern field descriptions</b> |                                                                                                                                                                                                                                             |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-UL-TransmissionPeriodicity</b>        | Periodicity of the DL-UL pattern, see TS 38.213 [13], clause 11.1. If the <i>dl-UL-TransmissionPeriodicity-v1530</i> is signalled, UE shall ignore the <i>dl-UL-TransmissionPeriodicity</i> (without suffix).                               |
| <b>nrofDownlinkSlots</b>                    | Number of consecutive full DL slots at the beginning of each DL-UL pattern, see TS 38.213 [13], clause 11.1. In this release, the maximum value for this field is 320.                                                                      |
| <b>nrofDownlinkSymbols</b>                  | Number of consecutive DL symbols in the beginning of the slot following the last full DL slot (as derived from <i>nrofDownlinkSlots</i> ). The value 0 indicates that there is no partial-downlink slot. (see TS 38.213 [13], clause 11.1). |
| <b>nrofUplinkSlots</b>                      | Number of consecutive full UL slots at the end of each DL-UL pattern, see TS 38.213 [13], clause 11.1. In this release, the maximum value for this field is 320.                                                                            |
| <b>nrofUplinkSymbols</b>                    | Number of consecutive UL symbols in the end of the slot preceding the first full UL slot (as derived from <i>nrofUplinkSlots</i> ). The value 0 indicates that there is no partial-uplink slot. (see TS 38.213 [13], clause 11.1).          |

— **TDD-UL-DL-ConfigDedicated**

The IE *TDD-UL-DL-ConfigDedicated* determines the UE-specific Uplink/Downlink TDD configuration.

**TDD-UL-DL-ConfigDedicated information element**

```
-- ASN1START
-- TAG-TDD-UL-DL-CONFIGDEDICATED-START

TDD-UL-DL-ConfigDedicated ::= SEQUENCE {
 slotSpecificConfigurationsToAddModList SEQUENCE (SIZE (1..maxNrofSlots)) OF TDD-UL-DL-SlotConfig OPTIONAL, -- Need N
 slotSpecificConfigurationsToReleaseList SEQUENCE (SIZE (1..maxNrofSlots)) OF TDD-UL-DL-SlotIndex OPTIONAL, -- Need N
 ...
}

TDD-UL-DL-ConfigDedicated-IAB-MT-r16 ::= SEQUENCE {
 slotSpecificConfigurationsToAddModList-IAB-MT-r16 SEQUENCE (SIZE (1..maxNrofSlots)) OF TDD-UL-DL-SlotConfig-IAB-MT-r16 OPTIONAL, -- Need N
 slotSpecificConfigurationsToReleaseList-IAB-MT-r16 SEQUENCE (SIZE (1..maxNrofSlots)) OF TDD-UL-DL-SlotIndex OPTIONAL, -- Need N
 ...
}

TDD-UL-DL-SlotConfig ::= SEQUENCE {
 slotIndex TDD-UL-DL-SlotIndex,
 symbols CHOICE {
 allDownlink NULL,
 allUplink NULL,
 explicit SEQUENCE {
 nrofDownlinkSymbols INTEGER (1..maxNrofSymbols-1)
 nrofUplinkSymbols INTEGER (1..maxNrofSymbols-1)
 }
 }
}
```

```

TDD-UL-DL-SlotConfig-IAB-MT-r16 ::= SEQUENCE {
 slotIndex-r16
 symbols-IAB-MT-r16
 CHOICE {
 allDownlink-r16
 allUplink-r16
 explicit-r16
 nrofDownlinkSymbols-r16
 nrofUplinkSymbols-r16
 },
 explicit-IAB-MT-r16
 nrofDownlinkSymbols-r16
 nrofUplinkSymbols-r16
 }
 }

TDD-UL-DL-SlotIndex ::= INTEGER (0..maxNrofSlots-1)

-- TAG-TDD-UL-DL-CONFIGDEDICATED-STOP
-- ASN1STOP

```

#### **TDD-UL-DL-ConfigDedicated field descriptions**

##### **slotSpecificConfigurationsToAddModList**

The *slotSpecificConfigurationToAddModList* allows overriding UL/DL allocations provided in tdd-UL-DL-configurationCommon, see TS 38.213 [13], clause 11.1.

#### **TDD-UL-DL-ConfigDedicated-IAB-MT field descriptions**

##### **slotSpecificConfigurationsToAddModList-IAB-MT**

The *slotSpecificConfigurationToAddModList-IAB-MT* allows overriding UL/DL allocations provided in tdd-UL-DL-configurationCommon with a limitation that effectively only flexible symbols can be overwritten in Rel-16.

##### **slotSpecificConfigurationsToReleaseList-IAB-MT**

The *slotSpecificConfigurationsToReleaseList-IAB-MT* allows release of a set of slot configuration previously add with *slotSpecificConfigurationToAddModList-IAB-MT*.

| <b>TDD-UL-DL-SlotConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nrofDownlinkSymbols</b>                     | Number of consecutive DL symbols in the beginning of the slot identified by <i>slotIndex</i> . If the field is absent the UE assumes that there are no leading DL symbols. (see TS 38.213 [13], clause 11.1).                                                                                                                                                                                      |
| <b>nrofUplinkSymbols</b>                       | Number of consecutive UL symbols in the end of the slot identified by <i>slotIndex</i> . If the field is absent the UE assumes that there are no trailing UL symbols. (see TS 38.213 [13], clause 11.1).                                                                                                                                                                                           |
| <b>slotIndex</b>                               | Identifies a slot within a slot configuration period given in <i>tdd-UL-DL-configurationCommon</i> , see TS 38.213 [13], clause 11.1.                                                                                                                                                                                                                                                              |
| <b>symbols</b>                                 | The direction (downlink or uplink) for the symbols in this slot. Value <i>allDownlink</i> indicates that all symbols in this slot are used for downlink; value <i>allUplink</i> indicates that all symbols in this slot are used for uplink; value <i>explicit</i> indicates explicitly how many symbols in the beginning and end of this slot are allocated to downlink and uplink, respectively. |

| <b>TDD-UL-DL-SlotConfig-IAB-MT field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>symbols-IAB-MT</b>                                 | The <i>symbols-IAB-MT</i> is used to configure an IAB-MT with the SlotConfig applicable for one serving cell. Value <i>allDownlink</i> indicates that all symbols in this slot are used for downlink; value <i>allUplink</i> indicates that all symbols in this slot are used for uplink; value <i>explicit</i> indicates explicitly how many symbols in the beginning and end of this slot are allocated to downlink and uplink, respectively; value <i>explicit-IAB-MT</i> indicates explicitly how many symbols in the beginning and end of this slot are allocated to uplink and downlink, respectively. |

## — *TrackingAreaCode*

The IE *TrackingAreaCode* is used to identify a tracking area within the scope of a PLMN/SNPN, see TS 24.501 [23].

### ***TrackingAreaCode* information element**

```
-- ASN1START
-- TAG-TRACKINGAREACODE-START

TrackingAreaCode ::= BIT STRING (SIZE (24))

-- TAG-TRACKINGAREACODE-STOP
-- ASN1STOP
```

## — *T-Reselection*

The IE *T-Reselection* concerns the cell reselection timer *Treselection<sub>RAT</sub>* for NR and E-UTRA. Value in seconds. For value 0, behaviour as specified in 7.1.2 applies.

### ***T-Reselection* information element**

```
-- ASN1START
-- TAG-TRESELECTION-START
```

```
T-Reselection ::= INTEGER (0..7)
-- TAG-TRESELECTION-STOP
-- ASN1STOP
```

### — *TimeAlignmentTimer*

The IE *TimeAlignmentTimer* is used to configure the time alignment timer as specified in TS 38.321 [3]. The values are in ms.

#### ***TimeAlignmentTimer* information element**

```
-- ASN1START
-- TAG-TIMEALIGNMENTTIMER-START
TimeAlignmentTimer ::= ENUMERATED {ms500, ms750, ms1280, ms1920, ms2560, ms5120, ms10240, infinity}
-- TAG-TIMEALIGNMENTTIMER-STOP
-- ASN1STOP
```

### — *TimeToTrigger*

The IE *TimeToTrigger* specifies the value range used for time to trigger parameter, which concerns the time during which specific criteria for the event needs to be met in order to trigger a measurement report. Value *ms0* corresponds to 0 ms and behaviour as specified in 7.1.2 applies, value *ms40* corresponds to 40 ms, and so on.

#### ***TimeToTrigger* information element**

```
-- ASN1START
-- TAG-TIMETOTRIGGER-START
TimeToTrigger ::= ENUMERATED {
 ms0, ms40, ms64, ms80, ms100, ms128, ms160, ms256,
 ms320, ms480, ms512, ms640, ms1024, ms1280, ms2560,
 ms5120}
-- TAG-TIMETOTRIGGER-STOP
-- ASN1STOP
```

### — *TN-AreaId*

The IE *TN-AreaId* is used to identify a TN coverage area in an NTN system.

***TN-AreaId information element***

```
-- ASN1START
-- TAG-TN-AREAID-START

TN-AreaId-r18 ::= INTEGER (1..maxTN-AreaInfo-r18)

-- TAG-TN-AREAID-STOP
-- ASN1STOP
```

***UAC-BarringInfoSetIndex***

The IE *UAC-BarringInfoSetIndex* provides the index of the entry in *uac-BarringInfoSetList*. Value 1 corresponds to the first entry in *uac-BarringInfoSetList*, value 2 corresponds to the second entry in this list and so on. An index value referring to an entry not included in *uac-BarringInfoSetList* indicates no barring.

***UAC-BarringInfoSetIndex information element***

```
-- ASN1START
-- TAG-UAC-BARRINGINFOSETINDEX-START

UAC-BarringInfoSetIndex ::= INTEGER (1..maxBarringInfoSet)

-- TAG-UAC-BARRINGINFOSETINDEX-STOP
-- ASN1STOP
```

***UAC-BarringInfoSetList***

The IE *UAC-BarringInfoSetList* provides a list of access control parameter sets. An access category can be configured with access parameters according to one of the sets.

***UAC-BarringInfoSetList information element***

```
-- ASN1START
-- TAG-UAC-BARRINGINFOSETLIST-START

UAC-BarringInfoSetList ::= SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet
UAC-BarringInfoSetList-v1700 ::= SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet-v1700

UAC-BarringInfoSet ::= SEQUENCE {
 uac-BarringFactor ENUMERATED {p00, p05, p10, p15, p20, p25, p30, p40,
 p50, p60, p70, p75, p80, p85, p90, p95},
 uac-BarringTime ENUMERATED {s4, s8, s16, s32, s64, s128, s256, s512},
 uac-BarringForAccessIdentity BIT STRING (SIZE(7))
}

UAC-BarringInfoSet-v1700 ::= SEQUENCE {
 uac-BarringFactorForAI3-r17 ENUMERATED {p00, p05, p10, p15, p20, p25, p30, p40, p50, p60, p70, p75, p80, p85, p90, p95}
```

```

}

-- TAG-UAC-BARRINGINFOSETLIST-STOP
-- ASN1STOP

```

OPTIONAL -- Need S

| <b><i>UAC-BarringInfoSetList</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>uac-BarringInfoSetList</i></b>                    | List of access control parameter sets. Each access category can be configured with access parameters corresponding to a particular set by <i>uac-barringInfoSetIndex</i> . Association of an access category with an index that has no corresponding entry in the <i>uac-BarringInfoSetList</i> is valid configuration and indicates no barring.                                                                                                                                                                                                                                                           |
| <b><i>uac-BarringForAccessIdentity</i></b>              | Indicates whether access attempt is allowed for each Access Identity. The leftmost bit, bit 0 in the bit string corresponds to Access Identity 1, bit 1 in the bit string corresponds to Access Identity 2, bit 2 in the bit string corresponds to Access Identity 11, bit 3 in the bit string corresponds to Access Identity 12, bit 4 in the bit string corresponds to Access Identity 13, bit 5 in the bit string corresponds to Access Identity 14, and bit 6 in the bit string corresponds to Access Identity 15. Value 0 means that access attempt is allowed for the corresponding access identity. |
| <b><i>uac-BarringFactor</i></b>                         | Represents the probability that access attempt would be allowed during access barring check.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>uac-BarringFactorForAI3</i></b>                   | Barring factor applicable for Access Identity 3. Represents the probability that access attempt would be allowed during access barring check. If absent, the UE considers the access attempt as allowed.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>uac-BarringTime</i></b>                           | The average time in seconds before a new access attempt is to be performed after an access attempt was barred at access barring check for the same access category, see 5.3.14.5.                                                                                                                                                                                                                                                                                                                                                                                                                          |

## – ***UAC-BarringPerCatList***

The IE *UAC-BarringPerCatList* provides access control parameters for a list of access categories.

### ***UAC-BarringPerCatList* information element**

```

-- ASN1START
-- TAG-UAC-BARRINGPERCATLIST-START

#### ***UL-DelayValueConfig field descriptions***

***delay-DRBlist***

Indicates the DRB IDs used by UE to provide results of UL PDCP Packet Delay value per DRB measurement as specified in TS 38.314 [53].

- ***UL-ExcessDelayConfig***

The IE ***UL-ExcessDelayConfig*** IE specifies the configuration of the UL PDCP Excess Packet Delay per DRB measurement specified in TS 38.314 [53].

#### ***UL-ExcessDelayConfig information element***

```

-- ASN1START
-- TAG-ULEXCESSDELAYCONFIG-START

UL-ExcessDelayConfig-r17 ::= SEQUENCE {
 excessDelay-DRBlist-r17 SEQUENCE (SIZE(1..maxDRB)) OF ExcessDelay-DRB-IdentityInfo-r17
}

ExcessDelay-DRB-IdentityInfo-r17 ::= SEQUENCE {
 drb-IdentityList SEQUENCE (SIZE (1..maxDRB)) OF DRB-Identity,

 ms80, ms90, ms100, ms150, ms300, ms500}
}

-- TAG-ULEXCESSDELAYCONFIG-STOP
-- ASN1STOP

```

#### ***UL-ExcessDelayConfig field descriptions***

***drb-IdentityList***

Indicates the DRB IDs used by UE to provide results of UL PDCP Excess Packet Delay per DRB measurement as specified in TS 38.314 [53].

***delayThreshold***

Indicates the delay threshold for the DRB IDs indicated in DRB-IdentityList. Value ms0dot25 corresponds to 0.25ms, ms0dot5 corresponds to 0.5ms, ms1 corresponds to 1ms and so on.

- ***UL-GapFR2-Config***

The IE ***UL-GapFR2-Config*** specifies the FR2 uplink gap configuration.

***UL-GapFR2-Config* information element**

```
-- ASN1START
-- TAG-UL-GAPFR2-CONFIG-START

UL-GapFR2-Config-r17 ::= SEQUENCE {
 gapOffset-r17 INTEGER (0..159),

 ugrp-r17 ENUMERATED {ms5, ms20, ms40, ms160},
 refFR2-ServCellAsyncCA-r17 ServCellIndex
} OPTIONAL -- Cond AsyncCA

-- TAG-UL-GAPFR2-CONFIG-STOP
-- ASN1STOP
```

| <b><i>UL-GapFR2-Config</i> field descriptions</b> |                                                                                                                                                                                                                                       |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gapOffset</b>                                  | Value <i>gapOffset</i> is the gap offset of the FR2 UL gap pattern with UGRP indicated in the field <i>ugrp</i> . The value range is from 0 to <i>ugrp</i> -1.                                                                        |
| <b>refFR2-ServCellAsyncCA</b>                     | Indicates the FR2 serving cell identifier whose SFN and subframe is used for FR2 UL gap calculation for this gap pattern with asynchronous CA involving FR2 carrier(s).                                                               |
| <b>ugl</b>                                        | Value <i>ugl</i> is the gap length in ms of the FR2 UL gap. The FR2 UL gap length is according to Table 9.1.11-1 in TS 38.133 [14]. Value <i>ms0dot125</i> corresponds to 0.125 ms, <i>ms0dot25</i> corresponds to 0.25 ms and so on. |
| <b>ugrp</b>                                       | Value <i>ugrp</i> is the gap repetition period in (ms) of the FR2 UL gap. The FR2 UL gap repetition period is according to Table 9.1.11-1 in TS 38.133 [14].                                                                          |

| Conditional Presence | Explanation                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncCA              | This field is mandatory present when configuring FR2 UL gap pattern to UE in:<br>- (NG)EN-DC, NR SA, NE-DC or NR-DC without FR2-FR2 band combination, with asynchronous CA involving FR2 carriers.<br>Otherwise, it is absent. |

— ***UplinkCancellation***

The IE *UplinkCancellation* is used to configure the UE to monitor PDCCH for the CI-RNTI.

***UplinkCancellation* information element**

```

| <b><i>UplinkCancellation</i> field descriptions</b> |                                                                                                                                                 |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ci-ConfigurationPerServingCell</i></b>        | Indicates (per serving cell) the position of the <i>ci-PayloadSize</i> bit CI values inside the DCI payload (see TS 38.213 [13], clause 11.2A). |
| <b><i>ci-RNTI</i></b>                               | RNTI used for indication cancellation in UL (see TS 38.212 [17] clause 7.3.1 and TS 38.213 [13], clause 11.2A).                                 |
| <b><i>dci-PayloadSizeForCI</i></b>                  | Total length of the DCI payload scrambled with CI-RNTI (see TS 38.213 [13], clause 11.2A).                                                      |

| <i>Ci-ConfigurationPerServingCell</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ci-PayloadSize</i></b>                             | Configures the field size for each UL cancelation indicator of this serving cell (servingCellId) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                          |
| <b><i>deltaOffset</i></b>                                | Configures the additional offset from the end of a PDCCH reception where the UE detects the DCI format 2_4 and the first symbol of the T_<sub>CI</sub> symbols, in the unit of OFDM symbols (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                               |
| <b><i>frequencyRegionForCI</i></b>                       | Configures the reference frequency region where a detected UL CI is applicable (see TS 38.213 [13], clause 11.2A). It is defined in the same way as <i>locationAndBandwidth</i> .                                                                                                                                                                                                                                                                                             |
| <b><i>positionInDCI</i></b>                              | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for this serving cell (servingCellId) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                    |
| <b><i>positionInDCI-ForSUL</i></b>                       | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for SUL of this serving cell (servingCellId) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                             |
| <b><i>timeDurationForCI</i></b>                          | Configures the duration of the reference time region in symbols where a detected UL CI is applicable of this serving cell (servingCellId) (see TS 38.213 [13], clause 11.2A). If the field is absent, i.e., the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is larger than 1 slot or 1 slot with only one monitoring occasion, the UE applies the value of the configured UL CI monitoring periodicity. |
| <b><i>timeFrequencyRegion</i></b>                        | Configures the reference time and frequency region where a detected UL CI is applicable of this serving cell (servingCellId) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                              |
| <b><i>timeGranularityForCI</i></b>                       | Configures the number of partitions within the time region of this serving cell (servingCellId) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                           |
| <b><i>uplinkCancellationPriority</i></b>                 | Configures uplink cancellation behavior if both UL CI and intra-UE priority indicator are configured for a given UE. If the field is present, then UL CI is only applicable to the UL transmissions indicated/configured as low priority level. If the field is absent, UL CI is applicable to UL transmission irrespective of its priority level (see TS 38.213 [13], clause 11.2A).                                                                                         |

| Conditional Presence | Explanation                                                                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUL-Only             | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfig</i> . It is absent otherwise.                                                                                   |
| SymbolPeriodicity    | This field is mandatory present if the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is 1 slot with more than one monitoring occasion, otherwise absent. |

## – *UplinkConfigCommon*

The IE *UplinkConfigCommon* provides common uplink parameters of a cell.

| <b><i>p0AlphaSetforPUSCH, p0AlphaSetforPUCCH, p0AlphaSetforSRS</i></b> | Configures power control parameters for PUSCH, PUCCH and SRS (see TS 38.213 [13], clause 7.2). When the field <i>alpha</i> is absent in <i>p0AlphaSetforPUSCH</i> , the UE applies the value 1 for PUSCH power control. When the field <i>alpha</i> is absent in <i>p0AlphaSetforSRS</i> , the UE applies the value 1 for SRS power control. In <i>p0AlphaSetForPUCCH</i> , the field <i>alpha</i> is absent (not used). |

## – *Uu-RelayRLC-ChannelConfig*

The IE *Uu-RelayRLC-ChannelConfig* is used to configure an RLC entity, a corresponding logical channel in MAC for Uu Relay RLC channel between L2 U2N Relay UE and network, or between a N3C relay UE and network in case of MP.

### *Uu-RelayRLC-ChannelConfig* information element

```
-- ASN1START
-- TAG-UU-RELAYRLC-CHANNELCONFIG-START

Uu-RelayRLC-ChannelConfig-r17 ::= SEQUENCE {
 uu-LogicalChannelIdentity-r17 LogicalChannelIdentity
 uu-RelayRLC-ChannelID-r17 Uu-RelayRLC-ChannelID-r17,
 OPTIONAL, -- Cond RelayLCH-SetupOnly
 reestablishRLC-r17 ENUMERATED {true}
 OPTIONAL, -- Need N
 rlc-Config-r17 RLC-Config
 OPTIONAL, -- Cond RelayLCH-Setup
 mac-LogicalChannelConfig-r17 LogicalChannelConfig
 OPTIONAL, -- Cond RelayLCH-Setup
 ...
}

-- TAG-UU-RELAYRLC-CHANNELCONFIG-STOP
-- ASN1STOP
```

| <i>Uu-RelayRLC-ChannelConfig</i> field descriptions |                                                                                     |
|-----------------------------------------------------|-------------------------------------------------------------------------------------|
| <b><i>uu-LogicalChannelIdentity</i></b>             | Indicates the logical channel id for Uu Relay RLC channel of the L2 U2N Relay UE.   |
| <b><i>uu-RelayRLC-ChannelID</i></b>                 | Indicates the Uu Relay RLC channel in the link between L2 U2N Relay UE and network. |
| <b><i>reestablishRLC</i></b>                        | Indicates that RLC should be re-established.                                        |
| <b><i>rlc-Config</i></b>                            | Determines the RLC mode (UM, AM) and provides corresponding parameters.             |

| Conditional Presence      | Explanation                                                                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>RelayLCH-Setup</i>     | This field is mandatory present upon creation of a new logical channel for a Uu Relay RLC channel. It is optionally present, Need M, otherwise. |
| <i>RelayLCH-SetupOnly</i> | This field is mandatory present upon creation of a new logical channel for a Uu Relay RLC channel. It is absent otherwise.                      |

## – *Uu-RelayRLC-ChannelID*

The IE *Uu-RelayRLC-ChannelID* is used to identify a Uu Relay RLC channel in the link between L2 U2N Relay UE and network.

### *Uu-RelayRLC-ChannelID* information element

```
-- ASN1START
```

```
-- TAG-UU-RELAYRLC-CHANNELID-START
Uu-RelayRLC-ChannelID-r17 ::= INTEGER (1..maxLC-ID)
-- TAG-UU-RELAYRLC-CHANNELID-STOP
-- ASN1STOP
```

## *UplinkTxDirectCurrentList*

The IE *UplinkTxDirectCurrentList* indicates the Tx Direct Current locations per serving cell for each configured UL BWP in the serving cell, based on the BWP numerology and the associated carrier bandwidth.

### *UplinkTxDirectCurrentList* information element

```
-- ASN1START
-- TAG-UPLINKTDXDIRECTCURRENTLIST-START

UplinkTxDirectCurrentList ::= SEQUENCE (SIZE (1..maxNrofServingCells)) OF UplinkTxDirectCurrentCell
UplinkTxDirectCurrentCell ::= SEQUENCE {

 uplinkDirectCurrentBWP
 ...
 [
 uplinkDirectCurrentBWP-SUL
]
}
UplinkTxDirectCurrentBWP ::= SEQUENCE {
 bwp-Id,
 shift7dot5kHz,
 txDirectCurrentLocation
}
-- TAG-UPLINKTDXDIRECTCURRENTLIST-STOP
-- ASN1STOP
```

| <i>UplinkTxDirectCurrentBWP</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bwp-Id</b>                                      | The BWP-Id of the corresponding uplink BWP.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>shift7dot5kHz</b>                               | Indicates whether there is 7.5 kHz shift or not. 7.5 kHz shift is applied if the field is set to <i>true</i> . Otherwise 7.5 kHz shift is not applied.                                                                                                                                                                                                                                                                         |
| <b>txDirectCurrentLocation</b>                     | The uplink Tx Direct Current location for the carrier. Only values in the value range of this field between 0 and 3299, which indicate the subcarrier index within the carrier corresponding to the numerology of the corresponding uplink BWP and value 3300, which indicates "Outside the carrier" and value 3301, which indicates "Undetermined position within the carrier" are used in this version of the specification. |

| <b><i>UplinkTxDirectCurrentCell</i> field descriptions</b> |                                                                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b><i>servCellIndex</i></b>                                | The serving cell ID of the serving cell corresponding to the <i>uplinkDirectCurrentBWP</i> .                        |
| <b><i>uplinkDirectCurrentBWP</i></b>                       | The Tx Direct Current locations for all the uplink BWPs configured at the corresponding serving cell.               |
| <b><i>uplinkDirectCurrentBWP-SUL</i></b>                   | The Tx Direct Current locations for all the supplementary uplink BWPs configured at the corresponding serving cell. |

– ***UplinkTxDirectCurrentMoreCarrierList***

The IE *UplinkTxDirectCurrentMoreCarrierList* indicates the Tx Direct Current locations for intra-band CA including one, two or more uplink carriers. The UE does not report the uplink Direct Current location information for SUL carrier(s).

***UplinkTxDirectCurrentMoreCarrierList* information element**

```
-- ASN1START

|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>CC-Group</i></b>                                                             | The contiguous carriers sharing the same PA in an intra-band UL CA configuration. The UE shall report only one DC location for an intra-band CC combination with one active uplink carrier in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>defaultDC-Location</i></b>                                                   | Indicates the default DC location derivation option. The default Tx Direct Current is located at the mathematical center of the UE bandwidth, i.e. between the lower edge of the lowest subcarrier of the lowest frequency component and the upper edge of the highest subcarrier of the highest frequency component, rounded to the subcarrier grid of the lowest SCS defined for the component carrier on which the default Direct Current is located. The lowest and highest frequency components used for derivation of mathematical center are indicated by <i>FrequencyComponent</i> in the associated CC-Group, where the lowest frequency component and the highest frequency component may be the same. If the mathematical center of the UE bandwidth lands on frequencies where there is no subcarrier grid defined, the subcarrier grid of the lowest SCS of the nearest lower frequency component carrier shall be extended to cover the frequency of the mathematical default Direct Current location. |
| <b><i>offsetToDefault</i></b>                                                      | Indicates the DC location offset to the default DC location derived from <i>defaultDC-Location</i> . The lowest SCS in the CC group is used as the offset granularity. Value 0 represents no offset.<br><i>offsetValue</i> is used in case <i>DefaultDC-Location</i> is set to <i>configuredCarrier</i> or <i>configuredBWP</i> . <i>offsetlist</i> is used in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> . Each entity in this list corresponds to the entry in carriers combination in <i>IntraBandCC-CombinationReqList</i> of the intra-band CA component. For each CC group, the UE shall include the same number of entries, and listed in the same order as in CC-CombinationList. If <i>DefaultDC-Location</i> is set the <i>activeCarrier</i> , same <i>offsetValue</i> is signalled for all requested carriers combinations with same active carriers states(regardless of the active BWP index).                                                                   |
| <b><i>servCellIndexHigher</i></b>                                                  | Indicates the serving cell index of the highest edge of the CC-Group. If absent, there is only one carrier in this group indicated by <i>servCellIndexLower</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>servCellIndexLower</i></b>                                                   | Indicates the serving cell index of the lowest edge of the CC-Group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>shift7dot5kHz</i></b>                                                        | Indicates whether there is 7.5 kHz shift or not. 7.5 kHz shift is applied if the field is set to true, otherwise 7.5 kHz shift is not applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b><i>DefaultDC-Location field descriptions</i></b> |                                                                                                                                |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dl</i></b>                                    | Indicates that the default DC location is derived based on the DL frequencies of the frequency component.                      |
| <b><i>ul</i></b>                                    | Indicates that the default DC location is derived based on the UL frequencies of the frequency component.                      |
| <b><i>ulAndDL</i></b>                               | Indicates that the default DC location is derived based on the edge most frequencies among any DL and UL frequency components. |

## – *UplinkTxDirectCurrentTwoCarrierList*

The IE *UplinkTxDirectCurrentTwoCarrierList* indicates the Tx Direct Current locations when uplink intra-band CA with two carriers is configured, based on the configured carriers and BWP numerology and the associated carrier bandwidth of the carriers. The UE does not report the uplink Direct Current location information for SUL carrier(s).

### ***UplinkTxDirectCurrentTwoCarrierList* information element**

```
-- ASN1START
-- TAG-UPLINKTDXDIRECTCURRENTTWOCARRIERLIST-START
```

```
UplinkTxDirectCurrentTwoCarrierList-r16 ::= SEQUENCE (SIZE (1..maxNrofTxDC-TwoCarrier-r16)) OF UplinkTxDirectCurrentTwoCarrier-r16
```

```

UplinkTxDirectCurrentTwoCarrier-r16 ::= SEQUENCE {
 carrierOneInfo-r16
 carrierTwoInfo-r16
 singlePA-TxDirectCurrent-r16
 secondPA-TxDirectCurrent-r16
} OPTIONAL

UplinkTxDirectCurrentCarrierInfo-r16 ::= SEQUENCE {
 servCellIndex-r16
 servCellInfo-r16
 bwp-Id-r16
 deactivatedCarrier-r16
} }

UplinkTxDirectCurrentTwoCarrierInfo-r16 ::= SEQUENCE {
 referenceCarrierIndex-r16
 shift7dot5kHz-r16
 txDirectCurrentLocation-r16
}

-- TAG-UPLINKTDXDIRECTCURRENTTWOCARRIERLIST-STOP
-- ASN1STOP

```

#### *UplinkTxDirectCurrentTwoCarrierInfo* field descriptions

##### ***referenceCarrierIndex***

The serving cell ID of the carrier which is to be used as the reference for interpreting the Tx Direction Current location as reported using *txDirectCurrentLocation-r16*. The numerology of the uplink BWP ID reported with *bwp-Id-r16* for this serving cell is the numerology used for interpreting the reported subcarrier location.

##### ***shift7dot5kHz***

Indicates whether there is 7.5 kHz shift or not. 7.5 kHz shift is applied if the field is set to *true*. Otherwise 7.5 kHz shift is not applied.

##### ***txDirectCurrentLocation***

The uplink Tx Direct Current location for the two carrier uplink CA with the serving cells reported using *carrierOneInfo-r16* and *carrierTwoInfo-r16*. Values in the range of this field between 0 and 3299 indicate the subcarrier index of the uplink Tx Direct Current location with the subcarrier taken from the serving cell with ID *referenceCarrierIndex* and the numerology of the corresponding uplink BWP reported for this serving cell. Value 3300 indicates "Outside the carrier" and value 3301 indicates "Undetermined position within the carrier".

#### *UplinkTxDirectCurrentCarrierInfo* field descriptions

##### ***bwp-Id***

The BWP ID of the serving cell which is part of the two carrier uplink carrier aggregation. The UE shall not report this field if the serving cell is reported as deactivated using *deactivatedCarrier-r16*.

##### ***deactivatedCarrier***

For the reported uplink Tx Direct Current location(s) corresponding to *singlePA-TxDirectCurrent-r16*, indicates whether the carrier is deactivated or not for this serving cell. If the carrier refers to the PCell, the UE shall not set this field to *deactivated*.

##### ***servCellIndex***

The serving cell ID of the serving cell which is part of the two carrier uplink carrier aggregation.

| <b><i>UplinkTxDirectCurrentTwoCarrier</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>carrierOneInfo</i></b>                                     | The serving cell ID and BWP ID of the first carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                     |
| <b><i>carrierTwoInfo</i></b>                                     | The serving cell ID and BWP ID of the second carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                    |
| <b><i>singlePA-TxDirectCurrent</i></b>                           | The uplink Tx Direct Current location for the UE which support single PA for this uplink carrier aggregation. For the UEs which support dual PA for this uplink carrier aggregation, this field is for reporting the uplink Tx Direct Current location of the first PA.                                                                          |
| <b><i>secondPA-TxDirectCurrent</i></b>                           | The uplink Tx Direct Current location used by the UE with the second PA for the UEs which support dual PA for this uplink carrier aggregation. This field shall be absent for the <i>UplinkTxDirectCurrentTwoCarrier</i> entity where <i>deactivatedCarrier</i> of <i>carrierOneInfo</i> or <i>carrierTwoInfo</i> is set to <i>deactivated</i> . |

### – **ZP-CSI-RS-Resource**

The IE *ZP-CSI-RS-Resource* is used to configure a Zero-Power (ZP) CSI-RS resource (see TS 38.214 [19], clause 5.1.4.2). Reconfiguration of a *ZP-CSI-RS-Resource* between periodic or semi-persistent and aperiodic is not supported.

#### **ZP-CSI-RS-Resource information element**

```
-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCE-START

ZP-CSI-RS-Resource ::= SEQUENCE {
 zp-CSI-RS-ResourceId,
 resourceMapping,
 periodicityAndOffset
 ...
}
zp-CSI-RS-ResourceId ::= INTEGER (0..maxNrofZP-CSI-RS-Resources-1)
-- TAG-ZP-CSI-RS-RESOURCE-STOP
-- ASN1STOP
```

| <b><i>ZP-CSI-RS-Resource</i></b> field descriptions |                                                                                                                                                                                                                                                           |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>periodicityAndOffset</i></b>                  | Periodicity and slot offset for periodic/semi-persistent ZP-CSI-RS (see TS 38.214 [19], clause 5.1.4.2). Network always configures the UE with a value for this field for periodic and semi-persistent ZP-CSI-RS resource (as indicated in PDSCH-Config). |
| <b><i>resourceMapping</i></b>                       | OFDM symbol and subcarrier occupancy of the ZP-CSI-RS resource within a slot.                                                                                                                                                                             |
| <b><i>zp-CSI-RS-ResourceId</i></b>                  | ZP CSI-RS resource configuration ID (see TS 38.214 [19], clause 5.1.4.2).                                                                                                                                                                                 |

| Conditional Presence            | Explanation                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent ZP-CSI-RS-Resources (as indicated in PDSCH-Config). The field is absent otherwise. |

## – *ZP-CSI-RS-ResourceSet*

The IE *ZP-CSI-RS-ResourceSet* refers to a set of *ZP-CSI-RS-Resources* using their *ZP-CSI-RS-ResourceIds*.

### **ZP-CSI-RS-ResourceSet information element**

```
-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCESET-START

ZP-CSI-RS-ResourceSet ::= SEQUENCE {
 zp-CSI-RS-ResourceSetId,
 zp-CSI-RS-ResourceIdList
 ...
}

-- TAG-ZP-CSI-RS-RESOURCESET-STOP
-- ASN1STOP
```

| <b>ZP-CSI-RS-ResourceSet field descriptions</b> |                                                                                                                   |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>zp-CSI-RS-ResourceIdList</b>                 | The list of <i>ZP-CSI-RS-ResourceId</i> identifying the <i>ZP-CSI-RS-Resource</i> elements belonging to this set. |

## – *ZP-CSI-RS-ResourceSetId*

The IE *ZP-CSI-RS-ResourceSetId* identifies a *ZP-CSI-RS-ResourceSet*.

### **ZP-CSI-RS-ResourceSetId information element**

```
-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCESETID-START

ZP-CSI-RS-ResourceSetId ::= INTEGER (0 .. maxNrofZP-CSI-RS-ResourceSets -1)

-- TAG-ZP-CSI-RS-RESOURCESETID-STOP
-- ASN1STOP
```

### 6.3.3 UE capability information elements

- ***AccessStratumRelease***

The IE *AccessStratumRelease* indicates the release supported by the UE.

#### ***AccessStratumRelease* information element**

```
-- ASN1START
-- TAG-ACCESSSTRATUMRELEASE-START

AccessStratumRelease ::= ENUMERATED {
 rel15, rel16, rel17, rel18, spare4, spare3, spare2, spare1, ...
}

-- TAG-ACCESSSTRATUMRELEASE-STOP
-- ASN1STOP
```

- ***AerialParameters***

The IE *AerialParameters* is used to convey the capabilities supported by the UE for aerial operation.

#### ***AerialParameters* information element**

```
-- ASN1START
-- TAG-AERIALPARAMETERS-START

## *BandCombinationList*

The IE *BandCombinationList* contains a list of NR CA, NR non-CA and/or MR-DC band combinations (also including DL only or UL only band).

### ***BandCombinationList* information element**

```

If the field is included in <i>supportedBandCombinationListNEDC-Only-v1610</i> , the UE shall include the same number of entries, and listed in the same order, as in <i>BandCombinationList</i> of <i>supportedBandCombinationListNEDC-Only</i> (without suffix) field. |
| | If the field is included in <i>supportedBandCombinationListNEDC-Only-v15a0</i> , the UE shall include the same number of entries, and listed in the same order, as in <i>BandCombinationList</i> (without suffix) of <i>supportedBandCombinationListNEDC-Only</i> (without suffix) field. |
| BandCombinationList-UplinkTxSwitch-r16, BandCombinationList-UplinkTxSwitch-v1630, BandCombinationList-UplinkTxSwitch-v1640, BandCombinationList-UplinkTxSwitch-v1650, BandCombinationList-UplinkTxSwitch-v1690, BandCombinationList-UplinkTxSwitch-v16a0, BandCombinationList-UplinkTxSwitch-v16e0, BandCombinationList-UplinkTxSwitch-v16j0, BandCombinationList-UplinkTxSwitch-v1700, BandCombinationList-UplinkTxSwitch-v1720, BandCombinationList-UplinkTxSwitch-v1730, BandCombinationList-UplinkTxSwitch-v1760, BandCombinationList-UplinkTxSwitch-v1780, BandCombinationList-UplinkTxSwitch-v1790, BandCombinationList-UplinkTxSwitch-v17b0, BandCombinationList-UplinkTxSwitch-v1800, BandCombinationList-UplinkTxSwitch-v1830, BandCombinationList-UplinkTxSwitch-v1840, BandCombinationList-UplinkTxSwitch-v1860 | The UE shall include the same number of entries, and listed in the same order, as in <i>BandCombinationList-UplinkTxSwitch-r16</i> .
For the field of <i>supportedBandCombinationList-UplinkTxSwitch-v1700</i> , if the UE does not support 2Tx-2Tx switching for a given band combination, the field of <i>supportedBandPairListNR-v1700</i> in the corresponding entry is absent. |
| ca-ParametersNRDC | If the field (without suffix) is included for a band combination in the NR capability container, the field (without suffix) indicates support of NR-DC. Otherwise, the field is absent. If a version of the field (with suffix) is absent for a band combination, <i>ca-ParametersNR</i> field version in <i>BandCombination</i> corresponding to the <i>ca-ParametersNR-ForDC</i> field version in the field (with suffix) is applicable to the UE configured with NR-DC for the band combination. |
| featureSetCombinationDAPS | If this field is present for a band combination, it reports the feature set combination supported for the band combination when any DAPS bearer is configured. |
| ne-DC-BC | If the field is included for a band combination in the MR-DC capability container, the field indicates support of NE-DC. Otherwise, the field is absent. |
| supportedBandPairListNR-r16, supportedBandPairListNR-v1700 | Indicates a list of band pair supporting UL Tx switching as defined in TS 38.101-1 [15] for a given band combination.
A UE supporting 2Tx-2Tx switching should include both of <i>supportedBandPairListNR-r16</i> and <i>supportedBandPairListNR-v1700</i> . And the UE shall include the same number of entries listed in the same order as in <i>supportedBandPairListNR-r16</i> .
If the UE does not support 2Tx-2Tx switching for a given band pair, the field of <i>uplinkTxSwitchingPeriod2T2T</i> in the corresponding entry is absent. |
| supportedBandPairListNR-r18, supportedBandPairListNR-v1840 | Indicates a list of band pair supporting UL Tx switching up to 4 bands as defined in TS 38.101-1 [15] for a given band combination. The UE shall include all the possible band pairs. If <i>supportedBandPairListNR-v1840</i> is included, the UE shall include the same number of entries listed in the same order as in <i>supportedBandPairListNR-r18</i> .
For a band pair only supporting 1Tx-1Tx switching, the UE should include <i>switchingPeriodFor1T</i> in <i>ULTxSwitchingBandPair-r18</i> .
For a band pair supporting 1Tx-2Tx switching, the UE always supports 1Tx-1Tx switching, and the UE should include <i>switchingPeriodFor1T</i> in <i>ULTxSwitchingBandPair-r18</i> .
For a band pair supporting 2Tx-2Tx switching, the UE always supports 1Tx-2Tx switching and 1Tx-1Tx switching, the UE should include <i>switchingPeriodFor2T</i> as well as <i>switchingPeriodFor1T</i> in <i>ULTxSwitchingBandPair-r18</i> . |
| srs-SwitchingTimesListNR | Indicates, for a particular pair of NR bands, the RF retuning time when switching between a NR carrier corresponding to this band entry and another (PUSCH-less) NR carrier corresponding to the band entry in the order indicated below: <ul style="list-style-type: none"> - For the first NR band, the UE shall include the same number of entries for NR bands as in <i>bandList</i>, i.e. first entry corresponds to first NR band in <i>bandList</i> and so on, - For the second NR band, the UE shall include one entry less, i.e. first entry corresponds to the second NR band in <i>bandList</i> and so on - And so on |

| |
|---|
| srs-SwitchingTimesListEUTRA |
| Indicates, for a particular pair of E-UTRA bands, the RF retuning time when switching between an E-UTRA carrier corresponding to this band entry and another (PUSCH-less) E-UTRA carrier corresponding to the band entry in the order indicated below: |
| <ul style="list-style-type: none"> - For the first E-UTRA band, the UE shall include the same number of entries for E-UTRA bands as in <i>bandList</i>, i.e. first entry corresponds to first E-UTRA band in <i>bandList</i> and so on, - For the second E-UTRA band, the UE shall include one entry less, i.e. first entry corresponds to the second E-UTRA band in <i>bandList</i> and so on - And so on |
| srs-TxSwitch |
| Indicates supported SRS antenna switch capability for the associated band. If the UE indicates support of <i>SRS-SwitchingTimeNR</i> , the UE is allowed to set this field for a band with associated <i>FeatureSetUplinkId</i> set to 0 for SRS carrier switching. |
| supportedIntraENDC-BandCombinationList |
| Indicates BCS and/or spectrum contiguity capability for each entry in a list of intra-band (NG)EN-DC components in an inter-band (NG)EN-DC band combination. The UE shall include the entries in the order corresponding to the order of NR band entries of the intra-band (NG)EN-DC components in the <i>bandList</i> in the inter-band (NG)EN-DC band combination (i.e., <i>BandCombination</i> without suffix). |
| uplinkTxSwitchingBandParametersList-v1700 |
| Indicates a list of per band per band combination capabilities for UL Tx switching. |

– *BandCombinationListSidelinkEUTRA-NR*

The IE *BandCombinationListSidelinkEUTRA-NR* contains a list of V2X sidelink and NR sidelink band combinations.

BandParametersSidelinkEUTRA-NR field descriptions

bandParametersSidelinkEUTRA1, bandParametersSidelinkEUTRA2

This field includes the *V2X-BandParameters-r14* and *V2X-BandParameters-v1530* IE as specified in 36.331 [10]. It is used for reporting the per-band capability for V2X sidelink communication.

- *BandCombinationListSL-Discovery*

The IE *BandCombinationListSL-Discovery* contains a list of NR Sidelink discovery band combinations.

***BandCombinationListSidelinkSL-Discovery* information element**

```
-- ASN1START
-- TAG-BANDCOMBINATIONLISTSLDISCOVERY-START

BandCombinationListSL-Discovery-r17 ::= SEQUENCE (SIZE (1..maxSimultaneousBands)) OF BandParametersSidelinkDiscovery-r17

BandParametersSidelinkDiscovery-r17 ::= SEQUENCE {
    sl-CrossCarrierScheduling-r17          ENUMERATED {supported}                                OPTIONAL,

CA-ParametersNRDC field descriptions

ca-ParametersNR-forDC (with and without suffix)

If this field is present for a band combination, it reports the UE capabilities when NR-DC is configured with the band combination. If a version of this field (i.e., with or without suffix) is absent for a band combination, the corresponding *ca-ParametersNR* field version in *BandCombination* is applicable to the UE configured with NR-DC for the band combination. If a version of this field (i.e., with or without suffix) is present for a band combination but does not contain any parameters, the UE does not support the corresponding field version when configured with NR-DC for the band combination.

featureSetCombinationDC

If this field is present for a band combination, it reports the feature set combination supported for the band combination when NR-DC is configured. If this field is absent for a band combination, the *featureSetCombination* in *BandCombination* (without suffix) is applicable to the UE configured with NR-DC for the band combination.

- *CarrierAggregationVariant*

The IE *CarrierAggregationVariant* informs the network about supported "placement" of the SpCell in an NR cell group.

| CodebookParameters field descriptions | |
|---|---|
| <i>supportedCSI-RS-ResourceListAlt</i> | This field indicates the alternative list of <i>SupportedCSI-RS-Resource</i> supported for each codebook type. The supported CSI-RS resource is indicated by an integer value which pinpoints <i>SupportedCSI-RS-Resource</i> defined in <i>CodebookVariantsList</i> . The value 0 corresponds to the first entry of <i>CodebookVariantsList</i> . The value 1 corresponds to the second entry of <i>CodebookVariantsList</i> , and so on. For each codebook type, the field shall be included in both <i>codebookParametersPerBC</i> (but optional for single CC) and <i>codebookParametersPerBand</i> . |
| | |

– *DL-PRS-MeasurementWithRxFH-RRC-Connected*

The IE *DL-PRS-MeasurementWithRxFH-RRC-Connected* is used to convey the capabilities supported by the UE for PRS measurement with Rx frequency hopping within a measurement gap and measurement reporting in RRC_CONNECTED for RedCap UEs.

- *FeatureSetCombination*

The IE *FeatureSetCombination* is a two-dimensional matrix of *FeatureSet* entries.

Each *FeatureSetsPerBand* contains a list of feature sets applicable to the carrier(s) of one band entry of the associated band combination. Across the associated bands, the UE shall support the combination of *FeatureSets* at the same position in the *FeatureSetsPerBand*. All *FeatureSetsPerBand* in one *FeatureSetCombination* must have the same number of entries.

The number of *FeatureSetsPerBand* in the *FeatureSetCombination* must be equal to the number of band entries in an associated band combination. The first *FeatureSetsPerBand* applies to the first band entry of the band combination, and so on.

Each *FeatureSet* contains either a pair of NR or E-UTRA feature set IDs for UL and DL.

In case of NR, the actual feature sets for UL and DL are defined in the *FeatureSets* IE and referred to from here by their ID, i.e., their position in the *featureSetsUplink* / *featureSetsDownlink* list in the *FeatureSet* IE.

In case of E-UTRA, the feature sets referred to from this list are defined in TS 36.331 [10] and conveyed as part of the *UE-EUTRA-Capability* container.

The *FeatureSetUplink* and *FeatureSetDownlink* referred to from the *FeatureSet* comprise, among other information, a set of *FeatureSetUplinkPerCC-Ids* and *FeatureSetDownlinkPerCC-Ids*. The number of these per-CC IDs determines the number of carriers that the UE is able to aggregate contiguously in frequency domain in the corresponding band. The number of carriers supported by the UE is also restricted by the bandwidth class indicated in the associated *BandCombination*, if present.

In feature set combinations the UE shall exclude entries with same or lower capabilities, since the network may anyway assume that the UE supports those.

NOTE 1: The UE may advertise fallback band-combinations in which it supports additional functionality explicitly in two ways: Either by setting FeatureSet IDs to zero (inter-band and intra-band non-contiguous fallback) and by reducing the number of FeatureSet-PerCC IDs in a Feature Set (intra-band contiguous fallback). Or by separate *BandCombination* entries with associated *FeatureSetCombinations*.

NOTE 2: The UE may advertise a *FeatureSetCombination* containing only fallback band combinations. That means, in a *FeatureSetCombination*, each group of *FeatureSets* across the bands may contain at least one pair of *FeatureSetUplinkId* and *FeatureSetDownlinkId* which is set to 0/0.

NOTE 3: The Network configures serving cell(s) and BWP(s) configuration to comply with capabilities derived from the combination of FeatureSets at the same position in the FeatureSetsPerBand, regardless of activated/deactivated serving cell(s) and BWP(s).

FeatureSetCombination information element

```
-- ASN1START
-- TAG-FEATURESETCOMBINATION-START

FeatureSetCombination ::=      SEQUENCE (SIZE (1..maxSimultaneousBands)) OF FeatureSetsPerBand

FeatureSetsPerBand ::=          SEQUENCE (SIZE (1..maxFeatureSetsPerBand)) OF FeatureSet

FeatureSet ::=                  CHOICE {
    eutra
    downlinkSetEUTRA
    uplinkSetEUTRA
},
    nr
    downlinkSetNR
    uplinkSetNR
}

-- TAG-FEATURESETCOMBINATION-STOP
-- ASN1STOP
```

FeatureSetCombinationId

The IE *FeatureSetCombinationId* identifies a *FeatureSetCombination*. The *FeatureSetCombinationId* of a *FeatureSetCombination* is the position of the *FeatureSetCombination* in the featureSetCombinations list (in *UE-NR-Capability* or *UE-MRDC-Capability*). The *FeatureSetCombinationId* = 0 refers to the first entry in the *featureSetCombinations* list (in *UE-NR-Capability* or *UE-MRDC-Capability*).

NOTE: The *FeatureSetCombinationId* = 1024 is not used due to the maximum entry number of *featureSetCombinations*.

FeatureSetCombinationId information element

```
-- ASN1START
-- TAG-FEATURESETCOMBINATIONID-START
```

```
FeatureSetCombinationId ::= INTEGER (0.. maxFeatureSetCombinations)
-- TAG-FEATURESETCOMBINATIONID-STOP
-- ASN1STOP
```

- *FeatureSetDownlink*

The IE *FeatureSetDownlink* indicates a set of features that the UE supports on the carriers corresponding to one band entry in a band combination.

***FeatureSetDownlink* information element**

```

| <i>FeatureSetDownlink</i> field descriptions | |
|--|---|
| <i>featureSetListPerDownlinkCC</i> | Indicates which features the UE supports on the individual DL carriers of the feature set (and hence of a band entry that refer to the feature set). The UE shall hence include at least as many <i>FeatureSetDownlinkPerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-BandwidthClassDL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetDownlinkPerCC-Id</i> in the feature set (see NOTE 1 in <i>FeatureSetCombination</i> IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetDownlinkPerCC-Id</i> in this list. |
| <i>supportedSRS-Resources</i> | Indicates supported SRS resources for SRS carrier switching to the band associated with this <i>FeatureSetDownlink</i> . The UE is only allowed to set this field for a band with associated <i>FeatureSetUplinkId</i> set to 0. |

- ***FeatureSetDownlinkId***

The IE *FeatureSetDownlinkId* identifies a downlink feature set. The *FeatureSetDownlinkId* of a *FeatureSetDownlink* is the index position of the *FeatureSetDownlink* in the *featureSetsDownlink* list in the *FeatureSets* IE. The first element in that list is referred to by *FeatureSetDownlinkId* = 1. The *FeatureSetDownlinkId*=0 is not used by an actual *FeatureSetDownlink* but means that the UE does not support a carrier in this band of a band combination.

***FeatureSetDownlinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETDOWNLINKID-START

FeatureSetDownlinkId ::=          INTEGER (0..maxDownlinkFeatureSets)

-- TAG-FEATURESETDOWNLINKID-STOP
-- ASN1STOP
```

- ***FeatureSetDownlinkPerCC***

The IE *FeatureSetDownlinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

***FeatureSetDownlinkPerCC* information element**

-- TAG-FEATURESETDOWNLINKPERCC-STOP
-- ASN1STOP

```

FeatureSetDownlinkPerCC-Id

The IE *FeatureSetDownlinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetDownlinkPerCC-Id* of a *FeatureSetDownlinkPerCC* is the index position of the *FeatureSetDownlinkPerCC* in the *featureSetsDownlinkPerCC*. The first element in the list is referred to by *FeatureSetDownlinkPerCC-Id* = 1, and so on.

***FeatureSetDownlinkPerCC-Id* information element**

```

-- ASN1START
-- TAG-FEATURESETDOWNLINKPERCC-ID-START

FeatureSetDownlinkPerCC-Id ::=      INTEGER (1..maxPerCC-FeatureSets)

-- TAG-FEATURESETDOWNLINKPERCC-ID-STOP
-- ASN1STOP

```

FeatureSetEUTRA-DownlinkId

The IE *FeatureSetEUTRA-DownlinkId* identifies a downlink feature set in E-UTRA list (see TS 36.331 [10]. The first element in that list is referred to by *FeatureSetEUTRA-DownlinkId* = 1. The *FeatureSetEUTRA-DownlinkId*=0 is used when the UE does not support a carrier in this band of a band combination.

***FeatureSetEUTRA-DownlinkId* information element**

```

-- ASN1START
-- TAG-FEATURESETEUTRADOWNLINKID-START

FeatureSetEUTRA-DownlinkId ::=      INTEGER (0..maxEUTRA-DL-FeatureSets)

-- TAG-FEATURESETEUTRADOWNLINKID-STOP
-- ASN1STOP

```

- ***FeatureSetEUTRA-UplinkId***

The IE *FeatureSetEUTRA-UplinkId* identifies an uplink feature set in E-UTRA list (see TS 36.331 [10]. The first element in that list is referred to by *FeatureSetEUTRA-UplinkId* = 1. The *FeatureSetEUTRA-UplinkId* = 0 is used when the UE does not support a carrier in this band of a band combination.

***FeatureSetEUTRA-UplinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETEUTRAUPLINKID-START

FeatureSetEUTRA-UplinkId ::= INTEGER (0 .. maxEUTRA-UL-FeatureSets)

-- TAG-FEATURESETEUTRAUPLINKID-STOP
-- ASN1STOP
```

- ***FeatureSets***

The IE *FeatureSets* is used to provide pools of downlink and uplink features sets. A *FeatureSetCombination* refers to the IDs of the feature set(s) that the UE supports in that *FeatureSetCombination*. The *BandCombination* entries in the *BandCombinationList* then indicate the ID of the *FeatureSetCombination* that the UE supports for that band combination.

The entries in the lists in this IE are identified by their index position. For example, the *FeatureSetUplinkPerCC-Id* = 4 identifies the 4th element in the *featureSetsUplinkPerCC* list.

NOTE: When feature sets (per CC) IEs require extension in future versions of the specification, new versions of the *FeatureSetDownlink*, *FeatureSetUplink*, *FeatureSets*, *FeatureSetDownlinkPerCC* and/or *FeatureSetUplinkPerCC* will be created and instantiated in corresponding new lists in the *FeatureSets* IE. For example, if new capability bits are to be added to the *FeatureSetDownlink*, they will instead be defined in a new *FeatureSetDownlink-rxy* which will be instantiated in a new *featureSetDownlinkList-rxy* list. If a UE indicates in a *FeatureSetCombination* that it supports the *FeatureSetDownlink* with ID #5, it implies that it supports both the features in *FeatureSetDownlink* #5 and *FeatureSetDownlink-rxy* #5 (if present). The number of entries in the new list(s) shall be the same as in the original list(s).

***FeatureSets* information element**

| FeatureSetUplink field descriptions | |
|--|--|
| featureSetListPerUplinkCC | Indicates which features the UE supports on the individual UL carriers of the feature set (and hence of a band entry that refers to the feature set). The UE shall hence include at least as many <i>FeatureSetUplinkPerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-BandwidthClassUL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetUplinkPerCC-Id</i> in the feature set (see NOTE 1 in <i>FeatureSetCombination</i> IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetUplinkPerCC-Id</i> in this list. |

– *FeatureSetUplinkId*

The IE *FeatureSetUplinkId* identifies an uplink feature set. The *FeatureSetUplinkId* of a *FeatureSetUplink* is the index position of the *FeatureSetUplink* in the *featureSetsUplink* list in the *FeatureSets* IE. The first element in the list is referred to by *FeatureSetUplinkId* = 1, and so on. The *FeatureSetUplinkId* = 0 is not used by an actual *FeatureSetUplink* but means that the UE does not support a carrier in this band of a band combination.

FeatureSetUplinkId information element

```

-- ASN1START
-- TAG-FEATURESETUPLINKID-START

FeatureSetUplinkId ::= INTEGER (0..maxUplinkFeatureSets)

-- TAG-FEATURESETUPLINKID-STOP
-- ASN1STOP

```

- *FeatureSetUplinkPerCC*

The IE *FeatureSetUplinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

FeatureSetUplinkPerCC-Id

The IE *FeatureSetUplinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetUplinkPerCC-Id* of a *FeatureSetUplinkPerCC* is the index position of the *FeatureSetUplinkPerCC* in the *featureSetsUplinkPerCC*. The first element in the list is referred to by *FeatureSetUplinkPerCC-Id* = 1, and so on.

FeatureSetUplinkPerCC-Id information element

-- ASN1START
-- TAG-FEATURESETUPLINKPERCC-ID-START

```
FeatureSetUplinkPerCC-Id ::= INTEGER (1..maxPerCC-FeatureSets)

-- TAG-FEATURESETUPLINKPERCC-ID-STOP
-- ASN1STOP
```

-- ASN1START
-- TAG-FREQBANDINDICATOREUTRA-START

```
FreqBandIndicatorEUTRA ::= INTEGER (1..maxBandsEUTRA)

-- TAG-FREQBANDINDICATOREUTRA-STOP
-- ASN1STOP
```

FreqBandList

The IE *FreqBandList* is used by the network to request NR CA, NR non-CA and/or MR-DC band combinations for specific NR and/or E-UTRA frequency bands and/or up to a specific number of carriers and/or up to specific aggregated bandwidth. This is also used to request feature sets (for NR) and feature set combinations (for NR and MR-DC). For NR sidelink communication, this is used by the initiating UE to request sidelink UE radio access capabilities from the peer UE. This is also used to request lower MSD capability for specific NR frequency bands for the UE supporting lower MSD.

FreqBandList information element

-- ASN1START
-- TAG-FREQBANDLIST-START

| MIMO-ParametersPerBand field descriptions | |
|--|--|
| codebookParametersPerBand | For a given frequency band, this field indicates the alternative list of <i>SupportedCSI-RS-Resource</i> supported for each codebook type. The supported CSI-RS resources indicated by this field are referred by <i>codebookParametersperBC</i> in <i>CA-ParametersNR</i> to indicate the supported CSI-RS resource per band combination. |
| csi-RS-IM-ReceptionForFeedback/ csi-RS-ProcFrameworkForSRS/ csi-ReportFramework | CSI related capabilities which the UE supports on each of the carriers operated on this band. If the network configures the UE with serving cells on both FR1 and FR2 bands these values may be further limited by the corresponding fields in <i>fr1-fr2-Add-UE-NR-Capabilities</i> . |
| supportNewDMRS-Port | Presence of this field set to <i>supported1</i> , <i>supported2</i> or <i>supported3</i> indicates that the UE supports the new DMRS port entry {0,2,3}. |

– *ModulationOrder*

The IE *ModulationOrder* is used to convey the maximum supported modulation order.

ModulationOrder information element

```

Phy-ParametersFRX-Diff field descriptions

csi-RS-IM-ReceptionForFeedback/ csi-RS-ProcFrameworkForSRS/ csi-ReportFramework

These fields are optionally present in *fr1-fr2-Add-UE-NR-Capabilities* in *UE-NR-Capability*. They shall not be set in any other instance of the IE *Phy-ParametersFRX-Diff*. If the network configures the UE with serving cells on both FR1 and FR2 bands, these parameters, if present, limit the corresponding parameters in *MIMO-ParametersPerBand*.

– Phy-ParametersMRDC

The IE *Phy-ParametersMRDC* is used to convey physical layer capabilities for MR-DC.

| <i>RF-Parameters</i> field descriptions | |
|---|--|
| <i>appliedFreqBandListFilter</i> | In this field the UE mirrors the <i>FreqBandList</i> that the NW provided in the capability enquiry, if any, as described in clause 5.6.1.4. The UE filtered the band combinations in the <i>supportedBandCombinationList</i> in accordance with this <i>appliedFreqBandListFilter</i> . The UE does not include this field if the UE capability is requested by E-UTRAN and the network request includes the field <i>eutra-nr-only</i> [10]. |
| <i>dummy1, dummy2, dummy-Itm-MAC-CE-JointTCI-r18, dummy-Itm-MAC-CE-SeparateTCI-r18</i> | <i>dummy1, dummy2, dummy-Itm-MAC-CE-JointTCI-r18, dummy-Itm-MAC-CE-SeparateTCI-r18</i>
The fields are not used in the specification and the network ignores the received values. |
| <i>supportedBandCombinationList</i> | A list of band combinations that the UE supports for NR (and NR-DC, if requested). The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-NR-Capability</i> IE. The UE does not include this field if the UE capability is requested by E-UTRAN and the network request includes the field <i>eutra-nr-only</i> [10]. |
| <i>supportedBandCombinationListSidelinkEUTRA-NR</i> | A list of band combinations that the UE supports for NR sidelink communication only, for joint NR sidelink communication and V2X sidelink communication, or for V2X sidelink communication only. The UE does not include this field if the UE capability is requested by E-UTRAN (see TS 36.331[10]) and the network request includes the field <i>eutra-nr-only</i> . |
| <i>supportedBandCombinationListSL-NonRelayDiscovery</i> | A list of band combinations that the UE supports for NR sidelink non-relay discovery. The encoding is defined in PC5 <i>BandCombinationListSidelinkNR-r16</i> . |
| <i>supportedBandCombinationListSL-RelayDiscovery</i> | A list of band combinations that the UE supports for NR sidelink relay discovery. The encoding is defined in PC5 <i>BandCombinationListSidelinkNR-r16</i> . |
| <i>supportedBandCombinationListSL-U2U-DiscoveryExt</i> | This field indicates the band parameter in <i>BandCombinationListSL-Discovery-r17</i> that the UE supports for NR U2U sidelink relay discovery in a band included in <i>supportedBandCombinationListSL-U2U-RelayDiscovery</i> . |
| <i>supportedBandCombinationListSL-U2U-RelayDiscovery</i> | A list of band combinations that the UE supports for NR U2U sidelink relay discovery. The encoding is defined in PC5 <i>BandCombinationListSidelinkNR-r16</i> . |
| <i>supportedBandCombinationList-UplinkTxSwitch</i> | A list of band combinations that the UE supports dynamic uplink Tx switching for NR UL CA and SUL. The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-NR-Capability</i> IE. The UE does not include this field if the UE capability is requested by E-UTRAN and the network request includes the field <i>eutra-nr-only</i> [10]. |
| <i>supportedBandListNR</i> | A list of NR bands supported by the UE. If <i>supportedBandListNR-v16c0</i> is included, the UE shall include the same number of entries, and listed in the same order, as in <i>supportedBandListNR</i> (without suffix). |

– *RF-ParametersMRDC*

The IE *RF-ParametersMRDC* is used to convey RF related capabilities for MR-DC.

}

-- TAG-UE-CAPABILITYREQUESTFILTERCOMMON-STOP
-- ASN1STOP
```

| UE-CapabilityRequestFilterCommon field descriptions | |
|--|--|
| codebookTypeRequest | Only if this field is present, the UE includes <i>SupportedCSI-RS-Resource</i> supported for the codebook type(s) requested within this field (i.e. type I single/multi-panel, type II and type II port selection) into <i>codebookVariantsList</i> , <i>codebookParametersPerBand</i> and <i>codebookParametersPerBC</i> . If this field is present and none of the codebook types is requested within this field (i.e. empty field), the UE includes <i>SupportedCSI-RS-Resource</i> supported for all codebook types into <i>codebookVariantsList</i> , <i>codebookParametersPerBand</i> and <i>codebookParametersPerBC</i> . |
| fallbackGroupFiveRequest | Only if this field is present, the UE supporting FR2 CA bandwidth class from fallback group 5 shall include band combinations with FR2 CA bandwidth class from fallback group 5, and shall omit band combinations with FR2 CA bandwidth class from fallback group 2 or 3 (see TS 38.101-2 [39]) with same or lower capabilities. |
| includeNE-DC | Only if this field is present, the UE supporting NE-DC shall indicate support for NE-DC in band combinations and include feature set combinations which are applicable to NE-DC. Band combinations supporting both NE-DC and (NG)EN-DC shall be included in <i>supportedBandCombinationList</i> , band combinations supporting only NE-DC shall be included in <i>supportedBandCombinationListNEDC-Only</i> . |
| includeNR-DC | Only if this field is present, the UE supporting NR-DC shall indicate support for NR-DC in band combinations and include feature set combinations which are applicable to NR-DC. |
| lowerMSDRequest | Only if this field is present, the UE supporting lower MSD shall indicate the lower MSD capability for the requested power class if supported. If no power class is explicitly requested, the UE supporting lower MSD shall indicate the lower MSD capability for the highest supported power class of the band combination consisting of victim band and aggressor band(s). |
| mode | The mode of NR-DC operation that the NW is interested in for this cell grouping. The value <i>sync</i> means that the UE only indicates NR-DC support for band combinations for which it supports synchronous NR-DC with the requested cell grouping. The value <i>async</i> means that the UE only indicates NR-DC support for band combinations for which it supports asynchronous NR-DC with the requested cell grouping. |
| omitEN-DC | Only if this field is present, the UE shall omit band combinations and feature set combinations which are only applicable to (NG)EN-DC. |
| requestedCellGrouping | The NR-DC cell groupings that the NW is interested in, i.e., the bands that it might use in an MCG and the bands that it might use in an SCG. Only if this field is present, the UE indicates NR-DC support for band combinations for which it supports the requested cell grouping, i.e., in which it supports at least one of the <i>mcg</i> bands on MCG and at least one of the <i>scg</i> bands on the SCG. In its <i>supportedBandCombinationList</i> , the UE indicates which of its NR-DC band combinations supports which of the requested cell groupings. The first element in this list is referred to by ID#0, the second by ID#1 and so on. If this field is absent, the UE only includes band combinations for which it supports NR-DC with only FR1 bands in MCG and only FR2 bands in SCG.
Example 1: <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n41, n66] and <i>scg</i> =[n78, n261]. This assumes that the NW would always use CA among n1, n7, n41 and n66 (depending on which are deployed on a given site) whereas with n78 and/or n261 the NW may need to use DC. With this filter a UE may report a band combination n1A-n7A-n78A for NR-DC only if it supports that serving cells for n1 and n7 are in the MCG and a serving cell for n78 is in the SCG. The UE may also report a band combination n41C-n261M for NR-DC provided that it supports a serving cell for n41 in the MCG and a serving cell for n261 in the SCG.
Example 2: One <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n41, n66] and <i>scg</i> =[n78, n261] and another <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n66] and <i>scg</i> =[n41, n78, n261]. This assumes that the NW uses sometimes CA among n1, n7, n41 and n66 (as in example 1) and sometimes CA among n1, n7 and n66 but DC towards one or several of n41, n78, n261. If a UE supports n1A-n41A-n78A only if n41A and n78A are in the same cell group, this UE may only indicate cell grouping ID#1 (not #0) in its BC. |
| uplinkTxSwitchRequest | Only if this field is present, the UE supporting dynamic UL Tx switching shall indicate support for UL Tx switching in band combinations which are applicable to inter-band UL CA, SUL and (NG)EN-DC. |

| Conditional Presence | Explanation |
|----------------------|--|
| NRDC | The field is optionally present, Need N, if <i>includeNR-DC</i> is included. It is absent otherwise. |

| <i>AppLayerMeasConfig</i> field descriptions | |
|---|---|
| <i>appLayerMeasPriority</i> | The field indicates the priority of the application layer measurement configuration, where a higher value indicates lower priority. If the field is not configured, the application layer measurement configuration has the lowest priority. |
| <i>idleInactiveReportAllowed</i> | The field indicates whether transmission of application layer measurement configurations and reports for application layer measurements applicable to RRC_IDLE and/or RRC_INACTIVE is allowed in the cell where the field is received. If the field is not configured, transmission of application layer measurement reports and configurations for RRC_IDLE/RRC_INACTIVE is not allowed. |
| <i>measConfigAppLayerContainer</i> | The field contains configuration of application layer measurements, see Annex L (normative) in TS 26.247 [68], clause 16.5 in TS 26.114 [69] and clause 9.4 in TS 26.118 [70]. |
| <i>measConfigAppLayerId</i> | The field contains the identity of the application layer measurements. When application layer measurements are configured for an SCG, the <i>measConfigAppLayerId</i> is obtained according to TS 38.423 [37], clauses 8.3.1 and 8.3.3. |
| <i>pauseReporting</i> | The field indicates whether the transmission of <i>measReportAppLayerContainer</i> is paused or not. Value <i>true</i> indicates the transmission of <i>measReportAppLayerContainer</i> is paused; value <i>false</i> indicates the transmission of <i>measReportAppLayerContainer</i> is not paused. |
| <i>ran-VisibleParameters</i> | The field indicates whether RAN visible application layer measurements shall be reported or not. |
| <i>ran-VisibleReportingSRB</i> | The field indicates the SRB to be used for transmission of RAN visible application layer measurement reports. |
| <i>reportingSRB</i> | The field indicates the SRB to be used for transmission of encapsulated application layer measurement reports. |
| <i>rrc-SegAllowedSRB4</i> | This field indicates that RRC segmentation of <i>MeasurementReportAppLayer</i> is enabled on SRB4. The field is only configured for an MCG. It may be present only if the UE supports RRC segmentation of the <i>MeasurementReportAppLayer</i> message. |
| <i>rrc-SegAllowedSRB5</i> | This field indicates that RRC segmentation of <i>MeasurementReportAppLayer</i> is enabled on SRB5. The field is only configured for an SCG. It may be present only if the UE supports RRC segmentation of the <i>MeasurementReportAppLayer</i> message. |
| <i>serviceType</i> | Indicates the type of application layer measurement. Value <i>streaming</i> indicates Quality of Experience Measurement Collection for streaming services (see TS 26.247 [68]), value <i>mtsi</i> indicates Quality of Experience Measurement Collection for MTSI (see TS 26.114 [69]) and value <i>vr</i> indicates Quality of Experience Measurement Collection for VR service (see TS 26.118 [70]). The network always configures <i>serviceType</i> when application layer measurements are initially configured and at <i>fullConfig</i> . |
| <i>transmissionOfSessionStartStop</i> | Value <i>true</i> indicates that the UE shall transmit indications when the measurement session in the application layer starts and stops. Value <i>false</i> indicates that the UE shall not transmit any session status indications. The UE transmits a session start indication upon configuration of this field set to value <i>true</i> if a session already has started in the application layer. |

| RAN-VisibleParameters field descriptions | |
|---|---|
| numberOfBufferLevelEntries | The field contains the maximum number of buffer level entries that can be reported for RAN visible application layer measurements. This field is also used by application layer to calculate the interval of RAN visible buffer level measurement, which is equal to the periodicity of RAN visible application layer measurements reporting divided by <i>numberOfBufferLevelEntries</i> . |
| ran-VisiblePeriodicity | The field indicates the periodicity of RAN visible application layer measurements reporting. Value <i>ms120</i> indicates 120 ms, value <i>ms240</i> indicates 240 ms and so on. If this field is absent, the periodicity of RAN visible application layer measurements reporting is the same as the reporting periodicity indicated in <i>measConfigAppLayerContainer</i> . |
| reportPlayoutDelayForMediaStartup | The field indicates whether the UE shall report Playout Delay for Media Startup for RAN visible application layer measurements. |

| Conditional Presence | Explanation |
|----------------------|---|
| <i>QoENRDC</i> | This field is optionally present, Need M, when QoE for an NR-DC configuration is configured, i.e. when either QoE for an SCG is configured or when SRB5 is configured. Otherwise, it is absent. |
| <i>ServiceType</i> | This field is optionally present, Need M, when <i>serviceType</i> is set to <i>streaming</i> or <i>vr</i> . Otherwise, it is absent. |

— *AreaConfiguration*

The *AreaConfiguration* indicates area for which UE is requested to perform measurement logging. If not configured, measurement logging is not restricted to specific cells or tracking areas but applies as long as the RPLMN is contained in *plmn-IdentityList* stored in *VarLogMeasReport* or the registered SNPN identity is included in *snpn-ConfigID-List* stored in *VarLogMeasReport*.

***AreaConfiguration* information element**

SNPN-ConfigID-r18 ::= SEQUENCE {
    plmn-Identity-r18
    nid-IdentityList-r18
}
-- TAG-ARECONFIGURATION-STOP

```

-- ASN1STOP

| <i>AreaConfiguration</i> field descriptions | |
|--|---|
| cag-IdentityList | The <i>cag-IdentityList</i> contains one or more CAG IDs. A PLMN ID may be present more than once within <i>CAG-ConfigList</i> . |
| InterFreqTargetInfo | If configured, it indicates the neighbouring frequency and cells for which UE is requested to perform measurement logging. It can include sync raster or non-sync raster frequencies. |
| nid-IdentityList | The <i>nid-IdentityList</i> contains one or more NID. All NIDs associated to the same PLMN ID are listed in the same <i>nid-IdentityList</i> entry. |

– *BT-NameList*

The IE *BT-NameList* is used to indicate the names of the Bluetooth beacon which the UE is configured to measure.

***BT-NameList* information element**

```
-- ASN1START
-- TAG-BTNAMELIST-START

BT-NameList-r16 ::= SEQUENCE (SIZE (1..maxBT-Name-r16)) OF BT-Name-r16
BT-Name-r16 ::= OCTET STRING (SIZE (1..248))

-- TAG-BTNAMELIST-STOP
-- ASN1STOP
```

| <i>BT-NameList</i> field descriptions | |
|--|---|
| bt-Name | If configured, the UE only performs Bluetooth measurements according to the names identified. For each name, it refers to LOCAL NAME defined in Bluetooth specification [51]. |

– *DedicatedInfoF1c*

The IE *DedicatedInfoF1c* is used to transfer IAB-DU specific F1-C related information between the network and the IAB node. The carried information consists of F1AP message encapsulated in SCTP/IP or F1-C related (SCTP)/IP packet, see TS 38.472 [64]. The RRC layer is transparent for this information.

***DedicatedInfoF1c* information element**

```
-- ASN1START
-- TAG-DEDICATEDINFOF1C-START

DedicatedInfoF1c-r17 ::= OCTET STRING
```

```
-- TAG-DEDICATEDINFO1C-STOP
-- ASN1STOP
```

EUTRA-AllowedMeasBandwidth

The IE *EUTRA-AllowedMeasBandwidth* is used to indicate the maximum allowed measurement bandwidth on a carrier frequency as defined by the parameter Transmission Bandwidth Configuration "N_{RB}" in TS 36.104 [33]. The values *mbw6*, *mbw15*, *mbw25*, *mbw50*, *mbw75*, *mbw100* indicate 6, 15, 25, 50, 75 and 100 resource blocks, respectively.

***EUTRA-AllowedMeasBandwidth* information element**

```
-- ASN1START
-- TAG-EUTRA-ALLOWEDMEASBANDWIDTH-START

EUTRA-AllowedMeasBandwidth ::= ENUMERATED {mbw6, mbw15, mbw25, mbw50, mbw75, mbw100}

-- TAG-EUTRA-ALLOWEDMEASBANDWIDTH-STOP
-- ASN1STOP
```

EUTRA-MBSFN-SubframeConfigList

The IE *EUTRA-MBSFN-SubframeConfigList* is used to define an E-UTRA MBSFN subframe pattern (for the purpose of NR rate matching).

***EUTRA-MBSFN-SubframeConfigList* information element**

```
-- ASN1START
-- TAG-EUTRA-MBSFN-SUBFRAMECONFIGLIST-START

EUTRA-MBSFN-SubframeConfigList ::= SEQUENCE (SIZE (1..maxMBSFN-Allocations)) OF EUTRA-MBSFN-SubframeConfig

EUTRA-MBSFN-SubframeConfig ::= SEQUENCE {
    radioframeAllocationPeriod ENUMERATED {n1, n2, n4, n8, n16, n32},
    radioframeAllocationOffset INTEGER (0..7),

        fourFrames BIT STRING (SIZE(8))
    }
}
OPTIONAL, -- Need R
...
}

-- TAG-EUTRA-MBSFN-SUBFRAMECONFIGLIST-STOP
-- ASN1STOP
```

| EUTRA-MBSFN-SubframeConfig field descriptions | |
|--|---|
| radioframeAllocationOffset | Field as defined in <i>MBSFN-SubframeConfig</i> in TS 36.331 [10]. |
| radioframeAllocationPeriod | Field as defined in <i>MBSFN-SubframeConfig</i> in TS 36.331 [10], where SFN refers to the SFN of the NR serving cell. |
| subframeAllocation1 | Field as defined in <i>MBSFN-SubframeConfig</i> in TS 36.331 [10], where the UE assumes the duplex mode (FDD or TDD) of the NR cell for which the <i>E-UTRA-MBSFN-SubframeConfig</i> is provided. |
| subframeAllocation2 | Field as defined in <i>MBSFN-SubframeConfig-v1430</i> in TS 36.331 [10], where the UE assumes the duplex mode (FDD or TDD) of the NR cell for which the <i>E-UTRA-MBSFN-SubframeConfig</i> is provided. |

– *EUTRA-MultiBandInfoList*

The IE *EUTRA-MultiBandInfoList* indicates the list of frequency bands in addition to the band represented by *CarrierFreq* for which cell reselection parameters are common, and a list of *additionalPmax* and *additionalSpectrumEmission*.

***EUTRA-MultiBandInfoList* information element**

```
-- ASN1START
-- TAG-EUTRA-MULTIBANDINFLIST-START

EUTRA-MultiBandInfoList ::= SEQUENCE (SIZE (1..maxMultiBands)) OF EUTRA-MultiBandInfo
EUTRA-MultiBandInfo ::= SEQUENCE {
    eutra-FreqBandIndicator,
    eutra-NS-PmaxList
} OPTIONAL -- Need R
}

-- TAG-EUTRA-MULTIBANDINFLIST-STOP
-- ASN1STOP
```

– *EUTRA-MultiBandInfoListAerial*

The IE *EUTRA-MultiBandInfoListAerial* indicates the list of frequency bands for aerial UE in addition to the band represented by *CarrierFreq* for which cell reselection parameters are common, and a list of *additionalPmax* and *additionalSpectrumEmission*.

***EUTRA-MultiBandInfoListAerial* information element**

```
-- ASN1START
-- TAG-EUTRA-MULTIBANDINFLISTAERIAL-START

EUTRA-MultiBandInfoListAerial-r18 ::= SEQUENCE (SIZE (1..maxMultiBands)) OF EUTRA-MultiBandInfoAerial-r18
```

```

EUTRA-MultiBandInfoAerial-r18 ::=      SEQUENCE {
    eutra-FreqBandIndicator-r18          FreqBandIndicatorEUTRA,
    eutra-NS-PmaxListAerial-r18         EUTRA-NS-PmaxList
}                                         OPTIONAL      -- Need R

-- TAG-EUTRA-MULTIBANDINFOLISTAERIAL-STOP
-- ASN1STOP

```

EUTRA-NS-PmaxList

The IE *EUTRA-NS-PmaxList* concerns a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 36.101 [22], clause 6, for a given frequency band.

***EUTRA-NS-PmaxList* information element**

```

-- ASN1START
-- TAG-EUTRA-NS-PMAXLIST-START

EUTRA-NS-PmaxList ::=      SEQUENCE (SIZE (1..maxEUTRA-NS-Pmax)) OF EUTRA-NS-PmaxValue

EUTRA-NS-PmaxValue ::=      SEQUENCE {
    additionalPmax           INTEGER (-30..33)           OPTIONAL,   -- Need R
    additionalSpectrumEmission INTEGER (1..288)        OPTIONAL,   -- Need R
}

-- TAG-EUTRA-NS-PMAXLIST-STOP
-- ASN1STOP

```

EUTRA-PhysCellId

The IE *EUTRA-PhysCellId* is used to indicate the physical layer identity of the cell, as defined in TS 36.211 [31].

***EUTRA-PhysCellId* information element**

```

-- ASN1START
-- TAG-EUTRA-PHYSCELLID-START

EUTRA-PhysCellId ::=      INTEGER (0..503)

-- TAG-EUTRA-PHYSCELLID-STOP
-- ASN1STOP

```

- ***EUTRA-PhysCellIdRange***

The IE *EUTRA-PhysCellIdRange* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *EUTRA-PhysCellIdRange*, NW may configure overlapping ranges of physical cell identities.

***EUTRA-PhysCellIdRange* information element**

```
-- ASN1START
-- TAG-EUTRA-PHYSCELLIDRANGE-START

EUTRA-PhysCellIdRange ::= SEQUENCE {
    start           EUTRA-PhysCellId,
    range          ENUMERATED {n4, n8, n12, n16, n24, n32, n48, n64, n84, n96,
                           n128, n168, n252, n504, spare2, spare1}      OPTIONAL   -- Need N
}
-- TAG-EUTRA-PHYSCELLIDRANGE-STOP
-- ASN1STOP
```

- ***EUTRA-PresenceAntennaPort1***

The IE *EUTRA-PresenceAntennaPort1* is used to indicate whether all the neighbouring cells use Antenna Port 1. When set to *true*, the UE may assume that at least two cell-specific antenna ports are used in all neighbouring cells.

***EUTRA-PresenceAntennaPort1* information element**

```
-- ASN1START
-- TAG-EUTRA-PRESENCEANTENNAPORT1-START

EUTRA-PresenceAntennaPort1 ::= BOOLEAN
-- TAG-EUTRA-PRESENCEANTENNAPORT1-STOP
-- ASN1STOP
```

- ***EUTRA-Q-OffsetRange***

The IE *EUTRA-Q-OffsetRange* is used to indicate a cell, or frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value in dB. Value *dB-24* corresponds to -24 dB, value *dB-22* corresponds to -22 dB and so on.

***EUTRA-Q-OffsetRange* information element**

```
-- ASN1START
-- TAG-EUTRA-Q-OFFSETRANGE-START
```

```

EUTRA-Q-OffsetRange ::= ENUMERATED {
    dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
    dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
    dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
    dB6, dB8, dB10, dB12, dB14, dB16, dB18,
    dB20, dB22, dB24}

-- TAG-EUTRA-Q-OFFSETRANGE-STOP
-- ASN1STOP

```

- ***IAB-IP-Address***

The IE *IAB-IP-Address* is used to indicate the IP address/prefix.

***IAB-IP-Address* information element**

```

-- ASN1START
-- TAG-IABIPADDRESS-START

IAB-IP-Address-r16 ::= CHOICE {
    IPv4-Address-r16      BIT STRING (SIZE(32)),
    IPv6-Address-r16      BIT STRING (SIZE(128)),
    IPv6-Prefix-r16       BIT STRING (SIZE(64)),
    ...
}

-- TAG-IABIPADDRESS-STOP
-- ASN1STOP

```

| <i>IAB-IP-Address</i> field descriptions | |
|---|---|
| <i>IPv4-Address</i> | This field is used to provide the allocated IPv4 address. |
| <i>IPv6-Address</i> | This field is used to provide the allocated IPv6 address. |
| <i>IPv6-Prefix</i> | This field is used to provide the allocated IPv6 prefix. |

- ***IAB-IP-AddressIndex***

The IE *IAB-IP-AddressIndex* is used to identify a configuration of an IP address.

***IAB-IP-AddressIndex* information element**

```

-- ASN1START
-- TAG-IABIPADDRESSINDEX-START

```

```
IAB-IP-AddressIndex-r16 ::= INTEGER (1..maxIAB-IP-Address-r16)
-- TAG-IABIPADDRESSINDEX-STOP
-- ASN1STOP
```

– ***IAB-IP-Usage***

The IE *IAB-IP-Usage* is used to indicate the usage of the assigned IP address/prefix.

***IAB-IP-Usage* information element**

```
-- ASN1START
-- TAG-IAB-IP-USAGE-START

IAB-IP-Usage-r16 ::= ENUMERATED {f1-C, f1-U, non-F1, spare}

-- TAG-IAB-IP-USAGE-STOP
-- ASN1STOP
```

– ***LoggingDuration***

The *LoggingDuration* indicates the duration for which UE is requested to perform measurement logging. Value min10 corresponds to 10 minutes, value min20 corresponds to 20 minutes and so on.

***LoggingDuration* information element**

```
-- ASN1START
-- TAG-LOGGINGDURATION-START

LoggingDuration-r16 ::= ENUMERATED {
    min10, min20, min40, min60, min90, min120, spare2, spare1}

-- TAG-LOGGINGDURATION-STOP
-- ASN1STOP
```

– ***LoggingInterval***

The *LoggingInterval* indicates the periodicity for logging measurement results. Value ms1280 corresponds to 1.28s, value ms2560 corresponds to 2.56s and so on. Value infinity means it is equal to the configured value of the *LoggingDuration* IE.

***LoggingInterval* information element**

```
-- ASN1START
```

```
-- TAG-LOGGINGINTERVAL-START
LoggingInterval-r16 ::= ENUMERATED {
    ms320, ms640, ms1280, ms2560, ms5120, ms10240, ms20480,
    ms30720, ms40960, ms61440, infinity}
-- TAG-LOGGINGINTERVAL-STOP
-- ASN1STOP
```

– *LogMeasResultListBT*

The IE *LogMeasResultListBT* covers measured results for Bluetooth.

***LogMeasResultListBT* information element**

```
-- ASN1START
-- TAG-LOGMEASRESULTLISTBT-START
LogMeasResultListBT-r16 ::= SEQUENCE (SIZE (1..maxBT-IdReport-r16)) OF LogMeasResultBT-r16
LogMeasResultBT-r16 ::= SEQUENCE {
    bt-Addr-r16      BIT STRING (SIZE (48)),
    rssi-BT-r16      INTEGER (-128..127)   OPTIONAL,
    ...
}
-- TAG-LOGMEASRESULTLISTBT-STOP
-- ASN1STOP
```

| <i>LogMeasResultListBT</i> field descriptions | |
|--|---|
| <i>bt-Addr</i> | This field indicates the Bluetooth public address of the Bluetooth beacon as defined in TS 37.355 [49]. |
| <i>rssi-BT</i> | This field provides the beacon received signal strength indicator (RSSI) in dBm as defined in TS 37.355 [49]. |

– *LogMeasResultListWLAN*

The IE *LogMeasResultListWLAN* covers measured results for WLAN.

***LogMeasResultListWLAN* information element**

```
-- ASN1START
-- TAG-LOGMEASRESULTLISTWLAN-START
LogMeasResultListWLAN-r16 ::= SEQUENCE (SIZE (1..maxWLAN-Id-Report-r16)) OF LogMeasResultWLAN-r16
```

```

LogMeasResultWLAN-r16 ::= SEQUENCE {
    wlan-Identifiers-r16
        WLAN-Identifiers-r16,
    rssiWLAN-r16

    rtt-WLAN-r16
        WLAN-RTT-r16            OPTIONAL,
    ...
}

WLAN-Identifiers-r16 ::= SEQUENCE {
    ssid-r16
        OCTET STRING (SIZE (1..32)) OPTIONAL,
    bssid-r16
        OCTET STRING (SIZE (6))   OPTIONAL,
    hessid-r16
        OCTET STRING (SIZE (6))   OPTIONAL,
    ...
}

WLAN-RSSI-Range-r16 ::= INTEGER(0..141)

WLAN-RTT-r16 ::= SEQUENCE {
    rttValue-r16
        INTEGER (0..16777215),
    rttUnits-r16
        ENUMERATED {
            microseconds,
            hundredsofnanoseconds,
            tensofnanoseconds,
            nanoseconds,
            tenthsofnanoseconds,
            ...},
    rttAccuracy-r16
        INTEGER (0..255)           OPTIONAL,
    ...
}

-- TAG-LOGMEASRESULTLISTWLAN-STOP
-- ASN1STOP

```

| <i>LogMeasResultListWLAN</i> field descriptions | |
|--|---|
| <i>bssid</i> | Basic Service Set Identifier (BSSID) defined in IEEE 802.11-2012 [50]. |
| <i>hessid</i> | Homogenous Extended Service Set Identifier (HESSID) defined in IEEE 802.11-2012 [50]. |

| LogMeasResultListWLAN field descriptions | |
|---|---|
| rssiWLAN | Measured WLAN RSSI result in dBm. The IE WLAN-RSSI-Range specifies the value range used in WLAN RSSI measurements and thresholds. Integer value for WLAN RSSI measurements is according to mapping table in TS 36.133 [40]. Value 0 corresponds to -infinity, value 1 to -100dBm, value 2 to -99dBm, and so on (i.e. in steps of 1dBm) until value 140, which corresponds to 39dBm, while value 141 corresponds to +infinity. |
| rtt-WLAN | This field provides the measured roundtrip time between the target device and WLAN AP and optionally the accuracy expressed as the standard deviation of the delay. Units for each of these are 1000ns, 100ns, 10ns, 1ns, and 0.1ns as defined in TS 37.355 [49]. |
| rttValue | This field specifies the Round Trip Time (RTT) measurement between the target device and WLAN AP in units given by the field rttUnits as defined in TS 37.355 [49]. |
| rttUnits | This field specifies the Units for the fields rttValue and rttAccuracy. The available Units are 1000ns, 100ns, 10ns, 1ns, and 0.1ns as defined in TS 37.355 [49]. |
| rttAccuracy | This field provides the estimated accuracy of the provided rttValue expressed as the standard deviation in units given by the field rttUnits as defined in TS 37.355 [49]. |
| ssid | Service Set Identifier (SSID) defined in IEEE 802.11-2012 [50]. |
| wlan-Identifiers | Indicates the WLAN parameters used for identification of the WLAN for which the measurement results are applicable. |

- **MeasConfigAppLayerId**

The IE *MeasConfigAppLayerId* identifies the application layer measurement.

MeasConfigAppLayerId information element

```
-- ASN1START
-- TAG-MEASCONFIGAPPLAYERID-START

MeasConfigAppLayerId-r17 ::= INTEGER (0..maxNrofAppLayerMeas-1-r17)

-- TAG-MEASCONFIGAPPLAYERID-STOP

```

| OtherConfig field descriptions | |
|---|--|
| aerial-FlightPathAvailabilityConfig | Configuration for the UE to indicate the availability of flight path information for Aerial UE operation. |
| bfd-RelaxationReportingConfig | Configuration for the UE to report the relaxation state of BFD measurements. |
| btNameList | Configuration for the UE to report measurements from specific Bluetooth beacons. NG-RAN configures the field if <i>includeBT-Meas</i> is configured for one or more measurements. |
| candidateBandwidth | Indicates the bandwidth of the candidate frequency range around the center frequency. |
| candidateCenterFreq | Indicates the center frequency of the candidate frequency range. |
| candidateServingFreqListNR | Indicates for each candidate NR serving cells, the center frequency around which UE is requested to report IDC issues. |
| candidateServingFreqRangeListNR | Indicates the candidate frequency range with the combination of the center frequency and the candidate bandwidth, around which the UE is requested to report IDC issues. |
| connectedReporting | Indicates that the UE can report a preference to remain in RRC_CONNECTED state following a report to leave RRC_CONNECTED state. If absent, the UE cannot report a preference to stay in RRC_CONNECTED state. |
| delayBudgetReportingProhibitTimer | Prohibit timer for delay budget reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot4 means prohibit timer is set to 0.4 seconds, and so on. |
| drx-PreferenceConfig | Configuration for the UE to report assistance information to inform the gNB about the UE's DRX preferences for power saving. |
| drx-PreferenceProhibitTimer | Prohibit timer for DRX preferences assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| idc-AssistanceConfig | Configuration for the UE to report assistance information to inform the gNB about UE detected IDC problem. |
| maxBW-PreferenceConfig | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred bandwidth for power saving. |
| maxBW-PreferenceProhibitTimer | Prohibit timer for preferred bandwidth assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| maxCC-PreferenceConfig | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred number of carriers for power saving. |
| maxBW-PreferenceConfigFR2-2 | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred bandwidth for power saving for FR2-2. |
| maxCC-PreferenceProhibitTimer | Prohibit timer for preferred number of carriers assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| maxMIMO-LayerPreferenceConfig | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred number of MIMO layers for power saving. |
| maxMIMO-LayerPreferenceConfigFR2-2 | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred number of MIMO layers for power saving for FR2-2. |
| maxMIMO-LayerPreferenceProhibitTimer | Prohibit timer for preferred number of number of MIMO layers assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |

| | |
|---|---|
| <i>minSchedulingOffsetPreferenceConfig</i> | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred <i>minimumSchedulingOffset</i> value for cross-slot scheduling for power saving. |
| <i>minSchedulingOffsetPreferenceConfigExt</i> | Configuration for the UE to report assistance information to inform the gNB about the UE's preferred <i>minimumSchedulingOffset</i> value for cross-slot scheduling for power saving for SCS 480 kHz and/or 960 kHz. |
| <i>minSchedulingOffsetPreferenceProhibitTimer</i> | Prohibit timer for preferred <i>minimumSchedulingOffset</i> assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| <i>multiRx-PreferenceReportingConfigFR2</i> | Configuration for the UE to report assistance information to inform gNB about the UE's preference on multi-Rx operation for FR2. |
| <i>multiRx-PreferenceReportingConfigFR2ProhibitTimer</i> | Prohibit timer for multi-Rx operation preference reporting for FR2. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| <i>musim-CandidateBandList</i> | A list of candidate bands that the network intends to use, e.g., for serving cells and for which the UE is requested to provide information on temporary restricted capabilities for MUSIM operation as specified in clause 5.7.4.3. |
| <i>musim-GapAssistanceConfig</i> | Configuration for the UE to report assistance information for gap preference. |
| <i>musim-GapPriorityAssistanceConfig</i> | Indicates the UE is allowed to provide MUSIM assistance information for gap(s) priority and/or MUSIM gaps keep preference. |
| <i>musim-GapProhibitTimer</i> | Prohibit timer for MUSIM assistance information reporting for gap preference. |
| <i>musim-LeaveAssistanceConfig</i> | Configuration for the UE to report assistance information for leaving RRC_CONNECTED for MUSIM purpose. |
| <i>musim-LeaveWithoutResponseTimer</i> | Indicates the timer for the UE to enter RRC_IDLE for MUSIM purpose as defined in clause 5.3.8.6. |
| <i>musim-ProhibitTimer</i> | Indicates the prohibit timer for UE temporary restricted capabilities for MUSIM operation. Value in milliseconds. Value ms0 means prohibit timer is set to 0 milliseconds, value ms10 means prohibit timer is set to 10 milliseconds and so on. |
| <i>musim-WaitTimer</i> | Indicates the wait timer for UE temporary restricted capabilities for MUSIM operation. Value in milliseconds. Value ms10 means wait timer is set to 10 milliseconds, value ms20 means wait timer is set to 20 milliseconds and so on. |
| <i>obtainCommonLocation</i> | Requests the UE to attempt to have detailed location information available using GNSS. NR configures the field if <i>includeCommonLocationInfo</i> is configured for one or more measurements. |
| <i>overheatingAssistanceConfig</i> | Configuration for the UE to report assistance information to inform the gNB about UE detected internal overheating. |
| <i>overheatingIndicationProhibitTimer</i> | Prohibit timer for overheating assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| <i>pdu-SessionsToReportUL-TrafficInfoList</i> | A list of PDU sessions for which the UE shall report UL traffic information. |
| <i>propDelayDiffReportConfig</i> | Configuration for the UE to report service link propagation delay difference between serving cell and neighbour cell(s). |
| <i>qfi-ToReportUL-TrafficInfoList</i> | A list of QFIs of a PDU session for which the UE shall report UL traffic information. |

| | |
|---|--|
| referenceTimePreferenceReporting | If present, the field indicates the UE is configured to provide reference time assistance information. |
| releasePreferenceConfig | Configuration for the UE to report assistance information to inform the gNB about the UE's preference to leave RRC_CONNECTED state. |
| rlm-RelaxationReportingConfig | Configuration for the UE to report the relaxation state of RLM measurements. |
| releasePreferenceProhibitTimer | Prohibit timer for release preference assistance information reporting. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s0dot5 means prohibit timer is set to 0.5 seconds, value s1 means prohibit timer is set to 1 second and so on. Value <i>infinity</i> means that once a UE has reported a release preference, the UE cannot report a release preference again during the RRC connection. |
| s-SearchDeltaP-Stationary | Parameter "S_SearchDeltaP-StationaryConnected" in 5.7.4.4. Value dB2 corresponds to 2 dB, dB3 corresponds to 3 dB and so on. |
| scg-DeactivationPreferenceConfig | Configuration of the UE to indicate its preference for SCG deactivation. |
| scg-StatePreferenceProhibitTimer | Prohibit timer for UE indication of its preference for SCG deactivation. Value in seconds. Value s0 means prohibit timer is set to 0 seconds, value s1 means prohibit timer is set to 1 second and so on. |
| sensorNameList | Configuration for the UE to report measurements from specific sensors. NG-RAN configures the field if <i>includeSensor-Meas</i> is configured for one or more measurements. |
| si-AssistanceConfigNR | Indicate whether UE is configured to provide configured grant assistance information for NR sidelink communication. |
| si-PRS-AssistanceConfigNR | Indicate whether UE is configured to provide configured grant assistance information for NR sidelink positioning. |
| sn-InitiatedPSCellChange | This field indicates whether the PSCell change procedure or the CPC included in the <i>RRConfiguration</i> message is SN initiated or not. In case of SN initiated inter-SN PSCell change procedure or SN configured inter-SN CPC, MN includes this field in the MCG RRC Reconfiguration message. In case of intra-SN PSCell change, or intra-SN CPC, source SN includes the field in the SCG RRC Reconfiguration. |
| sourceDAPS-FailureReporting | This field indicates whether the UE shall generate the SHR upon successfully completing the DAPS handover to the target cell and if a radio link failure was experienced in the source PCell while executing the DAPS handover. This field is set in the <i>otherConfig</i> configured by the source cell of the DAPS handover. |
| successHO-Config | Configuration for the UE to report the successful handover information to the network. |
| successPSCell-Config | Configuration for the UE to report the successful PSCell change or addition information to the network. When this field is configured in CG-Config, the <i>thresholdPercentageT304-SCG</i> is absent. |
| t-SearchDeltaP-Stationary | Parameter "T_SearchDeltaP-StationaryConnected" in 5.7.4.4. Value in seconds. Value s5 means 5 seconds, value s10 means 10 seconds and so on. |
| thresholdPercentageT304 | This field indicates the threshold for the ratio in percentage between the elapsed T304 timer and the configured value of the T304 timer. Value p40 corresponds to 40%, value p60 corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the target cell of the handover. |
| thresholdPercentageT310 | This field indicates the threshold for the ratio in percentage between the elapsed T310 timer and the configured value of the T310 timer. Value p40 corresponds to 40%, value p60 corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the source cell of the handover. |
| thresholdPercentageT312 | This field indicates the threshold for the ratio in percentage between the elapsed T312 timer and the configured value(s) of the T312 timer. Value p20 corresponds to 20%, value p40 corresponds to 40% and so on. This field is set in the <i>otherConfig</i> configured by the source cell of the handover. |

| | |
|--------------------------------------|---|
| thresholdPercentageT304-SCG | This field indicates the threshold for the ratio in percentage between the elapsed T304 timer associated to the target PSCell and the configured value of the T304 timer. Value p_{40} corresponds to 40%, value p_{60} corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the target PSCell of the PSCell change or addition. |
| thresholdPercentageT310-SCG | This field indicates the threshold for the ratio in percentage between the elapsed T310 timer associated to the source PSCell and the configured value of the T310 timer. Value p_{40} corresponds to 40%, value p_{60} corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the source PSCell of the PSCell change or CPC, or in the <i>otherConfig</i> configured by the PCell for the PSCell change or CPC. This field is not configured at the time of PSCell change via SRB3. |
| thresholdPercentageT312-SCG | This field indicates the threshold for the ratio in percentage between the elapsed T312 timer associated to the measurement identity of the target PSCell and the configured value of the T312 timer. Value p_{20} corresponds to 20%, value p_{40} corresponds to 40% and so on. This field is set in the <i>otherConfig</i> configured by the source PSCell of the PSCell change or CPC, or in the <i>otherConfig</i> configured by the PCell for the PSCell change or CPC. This field is not configured at the time of PSCell change via SRB3. |
| threshPropDelayDiff | Threshold for one-way service link propagation delay difference report as specified in 5.7.4.2. |
| ul-GapFR2-PreferenceConfig | Indicates whether UE is configured to request for FR2 UL gap activation/deactivation and preferred FR2 UL gap pattern. |
| wlanNameList | Configuration for the UE to report measurements from specific WLAN APs. NG-RAN configures the field if <i>includeWLAN-Meas</i> is configured for one or more measurements. |
| ul-TrafficInfoProhibitTimer | Prohibit timer for UL traffic information reporting. Value in seconds. Value s_0 means prohibit timer is set to 0 seconds, value s_0dot5 means prohibit timer is set to 0.5 seconds, value s_1 means prohibit timer is set to 1 second and so on. |
| ul-TrafficInfoReportingConfig | Configuration for the UE to report UL traffic information. |

| Conditional Presence | Explanation |
|-----------------------|---|
| <i>FDM</i> | This field is optionally present, need R, if <i>idc-AssistanceConfig-r16</i> or <i>idc-FDM-AssistanceConfig</i> is setup. Otherwise, it is absent, need R. |
| <i>maxBW</i> | This field is optionally present, need R, if <i>maxBW-PreferenceConfig-r16</i> is setup; otherwise it is absent, need R. |
| <i>maxMIMO</i> | This field is optionally present, need R, if <i>maxMIMO-LayerPreferenceConfig-r16</i> is setup; otherwise it is absent, need R. |
| <i>minOffset</i> | This field is optionally present, need R, if <i>minSchedulingOffsetPreferenceConfig-r16</i> is setup; otherwise it is absent, need R. |
| <i>musimGapConfig</i> | This field is optionally present, need R, if <i>musim-GapAssistanceConfig-r17</i> is setup; otherwise it is absent, need R. |
| <i>SCG</i> | This field is optionally present, need M, in an <i>RRCReconfiguration</i> message not within <i>mrdc-SecondaryCellGroup</i> and received, either via SRB3 within <i>DLInformationTransferMRDC</i> or via SRB1. Otherwise, it is absent. |

– *PhysCellIdUTRA-FDD*

The IE *PhysCellIdUTRA-FDD* is used to indicate the physical layer identity of the cell, i.e. the primary scrambling code, as defined in TS 25.331 [45].

***PhysCellIdUTRA-FDD* information element**

```
-- ASN1START
-- TAG-PHYSCELLIDUTRA-FDD-START
```

```
PhysCellIdUTRA-FDD-r16 ::= INTEGER (0..511)
```

```
-- TAG-PHYSCELLIDUTRA-FDD-STOP
-- ASN1STOP
```

- ***RRC-TransactionIdentifier***

The IE *RRC-TransactionIdentifier* is used, together with the message type, for the identification of an RRC procedure (transaction).

***RRC-TransactionIdentifier* information element**

```
-- ASN1START
-- TAG-RRC-TRANSACTIONIDENTIFIER-START

RRC-TransactionIdentifier ::= INTEGER (0..3)

-- TAG-RRC-TRANSACTIONIDENTIFIER-STOP
-- ASN1STOP
```

- ***Sensor-NameList***

The IE *Sensor-NameList* is used to indicate the names of the sensors which the UE is configured to measure.

***Sensor-NameList* information element**

```
-- ASN1START
-- TAG-SENSORMANELIST-START

Sensor-NameList-r16 ::= SEQUENCE {
    measUncomBarPre-r16    ENUMERATED {true}          OPTIONAL, -- Need R
    measUeSpeed             ENUMERATED {true}          OPTIONAL, -- Need R
    measUeOrientation        ENUMERATED {true}          OPTIONAL, -- Need R
}

-- TAG-SENSORMANELIST-STOP
-- ASN1STOP
```

| <i>Sensor-NameList</i> field descriptions | |
|--|---|
| <i>measUncomBarPre</i> | If configured, the UE reports the uncompensated Barometric pressure measurement as defined in TS 37.355 [49]. |
| <i>measUeSpeed</i> | If configured, the UE reports the UE speed measurement as defined in TS 37.355 [49]. |
| <i>measUeOrientation</i> | If configured, the UE reports the UE orientation information as defined in TS 37.355 [49]. |

- ***TraceReference***

The *TraceReference* contains parameter Trace Reference as defined in TS 32.422 [52].

***TraceReference* information element**

```
-- ASN1START
-- TAG-TRACEREFERENCE-START

TraceReference-r16 ::= SEQUENCE {
    plmn-Identity-r16      PLMN-Identity,
    traceId-r16            OCTET STRING (SIZE (3))
}

-- TAG-TRACEREFERENCE-STOP
-- ASN1STOP
```

- ***UE-MeasurementsAvailable***

The IE *UE-MeasurementsAvailable* is used to indicate all relevant available indicators for UE measurements.

***UE-MeasurementsAvailable* information element**

```
-- ASN1START
-- TAG-UE-MeasurementsAvailable-START

UE-MeasurementsAvailable-r16 ::= SEQUENCE {
    logMeasAvailable-r16          ENUMERATED {true}           OPTIONAL,

| SL-BWP-Config field descriptions | |
|---|---|
| sl-BWP-DiscPoolConfig | This field indicates the NR sidelink discovery dedicated resource pool configurations on the configured sidelink BWP. The total number of Rx/Tx resource pools configured for communication and discovery does not exceed the maximum number of Rx/Tx resource pool for NR sidelink communication (i.e. <i>maxNrofRXPool-r16/maxNrofTXPool-r16</i>). |
| sl-BWP-Generic | This field indicates the generic parameters on the configured sidelink BWP. |
| sl-BWP-Id | An identifier for this sidelink bandwidth part. |
| sl-BWP-PoolConfig | This field indicates the resource pool configurations on the configured sidelink BWP. |
| sl-BWP-PoolConfigA2X | This field indicates the resource pool configurations for A2X services on the configured sidelink BWP. This field does not include <i>sl-TxPoolScheduling</i> . This field does not include <i>sl-TxPoolExceptional</i> . |
| sl-BWP-PoolConfigPS | This field indicates the resource pool configurations for power saving on the configured sidelink BWP. This field does not include <i>sl-TxPoolExceptional</i> . |
| sl-BWP-PRS-PoolConfig | This field indicates the dedicated SL-PRS resource pool configurations for SL-PRS on the configured sidelink BWP. This field does not include <i>sl-PRS-TxPoolExceptional</i> . Dedicated SL-PRS resource pool is not expected to be configured in the slots colliding with the slots (pre)configured for any other resource pool(s) or S-SSB resource(s) in other SL carriers. |

| SL-BWP-Generic field descriptions | |
|--|---|
| sl-LengthSymbols | This field indicates the number of symbols used for sidelink in a slot without S-SSB. A single value can be (pre)configured per sidelink bandwidth part. |
| sl-StartSymbol | This field indicates the starting symbol used for sidelink in a slot without S-SSB. A single value can be (pre)configured per sidelink bandwidth part. |
| sl-Unlicensed | This field indicates the configurations for sidelink carrier of shared spectrum channel access. This field is not expected to be provided when <i>sl-FreqInfoListSizeExt</i> or <i>sl-PreconfigFreqInfoListSizeExt</i> is present. |
| sl-TxDirectCurrentLocation | The sidelink Tx/Rx Direct Current location for the carrier. Only values in the value range of this field between 0 and 3299, which indicate the subcarrier index within the carrier corresponding to the numerology of the corresponding sidelink BWP and value 3300, which indicates "Outside the carrier" and value 3301, which indicates "Undetermined position within the carrier" are used in this version of the specification. |

| <i>SL-Unlicensed field descriptions</i> | |
|--|--|
| <i>si-AbsoluteFrequencySSB-NonAnchorList</i> | Indicates the lowest S-SSB in a non-anchor RB set via each parameter in this list. Anchor RB set refers to the RB set where S-SSB indicated by <i>si-AbsoluteFrequencySSB-r16</i> locates. |
| <i>si-CPE-StartingPositionS-SSB</i> | Indicates the CPE starting position within the last symbol before the start of S-SSB transmission. The value is an index of the set of all candidate CPE starting positions specified in Table 5.3.1-3 of [16, TS 38.211] for Ci=1 and the corresponding SCS of the SL BWP. |
| <i>si-CWS-ForPsschWithoutHarqAck</i> | The latest CW_p is autonomously increased to the next higher allowed value for every priority class p of {1,2,3,4} if the same CW_p which is different from CW_(max,p) is consecutively used for general of N_init in SL Type 1 LBT for a number of times indicated by this parameter. This operation is restricted only to PSCCH/PSSCH transmission(s) with "HARQ feedback enabled/disabled indicator" in the 2nd stage SCI set to disabled, regardless of whether PSFCH resources being configured in a resource pool. |
| <i>si-GapOfAdditionalSSSB-Occasion</i> | Indicate the gap between each R16/R17 NR SL S-SSB slot and its first corresponding additional candidate S-SSB occasion, and the gap between adjacent two additional candidate S-SSB occasions corresponding to a R16/R17 NR SL S-SSB slot. |
| <i>si-IntraCellGuardBandsSL-List</i> | List of intra-cell guard bands for operation with shared spectrum channel access. If not configured, the guard bands are defined according to 38.101-1 [15], see TS 38.214 [19], clause 7. For operation in licensed spectrum, this field is absent, and no UE action is required.
NOTE: Value '0' is not expected to be (pre-)configured for <i>nrofCRBs</i> when the SL BWP is larger than UE supported RF bandwidth for SL-U operation. |
| <i>si-LBT-FailureRecoveryConfig</i> | Configures parameters used for detection and cancellation of Sidelink consistent LBT failures for operation with shared spectrum channel access, as specified in TS 38.321 [3]. |
| <i>si-NumOfAdditionalSSSBOccasion</i> | Indicate the number of additional candidate S-SSB occasion(s) for each R16/R17 NR SL S-SSB slot. |
| <i>si-SSSBPowerOffsetOfAnchorRBSet</i> | Indicate the power offset for one S-SSB transmission on anchor RB set, where anchor RB set refers to the RB set where S-SSB indicated by <i>si-AbsoluteFrequencySSB-r16</i> locates. Value <i>value1</i> corresponds to the power offset of 10lg(N), where N is the number of S-SSB repetitions within the anchor RB set, and <i>value2</i> corresponds to the power offset of 10lg(W), where W is the maximum total number of S-SSB repetitions on RB sets within the SL-BWP. |
| <i>si-StartingSymbolFirst</i> | Indicates the location of first starting symbol within a slot. Value <i>sym0</i> corresponds to first symbol, value <i>sym1</i> corresponds to the second symbol and so on. If the field is not configured, the UE shall use value <i>sym0</i> . |
| <i>si-StartingSymbolSecond</i> | Indicates the location of second starting symbol within a slot. Value <i>sym3</i> corresponds to fourth symbol, value <i>sym4</i> corresponds to the fifth symbol and so on. The number of symbols used for PSCCH/PSSCH transmission from second starting symbol is not smaller than 6. Within a slot, the second starting symbol is later than the first starting symbol. PSCCH/PSSCH transmission starting from first or second starting symbol shall have the same ending symbol within a slot. |
| <i>si-TransmissionStructureForPSCCHandPSSCH</i> | Indicate a SL-BWP is (pre-)configured with contiguous RB-based or interlace RB-based PSCCH/PSSCH transmission. Contiguous RB-based PSCCH/PSSCH are applicable in region with no OCB requirement, or with OCB exemption. |

| <i>SL-CBR-PriorityTxConfigList</i> field descriptions | |
|--|--|
| <i>sl-CBR-ConfigIndex</i> | Indicates the CBR ranges to be used by an index to the entry of the CBR range configuration in <i>sl-CBR-RangeConfigList</i> . |
| <i>sl-DefaultTxConfigIndex</i> | Indicates the PSSCH transmission parameters to be used by the UEs which do not have available CBR measurement results, by means of an index to the corresponding entry in <i>sl-Tx-ConfigIndexList</i> . Value 0 indicates the first entry in <i>sl-Tx-ConfigIndexList</i> . The field is ignored if the UE has available CBR measurement results. |
| <i>sl-MCS-RangeList</i> | Indicates the minimum MCS value and maximum MCS value for the associated MCS table(s). UE shall ignore the minimum MCS value and maximum MCS value used for table of 64QAM indicated in <i>SL-CBR-PriorityTxConfigList-r16</i> if <i>SL-CBR-PriorityTxConfigList-v1650</i> is present. |
| <i>sl-PriorityThreshold</i> | Indicates the upper bound of priority range which is associated with the configurations in <i>sl-CBR-ConfigIndex</i> and in <i>sl-Tx-ConfigIndexList</i> . The upper bounds of the priority ranges are configured in ascending order for consecutive entries of <i>SL-PriorityTxConfigIndex</i> in <i>SL-CBR-PriorityTxConfigList</i> . For the first entry of <i>SL-PriorityTxConfigIndex</i> , the lower bound of the priority range is 1. |
| <i>SL-CBR-PriorityTxConfigList-v1650</i> | If included, it includes the same number of entries, and listed in the same order, as in <i>SL-CBR-PriorityTxConfigList-r16</i> . |

— ***SL-CBR-CommonTxConfigList***

The IE *SL-CBR-CommonTxConfigList* indicates the list of PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number, CR limit) in *sl-CBR-PSSCH-TxConfigList*, and the list of CBR ranges in *sl-CBR-RangeConfigList*, to configure congestion control to the UE for sidelink communication.

***SL-CBR-CommonTxConfigList* information element**

```
-- ASN1START
-- TAG-SL-CBR-COMMONTXCONFIGLIST-START

SL-CBR-CommonTxConfigList-r16 ::= SEQUENCE {
    sl-CBR-RangeConfigList-r16      SEQUENCE (SIZE (1..maxCBR-Config-r16)) OF SL-CBR-LevelsConfig-r16   OPTIONAL, -- Need M

```

| <i>SL-CBR-CommonTxConfigList</i> field descriptions | |
|--|---|
| <i>sl-CBR-RangeConfigList</i> | Each entry in <i>sl-CBR-RangeConfigList</i> is <i>SL-CBR-LevelsConfig</i> containing the list of CBR ranges. The values within each <i>SL-CBR-LevelsConfig</i> indicate the upper bound of the each CBR range (and implicitly indicate the lower bound of next CBR range) and are configured in ascending order. For the first CBR range of each <i>SL-CBR-LevelsConfig</i> , the lower bound of the CBR range is 0. Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on. |
| <i>sl-CR-Limit</i> | Indicates the maximum limit on the occupancy ratio. Value 0 corresponds to 0, value 1 to 0.0001, value 2 to 0.0002, and so on (i.e. in steps of 0.0001) until value 10000, which corresponds to 1. |
| <i>sl-CBR-PSSCH-TxConfigList</i> | Indicates the list of available PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number and CR limit) configurations. |
| <i>sl-TxParameters</i> | Indicates PSSCH transmission parameters. |

– ***SL-CBR-CommonTxDedicatedSL-PRS-RP-List***

The IE *SL-CBR-CommonTxDedicatedSL-PRS-RP-List* indicates the list of SL PRS transmission parameters (such as Maximum SL PRS transmission power, Maximum Number of SL PRS (re-)transmissions, and CR limit) in *sl-CBR-SL-PRS-TxConfigList*, and the list of CBR ranges in *sl-CBR-RangeDedicatedSL-PRS-RP-List*, to configure congestion control to the UE for sidelink positioning.

```

| SL-ConfigDedicatedNR field descriptions | |
|--|---|
| sl-LBT-SchedulingRequestId | Indicates the scheduling request configuration applicable for Sidelink consistent LBT failure report, as specified in TS 38.321 [3]. |
| sl-MaxTransPowerCA | The maximum total transmit power to be used by the UE across all sidelink carriers. |
| sl-MeasConfigInfoToAddModList | This field indicates the RSRP measurement configurations for unicast destinations to add and/or modify. |
| sl-MeasConfigInfoToReleaseList | This field indicates the RSRP measurement configurations for unicast destinations to remove. |
| sl-PHY-MAC-RLC-Config | This field indicates the lower layer sidelink radio bearer configurations. |
| sl-RadioBearerToAddModList | This field indicates one or multiple sidelink radio bearer configurations to add and/or modify. This field is not configured to the PC5 connection used for L2 U2N relay operation. |
| sl-RadioBearerToReleaseList | This field indicates one or multiple sidelink radio bearer configurations to remove. This field is not configured to the PC5 connection used for L2 U2N relay operation. |

| SL-PHY-MAC-RLC-Config field descriptions | |
|--|--|
| networkControlledSyncTx | This field indicates whether the UE shall transmit synchronisation information (i.e. become synchronisation source). Value <i>on</i> indicates the UE to transmit synchronisation information while value <i>off</i> indicates the UE to not transmit such information. |
| sl-DRX-Config | This field indicates the sidelink DRX configuration(s) for unicast, groupcast and/or broadcast communication, as specified in TS 38.321 [3]. |
| sl-MaxNumConsecutiveDTX | This field indicates the maximum number of consecutive HARQ DTX before triggering sidelink RLF. Value n1 corresponds to 1, value n2 corresponds to 2, and so on. |
| sl-FreqInfoToAddModList, sl-FreqInfoToAddModListExt-v16k0, sl-FreqInfoToAddModListExt-v1800 | This field indicates the NR sidelink communication configuration on some carrier frequency (ies) to add and/or modify. If the network includes <i>sl-FreqInfoToAddModListExt-v16k0</i> , it includes the same number of entries, and listed in the same order, as in <i>sl-FreqInfoToAddModList-r16</i> . If the network includes <i>sl-FreqInfoToAddModListExt-v1800</i> , it includes the same number of entries, and listed in the same order, as in <i>sl-FreqInfoToAddModList-r16</i> . |
| sl-FreqInfoToReleaseList | This field indicates the NR sidelink communication configuration on some carrier frequency (ies) to remove. In this release, only one entry can be configured in the list. |
| sl-RLC-BearerToAddModList, sl-RLC-BearerToAddModListSizeExt | This field indicates one or multiple sidelink RLC bearer configurations to add and/or modify. |
| sl-RLC-BearerToReleaseList, sl-RLC-BearerToReleaseListSizeExt | This field indicates one or multiple sidelink RLC bearer configurations to remove. |
| sl-RLC-ChannelToAddModList | This field indicates one or multiple PC5 Relay RLC Channel configurations to add and/or modify. Each PC5 Relay RLC channel configuration provided by network to L2 U2N Relay UE is uniquely associated with one L2 U2N Remote UE. |
| sl-RLC-ChannelToReleaseList | This field indicates one or multiple PC5 Relay RLC Channel configurations to remove. |
| sl-ScheduledConfig | Indicates the configuration for UE to transmit NR sidelink communication based on network scheduling. This field is not configured simultaneously with <i>sl-UE-SelectedConfig</i> . This field is not configured to a L2 U2N Remote UE. |
| sl-UE-SelectedConfig | Indicates the configuration used for UE autonomous resource selection. This field is not configured simultaneously with <i>sl-ScheduledConfig</i> . |
| sl-CSI-Acquisition | Indicates whether CSI reporting is enabled in sidelink unicast. If the field is absent, sidelink CSI reporting is disabled. |
| sl-CSI-SchedulingRequestId | If present, it indicates the scheduling request configuration applicable for Sidelink CSI Reporting MAC CE and Sidelink DRX Command MAC CE, as specified in TS 38.321 [3]. |
| sl-PRS-SchedulingRequestId | If present, it indicates the scheduling request configuration applicable for Sidelink PRS Request MAC CE, as specified in TS 38.321 [3]. |
| sl-SSB-PriorityNR | This field indicates the priority of NR sidelink SSB transmission and reception. |
| sl-SyncFreqList | Indicates a list of candidate carrier frequencies that can be used for the synchronisation of NR sidelink communication. |
| sl-SyncTxMultiFreq | Indicates that the UE transmits S-SSB on multiple carrier frequencies for NR sidelink communication. If this field is absent, the UE transmits S-SSB only on the synchronisation carrier frequency. |

| <i>SL-SCCH-CarrierSetConfig</i> field descriptions | |
|--|--|
| <i>sl-AllowedCarrierFreqSet1, sl-AllowedCarrierFreqSet2</i> | Indicates the set of carrier frequencies applicable for the transmission of the MAC SDUs from the sidelink SRB logical channels whose associated destination is included in <i>sl-destinationList</i> . If present, network ensures <i>sl-AllowedCarrierFreqSet1</i> and <i>sl-AllowedCarrierFreqSet2</i> do not include the same carrier frequency. The value 1 corresponds to the frequency of first entry in <i>sl-FreqInfoList</i> broadcast in <i>SIB12</i> , the value 2 corresponds to the frequency of first entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> , the value 3 corresponds to the frequency of second entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on. |
| <i>sl-DestinationList</i> | This field indicates the list of destination identify that the <i>sl-AllowedCarrierFreqSet1</i> and <i>sl-AllowedCarrierFreqSet2</i> apply. Only destination identity for unicast link can be included in this field. |
| <i>sl-SRB-Identity</i> | This field indicates the list of sidelink SRB identities that the <i>sl-AllowedCarrierFreqSet1</i> and <i>sl-AllowedCarrierFreqSet2</i> apply. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>L2RelayUE</i> | For L2 U2N Relay UE, the field is optionally present, Need M. Otherwise, it is absent. |
| <i>L2RemoteUE</i> | For L2 U2N Remote UE, the field is optionally present, Need M. Otherwise, it is absent. |
| <i>L2U2N</i> | The field is optional present for L2 U2N or L2 U2U Relay UE and L2 U2N or L2 U2U Remote UE, need N. Otherwise, it is absent. |
| <i>U2URelayUE</i> | For U2U Relay UE, the field is optionally present, Need M. Otherwise, it is absent. |
| <i>U2URemoteUE</i> | For U2U Remote UE, the field is optionally present, Need M. Otherwise, it is absent. |

```

| <i>SL-ConfiguredGrantConfig</i> field descriptions | |
|---|--|
| <i>rrc-ConfiguredSidelinkGrant</i> | Configuration for "sidelink configured grant" transmission with fully RRC-configured SL grant (Type1). If this field is not configured, the UE uses SL grant configured by DCI addressed to SL-CS-RNTI (Type2). |
| <i>si-ConfigIndexCG</i> | This field indicates the ID to identify sidelink configured grant. |
| <i>si-CG-MaxTransNumList</i> | This field indicates the maximum number of times that a TB can be transmitted using the resources provided by the sidelink configured grant. <i>si-Priority</i> corresponds to the logical channel priority. |
| <i>si-FreqResourceCG-Type1</i> | Indicates the frequency resource location of sidelink configured grant type 1. An index giving valid combinations of one or two starting sub-channel and length (jointly encoded) as resource indicator value (RIV), as defined in TS 38.214 [19]. |
| <i>si-HARQ-ProcID-Offset</i> | Indicates the offset used in deriving the HARQ process ID for sidelink configured grant type 1 or sidelink configured grant type 2, see TS 38.321 [3], clause 5.8.3. |
| <i>si-N1PUCCH-AN</i> | This field indicates the PUCCH resource for HARQ feedback for sidelink configured grant type 1. The actual PUCCH-Resource is configured in <i>si-PUCCH-Config</i> and referred to by its ID. |
| <i>si-N1PUCCH-AN-Type2</i> | This field indicates the PUCCH resource for HARQ feedback for PSCCH/PSSCH transmissions without a corresponding PDCCH on sidelink configured grant type 2. The actual PUCCH-Resource is configured in <i>si-PUCCH-Config</i> and referred to by its ID. |
| <i>si-NrOfHARQ-Processes</i> | This field indicates the number of HARQ processes configured for a specific sidelink configured grant. It applies for both type 1 and type 2. |
| <i>si-PeriodCG</i> | This field indicates the period of sidelink configured grant in the unit of ms. |
| <i>si-PSFCH-ToPUCCH-CG-Type1</i> | This field, for sidelink configured grant type 1, indicates slot offset between the PSFCH associated with the last PSSCH resource of each period and the PUCCH occasion used for reporting sidelink HARQ. |
| <i>si-ResourcePoolID</i> | Indicates the resource pool in which the sidelink configured grant type 1 is applied. |
| <i>si-StartRBsetCG-Type1</i> | Indicates starting RB set index of the initial PSSCH transmission of the sidelink configured grant Type 1 for interlace RB-based PSSCH transmission. |
| <i>si-StartSubchannelCG-Type1</i> | This field indicates the starting sub-channel of sidelink configured grant type 1. An index giving valid sub-channel index. |
| <i>si-TimeOffsetCG-Type1</i> | This field indicates the slot offset with respect to logical slot defined by <i>si-TimeReferenceSFN-Type1</i> , as specified in TS 38.321 [3]. |
| <i>si-TimeReferenceSFN-Type1</i> | Indicates SFN used for determination of the offset of a resource in time domain. If it is present, the UE uses the 1 st logical slot of associated resource pool after the starting time of the closest SFN with the indicated number preceding the reception of the sidelink configured grant configuration type 1 as reference logical slot, see TS 38.321 [3], clause 5.8.3. If it is not present, the reference SFN is 0. |
| <i>si-TimeResourceCG-Type1</i> | This field indicates the time resource location of sidelink configured grant type 1. An index giving valid combinations of up to two slot positions (jointly encoded) as time resource indicator value (TRIV), as defined in TS 38.212 [17]. |

- ***SL-ConfiguredGrantConfigDedicated-SL-PRS-RP***

The IE ***SL-ConfiguredGrantConfigDedicated-SL-PRS-RP*** specifies the configured grant configuration information for NR sidelink positioning in a dedicated SL-PRS resource pool.

***SL-ConfiguredGrantConfigDedicated-SL-PRS-RP* information element**

```
-- ASN1START

| <i>SL-ConfiguredGrantConfigDedicated-SL-PRS-RP</i> field descriptions | |
|--|--|
| <i>sl-PRS-ConfigIndexCG</i> | This field indicates the ID to identify sidelink configured grant. The field value should not be duplicated with <i>sl-ConfigIndexCG</i> in IE <i>SL-ConfiguredGrantConfig</i> . |
| <i>sl-PRS-PeriodCG</i> | This field indicates the period of SL PRS configured grant in a dedicated resources in ms for either CG type 1 or CG type 2. |
| <i>sl-PRS-ResourceIndicationFirstType1</i> | Indicates SL-PRS Resource ID for the first SL-PRS transmission. |
| <i>sl-PRS-ResourceIndicationFutureType1</i> | Indicates SL-PRS resource IDs for future SL PRS transmissions. An index giving valid combinations of up to two SL PRS resource IDs (jointly encoded). |
| <i>sl-PRS-ResourcePoolID</i> | Indicates the resource pool in which the configured sidelink grant Type 1 is applied. This field value is configured with value up to 8 (<i>maxNrofSL-PRS-TxPool-r18</i>). The network always configures this field when <i>rrc-ConfiguredSidelinkGrantDedicated-SL-PRS-RP</i> contains parameters for a type 1 configured grant. |
| <i>sl-TimeOffsetCG-Type1</i> | This field indicates the slot offset with respect to logical slot defined by <i>sl-TimeReferenceSFN-Type1-Dedicated-SL-PRS-RP</i> , as specified in TS 38.321 [3]. |
| <i>sl-TimeReferenceSFN-Type1</i> | Indicates SFN used for determination of the offset of a resource in time domain. If it is present, the UE uses the 1 st logical slot of associated resource pool after the starting time of the closest SFN with the indicated number preceding the reception of the sidelink configured grant configuration type 1 as reference logical slot, see TS 38.321 [3], clause 5.8.3. If it is not present, the reference SFN is 0. |
| <i>sl-TimeResourceCG-Type1</i> | This field indicates the time resource location of sidelink configured grant type 1. An index giving valid combinations of up to two slot positions (jointly encoded) as time resource indicator value (TRIV), as defined in TS 38.212 [17]. |

- ***SL-DestinationIdentity***

The IE *SL-DestinationIdentity* is used to identify a destination of a NR sidelink communication.

***SL-DestinationIdentity* information element**

```
-- ASN1START
-- TAG-SL-DESTINATIONIDENTITY-START

SL-DestinationIdentity-r16 ::=      BIT STRING (SIZE (24))

-- TAG-SL-DESTINATIONIDENTITY-STOP
-- ASN1STOP
```

- ***SL-DRX-Config***

The IE *SL-DRX-Config* is used to configure DRX related parameters for NR sidelink communication/discovery. The SL DRX timers should be calculated in the unit of physical slot.

***SL-DRX-Config* information element**

```
-- ASN1START
-- TAG-SL-DRX-CONFIG-START

SL-DRX-Config-r17 ::=          SEQUENCE {
    sl-DRX-ConfigGC-BC-r17           OPTIONAL,      -- Cond HO

```

| <i>SL-DRX-ConfigGC-BC field descriptions</i> | |
|--|---|
| <i>si-DefaultDRX-GC-BC</i> | Indicates the default sidelink DRX configuration for groupcast and broadcast communications, which is used for QoS profile(s) that cannot be mapped into DRX configuration(s) configured for dedicated QoS profile(s). This field can be applied for the broadcast based or unicast based communication of Direct Link Establishment Request as described in TS 24.587 [57], ProSe Direct Link Establishment Request message and discovery message as described in TS 24.554 [72]. |
| <i>si-DRX-GC-BC-PerQoS-List</i> | List of one or multiple sidelink DRX configurations for groupcast and broadcast communication, which are mapped from QoS profile(s). |
| <i>si-DRX-GC-BC-Cycle</i> | Value in ms, ms10 corresponds to 10ms, ms20 corresponds to 20 ms, ms32 corresponds to 32 ms, and so on. |
| <i>si-DRX-GC-BC-MappedQoS-FlowsList</i> | List of QoS profiles of the NR sidelink communication, which are mapped to a sidelink DRX configuration. |
| <i>si-DRX-GC-BC-OnDurationTimer</i> | Value in multiples of 1/32 ms (subMilliSeconds) or in ms (milliSecond). For the latter, value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, and so on. |
| <i>si-DRX-GC-HARQ-RTT-Timer1, si-DRX-GC-HARQ-RTT-Timer2</i> | Value in number of slot lengths of the sidelink BWP where the transport block was received. Value sl0 corresponds to 0 slots, sl1 corresponds to 1 slot, sl2 corresponds to 2 slots, and so on. <i>si-DRX-GC-HARQ-RTT-Timer1</i> is used for HARQ feedback enabled sidelink retransmission if SCI does not indicate retransmission resource(s). <i>si-DRX-GC-HARQ-RTT-Timer2</i> is used for HARQ feedback disabled sidelink retransmission in resource pool configured with PSFCH if SCI does not indicate retransmission resource(s). |
| <i>si-DRX-GC-Generic</i> | Indicates a sidelink DRX configuration for groupcast communication, which is applicable to any QoS profile or any Destination Layer-2 ID. |
| <i>si-DRX-GC-InactivityTimer</i> | Value in multiple integers of 1 ms, ms0 corresponds to 0, ms1 corresponds to 1 ms, ms2 corresponds to 2 ms, and so on. This field is only valid for groupcast communication. |
| <i>si-DRX-GC-RetransmissionTimer</i> | Value in number of slot lengths of the sidelink BWP where the transport block was received. Value sl0 corresponds to 0 slots, sl1 corresponds to 1 slot, sl2 corresponds to 2 slots, and so on. |

– ***SL-DRX-ConfigUC***

The IE *SL-DRX-ConfigUC* is used to configure sidelink DRX related parameters for unicast communication.

| SL-FreqConfig field descriptions | |
|---|--|
| absenceOfAnyOtherTechnology | Presence of this field indicates absence on a long term basis (e.g. by level of regulation) of any other technology sharing the carrier; absence of this field indicates the potential presence of any other technology sharing the carrier, as specified in TS 37.213 [48] clauses 4.5. This parameter is not expected to be provided if the sidelink carrier is overlapped with uplink carrier. |
| additionalSpectrumEmission | Provides the <i>additionalSpectrumEmission</i> values as defined in TS 38.101-1 [15], clause 6.2E.3.1 or 6.2E.3F.1. Only one of <i>additionalSpectrumEmission-r16</i> or <i>additionalSpectrumEmission-v1860</i> is configured by network for each sidelink frequency. |
| si-EnergyDetectionConfig | Indicates whether to use the <i>maxEnergyDetectionThreshold</i> or the <i>energyDetectionThresholdOffset</i> (see TS 37.213 [48], clause 4.5.5). |
| si-EnergyDetectionThresholdOffset | Indicates the offset to the default maximum energy detection threshold value. Unit in dB. Value -13 corresponds to -13dB, value -12 corresponds to -12dB, and so on (i.e. in steps of 1dB) as specified in TS 37.213 [48], clause 4.5.5. |
| frequencyShift7p5kHzSL | Enable the NR SL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled. |
| harq-ACK-FeedbackRatioforCW-AdjustmentGC-Option2 | Indicates the ratio threshold for contention window adjustment for SL groupcast option 2 as specified in TS 37.213 [48], clause 4.5.4. Unit is percentage. |
| si-MaxEnergyDetectionThreshold | Indicates the absolute maximum energy detection threshold value. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm) as specified in TS 37.213 [48], clause 4.5.5. |
| si-AbsoluteFrequencyPointA | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A. |
| si-AbsoluteFrequencySSB | Indicates the frequency location of sidelink SSB. The transmission bandwidth for sidelink SSB is within the bandwidth of this sidelink BWP. |
| si-BWP-ToAddModList | This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration is to be added or reconfigured. In this release, only one BWP is allowed to be configured for NR sidelink communication. |
| si-BWP-ToReleaseList | This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration is to be released. |
| si-Freq-Id | This field indicates the identity of the dedicated configuration information on the carrier frequency for NR sidelink communication. |
| si-SCS-SpecificCarrierList | A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. In this release, only one <i>SCS-SpecificCarrier</i> is allowed to be configured for NR sidelink communication. |
| si-SyncTxDisabled | Indicates that the carrier, even though equipped with synchronisation resources, cannot be used as a synchronisation carrier frequency to transmit S-SSB. |
| si-SyncPriority | This field indicates synchronization priority order, as specified in clause 5.8.6. <i>si-SyncPriority</i> is configured with the same value across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies. |
| ue-ToUE-COT-SharingED-Threshold | Indicates the energy detection threshold that a UE uses to initiate a channel occupancy with other UE(s), and the other UE(s) that shares the initiated channel occupancy shall use this configured parameter for accessing the channel(s) as specified in TS 37.213 [48], clause 4.5.5 for sidelink channel access. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm). |
| valueN | Indicate the NR SL transmission with a <i>valueN</i> *5kHz shift to the LTE raster. (see TS 38.101-1 [15], clause 5.4E.2). |

| Conditional Presence | Explanation |
|----------------------|---|
| V2X-SL-Shared | This field is mandatory present if the carrier frequency configured for NR sidelink communication is shared by V2X sidelink communication. It is absent, Need R, otherwise. |

- *SL-FreqConfigCommon*

The IE *SL-FreqConfigCommon* specifies the cell-specific configuration information on one particular carrier frequency for NR sidelink communication/positioning.

| <i>SL-FreqConfigCommon</i> field descriptions | |
|--|---|
| <i>absenceOfAnyOtherTechnology</i> | Presence of this field indicates absence on a long term basis (e.g. by level of regulation) of any other technology sharing the carrier; absence of this field indicates the potential presence of any other technology sharing the carrier, as specified in TS 37.213 [48] clauses 4.5.5. This parameter is not expected to be provided if the sidelink carrier is overlapped with uplink carrier. |
| <i>additionalSpectrumEmission</i> | Provides the <i>additionalSpectrumEmission</i> values as defined in TS 38.101-1 [15], clause 6.2E.3.1 or 6.2E.3F.1. Only one of <i>additionalSpectrumEmission-r16</i> or <i>additionalSpectrumEmission-v1860</i> is configured by network for each sidelink frequency. |
| <i>si-EnergyDetectionConfig</i> | Indicates whether to use the <i>maxEnergyDetectionThreshold</i> or the <i>energyDetectionThresholdOffset</i> (see TS 37.213 [48], clause 4.5.5). |
| <i>si-EnergyDetectionThresholdOffset</i> | Indicates the offset to the default maximum energy detection threshold value. Unit in dB. Value -13 corresponds to -13dB, value -12 corresponds to -12dB, and so on (i.e. in steps of 1dB) as specified in TS 37.213 [48], clause 4.5.5. |
| <i>frequencyShift7p5kHzSL</i> | Enable the NR SL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled. |
| <i>harq-ACK-FeedbackRatioforCW-AdjustmentGC-Option2</i> | Indicates the ratio threshold for contention window adjustment for SL groupcast option 2 as specified in TS 37.213 [48], clause 4.5.4. Unit is percentage. |
| <i>si-MaxEnergyDetectionThreshold</i> | Indicates the absolute maximum energy detection threshold value. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm) as specified in TS 37.213 [48], clause 4.5.5. |
| <i>si-AbsoluteFrequencyPointA</i> | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A. |
| <i>si-AbsoluteFrequencySSB</i> | Indicates the frequency location of sidelink SSB. The transmission bandwidth for sidelink SSB is within the bandwidth of this sidelink BWP. |
| <i>si-BWP-List</i> | This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration. In this release, only one BWP is allowed to be configured for NR sidelink communication. |
| <i>si-NbAsSync</i> | This field indicates whether the network can be selected as synchronization reference directly/indirectly only, if <i>sl-SyncPriority</i> is set to gnss. If this field is set to TRUE, the network is enabled to be selected as synchronization reference directly/indirectly. The field is only present in <i>SidelinkPreconfigNR</i> . Otherwise it is absent. All values in <i>sl-NbAsSync</i> are same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies. |
| <i>si-PosBWP-List</i> | This field indicates the list of sidelink BWP(s) for NR sidelink positioning configuration. Only one BWP is allowed to be configured for NR sidelink positioning. |
| <i>si-SyncTxDisabled</i> | Indicates that the carrier, even though equipped with synchronisation resources, cannot be used as a synchronisation carrier frequency to transmit S-SSB. |
| <i>si-SyncPriority</i> | This field indicates synchronization priority order, as specified in clause 5.8.6. All values in <i>sl-SyncPriority</i> are same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies. |
| <i>si-SyncConfigList</i> | This field indicates the configuration by which the UE is allowed to receive and transmit synchronisation information for NR sidelink communication. Network configures <i>sl-SyncConfig</i> including <i>txParameters</i> when configuring UEs to transmit synchronisation information. If this field is configured in <i>SL-PreconfigurationNR-r16</i> , only one entry is configured in <i>sl-SyncConfigList</i> . |
| <i>ue-ToUE-COT-SharingED-Threshold</i> | Indicates the energy detection threshold that a UE uses to initiate a channel occupancy with to other UE(s), and the other UE(s) that shares the initiated channel occupancy shall use this configured parameter for accessing the channel(s) as specified in TS 37.213 [48], clause 4.5.5 for sidelink channel access. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm). |

valueN

Indicate the NR SL transmission with a valueN *5kHz shift to the LTE raster (see TS 38.101-1 [15], clause 5.4E.2).

| Conditional Presence | Explanation |
|----------------------|---|
| SIB12 | This field is optional present if included within SIB12, need R. Otherwise, the field is absent. |
| SIB23 | This field is optional present if included within SIB23, need R. Otherwise, the field is absent. |
| V2X-SL-Shared | This field is mandatory present if the carrier frequency configured for NR sidelink communication is shared by V2X sidelink communication. It is absent, Need R, otherwise. |

– *SL-FreqSelectionConfig*

The IE *SL-FreqSelectionConfig* specifies the configuration information for carrier selection for NR sidelink transmission using UE autonomous resource selection.

***SL-FreqSelectionConfig* information element**

```
-- ASN1START
-- TAG-SL-FREQSELECTIONCONFIG-START

SL-FreqSelectionConfig-r18 ::= SEQUENCE {
    sl-priorityList-r18      SEQUENCE (SIZE (1..8)) OF INTEGER (1..8),
    sl-threshCBR-FreqReselection-r18 SL-CBR-r16,
    sl-threshCBR-FreqKeeping-r18   SL-CBR-r16
}
-- TAG-SL-FREQSELECTIONCONFIG-STOP
-- ASN1STOP
```

| <i>SL-FreqSelectionConfig</i> field descriptions | |
|---|---|
| <i>sl-priorityList</i> | Indicates the list of sidelink logical channel priority which is associated with the configurations in <i>sl-threshCBR-FreqReselection</i> and in <i>sl-threshCBR-FreqKeeping</i> . |
| <i>sl-threshCBR-FreqReselection</i> | Indicates the CBR threshold based on which UE determines whether the carrier frequency can be (re)selected for the transmission of NR sidelink. See TS 38.321 [3]. |
| <i>sl-threshCBR-FreqKeeping</i> | Indicates the CBR threshold based on which UE determines whether the UE can keep using the carrier which was selected for the transmission of NR sidelink. See TS 38.321 [3]. |

– *SL-IndirectPathAddChange*

The IE *SL-IndirectPathAddChange* specifies the configuration information of SL indirect path for SL indirect path addition/change in MP.

***SL-IndirectPathAddChange* information element**

```
-- ASN1START
-- TAG-SL-INDIRECTPATHADDCHANGE-START

SL-IndirectPathAddChange-r18 ::= SEQUENCE {
    sl-IndirectPathRelayUE-Identity-r18,
    sl-IndirectPathCellIdentity-r18
    t421-r18
    ...
}

-- TAG-SL-INDIRECTPATHADDCHANGE-STOP
-- ASN1STOP
```

| <i>SL-IndirectPathAddChange</i> field descriptions | |
|---|---|
| <i>sl-IndirectPathRelayUEIdentity</i> | Indicates the L2 source ID of the L2 U2N Relay UE of SL indirect path. |
| <i>sl-IndirectPathCellIdentity</i> | Identifies the serving cell of the indicated L2 U2N Relay UE. |
| <i>t421</i> | Indicates the timer value of T421 to be used during indirect path addition or change. |

– ***SL-InterUE-CoordinationConfig***

The IE *SL-InterUE-CoordinationConfig* is used to configure the sidelink inter-UE coordination (between a UE, UE-A, and a peer UE, UE-B) parameters. The network ensures sidelink inter-UE coordination and sidelink DRX are not configured at the same time for a UE.

***SL-InterUE-CoordinationConfig* information element**

```

| <i>SL-InterUE-CoordinationScheme1</i> field descriptions | |
|---|---|
| <i>sl-Condition1-A-2</i> | Indicates disabling the use of condition of excluding from preferred resource set resource(s) in slot(s) where UE-A, when it is intended receiver of UE-B, does not expect to perform SL reception from UE-B due to half duplex operation. |
| <i>sl-ContainerCoordInfo</i> | Indicates whether a SCI format 2-C can be used as the container of inter-UE coordination information transmission from UE-A to UE-B in Scheme 1 in addition to using MAC CE. |
| <i>sl-ContainerRequest</i> | Indicates whether a SCI format 2-C can be used as the container of an explicit request for inter-UE coordination information transmission from UE-B to UE-A in Scheme 1 in addition to using MAC CE. |
| <i>sl-DetermineResourceType</i> | Indicates how to determine the resource set type to be provided by inter-UE coordination information transmission. Value "uea" means the resource set type is determined by UE-A's implementation. Value "ueb" means the resource set type is determined by UE-B's request. |
| <i>sl-IUC-Condition</i> | Indicates whether inter-UE coordination information triggered by a condition is enabled or not other than explicit request reception. |
| <i>sl-IUC-Explicit</i> | Indicates whether inter-UE coordination information triggered by an explicit request is enabled or not. |
| <i>sl-MaxSlotOffsetTRIV</i> | Indicates the maximum value of logical slot offset with respect to a reference slot that is used for representing the first resource location of each TRIV to indicate the set of resources in Scheme 1 as specified in TS 38.214 [19]. |
| <i>sl-NumSubCH-PreferredResouruceSet</i> | Indicates the number of sub-channels used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition other than explicit request reception. |
| <i>sl-PriorityCoordInfoCondition</i> | Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC MAC CE, triggered by a condition other than explicit request reception in Scheme 1. The priority value of IUC MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1". |
| <i>sl-PriorityCoordInfoExplicit</i> | Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC MAC CE, triggered by an explicit request in Scheme 1. The priority value of IUC MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1". |
| <i>sl-PriorityPreferredResourceSet</i> | Indicates the priority value used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition other than explicit request reception. |
| <i>sl-PriorityRequest</i> | Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC request MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC request MAC CE, in an explicit request for inter-UE coordination information in Scheme 1. The priority value of IUC request MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1". |
| <i>sl-ReservedPeriodPreferredResourceSet</i> | Indicates the resource reservation interval used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition, by means of an index to the corresponding entry of <i>sl-ResourceReservePeriodList-r16</i> . |
| <i>sl-TriggerConditionCoordInfo</i> | Indicates the additional alternative trigger condition of inter-UE coordination information triggered by a condition rather than request reception for data transmission in Scheme-1 from UE-A to UE-B. This field is also used to indicate the additional alternative trigger condition of inter-UE coordination information triggered by a condition rather than request reception for SL-PRS transmission in a shared SL PRS resource pool in Scheme-1 from UE-A to UE-B. Value 0 means inter-UE coordination information is triggered by UE-A's implementation. Value 1 means inter-UE coordination information can be triggered only when UE-A has data to be transmitted together with the inter-UE coordination information to UE-B. |

si-TriggerConditionRequest

Indicates the trigger condition of an explicit request from UE-B to UE-A for data transmission. This field is also used to indicate the trigger condition of an explicit request from UE-B to UE-A for SL-PRS transmission in a shared SL PRS resource pool. Value 0 means the explicit request is triggered by UE-B's implementation. Value 1 means the explicit request can be triggered only when UE-B has data or SL-PRS to be transmitted to UE-A.

si-ThresholdRSRP-Condition1-B-1-Option1List

Indicates the RSRP threshold used to determine reserved resource(s) of other UE(s) whose RSRP measurement is larger than it as the set of resource(s) non-preferred for UE-B's transmission for Condition 1-B-1 of Scheme 1, as specified in TS 38.214 [19]. Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to $(-128 + (n-1)*2)$ dBm and so on, value 66 corresponds to infinity dBm.

si-ThresholdRSRP-Condition1-B-1-Option2List

Indicates the RSRP threshold used to determine reserved resource(s) of other UE(s) whose RSRP measurement is smaller than it as the set of resource(s) non-preferred for UE-B's transmission for Condition 1-B-1 of Scheme 1, as specified in TS 38.214 [19]. Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to $(-128 + (n-1)*2)$ dBm and so on, value 66 corresponds to infinity dBm.

SL-InterUE-CoordinationScheme2* field descriptions**si-DeltaRSRP-Thresh***

Indicates the RSRP threshold delta value corresponding to *deltaRSRPTThresh* specified in clause 16.3.0 of TS 38.213 [13] and used to determine reserved resource(s) of other UE(s). Value in dB. Only even values (step size 2) allowed.

si-IndicationUE-B

Indicates whether to enable or disable the usage of 1 LSB of reserved bits of a SCI format 1-A to indicate of whether UE scheduling a conflict TB can be UE-B or not.

si-IUC-Scheme2

Indicates whether inter-UE coordination Scheme 2 is enabled or not.

si-OptionForCondition2-A-1

Indicates the RSRP threshold used to consider additional criteria for condition 2-A-1. Value 0 corresponds to using the RSRP threshold according to the priorities included in the SCI, UE uses thresholds *si-Thres-RSRP-List*, in its resource pool configuration *si-UE-SelectedConfigRP*, corresponding to *ThresPSSCH-RSRP-List* specified in clause 16.3.0 of TS 38.213 [13]. Value 1 corresponds to using a (pre)configured RSRP threshold delta value *si-DeltaRSRP-Thresh*, corresponding to *deltaRSRPTThresh* specified in clause 16.3.0 of TS 38.213 [13].

si-PSFCH-Occasion

Indicates the reference slot from which a PSFCH occasion for inter-UE coordination information transmission is derived. Value 0 corresponds to the slot where UE-B's SCI is transmitted and value 1 corresponds to the slot where expected/potential resource conflict occurs on PSSCH resource indicated by UE-B's SCI.

si-RB-SetPSFCH

Indicates the set of PRBs that are actually used for inter-UE coordination information transmission and reception in Scheme 2. The leftmost bit of the bitmap refers to the lowest RB index in the resource pool, and so on.

si-SlotLevelResourceExclusion

Indicates that physical layer of UE-B reports resources in a slot including the next reserved resource indicated by the corresponding UE-B's SCI to higher layer.

si-TypeUE-A

Indicates that a non-destination UE of a TB transmitted by UE-B can be UE-A which sends inter-UE coordination information to UE-B, when UE-A is a destination UE of another TB conflicting with the TB transmitted by UE-B.

– *SL-LBT-FailureRecoveryConfig*

The IE *SL-LBT-FailureRecoveryConfig-r18* is used to configure the parameters used for detection and cancellation of Sidelink consistent LBT failures for operation with shared spectrum channel access, as specified in TS 38.321 [3].

***SL-LBT-FailureRecoveryConfig* information element**

```
-- ASN1START
-- TAG-SL-LBT-FAILURERECOVERYCONFIG-START

SL-LBT-FailureRecoveryConfig-r18 ::= SEQUENCE {

    ]]
}

-- TAG-SL-LOGICALCHANNELCONFIG-STOP
-- ASN1STOP

```

| <i>SL-LogicalChannelConfig</i> field descriptions | |
|---|--|
| <i>sl-AllowedCarriers</i> | If present, SL MAC SDUs from this logical channel can only be mapped to the sidelink carriers indicated in this list. Otherwise, SL MAC SDUs from this logical channel can be mapped to any configured sidelink carriers. The value 1 corresponds to the frequency of first entry in <i>sl-FreqInfoList</i> broadcast in <i>SIB12</i> , the value 2 corresponds to the frequency of first entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> , the value 3 corresponds to the frequency of second entry in <i>sl-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on. |
| <i>sl-AllowedCG-List</i> | This restriction applies only when the SL grant is a configured grant. If present, SL MAC SDUs from this logical channel can only be mapped to the indicated configured grant configuration. If the size of the sequence is zero, then SL MAC SDUs from this logical channel cannot be mapped to any configured grant configurations. If the field is not present, SL MAC SDUs from this logical channel can be mapped to any configured grant configurations. If the field <i>sl-ConfiguredGrantType1Allowed</i> is present, only those sidelink configured grant type 1 configurations indicated in this sequence are allowed for use by this sidelink logical channel; otherwise, this sequence shall not include any sidelink configured grant type 1 configuration. Corresponds to "sl-AllowedCG-List" as specified in TS 38.321 [3]. |
| <i>sl-AllowedSCS-List</i> | If present, it indicates the numerology of UL-SCH resources that this sidelink logical channel is mapped to, when checking the SR trigger condition. Corresponds to 'sl-AllowedSCS-List' in TS 38.321 [3]. |
| <i>sl-BucketSizeDuration</i> | Value in ms. <i>ms5</i> corresponds to 5 ms, value <i>ms10</i> corresponds to 10 ms, and so on. |
| <i>sl-ChannelAccessPriority</i> | Indicates the Channel Access Priority Class (CAPC), as specified in TS 38.300 [2], to be used on sidelink transmissions for operation with shared spectrum channel access in FR1. The network configures this field only for DRBs. |
| <i>sl-ConfiguredGrantType1Allowed</i> | If present and set to true, or if the capability <i>Lcp-RestrictionSidelink</i> as specified in TS 38.306 [26] is not indicated, SL MAC SDUs from this sidelink logical channel can be transmitted on a sidelink configured grant type 1. Otherwise, SL MAC SDUs from this logical channel cannot be transmitted on a sidelink configured grant type 1. Corresponds to 'sl-configuredGrantType1Allowed' in TS 38.321 [3]. |
| <i>sl-HARQ-FeedbackEnabled</i> | Network always includes this field. It indicates the HARQ feedback enabled/disabled restriction in LCP for this sidelink logical channel. If set to <i>enabled</i> , the sidelink logical channel will be multiplexed only with a logical channel which enabling the HARQ feedback. If set to <i>disabled</i> , the sidelink logical channel cannot be multiplexed with a logical channel which enabling the HARQ feedback. Corresponds to 'sl-HARQ-FeedbackEnabled' in TS 38.321 [3]. If this field of at least one sidelink logical channel for the UE is set to enabled, <i>sl-PSFCH-Config</i> should be mandatory present in configuration <i>SL-ResourcePool</i> of at least one of the sidelink resource pools. |
| <i>sl-LogicalChannelGroup</i> | ID of the sidelink logical channel group, as specified in TS 38.321 [3], which the sidelink logical channel belongs to. |
| <i>sl-LogicalChannelSR-DelayTimerApplied</i> | Indicates whether to apply the delay timer for SR transmission for this sidelink logical channel. Set to false if <i>logicalChannelSR-DelayTimer</i> is not included in <i>sl-BSR-Config</i> . |
| <i>sl-MaxPUSCH-Duration</i> | If present, it indicates the maximum PUSCH duration of UL-SCH resources that this sidelink logical channel is mapped to, when checking the SR trigger condition. Corresponds to "sl-MaxPUSCH-Duration" in TS 38.321 [3]. |
| <i>sl-PrioritisedBitRate</i> | Value in kiloBytes/s. Value <i>kBps0</i> corresponds to 0 kiloBytes/s, value <i>kBps8</i> corresponds to 8 kiloBytes/s, value <i>kBps16</i> corresponds to 16 kiloBytes/s, and so on. |
| <i>sl-Priority</i> | Sidelink logical channel priority, as specified in TS 38.321 [3]. |
| <i>sl-SchedulingRequestId</i> | If present, it indicates the scheduling request configuration applicable for this sidelink logical channel, as specified in TS 38.321 [3]. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>CONNECTED</i> | This field is optionally present, Need M, in an RRConfigure message, for a SL DRB with additional sidelink RLC bearer being configured. The field is absent otherwise. |

– *SL-L2RelayUE-Config*

The IE *SL-L2RelayUE-Config* is used to configure L2 U2N relay operation related configurations used by L2 U2N Relay UE, or L2 U2U relay operation related configurations used by L2 U2U Relay UE.

***SL-L2RelayUE-Config* information element**

        OPTIONAL, -- Need M
    ...
}

-- TAG-SL-PBPS-CPS-CONFIG-STOP
-- ASN1STOP
```

| SL-PBPS-CPS-Config field descriptions | |
|--|--|
| sl-Additional-PBPS-Occasion | Indicates that UE additionally monitors periodic sensing occasions that correspond to a set of values. (see TS 38.214 [19], clause 8.1.4). |
| sl-AllowedResourceSelectionConfig | Indicates the allowed resource selection mechanism(s), i.e. full sensing only, partial sensing only, random resource selection only, or any combination(s) thereof. (see TS 38.214 [19], clause 8.1.4). Only <i>c1</i> , <i>c4</i> , <i>c5</i> or <i>c7</i> can be configured for a Rel-16 resource pool. Only <i>c1</i> can be configured for a resource pool included in <i>sl-TxPool/SelectedNormal</i> , for which <i>sl-NRPSFCH-EUTRA-ThresRSRP-List/sl-NRPSSCH-EUTRA-ThresRSRP-List</i> is configured. If this field is not configured for a resource pool included in <i>sl-TxPool/SelectedNormal</i> , only full sensing is allowed in the corresponding resource pool.
<i>c1</i> : only full sensing allowed
<i>c2</i> : only partial sensing allowed
<i>c3</i> : only random selection allowed
<i>c4</i> : full sensing+random selection allowed
<i>c5</i> : full sensing+ partial sensing allowed
<i>c6</i> : partial sensing + random selection allowed
<i>c7</i> : full sensing+ partial sensing + random selection allowed. |
| sl-CPS-WindowAperiodic | Parameter that indicates the minimum size of contiguous partial sensing window in logical slot units for a resource (re)selection procedure and re-evaluation/pre-emption checking triggered by aperiodic transmission. (see TS 38.214 [19], clause 8.1.4). If not configured, the size of contiguous partial sensing window in logical slot units is 31. |
| sl-CPS-WindowPeriodic | Indicates the size of contiguous partial sensing window in logical slot units when UE performs periodic-based and contiguous partial sensing for a resource (re)selection procedure triggered by periodic transmission. If not configured, the size of contiguous partial sensing window in logical slot units is 31. |
| sl-DefaultCBR-PartialSensing | Indicates default value of SL CBR measurement for a UE that is configured to perform partial sensing by its higher layer (including when SL DRX is configured) if the number of SL RSSI measurement slots over CBR measurement window is below <i>sl-MinNumRssiMeasurementSlots</i> , (see TS 38.214 [19], clause 8.1.6). Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on. |
| sl-DefaultCBR-RandomSelection | Indicates default value of CBR measurement for a UE that performs random resource selection if no SL CBR measurement result over SL CBR measurement window, (see TS 38.214 [19], clause 8.1.6). Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on. |
| sl-MinNumCandidateSlotsAperiodic | Indicates the minimum number of Y' slots that are included in the possible candidate resources corresponding to periodic-based partial sensing and/or contiguous partial sensing for resource (re)selection triggered by aperiodic transmission. (see TS 38.214 [19], clause 8.1.4). |
| sl-MinNumCandidateSlotsPeriodic | Indicates the minimum number of Y slots that are included in the possible candidate resources corresponding to periodic-based partial sensing for resource (re)selection triggered by periodic transmission. (see TS 38.214 [19], clause 8.1.4). |
| sl-MinNumRssiMeasurementSlots | Indicates a threshold for a minimum number of SL RSSI measurement slots over CBR measurement window for which the SL RSSI is measured for a UE that is configured to perform partial sensing by its higher layer (including when SL DRX is configured). (see TS 38.214 [19], clause 8.1.6). |
| sl-PartialSensingInactiveTime | Indicates whether or not UE is required to perform SL reception of PSCCH and RSRP measurement for partial sensing on slots in SL DRX inactive time when partial sensing is configured by its higher layer. (see TS 38.214 [19], clause 8.1.4). |
| sl-PBPS-OccasionReservePeriodList | Indicates the subset of periodicity values from <i>sl-ResourceReservePeriodList</i> used to determine periodic sensing occasions in periodic-based partial sensing, by means of an index to the corresponding entry in <i>sl-ResourceReservePeriodList-r16</i> . If not configured, all periodicity values from <i>sl-ResourceReservePeriodList</i> are used to determine periodic sensing occasions in periodic-based partial sensing (see TS 38.214 [19], clause 8.1.4). |

- ***SL-PDCP-Config***

The IE ***SL-PDCP-Config*** is used to set the configurable PDCP parameters for a sidelink radio bearer.

***SL-PDCP-Config* information element**

```
-- ASN1START
-- TAG-SL-PDCP-CONFIG-START

| <i>SL-PDCP-Config</i> field descriptions | |
|---|--|
| <i>sl-DiscardTimer</i> | Value in ms of <i>discardTimer</i> specified in TS 38.323 [5]. Value <i>ms50</i> corresponds to 50 ms, value <i>ms100</i> corresponds to 100 ms and so on. |
| <i>sl-OutOfOrderDelivery</i> | Indicates whether or not <i>OutOfOrderDelivery</i> specified in TS 38.323 [5] is configured. This field should be either always present or always absent, after the radio bearer is established. |
| <i>sl-PDCP-SN-Size</i> | PDCP sequence number size for unicast NR sidelink communication, 12 or 18 bits, as specified in TS 38.323 [5]. For groupcast and broadcast NR sidelink communication, only 12 bits is applicable, as specified in 9.1.1.5. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>Setup</i> | The field is mandatory present in case of sidelink DRB setup via dedicated signaling and in case of sidelink DRB configuration via system information and pre-configuration; otherwise the field is optionally present, need M. |
| <i>Setup2</i> | The field is mandatory present in case of sidelink DRB setup via dedicated signaling and in case of sidelink DRB configuration via system information and pre-configuration for RLC-AM and RLC-UM for unicast NR sidelink communication; otherwise the field is not present, Need M. |

- ***SL-PosBWP-ConfigCommon***

The IE ***SL-PosBWP-ConfigCommon*** is used to configure the cell-specific configuration for sidelink positioning on one particular sidelink bandwidth part.

```

| <i>SL-PRS-ResourcePool</i> field descriptions | |
|--|---|
| <i>sl-CBR-ConfigIndexDedicatedSL-PRS-RP</i> | Indicates the CBR ranges to be used by an index to the entry of the CBR range configuration in <i>sl-CBR-RangeDedicatedSL-PRS-RP-List</i> . |
| <i>sl-CBR-PriorityTxConfigDedicatedSL-PRS-RP-List</i> | Indicates the mapping between SL-PRS transmission parameter (such as transmission power, etc.) sets by using the indexes of the configurations in <i>sl-CBR-SL-PRS-TxConfigList</i> , CBR ranges by using the indexes to the entry of the CBR range configurations in <i>sl-CBR-SL-PRS-RangeDedicatedSL-PRS-RP-List</i> , and priority ranges. It also indicates the default SL-PRS transmission parameters to be used when CBR measurement results are not available. |
| <i>sl-DefaultTxConfigIndexDedicatedSL-PRS-RP</i> | Indicates the SL PRS transmission parameters to be used by the UEs which do not have available CBR measurement results, by means of an index to the corresponding entry in <i>sl-PRS-TxConfigIndexList</i> . Value 0 indicates the first entry in <i>sl-PRS-TxConfigIndexList</i> . The field is ignored if the UE has available CBR measurement results. |
| <i>sl-FilterCoefficient</i> | This field indicates the filtering coefficient for long-term measurement and reference signal power derivation used for sidelink open-loop power control. |
| <i>sl-MaxNumPerReserveDedicatedSL-PRS-RP</i> | Indicates the maximum number of SL PRS reservations that can be indicated by an SCI. |
| <i>sl-NumReservedBitsSCI1B-DedicatedSL-PRS-RP</i> | Indicates the number of reserved bits in SCI format 1-B. |
| <i>sl-NumSubchannelDedicatedSL-PRS-RP</i> | Indicates the number of subchannels in the corresponding resource pool, which consists of contiguous PRBs only. |
| <i>sl-PosAllowedResourceSelectionConfig</i> | Indicates allowed resource allocation method configured per resource pool.
c1: only sensing allowed
c2: only random resource selection allowed
c3: sensing and random resource selection allowed |
| <i>sl-PreemptionEnableDedicatedSL-PRS-RP</i> | Indicates whether pre-emption is disabled or enabled in a resource pool. If the field is present and the value is <i>p1</i> , <i>p2</i> , and so on (but not <i>enabled</i>), it means that pre-emption is enabled and a priority level <i>p_preemption</i> is configured. If the field is present and the value is <i>enabled</i> , the pre-emption is enabled (but <i>p_preemption</i> is not configured) and pre-emption is applicable to all levels. |
| <i>sl-PriorityThreshold</i> | Indicates the threshold used to determine whether NR sidelink transmission in dedicated SL PRS resource pool is prioritized over uplink transmission of priority index 0 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 0 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0. |
| <i>sl-PriorityThresholdDedicatedSL-PRS-RP</i> | Indicates the upper bound of priority range which is associated with the configurations in <i>sl-CBR-ConfigIndexDedicatedSL-PRS-RP</i> and in <i>sl-PRS-TxConfigIndexList</i> . The upper bounds of the priority ranges are configured in ascending order for consecutive entries of <i>SL-PriorityTxConfigIndexDedicatedSL-PRS-RP</i> in <i>sl-CBR-PriorityTxConfigDedicatedSL-PRS-RP-List</i> . For the first entry of <i>sl-PriorityThreshold-DedicatedSL-PRS-RP</i> , the lower bound of the priority range is 1. |

| | |
|---|---|
| sl-PriorityThreshold-UL-URLLC | Indicates the threshold used to determine whether NR sidelink transmission in dedicated SL PRS resource pool is prioritized over uplink transmission of priority index 1 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 1 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0. |
| sl-PRS-ResourceReservePeriodList | Indicates set of possible resource reservation period in the unit of ms allowed in the resource pool. Up to 16 values can be configured per resource pool. The value <i>ms0</i> is always configured. |
| sl-PRS-ResourcesDedicatedSL-PRS-RP | Indicates SL PRS resources in a slot of dedicated SL PRS resource pool as defined in TS 38.211 [16]. |
| sl-PRS-TxConfigIndex | Indicates SL PRS transmission Configuration index. |
| sl-PRS-TxConfigIndexList | Indicates List of <i>sl-PRS-Tx-ConfigIndex</i> indicating the SL PRS transmission index |
| sl-RB-Number | Indicates the number of PRBs in the corresponding SL PRS dedicated resource pool, which consists of contiguous PRBs only. |
| sl-SCI-basedSL-PRS-TxTriggerSCI1-B | Indicates presence of a bit-field in SCI format 1-B to trigger SL-PRS transmission by a receiving UE. |
| sl-SelectionWindowListDedicatedSL-PRS-RP | Parameter that determines the end of the selection window in the resource selection for a SL-PRS with respect to priority indicated in SCI. Value <i>n1</i> corresponds to $1 \cdot 2^{\mu}$, value <i>n5</i> corresponds to $5 \cdot 2^{\mu}$, and so on, where $\mu = 0,1,2,3$ refers to SCS 15,30,60,120 kHz respectively. |
| sl-SensingWindowDedicated-SL-PRS-RP | Indicates the start of the sensing window for SL PRS in a dedicated resource pool. |
| sl-SRC-ID-LenDedicatedSL-PRS-RP | Indicates the number of bits used for the source ID in SCI format 1-B. |
| sl-StartRB-Subchannel-DedicatedSL-PRS-RP | Indicates the lowest RB index of the SL PRS dedicated resource pool with respect to the lowest RB index of a SL BWP. |
| sl-SubchannelSizeDedicatedSL-PRS-RP | Indicates size of a subchannel for PSCCH in number of RBs. |
| sl-Thres-RSRP-ListDedicatedSL-PRS-RP | Indicates a list of 64 thresholds, the threshold should be selected based on the priority in the decoded SCI and the priority in the SCI to be transmitted. |
| sl-ThreshS-RSSI-PRS-CBR | Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the SL-PRS CBR measurement in a dedicated SL-PRS resource pool. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value <i>n</i> to $(-112 + n \cdot 2)$ dBm, and so on. |
| sl-TimeResource | This field indicates the bitmap of the SL PRS dedicated resource pool, which is defined by repeating the bitmap with a periodicity during a SFN or DFN cycle. |
| sl-TimeWindowSizeCBR-DedicatedSL-PRS-RP | Indicates the time window size for CBR measurement in a dedicated SL-PRS resource pool. |
| sl-TimeWindowSizeCR-DedicatedSL-PRS-RP | Indicates the time window size for CR evaluation in a dedicated SL-PRS resource pool. |
| sl-TxPercentageDedicatedSL-PRS-RP-List | Indicates List of minimum Tx percentage (list per priority) |

| <i>SL-PRS-PSCCH-Config</i> field descriptions | |
|---|---|
| <i>si-DMRS-ScrambleID-DedicatedSL-PRS-RP</i> | Indicates the initialization value for PSCCH DMRS scrambling in a dedicated SL PRS resource pool. |
| <i>si-FreqResourcePSCCH-DedicatedSL-PRS-RP</i> | Indicates the number of PRBs for PSCCH in a dedicated SL PRS resource pool. |
| <i>si-TimeResourcePSCCH-DedicatedSL-PRS-RP</i> | Indicates the number of symbols for PSCCH in a dedicated SL PRS resource pool. |

| <i>SL-PRS-PowerControl</i> field descriptions | |
|--|---|
| <i>dl-P0-SL-PRS</i> | Indicates P0 value for DL pathloss based open loop power control for SL PRS transmission in dedicated SL PRS resource pool. |
| <i>dl-Alpha-SL-PRS</i> | Indicates alpha value for DL pathloss based open loop power control for SL PRS transmission in dedicated SL PRS resource pool. |
| <i>sl-P0-SL-PRS</i> | Indicates P0 value for SL pathloss based open loop power control for SL PRS transmission in dedicated SL PRS resource pool. |
| <i>sl-Alpha-SL-PRS</i> | Indicates alpha value for SL pathloss based open loop power control for SL PRS transmission in dedicated SL PRS resource pool. When the field is absent the UE applies the value 1. |

– *SL-PSBCH-Config*

The IE *SL-PSBCH-Config* indicates PSBCH transmission parameters on each sidelink bandwidth part.

***SL-PSBCH-Config* information element**

```
-- ASN1START
-- TAG-SL-PSBCH-CONFIG-START

SL-PSBCH-Config-r16 ::= SEQUENCE {
    dl-P0-PSBCH-r16      INTEGER (-16..15)                                OPTIONAL,   -- Need M
    dl-Alpha-PSBCH-r16    ENUMERATED {alpha0, alpha04, alpha05, alpha06, alpha07, alpha08, alpha09, alpha1}  OPTIONAL,   -- Need M
    ...
    [
        dl-P0-PSBCH-r17    INTEGER (-202..24)                                OPTIONAL
    ]
}

-- TAG-SL-PSBCH-CONFIG-STOP
-- ASN1STOP
```

| SL-PSBCH-Config field descriptions | |
|---|--|
| dl-Alpha-PSBCH | Indicates alpha value for DL pathloss based power control for PSBCH. When the field is not configured the UE applies the value 1. |
| dl-P0-PSBCH | Indicates P0 value for DL pathloss based power control for PSBCH. If not configured, DL pathloss based power control is disabled for PSBCH. When <i>dl-P0-PSBCH-r17</i> is configured, the UE ignores <i>dl-P0-PSBCH-r16</i> .
A Remote UE which is out of coverage, considers downlink pathloss based power control is disabled for PSBCH when <i>dl-P0-PSBCH</i> is configured. |

– **SL-PSSCH-TxConfigList**

The IE *SL-PSSCH-TxConfigList* indicates PSSCH transmission parameters. When lower layers select parameters from the range indicated in IE *SL-PSSCH-TxConfigList*, the UE considers both configurations in IE *SL-PSSCH-TxConfigList* and the CBR-dependent configurations represented in IE *SL-CBR-PriorityTxConfigList*. Only one IE *SL-PSSCH-TxConfig* is provided per *SL-TypeTxSync*.

```

| <i>SL-PSSCH-TxConfigList</i> field descriptions | |
|--|---|
| <i>sl-MaxTxTransNumPSSCH</i> | Indicates the maximum transmission number (including new transmission and retransmission) for PSSCH. |
| <i>sl-MaxTxPower</i> | This field indicates the maximum transmission power for transmission on PSSCH and PSCCH. |
| <i>sl-MinMCS-PSSCH, sl-MaxMCS-PSSCH</i> | This field indicates the minimum and maximum MCS values used for transmissions on PSSCH. The UE shall ignore the minimum and maximum MCS values used for the associated MCS table(s) in <i>sl-ParametersAboveThres-r16</i> and <i>sl-ParametersBelowThres-r16</i> if <i>sl-ParametersAboveThres-v1650</i> and <i>sl-ParametersBelowThres-v1650</i> are present, respectively. |
| <i>sl-MinSubChannelNumPSSCH, sl-MaxSubChannelNumPSSCH</i> | This field indicates the minimum and maximum number of sub-channels which may be used for transmissions on PSSCH. |
| <i>sl-TypeTxSync</i> | This field indicates the synchronization reference type. For configurations by the eNB/gNB, only <i>gnbEnb</i> can be configured; and for pre-configuration or when this field is absent, the configuration is applicable for all synchronization reference types. |
| <i>sl-ThresUE-Speed</i> | This field indicates a UE absolute speed threshold. |

| Conditional Presence | Explanation |
|----------------------|---|
| <i>CBR</i> | The field is optionally present, Need R, when the IE <i>SL-PSSCH-TxParameters</i> is present in <i>SL-CBR-CommonTxConfigList</i> , <i>SL-UE-SelectedConfig</i> , <i>SIB12</i> or <i>SidelinkPreconfigNR</i> ; otherwise the field is not present, need R. |

– *SL-QoS-FlowIdentity*

The IE *SL-QoS-FlowIdentity* is used to identify a sidelink QoS flow.

SL-QoS-FlowIdentity information element

```
-- ASN1START
-- TAG-SL-QOS-FLOWIDENTITY-START

SL-QoS-FlowIdentity-r16 ::= INTEGER (1..maxNrofSL-QFIs-r16)

-- TAG-SL-QOS-FLOWIDENTITY-STOP
-- ASN1STOP
```

– *SL-QoS-Profile*

The IE *SL-QoS-Profile* is used to give the QoS parameters for a sidelink QoS flow. Need codes or conditions specified for *SL-QoS-Profile* do not apply, in case *SL-QoS-Profile* is included in *SidelinkUEInformationNR*.

SL-QoS-Profile information element

```
-- ASN1START
```

```
-- TAG-SL-QOS-PROFILE-START

SL-QoS-Profile-r16 ::= SEQUENCE {
    sl-PQI-r16           SL-PQI-r16
    sl-GFBR-r16          INTEGER (0..4000000000)
    sl-MFBR-r16          INTEGER (0..4000000000)
    sl-Range-r16          INTEGER (1..1000)
    ...
}

SL-PQI-r16 ::= CHOICE {
    sl-StandardizedPQI-r16   INTEGER (0..255),
    sl-Non-StandardizedPQI-r16 SEQUENCE {
        sl-ResourceType-r16      ENUMERATED {gbr, non-GBR, delayCriticalGBR, spare1}
        sl-PriorityLevel-r16     INTEGER (1..8)
        sl-PacketDelayBudget-r16 INTEGER (0..1023)
        sl-PacketErrorRate-r16   INTEGER (0..9)
        sl-AveragingWindow-r16   INTEGER (0..4095)
        sl-MaxDataBurstVolume-r16 INTEGER (0..4095)
    }
    ...
}

-- TAG-SL-QOS-PROFILE-STOP
-- ASN1STOP
```

| SL-QoS-Profile field descriptions | |
|--|--|
| sl-GFBR | Indicate the guaranteed bit rate for a GBR QoS flow. The unit is: Kbit/s |
| sl-MFBR | Indicate the maximum bit rate for a GBR QoS flow. The unit is: Kbit/s |
| sl-PQI | This field indicates either the PQI for standardized PQI or non-standardized QoS parameters. |
| sl-Range | This field indicates the range parameter of the Qos flow, as defined in clause 5.4.1.1.1, TS 23.287 [55]. It is present only for groupcast. The unit is meter. |

| <i>SL-PQI</i> field descriptions | |
|---|--|
| <i>sl-AveragingWindow</i> | Indicates the Averaging Window for a QoS flow, and applies to GBR QoS flows only. Unit: ms. The default value of the IE is 2000ms. |
| <i>sl-MaxDataBurstVolume</i> | Indicates the Maximum Data Burst Volume for a QoS flow, and applies to delay critical GBR QoS flows only. Unit: byte. |
| <i>sl-PacketDelayBudget</i> | Indicates the Packet Delay Budget for a QoS flow. Upper bound value for the delay that a packet may experience expressed in unit of 0.5ms. |
| <i>sl-PacketErrorRate</i> | Indicates the Packet Error Rate for a QoS flow. The packet error rate is expressed as Scalar x 10-k where k is the Exponent. |
| <i>sl-PriorityLevel</i> | Indicates the Priority Level for a QoS flow. Values ordered in decreasing order of priority, i.e. with 1 as the highest priority and 8 as the lowest priority. |
| <i>sl-StandardizedPQI</i> | Indicate the PQI for standardized PQI. |

– *SL-QuantityConfig*

The IE *SL-QuantityConfig* specifies the layer 3 filtering coefficients for NR SL RSRP measurement for a destination.

***SL-QuantityConfig* information element**

```
-- ASN1START
-- TAG-SL-QUANTITYCONFIG-START

SL-QuantityConfig-r16 ::= SEQUENCE {
    sl-FilterCoefficientDMRS-r16      FilterCoefficient
                                         DEFAULT fc4,
    ...
}

-- TAG-SL-QuantityConfig-STOP
-- ASN1STOP
```

| <i>SL-QuantityConfig</i> field descriptions | |
|--|---|
| <i>sl-FilterCoefficientDMRS</i> | DMRS based L3 filter configuration:
Specifies L3 filter configuration for sidelink RSRP measurement result from the L1 filter(s), as defined in TS 38.215 [9]. |

– *SL-RadioBearerConfig*

The IE *SL-RadioBearerConfig* specifies the sidelink DRB configuration information for NR sidelink communication.

***SL-RadioBearerConfig* information element**

```
-- ASN1START
```

```
-- TAG-SL-RADIOBEARERCONFIG-START

SL-RadioBearerConfig-r16 ::= SEQUENCE {
    slrb-Uu-ConfigIndex-r16           SLRB-Uu-ConfigIndex-r16,
    sl-SDAP-Config-r16                SL-SDAP-Config-r16
    sl-PDCP-Config-r16                SL-PDCP-Config-r16
    sl-TransRange-r16                 ENUMERATED {m20, m50, m80, m100, m120, m150, m180, m200, m220, m250, m270, m300, m350, m370,
                                                    m400, m420, m450, m480, m500, m550, m600, m700, m1000, spare9, spare8, spare7, spare6,
                                                    spare5, spare4, spare3, spare2, spare1} OPTIONAL, -- Cond SLRBSetup
    ...                                OPTIONAL, -- Cond SLRBSetup
}                                     OPTIONAL, -- Need R

-- TAG-SL-RADIOBEARERCONFIG-STOP
-- ASN1STOP
```

| <i>SL-RadioBearerConfig</i> field descriptions | |
|---|---|
| <i>sl-PDCP-Config</i> | This field indicates the PDCP parameters for the sidelink DRB. |
| <i>sl-SDAP-Config</i> | This field indicates how to map sidelink QoS flows to sidelink DRB. |
| <i>slrb-Uu-ConfigIndex</i> | This field indicates the index of sidelink DRB configuration. |
| <i>sl-TransRange</i> | This field indicates the transmission range of the sidelink DRB. The unit is meter. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>SLRBSetup</i> | The field is mandatory present in case of sidelink DRB setup via the dedicated signalling and in case of sidelink DRB configuration via system information and pre-configuration; otherwise the field is optionally present, need M. |

– *SL-RBSetConfig*

The IE *SL-RBSetConfig* specifies the configuration information for RB set for NR Sidelink Communication.

***SL-RBSetConfig* information element**

```
-- ASN1START
-- TAG-SL-RBSETCONFIG-START

SL-RBSetConfig-r18 ::= SEQUENCE {
    sl-RBSetIndex-r18          INTEGER (0..4),
    sl-NumOfSSSBRepetition-r18 INTEGER (2..9)
    sl-GapBetweenSSSBRepetition-r18 INTEGER (1..84)
}                                     OPTIONAL, -- Need R
                                         OPTIONAL, -- Need R

-- TAG-SL-RBSETCONFIG-STOP
-- ASN1STOP
```

| <i>SL-RBSetConfig</i> field descriptions | |
|---|--|
| <i>si-GapBetweenSSBRepetition</i> | Indicate the gap between two adjacent S-SSB repetitions in frequency domain in one RB set, and the gap is between the lowest subcarrier of the upper PSBCH and the highest subcarrier of the lower PSBCH. The Unit is PRB. |
| <i>si-NumOfSSBRepetition</i> | Indicate the number of S-SSB repetitions in frequency domain in one RB set. S-SSB in the frequency domain indicated by <i>si-AbsoluteFrequencySSB</i> (i.e. S-SSB transmission without repetition) is applicable in region with no OCB requirement, or with OCB exemption. |
| <i>si-RBSetIndex</i> | Indicates the index of RB-set for which the configuration applies. |

– ***SL-RelayIndicationMP***

The IE *SL-RelayIndicationMP* is used to indicate the L2 U2N Relay UE supporting RRC connection establishment/resume for MP operation triggered by receiving *RemoteUEInformationSidelink* containing the *connectionForMP* as specified in 5.3.3.1a and 5.3.13.1a in Rel-18.

***SL-RelayIndicationMP* information element**

```
-- ASN1START
-- TAG-SL-RELAYINDICATIONMP-START

SL-RelayIndicationMP-r18 ::= ENUMERATED {support}

-- TAG-SL-RELAYINDICATIONMP-STOP
-- ASN1STOP
```

– ***SL-RelayUE-Config***

The IE *SL-RelayUE-Config* specifies the configuration information for NR sidelink U2N Relay UE.

***SL-RelayUE-Config* information element**

```
-- ASN1START
-- TAG-SL-RELAYUE-CONFIG-START

SL-RelayUE-Config-r17 ::= SEQUENCE {
    threshHighRelay-r17      OPTIONAL,   -- Need R
    threshLowRelay-r17        OPTIONAL,   -- Need R
    hystMaxRelay-r17         OPTIONAL,   -- Cond ThreshHighRelay
    hystMinRelay-r17         OPTIONAL,   -- Cond ThreshLowRelay
}

-- TAG-SL-RELAYUE-CONFIG-STOP
-- ASN1STOP
```

| <i>SL-RelayUE-Config</i> field descriptions | |
|--|---|
| <i>threshHighRelay</i> | Indicates the upper threshold of Uu RSRP for a UE that is in network coverage to evaluate AS layer conditions for U2N relay UE operation. |
| <i>threshLowRelay</i> | Indicates the lower threshold of Uu RSRP for a UE that is in network coverage to evaluate AS layer conditions for U2N relay UE operation. |

| Conditional Presence | Explanation |
|------------------------|--|
| <i>ThreshHighRelay</i> | This field is mandatory present if <i>threshHighRelay</i> is included. Otherwise, the field is absent, Need R. |
| <i>ThreshLowRelay</i> | This field is mandatory present if <i>threshLowRelay</i> is included. Otherwise, the field is absent, Need R. |

– *SL-RelayUE-ConfigU2U*

The IE *SL-RelayUE-ConfigU2U* specifies the threshold configuration information for NR sidelink U2U Relay UE.

***SL-RelayUE-ConfigU2U* information element**

```
-- ASN1START
-- TAG-SL-RELAYUE-CONFIGU2U-START

SL-RelayUE-ConfigU2U-r18 ::= SEQUENCE {
    sl-RSRP-Thresh-DiscConfig-r18      OPTIONAL, -- Need R
    sd-RSRP-ThreshDiscConfig-r18       OPTIONAL, -- Need R

    sd-FilterCoefficientU2U-r18        OPTIONAL, -- Need R
    ...
}

-- TAG-SL-RELAYUE-CONFIGU2U-STOP
-- ASN1STOP
```

| <i>SL-RelayUE-ConfigU2U</i> field descriptions | |
|---|--|
| <i>sd-FilterCoefficientU2U</i> | Specifies L3 filter coefficient for SD-RSRP measurement results from L1 filter, and for SL-RSRP measurements. |
| <i>sd-RSRP-ThreshDiscConfig</i> | Indicates the threshold of SD-RSRP for a U2U Relay UE to evaluate AS layer conditions for discovery. The U2U relay UE applies the value of this field to evaluate AS layer conditions to decide which UE(s) can be announced as proximity UE(s) in the discovery message when performing U2U Relay Discovery with Model A, and decide whether to forward the discovery message when performing the U2U Relay Discovery with Model B or U2U relay communication with integrated Discovery as specified in TS 23.304 [65]. |
| <i>sl-FilterCoefficientU2U</i> | Specifies L3 filter coefficient for SL-RSRP measurement results from L1 filter. |
| <i>sl-RSRP-Thresh-DiscConfig</i> | Indicates the threshold of SL-RSRP for a U2U Relay UE to evaluate AS layer conditions for discovery. The U2U relay UE applies the value of this field to decide which UE(s) can be announced as proximity UE(s) in the discovery message when performing U2U Relay Discovery with Model A. |

| Conditional Presence | Explanation |
|----------------------------|---|
| <i>SD-RSRP-ThreshRelay</i> | This field is mandatory present if <i>sd-RSRP-ThreshDiscConfig</i> is included. Otherwise, the field is absent, Need R. |

– *SL-RemoteUE-Config*

The IE *SL-RemoteUE-Config* specifies the configuration information for NR sidelink U2N Remote UE.

***SL-RemoteUE-Config* information element**

```
-- ASN1START
-- TAG-SL-REMOTEUE-CONFIG-START

SL-RemoteUE-Config-r17 ::= SEQUENCE {
    threshHighRemote-r17           OPTIONAL,      -- Need R
    hystMaxRemote-r17              OPTIONAL,      -- Cond ThreshHighRemote
    sl-ReselectionConfig-r17       OPTIONAL,      -- Need R
}

SL-ReselectionConfig-r17 ::= SEQUENCE {
    sl-RSRP-Thresh-r17            OPTIONAL,      -- Need R
    sl-FilterCoefficientRSRP-r17   OPTIONAL,      -- Need R
    sl-HystMin-r17                OPTIONAL,      -- Cond SL-RSRP-Thresh
}

-- TAG-SL-REMOTEUE-CONFIG-STOP
-- ASN1STOP
```

| <i>SL-RemoteUE-Config</i> field descriptions | |
|---|--|
| <i>sl-ReselectionConfig</i> | Includes the parameters used by the U2N remote UE when selecting/ reselecting a U2N relay UE. |
| <i>thresHighRemote</i> | Indicates the threshold of Uu RSRP for a UE that is in network coverage to evaluate AS layer conditions for U2N remote UE operation. |

| <i>SL-ReselectionConfig</i> field descriptions | |
|---|---|
| <i>sl-FilterCoefficientRSRP</i> | Specifies L3 filter coefficient for SL communication/ discovery RSRP measurement results from L1 filter. |
| <i>sl-RSRP-Thresh</i> | Indicates the threshold of SL communication/ discovery RSRP for a U2N remote UE to perform relay UE selection/ reselection. |

| Conditional Presence | Explanation |
|-------------------------|---|
| <i>SL-RSRP-Thresh</i> | This field is mandatory present if <i>sl-RSRP-Thresh</i> is included. Otherwise, the field is absent, Need R. |
| <i>ThreshHighRemote</i> | This field is mandatory present if <i>threshHighRemote</i> is included. Otherwise, the field is absent, Need R. |

– *SL-RemoteUE-ConfigU2U*

The IE *SL-RemoteUE-ConfigU2U* specifies the threshold configuration information for NR sidelink U2U Remote UE.

***SL-RemoteUE-ConfigU2U* information element**

```
-- ASN1START
-- TAG-SL-REMOTEUE-CONFIGU2U-START

SL-RemoteUE-ConfigU2U-r18 ::= SEQUENCE {
    sl-RSRP-ThreshU2U-r18      OPTIONAL,   -- Need R
    sl-HystMinU2U-r18          OPTIONAL,   -- Cond SL-RSRP-ThreshU2U

}
}

SL-RemoteUE-ConfigU2U-v1830 ::= SEQUENCE {
    sl-FilterCoefficientU2U-r18  OPTIONAL,   -- Need R
    ...
}

-- TAG-SL-REMOTEUE-CONFIGU2U-STOP
-- ASN1STOP
```

| <i>SL-RemoteUE-ConfigU2U</i> field descriptions | |
|--|---|
| <i>sl-FilterCoefficientU2U</i> | Specifies L3 filter coefficient for SL-RSRP measurement results from L1 filter. |
| <i>sl-RSRP-ThreshU2U</i> | Indicates the threshold of SL-RSRP for a U2U Remote UE to perform Relay UE selection/ reselection. The U2U remote UE applies the value of this field to evaluate AS layer conditions on direct PC5 link with the peer U2U Remote UE to trigger relay selection, and evaluate AS layer conditions on U2U relay link with U2U Relay UE to trigger relay reselection. |
| <i>sd-RSRP-ThreshU2U</i> | Indicates the threshold of SD-RSRP for a U2U Remote UE to perform discovery and Relay UE selection/ reselection. For discovery, the U2U Remote UE applies the value of this field to evaluate AS layer conditions to decide whether to respond the discovery message when performing the U2U Relay Discovery with Model B as specified in TS 23.304 [65]. For relay selection and reselection, the U2U remote UE applies the value of this field to evaluate AS layer conditions on direct PC5 link to trigger relay selection, and evaluate AS layer conditions on U2U relay link to trigger relay reselection. The target U2U remote UE applies the value of this field to evaluate AS layer conditions trigger relay selection when performing U2U relay communication with integrated Discovery as specified in TS 23.304 [65]. |
| <i>sd-FilterCoefficientU2U</i> | Specifies L3 filter coefficient for SD-RSRP measurement results from L1 filter, and for SL-RSRP measurement. |

| Conditional Presence | Explanation |
|--------------------------|--|
| <i>SL-RSRP-ThreshU2U</i> | This field is mandatory present if <i>sl-RSRP-ThreshU2U</i> is included. Otherwise, the field is absent, Need R. |
| <i>SD-RSRP-ThreshU2U</i> | This field is mandatory present if <i>sd-RSRP-ThreshU2U</i> is included. Otherwise, the field is absent, Need R. |

– *SL-ReportConfigList*

The IE *SL-ReportConfigList* concerns a list of SL measurement reporting configurations to add or modify for a destination.

SL-ReportConfigList information element

```
-- ASN1START
-- TAG-SL-REPORTCONFIGLIST-START

SL-ReportConfigList-r16 ::=          SEQUENCE (SIZE (1..maxNrofSL-ReportConfigId-r16)) OF SL-ReportConfigInfo-r16
SL-ReportConfigInfo-r16 ::=          SEQUENCE {
    sl-ReportConfigId-r16,
    sl-ReportConfig-r16,
    ...
}
SL-ReportConfigId-r16 ::=          INTEGER (1..maxNrofSL-ReportConfigId-r16)
SL-ReportConfig-r16 ::=          SEQUENCE {
    CHOICE {

    ...
}

SL-RS-Type-r16 ::=                   ENUMERATED {dmrs, sl-prs, spare2, spare1}

-- TAG-SL-REPORTCONFIGLIST-STOP
-- ASN1STOP

```

| <i>SL-ReportConfig</i> field descriptions | |
|--|--|
| <i>sl-ReportType</i>
Type of the configured sidelink measurement report. | |

| <i>SL-EventTriggerConfig</i> field descriptions | |
|---|--|
| <i>sl-EventId</i>
Choice of sidelink measurement event triggered reporting criteria. | |
| <i>sl-ReportAmount</i>
Number of sidelink measurement reports applicable for <i>sl-EventTriggered</i> report type. | |
| <i>sl-ReportInterval</i>
Indicates the interval between periodical reports (i.e., when <i>sl-ReportAmount</i> exceeds 1) for <i>sl-EventTriggered</i> report type. | |
| <i>sl-ReportOnLeave</i>
indicates whether or not the UE shall initiate the sidelink measurement reporting procedure when the leaving condition is met for a frequency in <i>sl-FrequencyTriggeredList</i> , as specified in 5.8.10.4.1. | |
| <i>sl-ReportQuantity</i>
The sidelink measurement quantities to be included in the sidelink measurement report. | |
| <i>sl-TimeToTrigger</i>
Time during which specific criteria for the event needs to be met in order to trigger a sidelink measurement report. | |
| <i>sN-Threshold</i>
Threshold used for events S1 and S2 specified in clauses 5.8.10.4.2 and 5.8.10.4.3, respectively. | |

| <i>SL-PeriodicalReportConfig</i> field descriptions | |
|--|--|
| <i>sl-ReportAmount</i>
Number of sidelink measurement reports applicable for <i>sl-Periodical</i> report type. | |
| <i>sl-ReportInterval</i>
Indicates the interval between periodical reports (i.e., when <i>sl-ReportAmount</i> exceeds 1) for <i>sl-Periodical</i> report type. | |
| <i>sl-ReportQuantity</i>
The sidelink measurement quantities to be included in the sidelink measurement report. | |

– *SL-ResourcePool*

The IE *SL-ResourcePool* specifies the configuration information for NR sidelink communication resource pool.

***SL-ResourcePool* information element**

```
-- ASN1START
-- TAG-SL-RESOURCEPOOL-START

| SL-ZoneConfigMCR field descriptions | |
|--|--|
| sl-TransRange | Indicates the communication range requirement for the corresponding <i>sl-ZoneConfigMCR-Index</i> . The unit is meter. |
| sl-ZoneConfig | Indicates the zone configuration for the corresponding <i>sl-ZoneConfigMCR-Index</i> . |
| sl-ZoneConfigMCR-Index | Indicates the codepoint of the communication range requirement field in SCI. |

| <i>SL-ResourcePool</i> field descriptions | |
|---|--|
| <i>dummy, dummy1</i> | This field is not used in the specification. If received it shall be ignored by the UE. |
| <i>numSym-SL-PRS-2ndStageSCI</i> | Indicates the number symbols to be assumed for SL PRS in determining the number of coded modulation symbols for second stage SCI in a slot of a shared SL PRS resource pool. |
| <i>sl-A2X-Service</i> | Presence of this field indicates the resource pool is dedicated for A2X service, i.e., not to be used for other than A2X service. Value <i>brid</i> indicates the resource pool is for BRID, value <i>daa</i> indicates the resource pool is for DAA, and value <i>bridAndDAA</i> indicates the resource pool is for both BRID and DAA. If this field is absent in all the configured resource pools, the UE may choose non-dedicated resource pool for A2X service. |
| <i>sl-Additional-MCS-Table</i> | Indicates the MCS table(s) additionally used in the resource pool. 64QAM table is (pre-)configured as default. Zero, one or two can be additionally (pre-)configured using the 256QAM and/or low-SE MCS tables. If two MCS tables are indicated, 256QAM MCS table is the 1 st table and qam64lowSE MCS table is the 2 nd table as specified in TS 38.214 [19], clause 8.1.3.1. |
| <i>si-CPE-StartingPositionsPSCCH-PSSCH-InitiateCOT-Default</i> | Indicates CPE starting position index for the default CPE starting position, to be used for PSCCH/PSSCH transmission when UE initiating a COT. |
| <i>si-CPE-StartingPositionsPSCCH-PSSCH-InitiateCOT-List</i> | Indicates a set of selected indices that correspond to multiple candidate CPE starting positions to be used for PSCCH/PSSCH transmission when UE initiating a COT, associated per L1 priority of PSSCH. |
| <i>si-CPE-StartingPositionsPSCCH-PSSCH-WithinCOT-Default</i> | Indicates CPE starting position index for the default CPE starting position, to be used by UE for PSCCH/PSSCH transmission within a COT. |
| <i>si-CPE-StartingPositionsPSCCH-PSSCH-WithinCOT-List</i> | Indicates a set of one or multiple selected indices that correspond to one or multiple candidate CPE starting positions to be used by UE for PSCCH/PSSCH transmission within a COT, associated per L1 priority of PSSCH. |
| <i>si-CPE-StartingPositionPSFCH</i> | Indicates CPE starting position within the GP symbol before PSFCH transmission. The value is an index of the set of all candidate CPE starting positions specified in Table 5.3.1-3 of [16, TS38.211] for Ci=1 and the corresponding SCS of the SL BWP. |
| <i>si-FilterCoefficient</i> | This field indicates the filtering coefficient for long-term measurement and reference signal power derivation used for sidelink open-loop power control. |
| <i>si-InterUE-CoordinationConfig</i> | Indicates the configured sidelink inter-UE coordination parameters. |
| <i>si-IUC-RB-SetList</i> | The n-th value in the list indicates the set of PRBs of n-th PSFCH occasion that are actually used for inter-UE coordination information transmission and reception in Scheme 2. It shall be (pre-)configured such that N candidate PSFCH occasion(s) are associated with N different PRB sets. PRBs within intra-cell guard band are not used for PSFCH transmission. The length of this list is aligned with <i>si-NumPSFCH-Occasions</i> . For each PSFCH occasion, the set of PRBs are indicated in the same format as in <i>si-PSFCH-RB-Set</i> . |
| <i>si-NumDedicatedPRBs-ForPSFCH</i> | Indicates the value of K3 when each PSFCH transmission occupies "1 common interlace and K3 dedicated PRB(s)" (as indicated by <i>si-TransmissionStructureForPSFCH</i>). Value prb1 corresponds to K3=1, value prb2 corresponds to K3=2, and so on. UE expects the same (pre-)configured value of <i>si-NumDedicatedPRBs-ForPSFCH</i> across all resource pools. |
| <i>si-NumInterlacePerSubchannel</i> | Indicates the number of (K) interlaces per sub-channel within a resource pool. Value sc1 corresponds to 1 interlace per sub-channel, and value sc2 corresponds to 2 interlaces per sub-channel. The applicable values are related to the subcarrier spacing as below:
For SCS = 15 kHz: K=1 or 2
For SCS = 30 kHz: K=1 |

| | |
|---|--|
| si-NumPSFCH-Occasions | Indicates one PSCCH/PSSCH transmission has N associated candidate PSFCH occasion(s). Value o1 corresponds to N=1, value o2 corresponds to N=2, and so on. If the field is not configured, the UE shall use value o1. |
| si-NumReferencePRBs-OfInterlace | Indicate reference number of PRBs of one interlace within 1 RB set. Value prb10 corresponds to 10 PRBs, and value prb11 corresponds to 11 PRBs. |
| si-NumRefSymbolLength | Indicates a reference number of symbols for TBS determination. |
| si-NumSubchannel | Indicates the number of subchannels in the corresponding resource pool, which consists of contiguous PRBs only. |
| si-PBPS-CPS-Config | Indicates the allowed resource allocation schemes of full sensing only, partial sensing only, random resource selection only, or any combination(s), and the related configuration for power saving resource allocation schemes. This field is absent for <i>si-TxPoolExceptional</i> . |
| si-PreemptionEnable | Indicates whether pre-emption is disabled or enabled in a resource pool. If the field is present and the value is <i>p1</i> , <i>p2</i> , and so on (but not <i>enabled</i>), it means that pre-emption is enabled and a priority level <i>p_preemption</i> is configured. If the field is present and the value is <i>enabled</i> , the pre-emption is enabled (but <i>p_preemption</i> is not configured) and pre-emption is applicable to all levels. |
| si-PriorityThreshold-UL-URLLC | Indicates the threshold used to determine whether NR sidelink transmission is prioritized over uplink transmission of priority index 1 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 1 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0. |
| si-PriorityThreshold | Indicates the threshold used to determine whether NR sidelink transmission is prioritized over uplink transmission of priority index 0 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 0 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0. |
| si-PRS-ResourcesSharedSL-PRS-RP | Indicates SL PRS resources in a slot of shared SL PRS resource pool as defined in TS 38.211 [16]. The UE can use the resource pool to transmit or receive SL-PRS only if this field is present. |
| si-PSFCH-CommonInterlaceIndex | Indicate the index of common interlace to meet OCB requirements when <i>transmissionStructureForPSFCH</i> is set to common interlace. Value 0 corresponds to interlace 0 is used as common interlace, value 1 corresponds to interlace 1 is used as common interlace and so on. |
| si-PSFCH-PowerOffset | Indicates the power offset between Tx power on one common PRB (<i>P_common</i>) and Tx power on one dedicated PRB (<i>P_dedicated</i>) when <i>si-TransmissionStructureForPSFCH</i> is (pre-)configured as <i>commonInterlace</i> , i.e., <i>P_common</i> = <i>P_dedicated</i> - offset. UE expects the same (pre-)configured value of <i>si-PSFCH-PowerOffset</i> across all resource pools. The unit is dB. |
| si-PSFCH-RB-SetList | The n-th value in the list indicates the set of PRBs that are actually used for PSFCH transmission and reception of n-th PSFCH occasion of a PSCCH/PSSCH transmission. It shall be (pre-)configured such that N candidate PSFCH occasion(s) are associated with N different PRB sets. PRBs within intra-cell guard band are not used for PSFCH transmission. The length of this list is aligned with <i>si-NumPSFCH-Occasions</i> . For each PSFCH occasion, the set of PRBs are indicated in the same format as in <i>si-PSFCH-RB-Set</i> . |
| si-RB-Number | Indicates the number of PRBs in the corresponding resource pool, which consists of contiguous PRBs only. The remaining RB cannot be used (See TS 38.214[19], clause 8). |
| si-RBSetIndexOfResourcePool | For interlace RB based PSCCH/PSSCH, indicates the RB set index(s) included in the resource pool. Contiguous RB sets are (pre-)configured for a resource pool. |
| si-SCI-basedSL-PRS-TxTriggerSCI2-D | Indicates presence of a bit-field in SCI format 2-D to trigger SL-PRS transmission by a receiving UE. |
| si-StartRB-Subchannel | Indicates the lowest RB index of the subchannel with the lowest index in the resource pool with respect to the lowest RB index of a SL BWP. |

| | |
|---|---|
| sl-SubchannelSize | Indicates the minimum granularity in frequency domain for the sensing for PSSCH resource selection in the unit of PRB. |
| sl-SyncAllowed | Indicates the allowed synchronization reference(s) which is (are) allowed to use the configured resource pool. |
| sl-SyncConfigIndex | Indicates the synchronisation configuration that is associated with a reception pool, by means of an index to the corresponding entry <i>SL-SyncConfigList</i> of in <i>SIB12</i> for NR sidelink communication. |
| sl-TDD-Configuration | Indicates the TDD configuration associated with the reception pool of the cell indicated by <i>sl-SyncConfigIndex</i> . |
| sl-ThreshS-RSSI-CBR | Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the CBR measurement. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value n to (-112 + n*2) dBm, and so on. |
| sl-TimeResource | Indicates the bitmap of the resource pool, which is defined by repeating the bitmap with a periodicity during a SFN or DFN cycle. |
| sl-TimeWindowSizeCBR | Indicates the time window size for CBR measurement. |
| sl-TimeWindowSizeCR | Indicates the time window size for CR evaluation. |
| sl-TransmissionStructureForPSFCH | Indicate each PSFCH transmission occupies "1 common interlace and K3 dedicated PRB(s)", or "1 dedicated interlace". Value <i>commonInterlace</i> corresponds to "1 common interlace and K3 dedicated PRB(s)", and value <i>dedicatedInterlace</i> corresponds to "1 dedicated interlace". UE expects the same (pre-)configured value of <i>transmissionStructureForPSFCH</i> across all resource pools. |
| sl-TxPercentageList | Indicates the portion of candidate single-slot PSSCH resources over the total resources. Value p20 corresponds to 20%, and so on. |
| sl-Type1-LBT-BlockingOption1 | Indicates UE may avoid selection of N consecutive resource(s) before a reserved resource of another UE when the L1 SL priority value for the transmission is higher than the L1 SL priority value of the reserved resource, and UE may also avoid selection of M consecutive resource(s) after a reserved resource of another UE when the transmitting symbols of the reserved resource overlap with LBT of the selected resource. The selection of the value N is up to UE implementation from {0, 1, 2}. M is determined based on UE implementation (at least including 0). |
| sl-Type1-LBT-BlockingOption2 | Indicates UE may prioritize/select resource(s) in the slot(s) for transmission, if UE's transmission in slot(s) before a reserved resource is able to share its initiated COT to the reservation. |
| sl-X-Overhead | Accounts for overhead from CSI-RS, PT-RS. If the field is absent, the UE applies value <i>n0</i> (see TS 38.214 [19], clause 8.1.3.2). |

| SL-SyncAllowed field descriptions | |
|--|--|
| gnbEnb-Sync | If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to eNB or gNB (i.e., synchronized to a reference UE which is directly synchronized to eNB or gNB). |
| gnss-Sync | If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to GNSS (i.e., synchronized to a reference UE which is directly synchronized to GNSS). |
| ue-Sync | If configured, the (pre-) configured resources can be used if the UE is synchronized to a reference UE which is not synchronized to eNB, gNB and GNSS directly or indirectly. |

| <i>SL-PSCCH-Config</i> field descriptions | |
|--|---|
| <i>si-FreqResourcePSCCH</i> | Indicates the number of PRBs for PSCCH in a resource pool where it is not greater than the number PRBs of the subchannel. |
| <i>si-DMRS-ScrambleID</i> | Indicates the initialization value for PSCCH DMRS scrambling. |
| <i>si-NumReservedBits</i> | Indicates the number of reserved bits in first stage SCI. |
| <i>si-TimeResourcePSCCH</i> | Indicates the number of symbols of PSCCH in a resource pool. |

| <i>SL-PSSCH-Config</i> field descriptions | |
|--|---|
| <i>si-BetaOffsets2ndSCI</i> | Indicates candidates of beta-offset values to determine the number of coded modulation symbols for second stage SCI. The value indicates the index of Table 9.3-2 of TS 38.213 [13]. |
| <i>si-PSSCH-DMRS-TimePatternList</i> | Indicates the set of PSSCH DMRS time domain patterns in terms of PSSCH DMRS symbols in a slot that can be used in the resource pool. |
| <i>si-Scaling</i> | Indicates a scaling factor to limit the number of resource elements assigned to the second stage SCI on PSSCH. Value <i>f0p5</i> corresponds to 0.5, value <i>f0p65</i> corresponds to 0.65, and so on. |

| <i>SL-PSFCH-Config</i> field descriptions | |
|--|--|
| <i>si-MinTimeGapPSFCH</i> | The minimum time gap between PSFCH and the associated PSSCH in the unit of slots. |
| <i>si-NumMuxCS-Pair</i> | Indicates the number of cyclic shift pairs used for a PSFCH transmission that can be multiplexed in a PRB. |
| <i>si-PSFCH-CandidateResourceType</i> | Indicates the number of PSFCH resources available for multiplexing HARQ-ACK information in a PSFCH transmission (see TS 38.213 [13], clause 16.3). |
| <i>si-PSFCH-HopID</i> | Scrambling ID for sequence hopping of the PSFCH used in the resource pool. |
| <i>si-PSFCH-Period</i> | Indicates the period of PSFCH resource in the unit of slots within this resource pool. If set to <i>s/0</i> , no resource for PSFCH, and HARQ feedback for all transmissions in the resource pool is disabled. |
| <i>si-PSFCH-RB-Set</i> | Indicates the set of PRBs that are actually used for PSFCH transmission and reception. The leftmost bit of the bitmap refers to the lowest RB index in the resource pool, and so on. Value 0 in the bitmap indicates that the corresponding PRB is not used for PSFCH transmission and reception while value 1 indicates that the corresponding PRB is used for PSFCH transmission and reception (see TS 38.213 [13]). |

| <i>SL-PRS-ResourceShared</i>
<i>SL-PRS-RP field descriptions</i> | |
|---|---|
| <i>mNumberOfSymbols</i> | Indicates the number of symbols in the SL PRS resource in the shared resource pool. The maximum value that is configured for this field is 4. |
| <i>si-PRS-CombSizeN-AndReOffset</i> | Indicates a comb offset and a comb size of the SL PRS resource in a shared SL PRS resource pool (see TS 38.214 [19], clause 8.2.4). |
| <i>si-PRS-ResourceID</i> | Indicates the index of the SL PRS resource in shared resource pool. |

| <i>SL-PTRS-Config</i>
<i>field descriptions</i> | |
|--|--|
| <i>si-PTRS-FreqDensity</i> | Presence and frequency density of SL PT-RS as a function of scheduled BW. If the field is not configured, the UE uses K_PT-RS = 2 |
| <i>si-PTRS-TimeDensity</i> | Presence and time density of SL PT-RS as a function of MCS. If the field is not configured, the UE uses L_PT-RS = 1 |
| <i>si-PTRS-RE-Offset</i> | Indicates the subcarrier offset for SL PT-RS . If the field is not configured, the UE applies the value offset00 (see TS 38.211 [16], clause 8.4.1.2.2). |

| SL-UE-SelectedConfigRP field descriptions | |
|--|---|
| si-CBR-PriorityTxConfigList | Indicates the mapping between PSSCH transmission parameter (such as MCS, PRB number, retransmission number, CR limit) sets by using the indexes of the configurations in <i>si-CBR-PSSCH-TxConfigList</i> , CBR ranges by using the indexes to the entry of the CBR range configurations in <i>si-CBR-RangeConfigList</i> , and priority ranges. It also indicates the default PSSCH transmission parameters to be used when CBR measurement results are not available, and MCS range for the MCS tables used in the resource pool. The field <i>si-CBR-PriorityTxConfigList-v1650</i> is present only when <i>si-CBR-PriorityTxConfigList-r16</i> is configured. |
| si-MaxNumPerReserve | Indicates the maximum number of reserved PSCCH/PSSCH resources that can be indicated by an SCI. |
| si-MultiReserveResource | Indicates if it is allowed to reserve a sidelink resource for an initial transmission of a TB by an SCI associated with a different TB, based on sensing and resource selection procedure. |
| si-NRPSFCH-EUTRA-ThresRSRP-List | Indicates a list of 64 thresholds from which a threshold should be selected based on the priority in the decoded EUTRA SCI and the priority in the NR SCI to be transmitted. A NR SL resource is excluded if the corresponding PSFCH transmission occasions overlap with resources indicated or reserved by the decoded EUTRA SCI in time domain and EUTRA PSSCH RSRP in the associated data resource is above the threshold. |
| si-NRPSSCH-EUTRA-ThresRSRP-List | Indicates a list of 64 thresholds, and a threshold should be selected based on the priority in the decoded EUTRA SCI and the priority in the NR SCI to be transmitted. A NR SL resource is excluded if it is indicated or reserved by the decoded EUTRA SCI and EUTRA PSSCH RSRP in the associated data resource is above the threshold. If the field is present, the UE shall perform the dynamic co-channel coexistence of LTE sidelink and NR sidelink as specified in TS 38.214; otherwise it shall not perform it. |
| si-ResourceReservePeriodList | Set of possible resource reservation period allowed in the resource pool in the unit of ms. Up to 16 values can be configured per resource pool. The value <i>ms0</i> is always configured. |
| si-RS-ForSensing | Indicates whether DMRS of PSCCH or PSSCH is used for L1 RSRP measurement in the sensing operation. |
| si-SensingWindow | Parameter that indicates the start of the sensing window. |
| si-SelectionWindowList | Parameter that determines the end of the selection window in the resource selection for a TB with respect to priority indicated in SCI. Value <i>n1</i> corresponds to $1 \cdot 2^{\mu}$, value <i>n5</i> corresponds to $5 \cdot 2^{\mu}$, and so on, where $\mu = 0, 1, 2, 3$ refers to SCS 15, 30, 60, 120 kHz respectively. |
| si-Thres-RSRP-List | Indicates a list of 64 thresholds, and the threshold should be selected based on the priority in the decoded SCI and the priority in the SCI to be transmitted. A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH/PSCCH RSRP in the associated data resource is above a threshold. |

| <i>SL-PowerControl</i> field descriptions | |
|--|--|
| <i>si-MaxTransPower</i> | Indicates the maximum value of the UE's sidelink transmission power on this resource pool when the sidelink transmission is performed only on this resource pool. The unit is dBm. If the sidelink transmission is PSFCH, and multiple resource pools are used, the maximum transmission power for PSFCH is configured as sum of fields <i>si-maxTransPower</i> over multiple resource pools, as specified in TS 38.101-1 [15]. |
| <i>si-Alpha-PSSCH-PSCCH</i> | Indicates alpha value for sidelink pathloss based power control for PSCCH/PSSCH when <i>si-P0-PSSCH-PSCCH</i> is configured. When the field is absent the UE applies the value 1. |
| <i>si-P0-PSSCH-PSCCH</i> | Indicates P0 value for sidelink pathloss based power control for PSCCH/PSSCH. If not configured, sidelink pathloss based power control is disabled for PSCCH/PSSCH. When <i>si-P0-PSSCH-PSCCH-r17</i> is configured, the UE ignores <i>si-P0-PSSCH-PSCCH-r16</i> . |
| <i>dl-Alpha-PSSCH-PSCCH</i> | Indicates alpha value for downlink pathloss based power control for PSCCH/PSSCH when <i>dl-P0-PSSCH-PSCCH</i> is configured. When the field is absent the UE applies the value 1. |
| <i>dl-P0-PSSCH-PSCCH</i> | Indicates P0 value for downlink pathloss based power control for PSCCH/PSSCH. If not configured, downlink pathloss based power control is disabled for PSCCH/PSSCH. When <i>dl-P0-PSSCH-PSCCH-r17</i> is configured, the UE ignores <i>dl-P0-PSSCH-PSCCH-r16</i> . A Remote UE which is out of coverage, considers downlink pathloss based power control is disabled for PSCCH/PSSCH when <i>dl-P0-PSSCH-PSCCH</i> is configured. |
| <i>dl-Alpha-PSFCH</i> | Indicates alpha value for downlink pathloss based power control for PSFCH when <i>dl-P0-PSFCH</i> is configured. When the field is absent the UE applies the value 1. For resource pools configured with PSFCH resources overlapping in time, this field is either not configured in any of the resource pools or configured with the same value for all the resource pools. |
| <i>dl-P0-PSFCH</i> | Indicates P0 value for downlink pathloss based power control for PSFCH. If not configured, downlink pathloss based power control is disabled for PSFCH. When <i>dl-P0-PSFCH-r17</i> is configured, the UE ignores <i>dl-P0-PSFCH-r16</i> . For resource pools configured with PSFCH resources overlapping in time, this field is either not configured in any of the resource pools or configured with the same value for all the resource pools. A Remote UE which is out of coverage, considers downlink pathloss based power control is disabled for PSFCH when <i>dl-P0-PSFCH</i> is configured. |

| <i>SL-MinMaxMCS-Config</i> field descriptions | |
|--|--|
| <i>si-MaxMCS-PSSCH</i> | Indicates the maximum MCS value when using the associated MCS table. If no MCS is configured, UE autonomously selects MCS from the full range of values. |
| <i>si-MinMCS-PSSCH</i> | Indicates the minimum MCS value when using the associated MCS table. If no MCS is configured, UE autonomously selects MCS from the full range of values. |

| <i>SL-CPE-StartingPositionsPSCCH-PSSCH</i> field descriptions | |
|--|--|
| <i>si-Priority</i> | Indicates L1 priority of PSSCH. |
| <i>si-CPE-StartingPositions</i> | Indicates a set of candidate CPE starting positions specified in Table 5.3.1-3 [16, TS38.211], |

| Conditional Presence | Explanation |
|----------------------|--|
| A2X | The field is mandatory present in <i>sl-BWP-PoolConfigA2X</i> and <i>sl-BWP-PoolConfigCommonA2X</i> ; otherwise the field is optionally present, Need M. |

– *SL-RLC-BearerConfig*

The IE *SL-RLC-BearerConfig* specifies the SL RLC bearer configuration information for NR sidelink communication.

***SL-RLC-BearerConfig* information element**

```
-- ASN1START
-- TAG-SL-RLC-BEARERCONFIG-START

SL-RLC-BearerConfig-r16 ::= SEQUENCE {
    sl-RLC-BearerConfigIndex-r16,
    sl-ServedRadioBearer-r16
    sl-RLC-Config-r16
    sl-MAC-LogicalChannelConfig-r16
    ...
    [[
        sl-RLC-BearerConfigIndex-v1800
    ]]
}
-- TAG-SL-RLC-BEARERCONFIG-STOP
-- ASN1STOP
```

```
    SLRB-Uu-ConfigIndex-r16
    SL-RLC-Config-r16
    SL-LogicalChannelConfig-r16
}

OPTIONAL, -- Cond LCH-SetupOnly
OPTIONAL, -- Cond LCH-Setup
OPTIONAL, -- Cond LCH-Setup

OPTIONAL -- Need R
```

| <i>SL-RLC-BearerConfig</i> field descriptions | |
|--|--|
| <i>sl-MAC-LogicalChannelConfig</i> | The field is used to configure MAC SL logical channel parameters. |
| <i>sl-RLC-BearerConfigIndex</i> | The index of the RLC bearer configuration. If the field <i>sl-RLC-BearerConfigIndex-v1800</i> is present, the UE shall ignore the <i>sl-RLC-BearerConfigIndex-r16</i> field. |
| <i>sl-RLC-Config</i> | Determines the RLC mode (UM, AM) and provides corresponding parameters. |
| <i>sl-ServedRadioBearer</i> | Associates the sidelink RLC Bearer with a sidelink DRB. It indicates the index of SL radio bearer configuration, which is corresponding to the RLC bearer configuration. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>LCH-Setup</i> | The field is mandatory present upon creation of a new sidelink logical channel via the dedicated signalling and in case of sidelink DRB configuration via system information and pre-configuration; otherwise the field is optionally present, Need M. |
| <i>LCH-SetupOnly</i> | This field is mandatory present upon creation of a new sidelink logical channel via the dedicated signalling and in case of sidelink DRB configuration via system information and pre-configuration. Otherwise, it is absent, Need M. |

- ***SL-RLC-BearerConfigIndex***

The IE *SL-RLC-BearerConfigIndex* is used to identify a SL RLC bearer configuration.

***SL-RLC-BearerConfigIndex* information element**

```
-- ASN1START
-- TAG-SL-RLC-BEARERCONFIGINDEX-START

SL-RLC-BearerConfigIndex-r16 ::= INTEGER (1..maxSL-LCID-r16)
SL-RLC-BearerConfigIndex-v1800 ::= INTEGER (maxSL-LCID-Plus1-r18..maxSL-LCID-r18)

-- TAG-RLC-BEARERCONFIGINDEX-STOP
-- ASN1STOP
```

- ***SL-RLC-ChannelConfig***

The IE *SL-RLC-ChannelConfig* specifies the configuration information for PC5 Relay RLC channel between L2 U2N Relay UE and L2 U2N Remote UE, or between L2 U2U Remote UE and L2 U2U Relay UE.

***SL-RLC-ChannelConfig* information element**

```
-- ASN1START
-- TAG-SL-RLC-RLC-CHANNEL-CONFIG-START

SL-RLC-ChannelConfig-r17 ::= SEQUENCE {
    sl-RLC-ChannelID-r17,
    sl-RLC-Config-r16,
    sl-MAC-LogicalChannelConfig-r17,
    sl-PacketDelayBudget-r17
    ...
    OPTIONAL, -- Need M
    OPTIONAL, -- Need M
    OPTIONAL, -- Need M
}

-- TAG-SL-RLC-CHANNEL-CONFIG-STOP
-- ASN1STOP
```

| <i>SL-RLC-ChannelConfig</i> field descriptions | |
|---|--|
| <i>sl-MAC-LogicalChannelConfig</i> | The field is used to configure MAC SL logical channel parameters. |
| <i>sl-RLC-ChannelID</i> | Indicates the PC5 Relay RLC channel in the link between L2 U2N Relay UE and L2 U2N Remote UE, or between L2 U2U Remote UE and L2 U2U Relay UE. |
| <i>sl-RLC-Config</i> | Determines the RLC mode (UM, AM) and provides corresponding parameters. |
| <i>sl-PacketDelayBudget</i> | Indicates the Packet Delay Budget for a PC5 Relay RLC channel used in L2 U2N relay operation. Upper bound value for the delay that a packet may experience expressed in unit of 0.5ms. |

– ***SL-RLC-ChannelID***

The IE ***SL-RLC-ChannelID*** is used to identify a PC5 Relay RLC channel in the link between L2 U2N Relay UE and L2 U2N Remote UE, or between L2 U2U Relay UE and L2 U2U Remote UE.

SL-RLC-ChannelID information element

```
-- ASN1START
-- TAG-SL-RLC-CHANNELID-START

SL-RLC-ChannelID-r17 ::= INTEGER (1..maxSL-LCID-r16)

-- TAG-SL-RLC-CHANNELID-STOP
-- ASN1STOP
```

– ***SL-RLC-Config***

The IE ***SL-RLC-Config*** is used to specify the RLC configuration of sidelink DRB. RLC AM configuration is only applicable to the unicast NR sidelink communication.

SL-RLC-Config information element

```
-- ASN1START
-- TAG-SL-RLC-CONFIG-START

SL-RLC-Config-r16 ::= CHOICE {
    sl-AM-RLC-r16
        sl-SN-FieldLengthAM-r16
        sl-T-PollRetransmit-r16

```

```

} ,
...
}

-- TAG-SL-RLC-CONFIG-STOP
-- ASN1STOP

```

| <i>SL-RLC-Config</i> field descriptions | |
|--|---|
| <i>sl-MaxRetxThreshold</i> | Parameter value of <i>maxRetxThreshold</i> for RLC AM for NR sidelink communications, see TS 38.322 [4]. Value <i>t1</i> corresponds to 1 retransmission, value <i>t2</i> corresponds to 2 retransmissions and so on. |
| <i>sl-PollByte</i> | Parameter value of <i>pollByte</i> for RLC AM for NR sidelink communications, see TS 38.322 [4]. Value <i>kB25</i> corresponds to 25 kBytes, value <i>kB50</i> corresponds to 50 kBytes and so on. <i>infinity</i> corresponds to an infinite amount of kBytes. |
| <i>sl-PollPDU</i> | Parameter value of <i>pollPDU</i> for RLC AM for NR sidelink communications, see TS 38.322 [4]. Value <i>p4</i> corresponds to 4 PDUs, value <i>p8</i> corresponds to 8 PDUs and so on. <i>infinity</i> corresponds to an infinite number of PDUs. |
| <i>sl-SN-FieldLength</i> | This field indicates the RLC SN field size for NR sidelink communication, see TS 38.322 [4]. For groupcast and broadcast, only value <i>size6</i> (6 bits) is configured for the field <i>sl-SN-FieldLengthUM</i> . |
| <i>sl-T-PollRetransmit</i> | Timer value of <i>t-PollRetransmit</i> for RLC AM for NR sidelink communications, see TS 38.322 [4], in milliseconds. Value <i>ms5</i> means 5 ms, value <i>ms10</i> means 10 ms and so on. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>SLRBSetup</i> | The field is mandatory present in case of sidelink DRB setup via the dedicated signalling and in case of sidelink DRB configuration via system information and pre-configuration; otherwise the field is optionally present, need M. |

– *SL-ScheduledConfig*

The IE *SL-ScheduledConfig* specifies sidelink communication/positioning configurations used for network scheduled NR sidelink communication/positioning.

***SL-ScheduledConfig* information element**

```
-- ASN1START
-- TAG-SL-SCHEDULEDCONFIG-START
```

```

SL-ScheduledConfig-r16 ::=

```

| <i>SL-ScheduledConfig</i> field descriptions | |
|---|---|
| <i>si-CS-RNTI</i> | Indicate the RNTI used to scramble CRC of DCI format 3_0, see TS 38.321 [3]. |
| <i>si-DCI-ToSL-Trans</i> | Indicate the time gap between DCI reception and the first sidelink transmission scheduled by the DCI (see TS 38.214 [19], clause 8.1.2.1). Value 1 included in this field corresponds to 1 slot, value 2 corresponds to 2 slots and so on, based on the numerology of sidelink BWP. |
| <i>si-PRS-CS-RNTI</i> | Indicates the RNTI used to scramble CRC of DCI format 3_2 for configured grants. |
| <i>si-PRS-RNTI</i> | Indicates the SL-PRS-RNTI used for monitoring the network scheduling to transmit NR sidelink positioning reference signal (i.e. the mode 1) for dynamic grants. |
| <i>si-PSFCH-ToPUCCH</i> | For dynamic grant and configured grant type 2, this field configures the values (in number of slot lengths) of the PSFCH to PUCCH gap. The field PSFCH-to-HARQ_feedback timing indicator in DCI format 3_0 selects one of the configured values of the PSFCH to PUCCH gap. |
| <i>si-RNTI</i> | Indicate the SL-RNTI used for monitoring the network scheduling to transmit NR sidelink communication (i.e. the mode 1). |

| MAC-MainConfigSL field descriptions | |
|--|--|
| sl-BSR-Config | This field is to configure the sidelink buffer status report. |
| sl-PrioritizationThres | Indicates the SL priority threshold, which is used to determine whether SL TX is prioritized over UL TX, as specified in TS 38.321 [3]. Network does not configure the <i>sl-PrioritizationThres</i> and the <i>ul-PrioritizationThres</i> to the UE separately. |
| ul-PrioritizationThres | Indicates the UL priority threshold, which is used to determine whether SL TX is prioritized over UL TX, as specified in TS 38.321 [3]. Network does not configure the <i>sl-PrioritizationThres</i> and the <i>ul-PrioritizationThres</i> to the UE separately. |

– *SL-SDAP-Config*

The IE *SL-SDAP-Config* is used to set the configurable SDAP parameters for a Sidelink DRB.

SL-SDAP-Config information element

```
-- ASN1START
-- TAG-SL-SDAP-CONFIG-START

SL-SDAP-Config-r16 ::= SEQUENCE {
    sl-SDAP-Header-r16           ENUMERATED {present, absent},
    sl-DefaultRB-r16              BOOLEAN,
    sl-MappedQoS-Flows-r16        CHOICE {
        sl-MappedQoS-FlowsList-r16   SEQUENCE (SIZE (1..maxNrofSL-QFIs-r16)) OF SL-QoS-Profile-r16,

}                                -- Need N
-- Need N

-- TAG-SL-SDAP-CONFIG-STOP
-- ASN1STOP
```

| <i>SL-SDAP-Config</i> field descriptions | |
|---|--|
| <i>sl-DefaultRB</i> | Indicates whether or not this is the default sidelink DRB for this NR sidelink communication transmission destination. Among all configured instances of <i>SL-SDAP-Config</i> for this destination, this field shall be set to <i>true</i> in at most one instance of <i>SL-SDAP-Config</i> and to <i>false</i> in all other instances. |
| <i>sl-MappedQoS-Flows</i> | Indicates QoS flows to be mapped to the sidelink DRB. If the field is included in dedicated signalling, it is set to <i>sl-MappedQoS-FlowsListDedicated</i> ; otherwise, it is set to <i>sl-MappedQoS-FlowsList</i> . |
| <i>sl-MappedQoS-FlowsList</i> | Indicates the list of QoS profiles of the NR sidelink communication transmission destination mapped to this sidelink DRB. |
| <i>sl-MappedQoS-FlowsToAddList</i> | Indicates the list of SL QoS flows ID of the NR sidelink communication transmission destination to be additionally mapped to this sidelink DRB. |
| <i>sl-MappedQoS-FlowsToReleaseList</i> | Indicates the list of SL QoS flows ID of the NR sidelink communication transmission destination to be released from existing QoS flow to SRLB mapping of this sidelink DRB. |
| <i>sl-SDAP-Header</i> | Indicates whether or not a SDAP header is present on this sidelink DRB. The field cannot be changed after a sidelink DRB is established. This field is set to present if the field <i>sl-DefaultRB</i> is set to <i>true</i> . |

– ***SL-ServingCellInfo***

The IE *SL-ServingCellInfo* is used to indicate the L2 U2N Relay UE's PCell/camping cell, which is considered as PCell/camping cell by the L2 U2N Remote UEs connecting with this L2 U2N Relay UE.

***SL-ServingCellInfo* information element**

```
-- ASN1START
-- TAG-SL-SERVINGCELLINFO-START

SL-ServingCellInfo-r17 ::= SEQUENCE {
    sl-PhysCellId-r17      PhysCellId,
    sl-CarrierFreqNR-r17    ARFCN-ValueNR
}

-- TAG-SL-SERVINGCELLINFO-STOP
-- ASN1STOP
```

| <i>SL-ServingCellInfo</i> field descriptions | |
|---|--|
| <i>sl-CarrierFreqNR</i> | Indicates the DL frequency of the cell indicated by <i>sl-PhysCellId</i> . |
| <i>sl-PhysCellId</i> | Indicates the PCI of the PCell. |

- ***SL-SourceIdentity***

The IE *SL-SourceIdentity* is used to identify a source of a NR sidelink communication.

***SL-SourceIdentity* information element**

```
-- ASN1START
-- TAG-SL-SOURCEIDENTITY-START

SL-SourceIdentity-r17 ::= BIT STRING (SIZE (24))

-- TAG-SL-SOURCEIDENTITY-STOP
-- ASN1STOP
```

- ***SL-SRAP-Config***

The IE *SL-SRAP-Config* is used to set the configurable SRAP parameters used by L2 U2N Relay UE and L2 U2N Remote UE as specified in TS 38.351 [66].

***SL-SRAP-Config* information element**

```
-- ASN1START
-- TAG-SL-SRAP-CONFIG-START

SL-SRAP-Config-r17 ::= SEQUENCE {
    sl-LocalIdentity-r17           OPTIONAL, -- Need M
    sl-MappingToAddModList-r17     OPTIONAL, -- Need N
    sl-MappingToReleaseList-r17    OPTIONAL, -- Need N
    ...
}

SL-MappingToAddMod-r17 ::= SEQUENCE {
    sl-RemoteUE-RB-Identity-r17   OPTIONAL, -- Cond L2RelayUE
    sl-EgressRLC-ChannelUu-r17    OPTIONAL, -- Need N
    sl-EgressRLC-ChannelPC5-r17
    ...
}

SL-RemoteUE-RB-Identity-r17 ::= CHOICE {
    srb-Identity-r17
    drb-Identity-r17
    ...
}

-- TAG-SL-SRAP-CONFIG-STOP
-- ASN1STOP
```

| <i>SL-SRAP-Config</i> field descriptions | |
|---|--|
| <i>sl-LocalIdentity</i> | Indicates the local UE ID of the L2 U2N Remote UE used in SRAP as specified in TS 38.351 [66]. |
| <i>sl-MappingToAddModList</i> | Indicates the list of mappings between the bearer identity of the L2 U2N Remote UE and the egress RLC channel as specified in TS 38.351 [66] to be added or modified. |
| <i>sl-MappingToReleaseList</i> | Indicates the list of mappings between the bearer identity of the L2 U2N Remote UE and the egress RLC channel as specified in TS 38.351 [66] to be released. |
| <i>sl-RemoteUE-RB-Identity</i> | Identity of the end-to-end Uu bearer identity of the L2 U2N Remote UE. The value 3 for the field <i>srb-identity-r17</i> (i.e., for configuring SRB3) is not supported in this version of the specification. |
| <i>sl-EgressRLC-ChannelUu</i> | Indicates the egress RLC channel on Uu Hop for uplink transmissions at the L2 U2N Relay UE. |
| <i>sl-EgressRLC-ChannelPC5</i> | Indicates the egress RLC channel on PC5 Hop for downlink transmissions at the L2 U2N Relay UE and for uplink transmissions at the L2 U2N Remote UE. |

| Conditional Presence | Explanation |
|-----------------------------|--|
| <i>L2RelayUE</i> | For L2 U2N Relay UE, the field is optionally present, Need M. Otherwise, it is absent. |

– ***SL-SRAP-ConfigU2U***

The IE ***SL-SRAP-ConfigU2U*** is used to set the configurable SRAP parameters used by L2 U2U Relay UE and L2 U2U Remote UE as specified in TS 38.351 [66].

***SL-SRAP-ConfigU2U* information element**

```
-- ASN1START
-- TAG-SL-SRAP-CONFIGU2U-START

SL-SRAP-ConfigU2U-r18 ::= SEQUENCE {
    sl-MappingToAddMod-U2U-List-r18      OPTIONAL, -- Need N
    sl-MappingToRelease-U2U-List-r18      OPTIONAL -- Need N
}

SL-MappingConfig-U2U-r18 ::= SEQUENCE {
    sl-RemoteUE-SLRB-Identity-r18,
    sl-EgressRLC-ChannelPC5-r18,
    ...
}

-- TAG-SL-SRAP-CONFIGU2U-STOP
-- ASN1STOP
```

| SL-SRAP-ConfigU2U field descriptions | |
|---|--|
| sl-MappingToAddMod-U2U-List | Indicates the list of mappings between the end-to-end sidelink DRB of a given L2 U2U Remote UE and the egress PC5 Relay RLC channel used by L2 U2U Remote UE and L2 U2U Relay UE when acting as Tx UE, as specified in TS 38.351 [66] to be added or modified. |
| sl-MappingToRelease-U2U-List | Indicates the list of mappings between the end-to-end sidelink DRB of a given L2 U2U Remote UE and the egress PC5 Relay RLC channel as specified in TS 38.351 [66] to be released. |
| sl-EgressRLC-ChannelPC5 | Indicates the egress PC5 Relay RLC channel for sidelink transmissions at the L2 U2U Relay UE and at the L2 U2U Remote UE. |
| sl-RemoteUE-SLRB-Identity | Identity of the end-to-end sidelink DRB of the L2 U2U Remote UE. |

– **SL-SyncConfig**

The IE **SL-SyncConfig** specifies the configuration information concerning reception of synchronisation signals from neighbouring cells as well as concerning the transmission of synchronisation signals for sidelink communication.

SL-SyncConfig information element

```
-- ASN1START
-- TAG-SL-SYNCCONFIG-START

SL-SyncConfigList-r16 ::= SEQUENCE (SIZE (1..maxSL-SyncConfig-r16)) OF SL-SyncConfig-r16

SL-SyncConfig-r16 ::= SEQUENCE {
    sl-SyncRefMinHyst-r16          OPTIONAL,   -- Need R
    sl-SyncRefDiffHyst-r16          OPTIONAL,   -- Need R
    sl-FilterCoefficient-r16        OPTIONAL,   -- Need R
    sl-SSB-TimeAllocation1-r16      OPTIONAL,   -- Need R
    sl-SSB-TimeAllocation2-r16      OPTIONAL,   -- Need R
    sl-SSB-TimeAllocation3-r16      OPTIONAL,   -- Need R
    sl-SSID-r16                    OPTIONAL,   -- Need R
    txParameters-r16 {
        syncTxThreshIC-r16          OPTIONAL,   -- Need R
        syncTxThreshOoC-r16          OPTIONAL,   -- Need R
        syncInfoReserved-r16         OPTIONAL,   -- Need R
    },
    gnss-Sync-r16                  OPTIONAL,   -- Need R
    ...
}

SL-RSRP-Range-r16 ::= INTEGER (0..13)

SL-SSB-TimeAllocation-r16 ::= SEQUENCE {
    sl-NumSSB-WithinPeriod-r16    OPTIONAL,   -- Need R
    sl-TimeOffsetSSB-r16           OPTIONAL,   -- Need R
    sl-TimeInterval-r16            OPTIONAL,   -- Need R
}
```

-- TAG-SL-SYNCCONFIG-STOP
 -- ASN1STOP

| <i>SL-SyncConfig</i> field descriptions | |
|--|---|
| <i>gnss-Sync</i> | If configured, the synchronization configuration is used for SLSS transmission/reception when the UE is synchronized to GNSS. If not configured, the synchronization configuration is used for SLSS transmission/reception when the UE is synchronized to eNB/gNB. |
| <i>sl-SyncRefMinHyst</i> | Hysteresis when evaluating a SyncRef UE using absolute comparison. |
| <i>sl-SyncRefDiffHyst</i> | Hysteresis when evaluating a SyncRef UE using relative comparison. |
| <i>sl-NumSSB-WithinPeriod</i> | Indicates the number of sidelink SSB transmissions within one sidelink SSB period. The applicable values are related to the subcarrier spacing and frequency as follows:
FR1, SCS = 15 kHz: 1
FR1, SCS = 30 kHz: 1, 2
FR1, SCS = 60 kHz: 1, 2, 4
FR2, SCS = 60 kHz: 1, 2, 4, 8, 16, 32
FR2, SCS = 120 kHz: 1, 2, 4, 8, 16, 32, 64
All values in <i>sl-NumSSB-WithinPeriod</i> in <i>sl-SSB-TimeAllocation1</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-NumSSB-WithinPeriod</i> in <i>sl-SSB-TimeAllocation2</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-NumSSB-WithinPeriod</i> in <i>sl-SSB-TimeAllocation3</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. |
| <i>sl-TimeOffsetSSB</i> | Indicates the slot offset from the start of sidelink SSB period to the first sidelink SSB. All values in <i>sl-TimeOffsetSSB</i> in <i>sl-SSB-TimeAllocation1</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-TimeOffsetSSB</i> in <i>sl-SSB-TimeAllocation2</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-TimeOffsetSSB</i> in <i>sl-SSB-TimeAllocation3</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. |
| <i>sl-TimeInterval</i> | Indicates the slot interval between neighboring sidelink SSBs. This value is applicable when there are more than one sidelink SSBs within one sidelink SSB period. All values in <i>sl-TimeInterval</i> in <i>sl-SSB-TimeAllocation1</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-TimeInterval</i> in <i>sl-SSB-TimeAllocation2</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. All values in <i>sl-TimeInterval</i> in <i>sl-SSB-TimeAllocation3</i> is set to be same across all carrier frequencies configured for UEs performing NR sidelink communication on multiple carrier frequencies, if configured. |
| <i>sl-SSID</i> | Indicates the ID of sidelink synchronization signal associated with different synchronization priorities. |
| <i>syncInfoReserved</i> | Reserved for future use. |
| <i>syncTxThreshIC, syncTxThreshOoC</i> | Indicates the thresholds used while in coverage and out of coverage, respectively. Value 0 corresponds to -infinity, value 1 to -115 dBm, value 2 to -110 dBm, and so on (i.e. in steps of 5 dBm) until value 12, which corresponds to -60 dBm, while value 13 corresponds to +infinity. |

- ***SL-Thres-RSRP-List***

IE *SL-Thres-RSRP-List* indicates a threshold used for sensing based UE autonomous resource selection (see TS 38.215 [9]). A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH/PSCCH RSRP in the associated data resource is above the threshold defined by IE *SL-Thres-RSRP-List*. A NR sidelink resource is excluded if the corresponding PSFCH transmission occasions overlap with resources indicated or reserved by the decoded EUTRA SCI in time domain and EUTRA PSSCH RSRP in the associated data resource is above the threshold defined by IE *sl-NRPSFCH-EUTRA-ThresRSRP-List*. A NR sidelink resource is excluded if it is indicated or reserved by the decoded EUTRA SCI and EUTRA PSSCH RSRP in the associated data resource is above the threshold defined by IE *sl-NRPSSCH-EUTRA-ThresRSRP-List*. Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to $(-128 + (n-1)*2)$ dBm and so on, value 66 corresponds to infinity dBm.

***SL-Thres-RSRP-List* information element**

```
-- ASN1START
-- TAG-SL-THRES-RSRP-LIST-START

SL-Thres-RSRP-List-r16 ::= SEQUENCE (SIZE (64)) OF SL-Thres-RSRP-r16

SL-Thres-RSRP-r16 ::= INTEGER (0..66)

-- TAG-SL-THRES-RSRP-LIST-STOP
-- ASN1STOP
```

- ***SL-TxPower***

The IE *SL-TxPower* is used to limit the UE's sidelink transmission power on a carrier frequency. The unit is dBm. Value minusinfinity corresponds to -infinity.

***SL-TxPower* information element**

```
-- ASN1START
-- TAG-SL-TXPOWER-START

SL-TxPower-r16 ::= CHOICE{
    minusinfinity-r16
    txPower-r16
}

-- TAG-SL-TXPOWER-STOP
-- ASN1STOP
```

- ***SL-TypeTxSync***

The IE *SL-TypeTxSync* indicates the synchronization reference type.

***SL-TypeTxSync* information element**

```
-- ASN1START
-- TAG-SL-TYPETEXSYNC-START

SL-TypeTxSync-r16 ::= ENUMERATED {gnss, gnbEnb, ue}

-- TAG-SL-TYPETEXSYNC-STOP
-- ASN1STOP
```

– ***SL-UE-SelectedConfig***

IE *SL-UE-SelectedConfig* specifies sidelink communication/positioning configurations used for UE autonomous resource selection.

***SL-UE-SelectedConfig* information element**

```
-- ASN1START
-- TAG-SL-UE-SELECTEDCONFIG-START

SL-UE-SelectedConfig-r16 ::= SEQUENCE {
    sl-PSSCH-TxConfigList-r16
    sl-ProbResourceKeep-r16
    sl-ReselectAfter-r16
    sl-CBR-CommonTxConfigList-r16
    ul-PrioritizationThres-r16
    sl-PrioritizationThres-r16
    ...
    [
        sl-CBR-CommonTxDedicatedSL-PRS-RP-List-r18
        SL-CBR-CommonTxDedicatedSL-PRS-RP-List-r18
    ]
}
OPTIONAL, -- Cond SIB12
OPTIONAL, -- Need R
OPTIONAL, -- Cond notSIB12
OPTIONAL, -- Cond notSIB12

-- TAG-SL-UE-SELECTEDCONFIG-STOP
-- ASN1STOP
```

| <i>SL-UE-SelectedConfig</i> field descriptions | |
|---|--|
| <i>sl-PrioritizationThres</i> | Indicates the SL priority threshold, which is used to determine whether SL TX is prioritized over UL TX, as specified in TS 38.321 [3]. Network does not configure the <i>sl-PrioritizationThres</i> and the <i>ul-PrioritizationThres</i> to the UE separately. |
| <i>sl-ProbResourceKeep</i> | Indicates the probability with which the UE keeps the current resource when the resource reselection counter reaches zero for sensing based UE autonomous resource selection (see TS 38.321 [3]). |
| <i>sl-PSSCH-TxConfigList</i> | Indicates PSSCH TX parameters such as MCS, sub-channel number, retransmission number, associated to different UE absolute speeds and different synchronization reference types for UE autonomous resource selection. |
| <i>sl-ReselectAfter</i> | Indicates the number of consecutive skipped transmissions before triggering resource reselection for sidelink communication (see TS 38.321 [3]). |
| <i>ul-PrioritizationThres</i> | Indicates the UL priority threshold, which is used to determine whether SL TX is prioritized over UL TX, as specified in TS 38.321 [3]. Network does not configure the <i>sl-PrioritizationThres</i> and the <i>ul-PrioritizationThres</i> to the UE separately. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>SIB12</i> | This field is optional present if included within <i>SIB12</i> , need R. Otherwise, the field is absent. |
| <i>notSIB12</i> | The field is absent in <i>SIB12</i> . Otherwise, it is optional present, Need R |

– *SL-ZoneConfig*

The IE *SL-ZoneConfig* is used to configure the zone ID related parameters.

***SL-ZoneConfig* information element**

```
-- ASN1START
-- TAG-SL-ZONECONFIG-START

SL-ZoneConfig-r16 ::= SEQUENCE {
    sl-ZoneLength-r16
    ENUMERATED { m5, m10, m20, m30, m40, m50, spare2, spare1 },
    ...
}

-- TAG-SL-ZONECONFIG-STOP
-- ASN1STOP
```

| <i>SL-ZoneConfig</i> field descriptions | |
|--|---|
| <i>sl-ZoneLength</i> | Indicates the length of each geographic zone. |

- ***SLRB-Uu-ConfigIndex***

The IE *SLRB-Uu-ConfigIndex* is used to identify a sidelink DRB configuration from the network side, or to indicate an end-to-end sidelink DRB by L2 U2U Relay UE in *SidelinkUEInformation* message.

***SLRB-Uu-ConfigIndex* information element**

```
-- ASN1START
-- TAG-SLRB-UU-CONFIGINDEX-START

SLRB-Uu-ConfigIndex-r16 ::=      INTEGER (1..maxNrofSLRB-r16)

-- TAG-SLRB-UU-CONFIGINDEX-STOP
-- ASN1STOP
```

6.3.6 MBS information elements

- ***CarrierFreqListMBS***

The IE *CarrierFreqListMBS* is used to inform network of the frequencies on which the UE is receiving or interested to receive MBS broadcast service via a broadcast MRB.

***CarrierFreqListMBS* information element**

```
-- ASN1START
-- TAG-CARRIERFREQLISTMBS-START

CarrierFreqListMBS-r17 ::=      SEQUENCE (SIZE (1..maxFreqMBS-r17)) OF ARFCN-ValueNR

-- TAG-CARRIERFREQLISTMBS-STOP
-- ASN1STOP
```

- ***CFR-ConfigMCCH-MTCH***

The IE *CFR-ConfigMCCH-MTCH* is used to configure the common frequency resource used for MCCH, multicast MCCH and MTCH reception.

***CFR-ConfigMCCH-MTCH* information element**

```
-- ASN1START
-- TAG-CFR-CONFIGMCCH-MTCH-START

CFR-ConfigMCCH-MTCH-r17 ::= SEQUENCE {
    locationAndBandwidthBroadcast-r17   OPTIONAL, -- Need S
    pdsch-ConfigMCCH-r17                OPTIONAL, -- Need S
    commonControlResourceSetExt-r17     OPTIONAL, -- Cond NotSIB1CommonControlResource
}
```

```

LocationAndBandwidthBroadcast-r17 ::= CHOICE {
    sameAsSib1ConfiguredLocationAndBW
        NULL,
    locationAndBandwidth
        INTEGER (0..37949)
}

-- TAG-CFR-CONFIGMCCH-MTCH-STOP
-- ASN1STOP

```

| CFR-ConfigMCCH-MTCH field descriptions | |
|---|---|
| commonControlResourceSetExt | An additional common control resource set which may be configured and used for <i>searchSpaceMCCH/searchSpaceMTCH</i> or UE-specific search space in the BWP where <i>searchSpaceMCCH</i> is configured. It is contained in the bandwidth of the CFR for broadcast and larger than CORESET#0. |
| locationAndBandwidthBroadcast | <p>Indicates starting PRB and the number of PRBs of CFR used for MCCH, multicast MCCH and MTCH reception.</p> <p>Value <i>sameAsSib1ConfiguredLocationAndBW</i> means the CFR for broadcast or multicast has the same location and size as the <i>locationAndBandwidth</i> for initial BWP (for (e)RedCap UEs: <i>initialDownlinkBWP-RedCap</i> if it is configured and includes CD-SSB and the entire CORESET#0) configured in <i>SIB1</i>.</p> <p>Value <i>locationAndBandwidth</i> is used to configure CFR with bandwidth that is larger than and fully contains the bandwidth for the initial DL BWP (for (e)RedCap UEs: <i>initialDownlinkBWP-RedCap</i> if it is configured and includes CD-SSB and the entire CORESET#0) configured in <i>SIB1</i> and CORESET#0. The value of the field shall be interpreted as defined in TS 38.214 [19] with assumptions as described in TS 38.213 [13].</p> <p>This field is not included in <i>cfr-ConfigMCCH-MTCH-RedCap</i> if <i>initialDownlinkBWP-RedCap</i> in <i>SIB1</i> is configured but does not include CD-SSB and the entire CORESET#0. If the field is absent, the CFR for broadcast or multicast has the same location and size as CORESET#0.</p> |
| pdsch-ConfigMCCH | Indicates PDSCH parameters used for MCCH or multicast MCCH transmission. If the field is absent, PDSCH parameters used for MCCH or multicast MCCH are the same as those of PDSCH configuration provided in <i>initialDownlinkBWP</i> in <i>SIB1</i> . |

| Conditional Presence | Explanation |
|-------------------------------------|--|
| <i>NotSIB1CommonControlResource</i> | The field is optional present in case <i>commonControlResourceSet</i> is not configured in <i>SIB1</i> , Need R, otherwise it is absent. |

– DRX-ConfigPTM

The IE *DRX-ConfigPTM* is used to configure DRX related parameters for PTM transmission as specified in TS 38.321 [3].

DRX-ConfigPTM information element

```

-- ASN1START
-- TAG-DRX-CONFIGPTM-START

|---|---|
| drx-HARQ-RTT-TimerDL-PTM | Value in number of symbols of the CFR where the transport block was received. |
| drx-InactivityTimerPTM | Value in multiple integers of 1 ms. <i>ms0</i> corresponds to 0, <i>ms1</i> corresponds to 1 ms, <i>ms2</i> corresponds to 2 ms, and so on. |
| drx-LongCycleStartOffsetPTM | <i>drx-LongCycle-PTM</i> in ms and <i>drx-StartOffset-PTM</i> in multiples of 1 ms. |
| drx-onDurationTimerPTM | Value in multiples of 1/32 ms (subMilliSeconds) or in ms (milliSecond). For the latter, value <i>ms1</i> corresponds to 1 ms, value <i>ms2</i> corresponds to 2 ms, and so on. |
| drx-RetransmissionTimerDL-PTM | Value in number of slot lengths of the CFR where the transport block was received. value <i>s/0</i> corresponds to 0 slots, <i>s/1</i> corresponds to 1 slot, <i>s/2</i> corresponds to 2 slots, and so on. |
| drx-SlotOffsetPTM | Value in 1/32 ms. Value 0 corresponds to 0 ms, value 1 corresponds to 1/32 ms, value 2 corresponds to 2/32 ms, and so on. |

| Conditional Presence | Explanation |
|----------------------|--|
| <i>HARQFeedback</i> | The field is mandatory present if HARQ feedback is enabled for a G-RNTI/G-CS-RNTI associated with this DRX configuration. It is optionally present. Need R, otherwise. |

– *MBS-NeighbourCellList*

The IE *MBS-NeighbourCellList* indicates a list of neighbour cells where ongoing MBS sessions provided via broadcast/multicast MRB in the current cell may also be provided, as indicated in the *mtch-NeighbourCell*.

***MBS-NeighbourCellList* information element**

```
-- ASN1START
-- TAG-MBS-NEIGHBOURCELLLIST-START

MBS-NeighbourCellList-r17 ::= SEQUENCE (SIZE (0..maxNeighCellMBS-r17)) OF MBS-NeighbourCell-r17

MBS-NeighbourCell-r17 ::= SEQUENCE {
    physCellId-r17
    carrierFreq-r17
}
    PhysCellId,
    ARFCN-ValueNR
    OPTIONAL -- Need S

-- TAG-MBS-NEIGHBOURCELLLIST-STOP
-- ASN1STOP
```

| <i>MBS-NeighbourCellList</i> field descriptions | |
|--|--|
| <i>carrierFreq</i> | Indicates the frequency of the neighbour cell indicated by <i>physCellId</i> . Absence of the IE means that the neighbour cell is on the same frequency as the current cell. |

- ***MBS-NonServingInfoList***

The IE *MBS-NonServingInfoList* is used to inform network of the frequencies, CFR information and subcarrier spacing for MBS broadcast reception on the non-serving cell.

***MBS-NonServingInfoList* information element**

```
-- ASN1START
-- TAG-MBS-NONSERVINGINFOLIST-START

MBS-NonServingInfoList-r18 ::= SEQUENCE (SIZE (1..maxFreqMBS-r17)) OF NonServingInfo-r18

NonServingInfo-r18 ::= SEQUENCE {
    freqInfoMBS-r18                                OPTIONAL,
    cfr-InfoMBS-r18
    cfr-Bandwidth-r18
    cfr-LocationAndBW-r18
}
subcarrierSpacing-r18                         SubcarrierSpacing
}

FreqInfoMBS-r18 ::= SEQUENCE {
    carrierFreqMBS-r18
    freqBandIndicatorMBS-r18
}

CFR-LocationAndBW-r18 ::= SEQUENCE {
    locationAndBandwidthMBS-r18
    absoluteFrequencyPointA-MBS-r18
    offsetToCarrierMBS-r18
}
                                         OPTIONAL,
                                         OPTIONAL,
                                         OPTIONAL
}

-- TAG-MBS-NONSERVINGINFOLIST-STOP
-- ASN1STOP
```

| <i>MBS-NonServingInfoList</i> field descriptions | | |
|---|--|--|
| <i>freqInfoMBS</i> | Indicates MBS frequency of interest and the frequency band of the non-serving cell for MBS broadcast reception as specified in clause 5.9.4.3. | |
| <i>cfr-InfoMBS</i> | Indicates the CFR information of the non-serving cell for MBS broadcast reception. It is up to UE implementation to choose <i>cfr-Bandwidth</i> or <i>cfr-LocationAndBW</i> as the reported CFR information. | |
| <i>cfr-Bandwidth</i> | Indicates the CFR bandwidth of the non-serving cell for MBS broadcast reception. | |
| <i>cfr-LocationAndBW</i> | Indicates the CFR location and bandwidth of the non-serving cell for MBS broadcast reception. | |
| <i>subcarrierSpacing</i> | Indicates the subcarrier spacing of the CORESET#0 of the non-serving cell for MBS broadcast reception. | |

| CFR-LocationAndBW field descriptions | |
|---|--|
| locationAndBandwidthMBS | Indicates the starting PRB and the number of PRBs of CFR used for MBS broadcast reception from non-serving cell. The value of the field shall be interpreted as resource indicator value (RIV) as defined in TS 38.214 [19] with assumptions as described in TS 38.213 [13]. The first PRB is a PRB determined by <i>subcarrierSpacing</i> , <i>offsetToCarrierMBS</i> and <i>absoluteFrequencyPointA-MBS</i> of the non-serving cell. |
| absoluteFrequencyPointA-MBS | Indicates the absolute frequency position of the reference resource block (common RB 0) of the non-serving cell for MBS broadcast reception. Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). |
| offsetToCarrierMBS | Indicates the offset in frequency domain between Point A (lowest subcarrier of common RB 0) and the lowest usable subcarrier on this carrier in number of PRBs (using the <i>subcarrierSpacing</i> indicated for the non-serving cell). |

– *MBS-ServiceList*

The IE *MBS-ServiceList* is used to inform the network of the MBS services that the UE is receiving or interested to receive.

***MBS-ServiceList* information element**

```
-- ASN1START
-- TAG-MBS-SERVICELIST-START

MBS-ServiceList-r17 ::= SEQUENCE (SIZE (1..maxNrofMBS-ServiceListPerUE-r17)) OF MBS-ServiceInfo-r17

MBS-ServiceInfo-r17 ::= SEQUENCE {
    tmgi-r17
}

-- TAG-MBS-SERVICELIST-STOP
-- ASN1STOP
```

– *MBS-SessionInfoList*

The IE *MBS-SessionInfoList* provides the list of ongoing MBS broadcast sessions transmitted via broadcast MRB and, for each MBS broadcast session, the associated G-RNTI and scheduling information.

***MBS-SessionInfoList* information element**

```
-- ASN1START
-- TAG-MBS-SESSIONINFOLIST-START

MBS-SessionInfoList-r17 ::= SEQUENCE (SIZE (1..maxNrofMBS-Session-r17)) OF MBS-SessionInfo-r17

MBS-SessionInfo-r17 ::= SEQUENCE {

}
}

-- TAG-MBS-SESSIONINfolist-STOP
-- ASN1STOP

```

| MBS-SessionInfoList field descriptions | |
|---|---|
| g-RNTI | G-RNTI used to scramble the scheduling and transmission of MTCH. |
| headerCompression | If rohc is configured, the UE shall apply the configured ROHC profile(s) in downlink. |
| mbs-SessionId | Indicates an identifier of the MBS session provided by the MTCH. |
| mrb-listBroadcast | A list of broadcast MRBs to which the associated broadcast MBS session is mapped to. |
| mtch-neighbourCell | Indicates neighbour cells which provide this service on MTCH. The first bit is set to 1 if the service is provided on MTCH in the first cell in <i>mbs-NeighbourCellList</i> , otherwise it is set to 0. The second bit is set to 1 if the service is provided on MTCH in the second cell in <i>mbs-NeighbourCellList</i> , and so on. If the service is not available in any neighbouring cell and <i>mbs-NeighbourCellList</i> is signalled, the network sets all bits in this field to 0. The field is absent when <i>mbs-NeighbourCellList</i> is absent or an empty <i>mbs-NeighbourCellList</i> is signalled. If this field is absent when <i>mbs-NeighbourCellList</i> is absent or a non-empty <i>mbs-NeighbourCellList</i> is signalled, the related service may or may not be available in any neighbouring cell, i.e. the UE cannot determine the presence or absence of an MBS service in neighbouring cells based on the absence of this field. If this field is absent and an empty <i>mbs-NeighbourCellList</i> is signalled, then the UE shall assume that MBS broadcast services signalled in <i>mbs-SessionInfoList</i> in the <i>MBSBroadcastConfiguration</i> message are not provided in any neighbour cell. |
| mtch-schedulingInfo | Indicates the index of DRX configuration entry in <i>drx-ConfigPTM-List</i> that is used for scheduling the MTCH. The value 0 corresponds to the first entry in <i>drx-ConfigPTM-List</i> , the value 1 corresponds to the second entry in <i>drx-ConfigPTM-List</i> and so on. In case <i>mtch-schedulingInfo</i> is absent for a G-RNTI (i.e. no PTM DRX), the UE shall monitor for PDCCH scrambled with G-RNTI in any slot according to the search space configured for MTCH [see TS 38.213 [13], clause 10.1]. |
| mtch-SSB-MappingWindowIndex | Indicates the index of <i>MTCH-SSB-MappingWindowCycleOffset</i> configuration entry in <i>MTCH-SSB-MappingWindowList</i> . The value 0 corresponds to the first entry in <i>MTCH-SSB-MappingWindowList</i> , the value 1 corresponds to the second entry in <i>MTCH-SSB-MappingWindowList</i> and so on. This field is set to the same value for all MBS sessions mapped to the same G-RNTI. |
| pdcP-SN-SizeDL | Indicates that PDCP sequence number size of 12 bits is used, as specified in TS 38.323 [5]. When the field is absent the UE applies the value as specified in 9.1.1.7. |
| pdschConfigIndex | Indicates the index of PDSCH configuration entry in <i>pdschConfigList</i> for MTCH. Value 0 corresponds to the first entry in <i>pdschConfigList</i> , the value 1 corresponds to the second entry in <i>pdschConfigList</i> and so on. When the field is absent the UE applies the first entry in <i>pdschConfigList</i> for MTCH. |
| sn-FieldLength | Indicates that the RLC SN field size of 6 bits is used, see TS 38.322 [4]. When the field is absent the UE applies the value as specified in 9.1.1.7. |
| t-Reassembly | Timer for reassembly in TS 38.322 [4], in milliseconds. Value ms0 means 0 ms, value ms5 means 5 ms and so on. When the field is absent the UE applies the value as specified in 9.1.1.7. |
| t-Reordering | Value in ms of t-Reordering specified in TS 38.323 [5]. Value ms1 corresponds to 1 ms, value ms10 corresponds to 10 ms, and so on. When the field is absent the UE applies the value as specified in 9.1.1.7. |

| Conditional Presence | Explanation |
|----------------------|---|
| <i>MTCH-Mapping</i> | The field is mandatory present if the number of actual transmitted SSBs determined according to <i>ssb-PositionsInBurst</i> in SIB1 is more than 1, and <i>searchspaceMTCH</i> is not set to zero (including the case where <i>searchSpaceMTCH</i> is absent and <i>searchSpaceMCCH</i> is not set to zero). Otherwise, it is absent, Need R. |

— *MBS-SessionInfoListMulticast*

The IE *MBS-SessionInfoListMulticast* provides a list of MBS multicast sessions transmitted via multicast MRB for RRC_INACTIVE UEs and, for each MBS multicast session, the associated G-RNTI and scheduling information.

***MBS-SessionInfoListMulticast* information element**

```
-- ASN1START
-- TAG-MBS-SESSIONINFOLISTMULTICAST-START

-- ASN1STOP
```

| MBS-SessionInfoListMulticast field descriptions | |
|--|---|
| g-RNTI | G-RNTI used to scramble the scheduling and transmission of multicast MTCH. |
| mbs-SessionId | Indicates an identifier of the MBS session to be received by the UE in RRC_INACTIVE. |
| mrb-ListMulticast | A list of multicast MRBs to which the associated MBS multicast session is mapped to. |
| mtch-NeighbourCell | Indicates neighbour cells which provide this service on MTCH for RRC_INACTIVE. The first bit is set to 1 if the service is provided on MTCH in the first cell in <i>mbs-NeighbourCellList</i> , otherwise it is set to 0. The second bit is set to 1 if the service is provided on MTCH in the second cell in <i>mbs-NeighbourCellList</i> , and so on. If the service is not available in any neighbouring cell and <i>mbs-NeighbourCellList</i> is signalled, the network sets all bits in this field to 0. The field is absent when <i>mbs-NeighbourCellList</i> is absent or an empty <i>mbs-NeighbourCellList</i> is signalled. If this field is absent when <i>mbs-NeighbourCellList</i> is absent or a non-empty <i>mbs-NeighbourCellList</i> is signalled, the related service may or may not be available in any neighbouring cell, i.e. the UE cannot determine the presence or absence of an MBS service in neighbouring cells based on the absence of this field. If this field is absent and an empty <i>mbs-NeighbourCellList</i> is signalled, then the UE shall assume that MBS multicast services signalled in <i>mbs-SessionInfoListMulticast</i> in the <i>MBSMulticastConfiguration</i> message are not provided in any neighbour cell. |
| mtch-SchedulingInfo | Indicates the index of DRX configuration entry in <i>drx-ConfigPTM-List</i> that is used for scheduling the MTCH. The value 0 corresponds to the first entry in <i>drx-ConfigPTM-List</i> , the value 1 corresponds to the second entry in <i>drx-ConfigPTM-List</i> and so on. In case <i>mtch-schedulingInfo</i> is absent for a G-RNTI (i.e. no PTM DRX), the UE shall monitor for PDCCCH scrambled with G-RNTI in any slot according to the search space configured for MTCH. |
| mtch-SSB-MappingWindowIndex | Indicates the index of <i>MTCH-SSB-MappingWindowCycleOffset</i> configuration entry in <i>MTCH-SSB-MappingWindowList</i> . The value 0 corresponds to the first entry in <i>MTCH-SSB-MappingWindowList</i> , the value 1 corresponds to the second entry in <i>MTCH-SSB-MappingWindowList</i> and so on. This field is set to the same value for all MBS sessions mapped to the same G-RNTI. |
| pdcn-SN-SizeDL | Indicates PDCP sequence number size of 12 or 18 bits, as specified in TS 38.323 [5]. |
| pdsch-ConfigIndex | Indicates the index of PDSCH configuration entry in <i>pdsch-ConfigList</i> for MTCH. Value 0 corresponds to the first entry in <i>pdsch-ConfigList</i> , the value 1 corresponds to the second entry in <i>pdsch-ConfigList</i> and so on. When the field is absent the UE applies the first entry in <i>pdsch-ConfigList</i> for MTCH. |
| pdcn-SyncIndicator | Indicates the PDCP COUNT of the corresponding multicast session is synchronized in the RNA, i.e. the cells in the RNA follow a common QoS flow to MRB mapping rule and at the same time PDCP COUNT is set according to the MBS QoS Flow SN. |
| sn-FieldLength | Indicates RLC SN field size of 6 or 12 bits, as specified in TS 38.322 [4]. |
| stopMonitoringRNTI | Indicates the UE to stop monitoring the G-RNTI for the corresponding multicast session. |
| t-Reassembly | Timer for reassembly in TS 38.322 [4], in milliseconds. Value ms0 means 0 ms, value ms5 means 5 ms and so on. |
| t-Reordering | Value in ms of <i>t-Reordering</i> specified in TS 38.323 [5]. Value ms1 corresponds to 1 ms, value ms10 corresponds to 10 ms, and so on. |
| thresholdIndex | Indicates the index of <i>thresholdMBS</i> entry in <i>thresholdMBS-List</i> that is used for RRC connection resume for a UE receiving the corresponding multicast session in RRC_INACTIVE. Value 0 corresponds to the first entry in <i>thresholdMBS-List</i> , the value 1 corresponds to the second entry in <i>thresholdMBS-List</i> and so on. |

| Conditional Presence | Explanation |
|----------------------|--|
| G-RNTI | The field is optionally present, Need R, if <i>g-RNTI</i> is included. Otherwise, it is absent. |
| MTCH-Mapping | The field is mandatory present if the number of actual transmitted SSBs determined according to <i>ssb-PositionsInBurst</i> in SIB1 is more than 1, and <i>searchSpaceMulticastMTCH</i> is not set to zero (including the case where <i>searchSpaceMulticastMTCH</i> is absent and <i>searchSpaceMulticastMCCH</i> is not set to zero). Otherwise, it is absent, Need R. |
| RRCRelease | The field is optionally present, Need R, if <i>mbs-SessionInfoListMulticast</i> is included in <i>RRCRelease</i> message. Otherwise, it is absent. |

– *MTCH-SSB-MappingWindowList*

The IE *MTCH-SSB-MappingWindowList* is used to configure MTCH PDCCH occasions to SSB mapping window related periodic and offset parameters.

***MTCH-SSB-MappingWindowList* information element**

```
-- ASN1START
-- TAG-MTCH-SSB-MAPPINGWINDOWLIST-START

MTCH-SSB-MappingWindowList-r17 ::= SEQUENCE (SIZE (1..maxNrofMTCH-SSB-MappingWindow-r17)) OF MTCH-SSB-MappingWindowCycleOffset-r17

MTCH-SSB-MappingWindowCycleOffset-r17 ::= CHOICE {
    ms10          INTEGER(0..9),
    ms20          INTEGER(0..19),
    ms32          INTEGER(0..31),
    ms64          INTEGER(0..63),
    ms128         INTEGER(0..127),
    ms256         INTEGER(0..255)
}

-- TAG-MTCH-SSB-MAPPINGWINDOWLIST-STOP
-- ASN1STOP
```

| <i>MTCH-SSB-MappingWindowList</i> field descriptions | |
|---|---|
| <i>MTCH-SSB-MappingWindowCycleOffset</i> | Indicates the cycle and offset for MTCH PDCCH occasions to SSB mapping. Values in unit of ms. <i>ms10</i> corresponds to cycle of 10 ms with corresponding offset between 0 and 9 ms, value <i>ms20</i> corresponds to cycle of 20 ms with corresponding offset between 0 and 19 ms, and so on. The mapping window starts at a subframe in a SFN where $[(\text{SFN number} \times 10) + \text{subframe number}] \bmod (\text{cycle}) = \text{offset}$.
PDCCH monitoring occasions for MTCH in a mapping window which are not overlapping with UL symbols (determined according to <i>tdd-UL-DL-ConfigurationCommon</i>) are sequentially numbered starting from 1 in the mapping window. The $[xxN+K]^{\text{th}}$ PDCCH monitoring occasion for MTCH in this mapping window corresponds to the K^{th} transmitted SSB, where $x = 0, 1, \dots, X-1$, $K = 1, 2, \dots, N$, N is the number of actual transmitted SSBs determined according to <i>ssb-PositionsInBurst</i> in SIB1 and X is equal to $\text{CEIL}(\text{number of PDCCH monitoring occasions in MTCH to SSB mapping transmission window})/N$. The actual transmitted SSBs are sequentially numbered from one in ascending order of their SSB indexes. |

- **PDSCH-ConfigBroadcast**

The IE *PDSCH-ConfigBroadcast* is used to configure parameters for acquiring the PDSCH for MCCH, multicast MCCH and MTCH.

PDSCH-ConfigBroadcast information element

```
-- ASN1START
-- TAG-PDSCH-CONFIGBROADCAST-START

PDSCH-ConfigBroadcast-r17 ::= SEQUENCE {
    pdschConfigList-r17
    pdsch-TimeDomainAllocationList-r17
    rateMatchPatternToAddModList-r17
    lte-CRS-ToMatchAround-r17
    mcs-Table-r17
    xOverhead-r17
}

PDSCH-ConfigPTM-r17 ::= SEQUENCE {
    dataScramblingIdentityPDSCH-r17
    dmrs-ScramblingID0-r17
    pdsch-AggregationFactor-r17
}

-- TAG-PDSCH-CONFIGBROADCAST-STOP
-- ASN1STOP
```

| PDSCH-ConfigBroadcast field descriptions | | | |
|--|--|--|--|
| Ite-CRS-ToMatchAround
Parameters to determine an LTE CRS pattern that the UE shall rate match around. | | | |
| pdschConfigList
List of PDSCH parameters which can be configured per G-RNTI. Only one entry is allowed to be configured if included in <i>SIB20</i> or <i>SIB24</i> . | | | |
| pdsch-TimeDomainAllocationList
List of time-domain configurations for timing of DL assignment to DL data.
The field <i>pdsch-TimeDomainAllocationList</i> applies to DCI format 4_0 (see table 5.1.2.1.1-1 in TS 38.214 [19]). When the field is absent, the UE follows PDSCH time domain resource allocation determination rule as specified in TS 38.214 [19], clause 5.1.2.1.1. | | | |
| rateMatchPatternToAddModList
Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns (see TS 38.214 [19], clause 5.1.4.1). | | | |
| mcs-Table
Indicates which MCS table the UE shall use for PDSCH. If the field is absent the UE applies the value 64QAM. The field <i>mcs-Table</i> applies to DCI format 4_0 with CRC scrambled by MCCH-RNTI/G-RNTI for MBS broadcast or by Multicast MCCH-RNTI for MBS multicast in RRC_INACTIVE, and applies to DCI format 4_1 with CRC scrambled by G-RNTI for MBS multicast in RRC_INACTIVE (see TS 38.214 [19], clause 5.1.3.1). | | | |
| xOverhead
Accounts for an overhead from CSI-RS, CORESET, etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19], clause 5.1.3.2). | | | |

| PDSCH-ConfigPTM field descriptions | |
|---|--|
| dataScramblingIdentityPDSCH | Identifier(s) used to initialize data scrambling (<i>c_init</i>) for PDSCH as specified in TS 38.211 [16], clause 7.3.1.1. When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell. |
| dmrs-ScramblingID0 | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell. |
| pdsch-AggregationFactor | Number of repetitions for dynamic scheduling of MBS broadcast data for MTCH PDSCH (see TS 38.214 [19], clause 5.1.2.1). When the field is absent the UE applies the value 1. |

— TMGI

The IE *TMGI* is used to identify the MBS session.

TMGI information element

```
-- ASN1START
-- TAG-TMGI-START

TMGI-r17 ::= SEQUENCE {
    plmn-Id-r17 CHOICE {
        INTEGER (1..maxPLMN),
        PLMN-Identity
    },
    serviceId-r17 OCTET STRING (SIZE (3))
}

-- TAG-TMGI-STOP
-- ASN1STOP
```

| TMGI field descriptions | |
|--------------------------------|--|
| plmn-Index | PLMN index or NPN index according to the <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList</i> fields included in <i>SIB1</i> . If this field is included in the <i>MRB-ToAddMod-r17</i> , the UE translates the <i>plmn-Index</i> into the PLMN Identity or SNPN Identity based on the configuration in <i>SIB1</i> (which is the <i>SIB1</i> of the target cell in case of handover). The <i>explicitValue</i> is not used for MBS service(s) of an SNPN. |
| serviceId | Uniquely identifies the identity of an MBS service within a PLMN. The field contains octet 3- 5 of the IE Temporary Mobile Group Identity (TMGI) as defined in TS 24.008 [38]. The first octet contains the third octet of the TMGI, the second octet contains the fourth octet of the TMGI and so on. |

6.4 RRC multiplicity and type constraint values

– Multiplicity and type constraint definitions

```
-- ASN1START
-- TAG-MULTIPLICITY-AND-TYPE-CONSTRAINT-DEFINITIONS-START

maxAdditionalRACH-r17           INTEGER ::= 256      -- Maximum number of additional RACH configurations.
maxAI-DCI-PayloadSize-r16       INTEGER ::= 128     -- Maximum size of the DCI payload scrambled with ai-RNTI
maxAI-DCI-PayloadSize-1-r16     INTEGER ::= 127     -- Maximum size of the DCI payload scrambled with ai-RNTI minus 1
maxBandComb                      INTEGER ::= 65536    -- Maximum number of DL band combinations
maxBandComb-MUSIM-r18            INTEGER ::= 64      -- Maximum number of MUSIM bands and/or band combinations
maxBandsUTRA-FDD-r16             INTEGER ::= 64      -- Maximum number of bands listed in UTRA-FDD UE caps
maxCandidateBandIndex-r18         INTEGER ::= 8       -- Maximum number of band entry index for MUSIM capability
maxBH-RLC-ChannelID-r16          INTEGER ::= 65536    -- Maximum value of BH RLC Channel ID
maxBT-IdReport-r16                INTEGER ::= 32     -- Maximum number of Bluetooth IDs to report
maxBT-Name-r16                   INTEGER ::= 4       -- Maximum number of Bluetooth name
maxCAG-Cell-r16                  INTEGER ::= 16     -- Maximum number of NR CAG cell ranges in SIB3, SIB4
maxTwoPUCCH-Grp-ConfigList-r16   INTEGER ::= 32     -- Maximum number of supported configuration(s) of {primary PUCCH group config, secondary PUCCH group config}
maxTwoPUCCH-Grp-ConfigList-r17   INTEGER ::= 16     -- Maximum number of supported configuration(s) of {primary PUCCH group config, secondary PUCCH group config} for PUCCH cell switching
maxCBR-Config-r16                 INTEGER ::= 8       -- Maximum number of CBR range configurations for sidelink communication
maxCBR-Config-1-r16               INTEGER ::= 7       -- Maximum number of CBR range configurations for sidelink communication
                                         -- congestion control
                                         -- congestion control minus 1
maxCBR-Level-r16                  INTEGER ::= 16     -- Maximum number of CBR levels
maxCBR-Level-1-r16                INTEGER ::= 15     -- Maximum number of CBR levels minus 1
maxCellATG-r18                    INTEGER ::= 8       -- Maximum number of ATG neighbour cells for which assistance information is provided
maxCellExcluded                   INTEGER ::= 16     -- Maximum number of NR exclude-listed cell ranges in SIB3, SIB4
maxCellGroupings-r16               INTEGER ::= 32     -- Maximum number of cell groupings for NR-DC
maxCellHistory-r16                 INTEGER ::= 16     -- Maximum number of visited PCells reported
maxPSCellHistory-r17              INTEGER ::= 16     -- Maximum number of visited PSCells across all reported PCells
maxCellInter                       INTEGER ::= 16     -- Maximum number of inter-Freq cells listed in SIB4
maxCellIntra                        INTEGER ::= 16     -- Maximum number of intra-Freq cells listed in SIB3
maxCellMeasEUTRA                   INTEGER ::= 32     -- Maximum number of cells in E-UTRAN
maxCellMeasIdle-r16                 INTEGER ::= 8       -- Maximum number of cells per carrier for idle/inactive measurements
maxCellMeasUTRA-FDD-r16            INTEGER ::= 32     -- Maximum number of cells in FDD UTRAN
maxCellNTN-r17                      INTEGER ::= 4       -- Maximum number of NTN neighbour cells for which assistance information is provided
maxCarrierTypePairList-r16          INTEGER ::= 16     -- Maximum number of supported carrier type pair of (carrier type on which CSI measurement is performed, carrier type on which CSI reporting is performed) for CSI reporting cross PUCCH group
maxCellAllowed                      INTEGER ::= 16     -- Maximum number of NR allow-listed cell ranges in SIB3, SIB4
maxEARFCN                          INTEGER ::= 262143   -- Maximum value of E-UTRA carrier frequency
maxEUTRA-CellExcluded              INTEGER ::= 16     -- Maximum number of E-UTRA exclude-listed physical cell identity ranges in SIB5
maxEUTRA-NS-Pmax                   INTEGER ::= 8       -- Maximum number of NS and P-Max values per band
maxFeatureCombPreamblesPerRACHResource-r17 INTEGER ::= 256 -- Maximum number of feature combination preambles.
maxLogMeasReport-r16                INTEGER ::= 520    -- Maximum number of entries for logged measurements
maxMultiBands                       INTEGER ::= 8       -- Maximum number of additional frequency bands that a cell belongs to
```

```

maxNARFCN                                INTEGER ::= 3279165 -- Maximum value of NR carrier frequency
maxNR-NS-Pmax                            INTEGER ::= 8    -- Maximum number of NS and P-Max values per band
maxFreqIdle-r16                           INTEGER ::= 8    -- Maximum number of carrier frequencies for idle/inactive measurements
maxNrofServingCells                      INTEGER ::= 32   -- Max number of serving cells (SpCells + SCells)
maxNrofServingCells-1                     INTEGER ::= 31   -- Max number of serving cells (SpCells + SCells) minus 1
maxNrofAggregatedCellsPerCellGroup       INTEGER ::= 16   --
maxNrofAggregatedCellsPerCellGroupMinus4-r16 INTEGER ::= 12
maxNrofAperiodicFwdTimeResource-r18      INTEGER ::= 112   -- Max number of aperiodic fowarding time resources for NCR
maxNrofAperiodicFwdTimeResource-1-r18    INTEGER ::= 111   -- Max number of aperiodic fowarding time resources for NCR minus 1
maxNrofDUCells-r16                        INTEGER ::= 512   -- Max number of cells configured on the collocated IAB-DU
maxNrofAppLayerMeas-r17                  INTEGER ::= 16    -- Max number of simultaneous application layer measurements
maxNrofAppLayerMeas-1-r17                INTEGER ::= 15    -- Max number of simultaneous application layer measurements minus 1

maxNrofAppLayerReports-r18                INTEGER ::= 16   -- Max number of application layer measurement reports with the same
                                                               -- measConfigAppLayerId included in the same
                                                               -- MeasurementReportAppLayerMessage
maxNrofAvailabilityCombinationsPerSet-r16  INTEGER ::= 512   --
maxNrofAvailabilityCombinationsPerSet-1-r16 INTEGER ::= 511   -- Max number of AvailabilityCombinationId used in the DCI format 2_5
maxNrofIABResourceConfig-r17              INTEGER ::= 65536  -- Max number of IAB-ResourceConfigID used in MAC CE
maxNrofIABResourceConfig-1-r17            INTEGER ::= 65535  -- Max number of IAB-ResourceConfigID used in MAC CE minus 1
maxNrofPeriodicFwdResourceSet-r18        INTEGER ::= 32    -- Max number of periodic fowarding resource sets for NCR
maxNrofPeriodicFwdResourceSet-1-r18      INTEGER ::= 31    -- Max number of periodic fowarding resource sets for NCR minus 1
maxNrofPeriodicFwdResource-r18           INTEGER ::= 1024   -- Max number of periodic fowarding resources for NCR
maxNrofPeriodicFwdResource-1-r18         INTEGER ::= 1023   -- Max number of periodic fowarding resources for NCR minus 1
maxNrofSemiPersistentFwdResourceSet-r18  INTEGER ::= 32    -- Max number of semi-persistent fowarding resource sets for NCR
maxNrofSemiPersistentFwdResourceSet-1-r18 INTEGER ::= 31    -- Max number of semi-persistent fowarding resource sets for NCR minus 1
maxNrofSemiPersistentFwdResource-r18     INTEGER ::= 128   -- Max number of semi-persistent fowarding resources for NCR
maxNrofSemiPersistentFwdResource-1-r18   INTEGER ::= 127   -- Max number of semi-persistent fowarding resources for NCR minus 1
maxNrofSCellActRS-r17                   INTEGER ::= 255   -- Max number of RS configurations per SCell for SCell activation
maxNrofSCells                            INTEGER ::= 31    -- Max number of secondary serving cells per cell group
maxNrofCellMeas                          INTEGER ::= 32    -- Maximum number of entries in each of the cell lists in a measurement object
maxNrofCRS-IM-InterfCell-r17            INTEGER ::= 8    -- Maximum number of LTE interference cells for CRS-IM per UE
maxNrofRelayMeas-r17                     INTEGER ::= 32    -- Maximum number of L2 U2N Relay UEs to measure for each measurement object
                                                               -- on sidelink frequency
maxNrofCG-SL-r16                         INTEGER ::= 8    -- Max number of sidelink configured grant
maxNrofCG-SL-1-r16                        INTEGER ::= 7    -- Max number of sidelink configured grant minus 1
maxSL-GC-BC-DRX-QoS-r17                 INTEGER ::= 16   -- Max number of sidelink DRX configurations for NR
                                                               -- sidelink groupcast/broadcast communication
maxNrofSL-RxInfoSet-r17                  INTEGER ::= 4    -- Max number of sidelink DRX configuration sets in sidelink DRX assistant
                                                               -- information
maxNrofSS-BlocksToAverage
measurement                                INTEGER ::= 16   -- Max number for the (max) number of SS blocks to average to determine cell
                                                               -- measurement
maxNrofCondCells-r16                      INTEGER ::= 8    -- Max number of conditional candidate SpCells
maxNrofCondCells-1-r17                    INTEGER ::= 7    -- Max number of conditional candidate SpCells minus 1
maxNrofCSI-RS-ResourcesToAverage          INTEGER ::= 16   -- Max number for the (max) number of CSI-RS to average to determine cell measurement
maxNrofDL-Allocations                    INTEGER ::= 16   -- Maximum number of PDSCH time domain resource allocations
maxNrofDL-AllocationsExt-r17             INTEGER ::= 64   -- Maximum number of PDSCH time domain resource allocations for multi-PDSCH
                                                               -- scheduling
maxNrofDL-Allocations-1-r18              INTEGER ::= 15   -- Maximum number of PDSCH time domain resource allocations minus 1
maxNrofPDU-Sessions-r17                  INTEGER ::= 256  -- Maximum number of PDU Sessions
maxNrofSR-ConfigPerCellGroup             INTEGER ::= 8    -- Maximum number of SR configurations per cell group
maxNrofLCGs-r18                          INTEGER ::= 8    -- Maximum number of LCGs
maxLCG-ID                                INTEGER ::= 7    -- Maximum value of LCG ID
maxLCG-ID-IAB-r17                        INTEGER ::= 255  -- Maximum value of LCG ID for IAB-MT

```

| | | |
|---|-------------------|--|

6.5 Short Message

Short Messages can be transmitted on PDCCH using P-RNTI with or without associated *Paging* message using Short Message field in DCI format 1_0 (see TS 38.212 [17], clause 7.3.1.2.1).

Table 6.5-1 defines Short Messages. Bit 1 is the most significant bit.

Table 6.5-1: Short Messages

| Bit | Short Message |
|-------|---|
| 1 | systemInfoModification
If set to 1: indication of a BCCH modification other than SIB6, SIB7, SIB8 and posSIBs. |
| 2 | etwsAndCmasIndication
If set to 1: indication of an ETWS primary notification and/or an ETWS secondary notification and/or a CMAS notification. |
| 3 | stopPagingMonitoring
This bit can be used for only operation with shared spectrum channel access and if nrofPDCCH-MonitoringOccasionPerSSB-InPO is present.
If set to 1: indication that the UE may stop monitoring PDCCH occasion(s) for paging in this Paging Occasion as specified in TS 38.304 [20], clause 7.1. |
| 4 | systemInfoModification-eDRX
If set to 1: indication of a BCCH modification other than SIB6, SIB7, SIB8 and posSIBs. This indication applies only to UEs using IDLE eDRX cycle longer than the BCCH modification period. |
| 5 – 8 | Not used in this release of the specification, and shall be ignored by UE if received. |

6.6.2 Message definitions

- MasterInformationBlockSidelink

The *MasterInformationBlockSidelink* includes the system information transmitted by a UE via SL-BCH.

Signalling radio bearer: N/A

RLC-SAP: TM

Logical channel: SBCCH

Direction: UE to UE

MasterInformationBlockSidelink

```
-- ASN1START
-- TAG-MASTERINFORMATIONBLOCKSIDELINK-START
```

```
MasterInformationBlockSidelink ::= SEQUENCE {
    sl-TDD-Config-r16
    inCoverage-r16
    directFrameNumber-r16
    slotIndex-r16
    reservedBits-r16
}
```

```
-- TAG-MASTERINFORMATIONBLOCKSIDELINK-STOP
-- ASN1STOP
```

| <i>MasterInformationBlockSidelink</i> field descriptions | |
|---|--|
| <i>directFrameNumber</i> | Indicates the frame number in which S-SSB transmitted. |
| <i>inCoverage</i> | Value true indicates that the UE transmitting the <i>MasterInformationBlockSidelink</i> is in network coverage, or UE selects GNSS timing as the synchronization reference source. |
| <i>slotIndex</i> | Indicates the slot index in which S-SSB transmitted. |

MeasurementReportSidelink

The *MeasurementReportSidelink* message is used for the indication of measurement results of NR sidelink.

Signalling radio bearer: SL-SRB3

RLC-SAP: AM

Logical channel: SCCH

Direction: UE to UE

|---|--|
| <i>connectionForMP</i> | Indicates the connected L2 U2N Relay UE by the L2 U2N Remote UE that the access is for MP. |
| <i>si-DestinationIdentityRemoteUE</i> | Indicates the peer L2 U2U Remote UE upon end-to-end PC5 connection failure or release. |
| <i>si-PagingCycleRemoteUE</i> | Indicates the L2 U2N Remote UE's UE specific DRX cycle as the minimum value of the one provided by upper layers (if configured) and the one provided by RRC layer (if configured). Value rf32 corresponds to 32 radio frames, value rf64 corresponds to 64 radio frames and so on. |
| <i>si-PagingIdentityRemoteUE</i> | Indicates the L2 U2N Remote UE's paging UE ID. |
| <i>si-PagingInfo-RemoteUE</i> | Indicates the paging information used by L2 U2N Relay UE to perform the connected L2 U2N Remote UE's paging monitoring. |
| <i>si-RequestedPosSIB-List</i> | Contains a list of requested PosSIBs. |
| <i>si-RequestedSIB-List</i> | Contains a list of requested SIBs. |
| <i>si-SFN-DFN-OffsetRequested</i> | If present, this field indicates that the L2 U2N Remote UE requests the L2 U2N Relay UE to provide the SFN-DFN offset in a subsequent <i>RRCReconfigurationSidelink</i> message. |
| <i>SL-SIB-ReqInfo</i> | Indicates the requested SIB type. Values sibNotReq11, sibNotReq10, ..., sibNotReq1 shall be ignored by L2 U2N relay UE (i.e., no SIB requested). |

| Conditional presence | Explanation |
|----------------------|--|
| GNSS-ID-SBAS | The field is mandatory present if <i>gnss-id</i> is set to <i>sbas</i> . It is absent otherwise. |

— *RRCReconfigurationSidelink*

The *RRCReconfigurationSidelink* message is the command to AS configuration of the PC5 RRC connection. It is only applied to unicast of NR sidelink communication.

Signalling radio bearer: SL-SRB3

RLC-SAP: AM

Logical channel: SCCH

Direction: UE to UE

```

| <i>RRCReconfigurationSidelink</i> field descriptions | |
|---|---|
| <i>si-AbsoluteFrequencyPointA</i> | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A. |
| <i>si-CarrierToAddModList</i> | Indicate the carrier(s) to be added/modified for transmission by UE transmitting <i>RRCReconfigurationSidelink</i> message, corresponding to the frequency in <i>si-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> or corresponding to the frequency in <i>si-PreconfigFreqInfoListSizeExt</i> in <i>SL-PreconfigurationNR</i> . |
| <i>si-CarrierToReleaseList</i> | Indicate the carrier(s) to be released for the transmission by UE transmitting <i>RRCReconfigurationSidelink</i> message. |
| <i>si-CSI-RS-FreqAllocation</i> | Indicates the frequency domain position for sidelink CSI-RS. |
| <i>si-CSI-RS-FirstSymbol</i> | Indicates the position of first symbol of sidelink CSI-RS. |
| <i>si-DRX-ConfigUC-PC5</i> | Indicates the NR sidelink DRX configuration for unicast communication, as specified in TS 38.321 [3] |
| <i>si-LatencyBoundCSI-Report</i> | Indicates the latency bound of SL CSI report from the associated SL CSI triggering in terms of number of slots. |
| <i>si-LatencyBoundIUC-Report</i> | Indicates the latency bound of SL Inter-UE coordination report from the associated SL Inter-UE coordination explicit request triggering in terms of number of slots. |
| <i>si-LocalID-PairList</i> | Indicate a list of local ID pair which is assigned for one end-to-end PC5 connection by the L2 U2U Relay UE. |
| <i>si-LogicalChannelIdentity</i> | Indicates the identity of the sidelink logical channel, as specified in TS 38.321 [3], clause 6.2.4. If the <i>si-LogicalChannelIdentity-v1800</i> is present, the UE shall ignore the <i>si-LogicalChannelIdentity-r16</i> field. |
| <i>si-MappedQoS-FlowsToAddList</i> | Indicate the QoS flows to be mapped to the configured sidelink DRB. Each entry is indicated by the <i>SL-PQFI</i> , which is used between UEs, as defined in TS 23.287 [55]. |
| <i>si-MappedQoS-FlowsToReleaseList</i> | Indicate the QoS flows to be released from the configured sidelink DRB. Each entry is indicated by the <i>SL-PQFI</i> , which is used between UEs, as defined in TS 23.287 [55]. |
| <i>si-MeasConfig</i> | Indicates the sidelink measurement configuration for the unicast destination. |
| <i>si-OffsetToCarrier</i> | Offset in frequency domain between Point A (lowest subcarrier of common RB 0) and the lowest usable subcarrier on this carrier in number of PRBs (using the subcarrierSpacing defined for this carrier). The maximum value corresponds to 275*8-1. See TS 38.211 [16], clause 4.4.2. |
| <i>si-OutOfOrderDelivery</i> | Indicates whether or not outOfOrderDelivery specified in TS 38.323 [5] is configured. This field should be either always present or always absent, after the sidelink radio bearer is established. |
| <i>si-PDCP-SN-Size</i> | Indicates the PDCP SN size of the configured sidelink DRB. |
| <i>si-Resetconfig</i> | Indicates that the full configuration should be applicable for the <i>RRCReconfigurationSidelink</i> message. |
| <i>si-RLC-BearerToAddModList</i> | Indicate the additional Sidelink RLC bearer to be added / modified for the configured sidelink SRB/DRB. |
| <i>si-RLC-BearerToReleaseList</i> | Indicate the additional Sidelink RLC bearer to be released for the configured sidelink SRB/DRB. |
| <i>si-SDAP-Header</i> | Indicates whether or not a SDAP header is present on this sidelink DRB. |

| |
|--|
| si-SFN-DFN-Offset |
| Indicates the SFN-DFN offset to be used for determining the SFN timeline based on the DFN timeline. |
| si-SRB-IdentityWithDuplication |
| Indicate the sidelink SRB for which duplication is configured. |
| slrb-PC5-ConfigIndex |
| Indicates the identity of the configuration of a sidelink DRB. In case of L2 U2U relay, only value 4-31 can be signaled for an end-to-end sidelink DRB, and all other values are reserved. |

| SL-SRAP-ConfigPC5 field descriptions |
|---|
| si-RemoteUE-LocalIdentity |
| Indicates the local UE ID of the L2 U2U Remote UE used in SRAP as specified in TS 38.351 [66]. |
| si-RemoteUE-L2Identity |
| Indicates the Source L2 ID of the L2 U2U Remote UE as specified in TS 23.304 [65]. |
| si-PeerRemoteUE-LocalIdentity |
| Indicates the local UE ID of the peer L2 U2U Remote UE used in SRAP as specified in TS 38.351 [66]. |
| si-PeerRemoteUE-L2Identity |
| Indicates the destination L2 ID identifying the peer L2 U2U Remote UE as specified in TS 23.304 [65]. |

UEInformationRequestSidelink

The *UEInformationRequestSidelink* message is used to transfer UE information in sidelink, e.g. the end-to-end QoS information for L2 U2U Relay operation.

Signalling radio bearer: SL-SRB3

RLC-SAP: AM

Logical channel: SCCH

Direction: L2 U2U Remote UE to L2 U2U Relay UE

***UEInformationRequestSidelink* message**

```

***UEInformationRequestSidelink* field descriptions**

sl-E2E-QoS-InfoListPC5

Indicates the per-QoS flow QoS info for a list of end-to-end PC5 connections with each connection indicated by the destination L2 ID of the peer L2 U2U Remote UE. In addition, the end-to-end SLRB index is included to indicate the mapping from the QoS flow to the SLRB.

***SL-E2E-QoS-InfoPC5* field descriptions**

sl-DestinationIdentityRemoteUE

Indicates the destination L2 ID of the peer L2 U2U Remote UE for an end-to-end PC5 connection.

sl-E2E-SLRB-Index

Indicates the index of an end-to-end SLRB.

sl-QoS-InfoList

List of QoS profile of the sidelink QoS flow for an end-to-end PC5 connection, with each QoS flow indicated by *sl-QoS-FlowIdentity* which is unique for different end-to-end PC5 connection in the scope of UE, and uniquely identifies one sidelink QoS flow between the L2 U2U Remote UE and the L2 U2U Relay UE.

– *UEInformationResponseSidelink*

The *UEInformationResponseSidelink* message is used to deliver UE information in sidelink, e.g. the split QoS information for L2 U2U Relay operation.

Signalling radio bearer: SL-SRB3

RLC-SAP: AM

Logical channel: SCCH

Direction: L2 U2U Relay UE to L2 U2U Remote UE

7 Variables and constants

7.1 Timers

7.1.1 Timers (Informative)

| Timer | Start | Stop | At expiry |
|-------|--|---|--|
| T300 | Upon transmission of <i>RRCSetup</i> or <i>RRCSetupRequest</i> . | Upon reception of <i>RRCSetup</i> or <i>RRCReject</i> message, cell re-selection, relay (re)selection or cell selection by a L2 U2N Remote UE, and upon abortion of connection establishment by upper layers. | Perform the actions as specified in 5.3.3.7. |
| T301 | Upon transmission of <i>RRCReestablishmentRequest</i> | Upon reception of <i>RRCReestablishment</i> or <i>RRCSetup</i> message as well as when the selected cell becomes unsuitable or the (re)selected L2 U2N Relay UE becomes unsuitable, upon reception of <i>NotificationMessageSidelink</i> indicating <i>relayUE-HO</i> or <i>relayUE-CellReselection</i> . | Go to RRC_IDLE |
| T302 | Upon reception of <i>RRCReject</i> while performing RRC connection establishment or resume, upon reception of <i>RRCRelease</i> with <i>waitTime</i> . | Upon entering RRC_CONNECTED or RRC_IDLE, upon cell re-selection, upon cell change due to relay (re)selection or cell selection by a L2 U2N Remote UE, and upon reception of <i>RRCReject</i> message. | Inform upper layers about barring alleviation as specified in 5.3.14.4 |

| Timer | Start | Stop | At expiry |
|-------|---|---|--|
| T304 | <p>Upon reception of <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> for the MCG which does not include <i>sl-PathSwitchConfig</i>, or upon reception of <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> for the SCG not indicated as deactivated in the NR or E-UTRA message containing the <i>RRCReconfiguration</i> message or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i>.</p> <p>Also, for the MCG and SCG upon an indication from lower layer that an LTM cell switch procedure is triggered and, for the MCG, upon performing an LTM cell switch procedure following cell selection performed while timer T311 is running.</p> | <p>Upon successful completion of random access on the corresponding SpCell.</p> <p>Upon receiving an indication from lower layers of successful completion of Rach-less handover, or upon receiving an indication from lower layers of successful completion of an LTM RACH-less cell switch.</p> <p>For T304 of SCG, upon SCG release.</p> | <p>For T304 of MCG, in case of the handover from NR or intra-NR handover, or path switch from a L2 U2N Relay UE to a NR cell, or an LTM cell switch procedure, initiate the RRC re-establishment procedure; In case of handover to NR, perform the actions defined in the specifications applicable for the source RAT. If any DAPS bearer is configured and if there is no RLF in source PCell, initiate the failure information procedure.</p> <p>For T304 of SCG, inform network about the reconfiguration with sync failure by initiating the SCG failure information procedure as specified in 5.7.3.</p> |

| Timer | Start | Stop | At expiry |
|-------|---|--|---|
| T310 | Upon detecting physical layer problems for the SpCell i.e. upon receiving N310 consecutive out-of-sync indications from lower layers. | Upon receiving N311 consecutive in-sync indications from lower layers for the SpCell, upon receiving RRCReconfiguration with <i>reconfigurationWithSync</i> for that cell group, upon reception of <i>MobilityFromNRCommand</i> , upon the reconfiguration of <i>rlf-TimersAndConstant</i> , upon initiating the connection re-establishment procedure, upon conditional reconfiguration execution i.e. when applying a stored RRCReconfiguration message including <i>reconfigurationWithSync</i> for that cell group, upon an indication from lower layers that an LTM cell switch procedure is triggered, and upon initiating the MCG failure information procedure.
Upon SCG release, if the T310 is kept in SCG. | If the T310 is kept in MCG: If AS security is not activated: go to RRC_IDLE else: initiate the MCG failure information procedure as specified in 5.7.3b or the connection re-establishment procedure as specified in 5.3.7 or the procedure as specified in 5.3.10.3 if any DAPS bearer is configured.
If the T310 is kept in SCG, Inform E-UTRAN/NR about the SCG radio link failure by initiating the SCG failure information procedure as specified in 5.7.3. |
| T311 | Upon initiating the RRC connection re-establishment procedure | Upon selection of a suitable NR cell, or upon selection of a suitable L2 U2N Relay UE, or a cell using another RAT. | Enter RRC_IDLE |

| Timer | Start | Stop | At expiry |
|-------|---|---|--|
| T312 | If T312 is configured in MCG: Upon triggering a measurement report for a measurement identity for which T312 has been configured and <i>useT312</i> has been set to true, while T310 in PCell is running.
If T312 is configured in SCG and <i>useT312</i> has been set to true: Upon triggering a measurement report for a measurement identity for which T312 has been configured, while T310 in PSCell is running. | Upon receiving N311 consecutive in-sync indications from lower layers for the SpCell, receiving <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> for that cell group, upon reception of <i>MobilityFromNRCommand</i> , upon initiating the connection re-establishment procedure, upon the reconfiguration of <i>r1f-TimersAndConstant</i> , upon initiating the MCG failure information procedure, upon conditional reconfiguration execution i.e. when applying a stored RRCReconfiguration message including <i>reconfigurationWithSync</i> for that cell group, upon an indication from lower layers that an LTM cell switch procedure is triggered, and upon the expiry of T310 in corresponding SpCell. Upon SCG release, if the T312 is kept in SCG | If the T312 is kept in MCG, initiate the MCG failure information procedure as specified in 5.7.3b or the connection re-establishment procedure.
If the T312 is kept in SCG, Inform E-UTRAN/NR about the SCG radio link failure by initiating the SCG failure information procedure as specified in 5.7.3. |
| T316 | Upon transmission of the <i>MCGFailureInformation</i> message | Upon receiving <i>RRCRelease</i> , <i>RRCReconfiguration</i> with <i>reconfigurationwithSync</i> for the PCell, <i>MobilityFromNRCommand</i> , or upon initiating the re-establishment procedure | Perform the actions as specified in 5.7.3b.5. |
| T319 | Upon transmission of <i>RRCResumeRequest</i> or <i>RRCResumeRequest1</i> when the resume procedure is not initiated for SDT. | Upon reception of <i>RRCResume</i> , <i>RRCSetup</i> , <i>RRCRelease</i> , <i>RRCRelease</i> with <i>suspendConfig</i> or <i>RRCReject</i> message, upon cell re-selection or upon relay (re)selection. | Perform the actions as specified in 5.3.13.5. |
| T319a | Upon transmission of <i>RRCResumeRequest</i> or <i>RRCResumeRequest1</i> when the resume procedure is initiated for SDT. | Upon reception of <i>RRCResume</i> , <i>RRCSetup</i> , <i>RRCRelease</i> , <i>RRCReject</i> message or upon failure to resume RRC connection for SDT as specified in 5.3.13.5 or upon cell reselection. | Perform the actions as specified in 5.3.13.5. |

| Timer | Start | Stop | At expiry |
|-------|---|---|---|
| T320 | Upon reception of $t320$ or upon cell (re)selection to NR from another RAT with validity time configured for dedicated priorities (in which case the remaining validity time is applied). | Upon entering RRC_CONNECTED, upon reception of <i>RRCRelease</i> , when PLMN selection or SNPN selection is performed on request by NAS, when the UE enters RRC_IDLE from RRC_INACTIVE, or upon cell (re)selection to another RAT (in which case the timer is carried on to the other RAT). | Discard the cell reselection priority information provided by dedicated signalling. |
| T321 | Upon receiving <i>measConfig</i> including a <i>reportConfig</i> with the <i>reportType</i> set to <i>reportCGI</i> | Upon acquiring the information needed to set all fields of <i>cgi-info</i> , upon receiving <i>measConfig</i> that includes removal of the <i>reportConfig</i> with the <i>reportType</i> set to <i>reportCGI</i> and upon detecting that a cell is not broadcasting SIB1. | Initiate the measurement reporting procedure, stop performing the related measurements. |
| T322 | Upon receiving <i>measConfig</i> including <i>reportConfigNR</i> with the <i>reportType</i> set to <i>reportSFTD</i> and <i>drx-SFTD-NeighMeas</i> is set to <i>true</i> . | Upon acquiring the SFTD measurement results, upon receiving <i>measConfig</i> that includes removal of the <i>reportConfig</i> with the <i>reportType</i> set to <i>reportSFTD</i> . | Initiate the measurement reporting procedure, stop performing the related measurements. |
| T325 | Upon reception of <i>RRCRelease</i> message with <i>deprioritisationTimer</i> . | When PLMN selection or SNPN selection is performed on request by NAS according to TS 38.304 [20]. | Stop deprioritisation of all frequencies or NR signalled by <i>RRCRelease</i> and discard the stored deprioritisation request(s). |
| T330 | Upon receiving <i>LoggedMeasurementConfiguration</i> message | Upon log volume exceeding the suitable UE memory, upon initiating the release of <i>LoggedMeasurementConfiguration</i> procedure | Perform the actions specified in 5.5a.1.4 |
| T331 | Upon receiving <i>RRCRelease</i> message with <i>measIdleDuration</i> | Upon receiving <i>RRSetup</i> , <i>RRResume</i> , <i>RRCRelease</i> with idle/inactive measurement configuration, upon cell selection/reselection to a cell that does not belong to the <i>validityArea</i> (if configured), or upon cell re-selection to another RAT. | Perform the actions as specified in 5.7.8.3. |

| Timer | Start | Stop | At expiry |
|---|--|--|------------|
| T342 | Upon transmitting <i>UEAssistanceInformation</i> message with <i>DelayBudgetReport</i> . | Upon releasing <i>delayBudgetReportingConfig</i> during the connection re-establishment/resume procedures, and upon receiving <i>delayBudgetReportingConfig</i> set to <i>release</i> . | No action. |
| T345 | Upon transmitting <i>UEAssistanceInformation</i> message with <i>overheatingAssistance</i> | Upon releasing <i>overheatingAssistanceConfig</i> during the connection re-establishment procedure, upon initiating the connection resumption procedure, and upon receiving <i>overheatingAssistanceConfig</i> set to <i>release</i> . | No action. |
| T346a
(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>drx-Preference</i> . | Upon releasing <i>drx-PreferenceConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>drx-PreferenceConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346b
(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>maxBW-Preference</i> . | Upon releasing <i>maxBW-PreferenceConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>maxBW-PreferenceConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346c
(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>maxCC-Preference</i> . | Upon releasing <i>maxCC-PreferenceConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>maxCC-PreferenceConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |

| Timer | Start | Stop | At expiry |
|---|--|---|--|
| T346d
(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>maxMIMO-LayerPreference</i> . | Upon releasing <i>maxMIMO-LayerPreferenceConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>maxMIMO-LayerPreferenceConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346e
(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>minSchedulingOffsetPreference</i> . | Upon releasing <i>minSchedulingOffsetPreference Config</i> during the connection re-establishment/resume procedures, upon receiving <i>minSchedulingOffsetPreference Config</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346f | Upon transmitting <i>UEAssistanceInformation</i> message with <i>releasePreference</i> . | Upon releasing <i>releasePreferenceConfig</i> during the connection re-establishment/resume procedures, or upon receiving <i>releasePreferenceConfig</i> set to <i>release</i> . | No action. |
| T346g | Upon transmitting <i>UEAssistanceInformation</i> message with <i>musim-PreferredRRC-State</i> . | Upon receiving <i>RRCRelease</i> , or upon receiving <i>musim-LeaveAssistanceConfig</i> set to <i>release</i> . | Perform the actions as specified in 5.3.8.6. |
| T346h | Upon transmitting <i>UEAssistanceInformation</i> message with <i>musim-GapPreferenceList</i> and/or <i>musim-GapPriorityPreferenceList</i> and/or <i>musim-GapKeepPreference Information</i> . | Upon releasing <i>musim-GapAssistanceConfig</i> during the connection re-establishment/resume procedures, or upon receiving <i>musim-GapAssistanceConfig</i> set to <i>release</i> . | No action. |
| T346i | Upon transmitting <i>UEAssistanceInformation</i> message with <i>scg-DeactivationPreference</i> | Upon releasing <i>scg-DeactivationPreferenceConfig</i> during RRC connection re-establishment/resume or upon receiving <i>scg-DeactivationPreferenceConfig</i> set to <i>release</i> . | No action. |

| Timer | Start | Stop | At expiry |
|--|--|---|------------|
| T346j (The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>rIm-RelaxationReportingConfig</i> . | Upon releasing <i>rIm-RelaxationReportingConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>rIm-RelaxationReportingConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346k (The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>bfd-RelaxationReportingConfig</i> . | Upon releasing <i>bfd-RelaxationReportingConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>bfd-RelaxationReportingConfig</i> set to <i>release</i> , or upon performing MR-DC release. | No action. |
| T346l (The UE maintains one instance of this timer per QoS flow) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>ul-TrafficInfo</i> for the concerned QoS flow. | Upon releasing <i>ul-TrafficInfoReportingConfig</i> during the connection re-establishment/resume procedures, or upon receiving <i>ul-TrafficInfoReportingConfig</i> set to <i>release</i> . | No action. |
| T346m | Upon transmitting <i>UEAssistanceInformation</i> message with <i>multiRx-PreferenceFR2</i> . | Upon releasing <i>multiRx-PreferenceReportingConfigFR2</i> during the connection re-establishment/resume procedures, upon receiving <i>multiRx-PreferenceReportingConfigFR2</i> set to <i>release</i> . | No action. |
| T346n | Upon transmission of MUSIM temporary restriction of <i>musim-CapRestriction</i> for affected bands or combination of bands and/or avoided band(s) or combination of bands. | Upon releasing <i>musim-CapabilityRestrictionConfig</i> during the connection re-establishment/resume procedures, or upon receiving <i>musim-CapabilityRestrictionConfig</i> set to <i>release</i> . | No action. |

| Timer | Start | Stop | At expiry |
|-------|---|---|--|
| T348 | Upon transmission of MUSIM temporary restriction of <i>musim-CapRestriction</i> for serving cell(s) with capabilities restricted, release of SCell or PSCell or release of SCG. | Upon reception of <i>RRCReconfiguration</i> message that does not exceed UE temporary capability restriction indicated via <i>musim-CapRestriction</i> . | UE may apply the temporary UE capability restriction in accordance with the one indicated in the last transmission of the <i>UEAssistanceInformation</i> message including <i>musim-CapRestriction</i> . UE may apply the temporary capability restriction that SCG is not supported if <i>ServCell/Index</i> of PSCell was included in indicated <i>MUSIM-CellToRelease-r18</i> . |
| T350 | Upon transmitting <i>DedicatedSIBRequest</i> message with <i>requestedSIB-List</i> and/or <i>requestedPosSIB-List</i> . | Upon acquiring the requested SIB(s) or posSIB(s), upon releasing <i>onDemandSIB-Request</i> during the connection re-establishment procedures, upon receiving <i>onDemandSIB-Request</i> set to release, upon reception of <i>RRCRelease</i> or upon successful change of PCell while in RRC_CONNECTED. | No action |
| T380 | Upon reception of t380 in <i>RRCRelease</i> . | Upon reception of <i>RRCResume</i> , <i>RRCSetup</i> or <i>RRCRelease</i> . | Perform the actions as specified in 5.3.13. |
| T390 | When access attempt is barred at access barring check for an Access Category. The UE maintains one instance of this timer per Access Category. | Upon cell (re)selection, upon relay (re)selection, upon entering RRC_CONNECTED, upon reception of <i>RRCReconfiguration</i> including <i>reconfigurationWithSync</i> , upon change of PCell while in RRC_CONNECTED, upon reception of <i>MobilityFromNRCommand</i> , or upon reception of <i>RRCRelease</i> . | Perform the actions as specified in 5.3.14.4. |
| T400 | Upon transmission of <i>RRCReconfigurationSidelink</i> | Upon reception of <i>RRCReconfigurationFailureSidelink</i> or <i>RRCReconfigurationCompleteSidelink</i> | Perform the Sidelink radio link failure related actions as specified in 5.8.9.3. |

| Timer | Start | Stop | At expiry |
|-------|---|---|---|
| T420 | Upon reception of the <i>RRCReconfiguration</i> message including <i>sl-PathSwitchConfig</i> where <i>sl-IndirectPathMaintain</i> is not included in <i>reconfigurationWithSync</i> | Upon successfully sending <i>RRCReconfigurationComplete</i> message (i.e., PC5 RLC acknowledgement is received from target L2 U2N Relay UE) | Perform the RRC re-establishment procedure as specified in 5.3.7. |
| T421 | Upon reception of the <i>RRCReconfiguration</i> message including <i>sl-IndirectPathAddChange</i> where <i>sl-IndirectPathMaintain</i> is not included in <i>reconfigurationWithSync</i> | Upon successfully sending <i>RRCReconfigurationComplete</i> message (i.e., PC5 RLC acknowledgement is received from target L2 U2N Relay UE) if split SRB1 with duplication is configured, or upon reception of <i>RRCReconfigurationCompleteSidelink</i> if split SRB1 with duplication is not configured, or upon initiation of indirect path failure information procedure. | Perform the Failure Information Reporting as specified in 5.7.3c. |
| T430 | Start or restart from the subframe indicated by <i>epochTime</i> upon reception of <i>SIB19</i> , or upon reception of <i>RRCReconfiguration</i> message for the target cell including <i>reconfigurationWithSync</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCReconfiguration</i> message for the target cell including <i>reconfigurationWithSync</i> , or upon satellite switch with resynchronization. | Stop T430, if it is running, for the source cell upon reception of <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> , or upon satellite switch with resynchronization. | Perform the actions as specified in 5.2.2.6. |

7.1.2 Timer handling

When the UE applies zero value for a timer, the timer shall be started and immediately expire unless explicitly stated otherwise.

7.2 Counters

| Counter | Reset | Incremented | When reaching max value |
|---------|--|---|-------------------------|
| N310 | Upon reception of "in-sync" indication from lower layers; upon receiving <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> for that cell group; upon initiating the connection re-establishment procedure. | Upon reception of "out-of-sync" from lower layer while the timer T310 is stopped. | Start timer T310 |
| N311 | Upon reception of "out-of-sync" indication from lower layers; upon receiving <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> for that cell group; upon initiating the connection re-establishment procedure. | Upon reception of the "in-sync" from lower layer while the timer T310 is running. | Stop the timer T310. |

7.3 Constants

| Constant | Usage |
|----------|---|
| N310 | Maximum number of consecutive "out-of-sync" indications for the SpCell received from lower layers |
| N311 | Maximum number of consecutive "in-sync" indications for the SpCell received from lower layers |

7.4 UE variables

NOTE: To facilitate the specification of the UE behavioural requirements, UE variables are represented using ASN.1. Unless explicitly specified otherwise, it is however up to UE implementation how to store the variables. The optionality of the IEs in ASN.1 is used only to indicate that the values may not always be available.

– NR-UE-Variables

This ASN.1 segment is the start of the NR UE variable definitions.

}

SRS-RSRP-TriggeredList-r16 ::=  SEQUENCE (SIZE (1.. maxNrofCLI-SRS-Resources-r16)) OF SRS-ResourceId

CLI-RSSI-TriggeredList-r16 ::=  SEQUENCE (SIZE (1.. maxNrofCLI-RSSI-Resources-r16)) OF RSSI-ResourceId-r16

RelaysTriggeredList-r17 ::=     SEQUENCE (SIZE (1.. maxNrofRelayMeas-r17)) OF SL-SourceIdentity-r17

-- TAG-VARMEASREPORTLIST-STOP
-- ASN1STOP
```

VarMeasReportListSL

The UE variable *VarMeasReportListSL* includes information about the NR sidelink measurements for which the triggering conditions have been met.

VarMeasReportListSL UE variable

```
-- ASN1START
-- TAG-VARMEASREPORTLISTSL-START

VarMeasReportListSL-r16 ::=      SEQUENCE (SIZE (1..maxNrofSL-MeasId-r16)) OF VarMeasReportSL-r16

VarMeasReportSL-r16 ::=          SEQUENCE {
```

```

-- List of NR sidelink measurement that have been triggered
sl-MeasId-r16                               SL-MeasId-r16,
sl-FrequencyTriggeredList-r16                SEQUENCE (SIZE (1..maxNrofFreqSL-r16)) OF ARFCN-ValueNR      OPTIONAL,
sl-NumberOfReportsSent-r16                  INTEGER
}

-- TAG-VARMEASREPORTLISTSL-STOP
-- ASN1STOP

```

VarMeasReselectionConfig

The UE variable *VarMeasReselectionConfig* includes the configuration for reporting the NR inter-frequency and inter-RAT (i.e. EUTRA) reselection measurements while in RRC_IDLE or RRC_INACTIVE for.

***VarMeasReselectionConfig* UE variable**

```

-- ASN1START
-- TAG-VARMEASRESELECTIONCONFIG-START

VarMeasReselectionConfig-r18 ::=   SEQUENCE {
    measReselectionCarrierListNR-r18   SEQUENCE (SIZE (1..maxFreqIdle-r16)) OF MeasReselectionCarrierNR-r18      OPTIONAL,
    measReselectionValidityDuration-r18 MeasurementValidityDuration-r18      OPTIONAL
}
}

-- TAG-VARMEASRESELECTIONCONFIG-STOP
-- ASN1STOP

```

VarMobilityHistoryReport

The UE variable *VarMobilityHistoryReport* includes the mobility history information.

***VarMobilityHistoryReport* UE variable**

```

-- ASN1START
-- TAG-VARMOBILITYHISTORYREPORT-START

VarMobilityHistoryReport-r16 ::= VisitedCellInfoList-r16

VarMobilityHistoryReport-r17 ::= SEQUENCE {
    visitedCellInfoList-r16           VisitedCellInfoList-r16,
    visitedPSCellInfoList-r17        VisitedPSCellInfoList-r17      OPTIONAL
}

-- TAG-VARMOBILITYHISTORYREPORT-STOP
-- ASN1STOP

```

- ***VarPendingRNA-Update***

The UE variable *VarPendingRNA-Update* indicates whether there is a pending RNA update procedure or not. The setting of this BOOLEAN variable to *true* means that there is a pending RNA Update procedure.

VarPendingRNA-Update UE variable

```
-- ASN1START
-- TAG-VARPENDINGRNA-UPDATE-START

VarPendingRNA-Update ::= SEQUENCE {
    pendingRNA-Update      BOOLEAN           OPTIONAL
}

-- TAG-VARPENDINGRNA-UPDATE-STOP
-- ASN1STOP
```

- ***VarRA-Report***

The UE variable *VarRA-Report* includes the random-access related information.

VarRA-Report UE variable

```
-- ASN1START
-- TAG-VARRA-REPORT-START

VarRA-Report-r16 ::= SEQUENCE {
    ra-ReportList-r16      RA-ReportList-r16,
    identityList-r18       CHOICE {
        plmn-IdentityList-r18   PLMN-IdentityList2-r16,

    }
}

-- TAG-VARRA-REPORT-STOP
-- ASN1STOP
```

- ***VarResumeMAC-Input***

The UE variable *VarResumeMAC-Input* specifies the input used to generate the *resumeMAC-I* during RRC Connection Resume procedure.

VarResumeMAC-Input UE variable

```
-- ASN1START
-- TAG-VARRESUMEMAC-INPUT-START
```

```

VarResumeMAC-Input ::= SEQUENCE {
    sourcePhysCellId,
    targetCellIdentity,
    source-c-RNTI
}
-- TAG-VARRESUMEMAC-INPUT-STOP
-- ASN1STOP

```

| <i>VarResumeMAC-Input</i> field descriptions | |
|---|--|
| <i>targetCellIdentity</i> | An input variable used to calculate the <i>resumeMAC-I</i> . Set to the <i>cellIdentity</i> of the first <i>PLMN-Identity</i> included in the <i>PLMN-IdentityInfoList</i> broadcasted in <i>SIB1</i> of the target cell i.e. the cell the UE is trying to resume. |
| <i>source-c-RNTI</i> | Set to C-RNTI that the UE had in the PCell it was connected to prior to suspension of the RRC connection. |
| <i>sourcePhysCellId</i> | Set to the physical cell identity of the PCell the UE was connected to prior to suspension of the RRC connection. |

– *VarRLF-Report*

The UE variable *VarRLF-Report* includes the radio link failure information or handover failure information.

***VarRLF-Report* UE variable**

```

-- ASN1START
-- TAG-VARRLF-REPORT-START

VarRLF-Report-r16 ::= SEQUENCE {
    rlf-Report-r16          RLF-Report-r16,
    identityList-r18        CHOICE {
        plmn-IdentityList-r18   PLMN-IdentityList2-r16,
        snpn-IdentityList-r18   SEQUENCE (SIZE (1..maxNPN-r16)) OF SNPN-Identity-r18
    }
}
-- TAG-VARRLF-REPORT-STOP
-- ASN1STOP

```

– *VarServingSecurityCellSetID*

The UE variable *VarServingSecurityCellSetID* includes the security cell set ID of serving PSCell.

***VarServingSecurityCellSetID* UE variable**

```
-- ASN1START
```

```
-- TAG-VARSERVINGSECURITYCELLSETID-START
VarServingSecurityCellSetID ::=      SEQUENCE {
    servingSecurityCellSetId-r18      INTEGER (1.. maxSecurityCellSet-r18)
}

-- TAG-VARSERVINGSECURITYCELLSETID-STOP
-- ASN1STOP
```

– *VarShortMAC-Input*

The UE variable *VarShortMAC-Input* specifies the input used to generate the *shortMAC-I* during RRC Connection Reestablishment procedure.

***VarShortMAC-Input* UE variable**

```
-- ASN1START
-- TAG-VARSHORTMAC-INPUT-START
VarShortMAC-Input ::=      SEQUENCE {
    sourcePhysCellId                PhysCellId,
    targetCellIdentity              CellIdentity,
    source-c-RNTI                  RNTI-Value
}
-- TAG-VARSHORTMAC-INPUT-STOP
-- ASN1STOP
```

| <i>VarShortMAC-Input</i> field descriptions | |
|--|--|
| <i>targetCellIdentity</i> | An input variable used to calculate the <i>shortMAC-I</i> . Set to the <i>cellIdentity</i> of the first <i>PLMN-Identity</i> in the <i>PLMN-IdentityInfoList</i> broadcasted in <i>SIB1</i> of the target cell i.e. the cell the UE is trying to reestablish the connection. |
| <i>source-c-RNTI</i> | Set to C-RNTI that the UE had in the PCell it was connected to prior to the reestablishment. |
| <i>sourcePhysCellId</i> | Set to the physical cell identity of the PCell the UE was connected to prior to the reestablishment. |

– *VarSuccessHO-Report*

The UE variable *VarSuccessHO-Report* includes the successful handover information.

***VarSuccessHO-Report* UE variable**

```
-- ASN1START
-- TAG-VARSUCCESSHO-Report-START
```

```

VarSuccessHO-Report-r17 ::= SEQUENCE {
    successHO-Report-r17,
    identityList-r18 CHOICE {
        plmn-IdentityList-r18,
        snpn-IdentityList-r18
    }
}
-- TAG-VARSUCCESSHO-Report-STOP
-- ASN1STOP

```

– VarSuccessPSCell-Report

The UE variable *VarSuccessPSCell-Report* includes the successful PSCell change or addition information.

VarSuccessPSCell-Report UE variable

```

-- ASN1START
-- TAG-VARSUCCESSPSCELL-Report-START

VarSuccessPSCell-Report-r18 ::= SEQUENCE {
    successPSCell-Report-r18,
    identityList-r18 CHOICE {
        plmn-IdentityList-r18,
        snpn-IdentityList-r18
    }
}
-- TAG-VARSUCCESSPSCELL-Report-STOP
-- ASN1STOP

```

– VarTSS-Info

The UE variable *VarTSS-Info* includes information about the current value of *eventID-TSS* and the current value of the global gNB Identity.

VarTSS-Info UE variable

```

-- ASN1START
-- TAG-VARTSS-INFO-START

VarTSS-Info-r18 ::= SEQUENCE {
    storedEventID-r18      INTEGER (0..63),
    storedGlobalGnbID-r18  SEQUENCE {
        plmn-Identity-r18,
        gnb-ID-r18         BIT STRING (SIZE (22..32))
    }
}
-- TAG-VARTSS-INFO-STOP

```

-- ASN1STOP

— End of *NR-UE-Variables*

-- ASN1START

END

-- ASN1STOP

8 Protocol data unit abstract syntax

8.1 General

The RRC PDU contents in clause 6 and clause 10 are described using abstract syntax notation one (ASN.1) as specified in ITU-T Rec. X.680 [6] and X.681 [7]. Transfer syntax for RRC PDUs is derived from their ASN.1 definitions by use of Packed Encoding Rules, unaligned as specified in ITU-T Rec. X.691 [8].

The following encoding rules apply in addition to what has been specified in X.691:

- When a bit string value is placed in a bit-field as specified in 15.6 to 15.11 in X.691, the leading bit of the bit string value shall be placed in the leading bit of the bit-field, and the trailing bit of the bit string value shall be placed in the trailing bit of the bit-field;

NOTE: The terms 'leading bit' and 'trailing bit' are defined in ITU-T Rec. X.680. When using the 'bstring' notation, the leading bit of the bit string value is on the left, and the trailing bit of the bit string value is on the right.

- When decoding types constrained with the ASN.1 Contents Constraint ("CONTAINING"), automatic decoding of the contained type should not be performed because errors in the decoding of the contained type should not cause the decoding of the entire RRC message PDU to fail. It is recommended that the decoder first decodes the outer PDU type that contains the OCTET STRING or BIT STRING with the Contents Constraint, and then decodes the contained type that is nested within the OCTET STRING or BIT STRING as a separate step;
- When decoding a) RRC message PDUs, b) BIT STRING constrained with a Contents Constraint, or c) OCTET STRING constrained with a Contents Constraint, PER decoders are required to never report an error if there are extraneous zero or non-zero bits at the end of the encoded RRC message PDU, BIT STRING or OCTET STRING.

8.2 Structure of encoded RRC messages

An RRC PDU, which is the bit string that is exchanged between peer entities/across the radio interface contains the basic production as defined in X.691.

RRC PDUs shall be mapped to and from PDCP SDUs (in case of DCCH) or RLC SDUs (in case of PCCH, BCCH or CCCH) upon transmission and reception as follows:

- when delivering an RRC PDU as an PDCP SDU to the PDCP layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the PDCP SDU and onwards; and
- when delivering an RRC PDU as an RLC SDU to the RLC layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the RLC SDU and onwards; and
- upon reception of an PDCP SDU from the PDCP layer, the first bit of the PDCP SDU shall represent the first bit of the RRC PDU and onwards; and
- upon reception of an RLC SDU from the RLC layer, the first bit of the RLC SDU shall represent the first bit of the RRC PDU and onwards.

8.3 Basic production

The 'basic production' is obtained by applying UNALIGNED PER to the abstract syntax value (the ASN.1 description) as specified in X.691. It always contains a multiple of 8 bits.

8.4 Extension

The following rules apply with respect to the use of protocol extensions:

- A transmitter compliant with this version of the specification shall, unless explicitly indicated otherwise on a PDU type basis, set the extension part empty. Transmitters compliant with a later version may send non-empty extensions;
- A transmitter compliant with this version of the specification shall set spare bits to zero.

8.5 Padding

If the encoded RRC message does not fill a transport block, the RRC layer shall add padding bits. This applies to PCCH and BCCH.

Padding bits shall be set to 0 and the number of padding bits is a multiple of 8.

Figure 8.5-1: RRC level padding

9 Specified and default radio configurations

Specified and default configurations are configurations of which the details are specified in the standard. Specified configurations are fixed while default configurations can be modified using dedicated signalling. The default value for the parameters not listed in following clauses shall be set such as the corresponding features are not configured, i.e. *release* or *false* unless explicitly stated otherwise.

NOTE: The UE applies the default values specified in the field description of ASN.1 parameters only when the parent IE is present. Hence, the UE does not apply all default values in field descriptions when it applies the "default radio configuration" in accordance with this clause.

9.1 Specified configurations

9.1.1 Logical channel configurations

9.1.1.1 BCCH configuration

Parameters

| Name | Value | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration | Not used | | |
| PDCP configuration | Not used | | |
| RLC configuration | TM | | |
| Logical channel configuration | Not used | | |

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

9.1.1.2 CCCH configuration

Parameters

| Name | Value | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration | Not used | | |
| PDCP configuration | Not used | | |
| RLC configuration | TM | | |
| Logical channel configuration | | | |
| >priority | 1 | Highest priority | |
| >prioritisedBitRate | infinity | | |
| >bucketSizeDuration | ms1000 | | |
| >logicalChannelGroup | 0 | | |

9.1.1.3 PCCH configuration

Parameters

| Name | Value | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration | Not used | | |
| PDCP configuration | Not used | | |
| RLC configuration | TM | | |
| Logical channel configuration | Not used | | |

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

9.1.1.4 SCCH configuration

Parameters that are specified for unicast of NR sidelink communication, which is used for the sidelink signalling radio bearer of PC5-RRC message. The SL-SRB using this SCCH configuration is named as SL-SRB3.

| Name | Value | Semantics description | Ver |
|--|-----------|--|-------|
| PDCP configuration | | | |
| > <i>t-Reordering</i> | Undefined | Selected by the receiving UE, up to UE implementation | |

9.1.1.7 MTCH configuration for MBS broadcast

Parameters that are specified for MBS broadcast MTCH.

| Name | Value | Semantics description | Ver |
|--------------------------|-------|-----------------------|-----|
| PDCP configuration | | | |
| > <i>t-Reordering</i> | ms0 | | |
| > <i>pdcpc-SN-SizeDL</i> | 18 | | |
| RLC configuration | | UM RLC | |
| > <i>sn-FieldLength</i> | 12 | | |
| > <i>t-Reassembly</i> | ms0 | | |

9.1.2 Void

9.2 Default radio configurations

The following clauses only list default values for REL-15 parameters included in protocol version v15.3.0. For all fields introduced in a later protocol version, the default value is "released" or "false" unless explicitly specified otherwise. If the UE is to apply default configuration while it is configured with some critically extended fields, the UE shall apply the original version of those fields with only default values.

NOTE 1: In general, the signalling should preferably support a "release" option for fields introduced after v15.3.0. The "value not applicable" should be used restrictively, mainly limited to fields which value is relevant only if another field is set to a value other than its default.

NOTE 2: For parameters in *ServingCellConfig*, the default values are specified in the corresponding specification.

9.2.1 Default SRB configurations

Parameters

| Name | Value | | | Semantics description | Ver |
|-------------------------------|----------|------|------|-----------------------|-----|
| | SRB1 | SRB2 | SRB3 | | |
| <i>PDCP-Config</i> | | | | | |

```

| SL-PreconfigurationNR field descriptions | |
|---|---|
| sl-DRX-PreConfig-GC-BC | This field indicates the sidelink DRX configuration for groupcast and broadcast communication, as specified in TS 38.321 [3]. |
| sl-OffsetDFN | Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on. If the field is absent, no offset is applied. |
| sl-PosPreconfigFreqInfoList | This field indicates the NR sidelink positioning carrier frequencies of SL-PRS dedicated resource pool for SL-PRS transmission and reception. In this release, only one entry of <i>SL-FreqConfigCommon</i> is included in the list. |
| sl-PreconfigDiscConfig | This field indicates the configuration for discovery message transmission used by NR sidelink U2N Remote UE, used by NR sidelink U2U Relay UE or used by NR sidelink U2U Remote UE. |
| sl-PreconfigEUTRA-AnchorCarrierFreqList | This field indicates the EUTRA anchor carrier frequency list, which can provide the NR sidelink communication configuration. |
| sl-PreconfigFreqInfoList, sl-PreconfigFreqInfoListSizeExt, sl-PreconfigFreqInfoListExt | This field indicates the NR sidelink communication and/or NR sidelink discovery configuration some carrier frequency(ies). In this release, only one <i>SL-FreqConfig</i> can be configured in <i>sl-PreconfigFreqInfoList</i> . More entries of <i>SL-FreqConfig</i> can be configured in <i>sl-PreconfigFreqInfoListSizeExt</i> . If <i>sl-PreconfigFreqInfoListExt</i> is included, it contains the same number of entries, and listed in the same order, as in <i>sl-PreconfigFreqInfoList</i> together with <i>sl-PreconfigFreqInfoListSizeExt</i> . The first entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>sl-PreconfigFreqInfoList</i> , the second entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>sl-PreconfigFreqInfoListSizeExt</i> , the third entry corresponds to the AdditionalSpectrumEmission of the frequency of second entry in <i>sl-PreconfigFreqInfoListSizeExt</i> and so on. |
| sl-PreconfigNR-AnchorCarrierFreqList | This field indicates the NR anchor carrier frequency list, which can provide the NR sidelink communication configuration. |
| sl-RadioBearerPreConfigList | This field indicates one or multiple sidelink radio bearer configurations. |
| sl-RLC-BearerPreConfigList, sl-RLC-BearerPreConfigListSizeExt | This field indicates one or multiple sidelink RLC bearer configurations. |
| sl-RoHC-Profiles | This field indicates the supported RoHC profiles for NR sidelink communications. |
| sl-SSB-PriorityNR | This field indicates the priority of NR sidelink SSB transmission and reception. |
| sl-SyncFreqList | Indicates a list of candidate carrier frequencies that can be used for the synchronisation of NR sidelink communication. For <i>SL-Freq-Id-r16</i> , the value 1 corresponds to the frequency of first entry in <i>sl-PreconfigFreqInfoList</i> , the value 2 corresponds to the frequency of first entry in <i>sl-PreconfigFreqInfoListSizeExt</i> , the value 3 corresponds to the frequency of second entry in <i>sl-PreconfigFreqInfoListSizeExt</i> and so on. |
| sl-SyncTxMultiFreq | Indicates that the UE transmits S-SSB on multiple carrier frequencies for NR sidelink communication. If this field is absent, the UE transmits S-SSB only on the synchronisation carrier frequency. |
| sl-TxProfileList | List of one or multiple Tx profiles, indicating the compatibility of supporting SL DRX as specified in TS 38.321 [3]. Value <i>drx-Compatible</i> means SL DRX is supported, and value <i>drx-Incompatible</i> means SL DRX is not supported. It is up to the UE implementation whether/how to apply this field. |
| t400 | Indicates the value for timer T400 as described in clause 7.1. Value <i>ms100</i> corresponds to 100 ms, value <i>ms200</i> corresponds to 200 ms and so on. |
| t400-U2U | Indicates the value for timer T400 to be applied for end-to-end PC5 connection in sidelink U2U relay operation as described in clause 7.1. Value <i>ms200</i> corresponds to 200 ms, value <i>ms400</i> corresponds to 400 ms and so on. |

9.5 Void

10 Generic error handling

10.1 General

The generic error handling defined in the subsequent clauses applies unless explicitly specified otherwise e.g. within the procedure specific error handling.

The UE shall consider a value as not comprehended when it is set:

- to an extended value that is not defined in the version of the transfer syntax supported by the UE;
- to a spare or reserved value unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/reserved value.

The UE shall consider a field as not comprehended when it is defined:

- as spare or reserved unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/reserved field.

10.2 ASN.1 violation or encoding error

The UE shall:

- 1> when receiving an RRC message on the BCCH, CCCH, PCCH, MCCH, multicast MCCH or a PC5 RRC message on SBCCH for which the abstract syntax is invalid [6]:
- 2> ignore the message.

NOTE: This clause applies in case one or more fields is set to a value, other than a spare, reserved or extended value, not defined in this version of the transfer syntax. E.g. in the case the UE receives value 12 for a field defined as INTEGER (1..11). In cases like this, it may not be possible to reliably detect which field is in the error hence the error handling is at the message level.

10.3 Field set to a not comprehended value

The UE shall, when receiving an RRC message or PC5 RRC message on any logical channel:

- 1> if the message includes a field that has a value that the UE does not comprehend:
- 2> if a default value is defined for this field:
 - 3> treat the message while using the default value defined for this field;
- 2> else if the concerned field is optional:
 - 3> treat the message as if the field were absent and in accordance with the need code for absence of the concerned field;
- 2> else:
 - 3> treat the message as if the field were absent and in accordance with clause 10.4.

10.4 Mandatory field missing

The UE shall:

- 1> if the message includes a field that is mandatory to include in the message (e.g. because conditions for mandatory presence are fulfilled) and that field is absent or treated as absent:
- 2> if the RRC message was not received on DCCH or CCCH; or
- 2> if the PC5 RRC message was not received on SCCH:
 - 3> if the field concerns a (sub-field of) an entry of a list (i.e. a SEQUENCE OF):
 - 4> treat the list as if the entry including the missing or not comprehended field was absent;
 - 3> else if the field concerns a sub-field of another field, referred to as the 'parent' field i.e. the field that is one nesting level up compared to the erroneous field:
 - 4> consider the 'parent' field to be set to a not comprehended value;
 - 4> apply the generic error handling to the subsequent 'parent' field(s), until reaching the top nesting level i.e. the message level;
 - 3> else (field at message level):
 - 4> ignore the message.

NOTE 1: The error handling defined in these clauses implies that the UE ignores a message with the message type or version set to a not comprehended value.

NOTE 2: The nested error handling for messages received on logical channels other than DCCH, CCCH and SCCH applies for errors in extensions also, even for errors that can be regarded as invalid network operation e.g. the network not observing conditional presence.

NOTE 3: UE behaviour on receipt of an RRC message on DCCH or CCCH or a PC5 RRC message on SCCH that does not include a field that is mandatory (e.g. because conditions for mandatory presence are fulfilled) is unspecified.

The following ASN.1 further clarifies the levels applicable in case of nested error handling for errors in extension fields.

```
-- /example/ ASN1START

-- Example with extension addition group

ItemInfoList ::= SEQUENCE (SIZE (1..max)) OFItemInfo

ItemInfo ::= SEQUENCE {
    itemIdentity
    field1
    field2
    ...
    [
    field3-r9
    field4-r9
    ]
}

-- Example with traditional non-critical extension (empty sequence)

BroadcastInfoBlock1 ::= SEQUENCE {
    itemIdentity
    field1
    field2
    nonCriticalExtension
}

BroadcastInfoBlock1-v940-IEs ::= SEQUENCE {
    field3-r9
    field4-r9
    nonCriticalExtension
}

-- ASN1STOP
```

The UE shall, apply the following principles regarding the levels applicable in case of nested error handling:

- an extension addition group is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, an error regarding the conditionality of *field3* would result in the entire itemInfo entry to be ignored (rather than just the extension addition group containing *field3* and *field4*);
- a traditional *nonCriticalExtension* is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, an error regarding the conditionality of *field3* would result in the entire *BroadcastInfoBlock1* to be ignored (rather than just the non-critical extension containing *field3* and *field4*).

10.5 Not comprehended field

The UE shall, when receiving an RRC message on any logical channel:

- 1> if the message includes a field that the UE does not comprehend:
- 2> treat the rest of the message as if the field was absent.

NOTE: This clause does not apply to the case of an extension to the value range of a field. Such cases are addressed instead by the requirements in clause 10.3.

11 Radio information related interactions between network nodes

11.1 General

This clause specifies RRC messages that are transferred between network nodes. These RRC messages may be transferred to or from the UE via another Radio Access Technology. Consequently, these messages have similar characteristics as the RRC messages that are transferred across the NR radio interface, i.e. the same transfer syntax and protocol extension mechanisms apply.

11.2 Inter-node RRC messages

11.2.1 General

This clause specifies RRC messages that are sent either across the X2-, Xn- or the NG-interface, either to or from the gNB, i.e. a single 'logical channel' is used for all RRC messages transferred across network nodes. The information could originate from or be destined for another RAT.

```

| <i>HandoverPreparationInformation</i> field descriptions | |
|--|--|
| as-Context | Local RAN context required by the target gNB or DU. |
| rrm-Config | Local RAN context used mainly for RRM purposes. |
| sourceConfig | The radio resource configuration as used in the source cell. |
| ue-CapabilityRAT-List | The UE radio access related capabilities concerning RATs supported by the UE. A gNB that retrieves MRDC related capability containers ensures that the set of included MRDC containers is consistent w.r.t. the feature set related information. |
| ue-InactiveTime | Duration while UE has not received or transmitted any user data. Thus the timer is still running in case e.g., UE measures the neighbour cells for the HO purpose. Value <i>s1</i> corresponds to 1 second, <i>s2</i> corresponds to 2 seconds and so on. Value <i>min1</i> corresponds to 1 minute, value <i>min1s20</i> corresponds to 1 minute and 20 seconds, value <i>min1s40</i> corresponds to 1 minute and 40 seconds and so on. Value <i>hr1</i> corresponds to 1 hour, <i>hr1min30</i> corresponds to 1 hour and 30 minutes and so on. |

| <i>AS-Config</i> field descriptions | |
|---|---|
| rrcReconfiguration | Contains the <i>RRCReconfiguration</i> configuration as generated entirely by the MN. If the <i>TMGI-r17</i> is included in the <i>MRB-ToAddMod-r17</i> in the <i>RadioBearerConfig</i> , the <i>plmn-Index</i> is replaced by the PLMN ID, if needed. |
| sdt-Config | Contains the IE <i>SDT-Config</i> as generated entirely by the last serving gNB. This field is only used during the SDT procedure and the RNA update procedure with UE context relocation as defined in TS 38.300 [2], clause 18.2 and 9.2.2.5 respectively. |
| sourceRB-SN-Config | Contains the IE <i>RadioBearerConfig</i> as generated entirely by the SN. This field is only used when the UE is configured with SN terminated RB(s). |
| sourceSCG-Configured | Value <i>true</i> indicates that the UE is configured with NR or EUTRA SCG in source configuration. The field is only used in NR-DC and NE-DC and is included only if the fields <i>sourceSCG-NR-Config</i> and <i>sourceSCG-EUTRA-Config</i> are absent. |
| sourceSCG-EUTRA-Config | Contains the current dedicated SCG configuration in <i>RRCConnectionReconfiguration</i> message as specified in TS 36.331 [10] and generated entirely by the SN. In this version of the specification, the E-UTRA <i>RRCConnectionReconfiguration</i> message can only include the field <i>scg-Configuration</i> . This field is only used in NE-DC. |
| sourceSCG-NR-Config | Contains the current dedicated SCG configuration in <i>RRCReconfiguration</i> message as generated entirely by the SN. In this version of the specification, the <i>RRCReconfiguration</i> message can only include fields <i>secondaryCellGroup</i> , <i>measConfig</i> , and <i>conditionalReconfiguration</i> . This field is only used in NR-DC. |
| srs-PosRRC-InactiveValidityAreaPreConfigList | Contains the IE <i>SRS-PosRRC-InactiveValidityAreaPreConfigList</i> as generated entirely by the last serving gNB. This field is only used UE is preconfigured with SRS for positioning with validity area and during the RNA update procedure with UE context relocation as defined in TS 38.300 [2], clause 18.2 and 9.2.2.5 respectively. |

| AS-Context field descriptions | |
|-----------------------------------|---|
| configRestrictInfoDAPS | Includes fields for which source cell explicitly indicates the restriction to be observed by target cell during DAPS handover. |
| mbsInterestIndication | Includes the information last reported by the UE in the NR <i>MBSInterestIndication</i> message, where the <i>plmn-Index</i> (if included by the UE in <i>tmgi</i>) is replaced by the PLMN ID, if needed. A TMGI for which the <i>plmn-Index</i> points to a non-serving SNPN is removed from the NR <i>MBSInterestIndication</i> message. |
| needForGapsInfoNR | Includes measurement gap requirement information of the UE for NR target bands. The field includes <i>needForGapsInfoNR</i> in <i>RRCReconfigurationComplete</i> message, <i>needForGapsInfoNR</i> in <i>RRCResumeComplete</i> message or <i>musim-needForGapsInfoNR</i> in <i>UEAssistanceInformation</i> message that is last reported by the UE, if any. |
| selectedBandCombinationSN | Indicates the band combination selected by SN in (NG)EN-DC, NE-DC, and NR-DC. |
| sidelinkUEInformationEUTRA | This field includes <i>SidelinkUEInformation</i> IE as specified in TS 36.331 [10]. |
| sidelinkUEInformationNR | This field includes <i>SidelinkUEInformationNR</i> IE. |
| ueAssistanceInformation | Includes for each UE assistance feature the information last reported by the UE, if any. |
| ueAssistanceInformationSCG | Includes for each UE assistance feature associated with the SCG, the information last reported by the UE in the NR <i>UEAssistanceInformation</i> message for the SCG, if any. |

| ConfigRestrictInfoDAPS field descriptions | |
|--|---|
| sourceFeatureSetPerUplinkCC/sourceFeatureSetPerDownlinkCC | Indicates an index referring to the position of the <i>FeatureSetUplinkPerCC/FeatureSetDownlinkPerCC</i> selected by source in the <i>featureSetsUplinkPerCC/featureSetsDownlinkPerCC</i> . |

| RRM-Config field descriptions | |
|--------------------------------------|---|
| candidateCellInfoList | A list of the best cells on each frequency for which measurement information was available |
| candidateCellInfoListSN-EUTRA | A list of EUTRA cells including serving cells and best neighbour cells on each serving frequency, for which measurement results were available. This field is only used in NE-DC. |

| Conditional Presence | Explanation |
|----------------------|---|
| <i>HO</i> | The field is mandatory present in case of handover within NR or UE context retrieval, e.g. in case of resume or re-establishment. The field is optionally present in case of handover from E-UTRA/5GC. Otherwise the field is absent. |
| <i>HO2</i> | The field is optionally present in case of handover within NR; otherwise the field is absent. |

NOTE 1: The following table indicates per source RAT whether RAT capabilities are included or not.

| Source RAT | NR capabilities | E-UTRA capabilities | MR-DC capabilities | UTRA capabilities |
|------------|---|---------------------|--------------------|---|
| NR | May be included if UE Radio Capability ID as specified in 23.502 [43] is used for the UE. Included otherwise. | May be included | May be included | May be included, ignored by gNB if received |
| E-UTRAN | May be included if UE Radio Capability ID as specified in 23.502 [43] is used for the UE. Included otherwise. | May be included | May be included | May be included, ignored by gNB if received |

NOTE 2: The following table indicates, in case of inter-RAT handover from E-UTRA, which additional IEs are included or not:

| Source system | sourceConfig | rrm-Config | as-Context |
|---------------|---|-----------------|--------------|
| E-UTRA/EPC | Not included | May be included | Not included |
| E-UTRA/5GC | May be included, but only <i>radioBearerConfig</i> is included in the <i>RRCReconfiguration</i> . | May be included | Not included |

– CG-Config

This message is used to transfer the SCG radio configuration as generated by the SgNB or SeNB. It can also be used by a CU to request a DU to perform certain actions, e.g. to request the DU to perform a new lower layer configuration.

Direction: Secondary gNB or eNB to master gNB or eNB, alternatively CU to DU.

}

-- TAG-CG-CONFIG-STOP
-- ASN1STOP

```

| CG-Config field descriptions | |
|--|--|
| aggregatedBandwidthSN | Used to indicate or request the maximum aggregated bandwidth at the SN side if the <i>supportedAggBW-FR1</i> was reported for the <i>selectedBandCombination</i> or <i>requestedBC-MRDC</i> , respectively. This field is only used in NR-DC.
- <i>aggBW-FDD-DL/UL-r17</i> indicates the aggregated bandwidth across FDD DL/UL CCs in SCG;
- <i>aggBW-TDD-DL/UL-r17</i> indicates the aggregated bandwidth across TDD DL/UL CCs in SCG;
- <i>aggBW-TotalDL/UL-r17</i> indicates the aggregated bandwidth across all DL/UL CCs in SCG. |
| candidateCellInfoListCPC | Contains information regarding candidate target cells for Conditional PSCell Change (CPC) or inter-SN subsequent CPAC that the source secondary gNB suggests the target secondary gNB to consider configuring for CPC or subsequent CPAC, and/or that the source secondary gNB prepares for intra-SN subsequent CPAC configuration(s) which are delivered embedded within an RRC message generated by the MN. This field is only used in SN initiated CPC and SN initiated subsequent CPAC. |
| candidateCellInfoListSN | Contains information regarding cells that the source secondary node suggests the target secondary gNB to consider configuring. |
| candidateCellInfoListSN-EUTRA | Includes the <i>MeasResultList3EUTRA</i> as specified in TS 36.331 [10]. Contains information regarding cells that the source secondary node suggests the target secondary eNB to consider configuring. This field is only used in NE-DC. |
| candidateCellInfoListSubsequentCPC | Contains information regarding candidate target cells for subsequent CPAC that candidate secondary gNB (or the serving secondary gNB in case of intra-SN subsequent CPAC configuration(s) which are delivered embedded within an RRC message generated by the MN) suggests the master gNB to consider configuring for subsequent CPAC. This field is only used in MN initiated and SN initiated subsequent CPAC. This field is only included in a CG-Config message which is contained within a CG-CandidateList message. |
| candidateServingFreqListNR, candidateServingFreqListEUTRA | Indicates frequencies of candidate serving cells for In-Device Co-existence Indication (see TS 36.331 [10]). |
| candidateServingFreqListNR-r18 | Indicates the candidate frequencies configured by SN for IDC. This field is only used in NR-DC. |
| candidateServingFreqRangeListNR | Indicates the candidate frequency ranges configured by SN for IDC. This field is only used in NR-DC. |
| configRestrictModReq | Used by SN to request changes to SCG configuration restrictions previously set by MN to ensure UE capabilities are respected and to indicate the configured/reserved SCG resources. E.g. can be used to request configuring an NR band combination whose use MN has previously forbidden. SN only includes this field in SN-initiated procedures unless this field is used to indicate configured/reserved SCG resources (corresponding to <i>reservedResourceConfigNRDC</i> and/or <i>aggregatedBandwidthSN</i> only). |
| drx-ConfigSCG | This field contains the complete DRX configuration of the SCG. This field is only used in NR-DC. |
| drx-InfoSCG | This field contains the DRX long and short cycle configuration of the SCG. This field is used in (NG)EN-DC and NE-DC. |
| drx-InfoSCG2 | This field contains the drx-onDurationTimer configuration of the SCG. This field is only used in (NG)EN-DC. |
| fr-InfoListSCG | Contains information of FR information of serving cells that include PScell and SCells configured in SCG. |
| fr1-Carriers-SCG, fr2-Carriers-SCG | Indicates the number of FR1 or FR2 serving cells configured in SCG. |
| idc-TDM-AssistanceConfig | Indicates if the IDC TDM reporting is enabled for the UE by SN. This field is only used in NR-DC. |
| measuredFrequenciesSN | Used by SN to indicate a list of frequencies measured by the UE. |
| needForGaps | In NE-DC, indicates whether the SN requests gNB to configure measurements gaps. |

| | |
|--|--|
| ph-InfoSCG | Power headroom information in SCG that is needed in the reception of PHR MAC CE of MCG |
| ph-SupplementaryUplink | Power headroom information for supplementary uplink. In the case of (NG)EN-DC and NR-DC, this field is only present when two UL carriers are configured for a serving cell and one UL carrier reports type1 PH while the other reports type 3 PH. |
| ph-Type1or3 | Type of power headroom for a certain serving cell in SCG (PSCell and activated SCells). Value <i>type1</i> refers to type 1 power headroom, value <i>type3</i> refers to type 3 power headroom. (See TS 38.321 [3]). |
| ph-Uplink | Power headroom information for uplink. |
| pSCellFrequency, pSCellFrequencyEUTRA | Indicates the frequency of PSCell in NR (i.e., <i>pSCellFrequency</i>) or E-UTRA (i.e., <i>pSCellFrequencyEUTRA</i>). In this version of the specification, <i>pSCellFrequency</i> is not used in NE-DC whereas <i>pSCellFrequencyEUTRA</i> is only used in NE-DC. <i>pSCellFrequency</i> indicates the <i>absoluteFrequencySSB</i> . |
| reportCGI-RequestNR, reportCGI-RequestEUTRA | Used by SN to indicate to MN about configuring <i>reportCGI</i> procedure. The request may optionally contain information about the cell for which SN intends to configure <i>reportCGI</i> procedure. In this version of the specification, the <i>reportCGI-RequestNR</i> is used in (NG)EN-DC and NR-DC whereas <i>reportCGI-RequestEUTRA</i> is used only for NE-DC. |
| requestedBC-MRDC | Used to request configuring a band combination and corresponding feature sets which are forbidden to use by MN (i.e. outside of the <i>allowedBC-ListMRDC</i>) to allow re-negotiation of the UE capabilities for SCG configuration. |
| requestedL1-MeasConfigNRDC | Used to request the maximum number of allowed resources for L1 measurements to be configured for LTM at the SCG. This field is only used in NR-DC. |
| requestedLTM-ResourceConfigNRDC | Used to request the maximum number of allowed resources for configuring LTM at the SCG. This field is only used in NR-DC. |
| requestedMaxInterFreqMeasIdSCG | Used to request the maximum number of allowed measurement identities to configure for inter-frequency measurement. This field is only used in NR-DC. |
| requestedMaxIntraFreqMeasIdSCG | Used to request the maximum number of allowed measurement identities to configure for intra-frequency measurement on each serving frequency. |
| requestedMaxLTM-CandidateIdSCG | Used to request the maximum number of allowed LTM candidate configurations to configure. This field is only used in NR-DC. |
| requestedPDCCH-BlindDetectionSCG | Requested value of the reference number of cells for PDCCH blind detection allowed to be configured for the SCG. |
| requestedP-MaxEUTRA | Requested value for the maximum power for the serving cells the UE can use in E-UTRA SCG. This field is only used in NE-DC. |
| requestedP-MaxFR1 | Requested value for the maximum power for the serving cells on frequency range 1 (FR1) in this secondary cell group (see TS 38.104 [12]) the UE can use in NR SCG. |
| requestedP-MaxFR2 | Requested value for the maximum power for the serving cells on frequency range 2 (FR2) in this secondary cell group the UE can use in NR SCG. This field is only used in NR-DC. |
| requestedToffset | Requests the new value for the time offset restriction used by the SN for scheduling SCG transmissions (i.e. $T_{proc,SCG}^{max}$, see TS 38.213 [13]). This field is used in NR-DC only when the fields <i>nrdc-PC-mode-FR1-r16</i> or <i>nrdc-PC-mode-FR2-r16</i> are set to dynamic. Value ms0dot5 corresponds to 0.5 ms, value ms0dot75 corresponds to 0.75 ms, value ms1 corresponds to 1ms and so on. |
| reservedResourceConfigNRDC | Used to request or indicate the maximum number of resources reserved for the SCG. This field is only used in NR-DC. |

scellFrequenciesSN-EUTRA, scellFrequenciesSN-NR

Indicates the frequency of all SCells with SSB configured in SCG. The field *sceI/FrequenciesSN-EUTRA* is used in NE-DC; the field *sceI/FrequenciesSN-NR* is used in (NG)EN-DC and NR-DC. In (NG)EN-DC, the field is optionally provided to the MN. *sceI/FrequenciesSN-NR* indicates *absoluteFrequencySSB*.

scg-CellGroupConfig

Contains the *RRCReconfiguration* message (containing only *secondaryCellGroup* and/or *measConfig* and/or *otherConfig* and/or *appLayerMeasConfig* and/or *conditionalReconfiguration*, *l1m-Config*, and/or *bap-Config* and/or *iab-IP-AddressConfigurationList*):

- to be sent to the UE, used upon SCG establishment or modification (only when the SCG is not released by the SN), as generated (entirely) by the (target) SgNB. In this case, the SN sets the *RRCReconfiguration* message in accordance with clause 6 e.g. regarding the "Need" or "Cond" statements.

or

- including the current SCG configuration of the UE, when provided in response to a query from MN, or in SN triggered SN change in order to enable delta signaling by the target SN, or in SN triggered modification procedure in order to coordinate CHO or MN-initiated CPC with SCG reconfigurations (see TS 38.423 [35]). In this case, the SN sets the *RRCReconfiguration* message in accordance with clause 11.2.3.

The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered modification procedure in order to coordinate CHO or MN-initiated CPC with SCG reconfigurations (see TS 38.423 [35]) nor SN triggered SN change is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG (re)configuration towards the UE. The field is also absent upon an SCG release triggered by the SN. This field is not applicable in NE-DC.

scg-CellGroupConfigEUTRA

Includes the E-UTRA *RRCConnectionReconfiguration* message as specified in TS 36.331 [10]. In this version of the specification, the E-UTRA RRC message can only include the field *scg-Configuration*:

- to be sent to the UE, used to (re-)configure the SCG configuration upon SCG establishment or modification (only when the SCG is not released by the SN), as generated (entirely) by the (target) SeNB. In this case, the SN sets the *scg-Configuration* within the EUTRA *RRCConnectionReconfiguration* message in accordance with clause 6 in TS 36.331 [10] e.g. regarding the "Need" or "Cond" statements.

or

- including the current SCG configuration of the UE, when provided in response to a query from MN, or in SN triggered SN change in order to enable delta signalling by the target SN.

The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered SN change is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG (re)configuration towards the UE. The field is also absent upon an SCG release triggered by the SN. This field is only used in NE-DC.

scg-RB-Config

Contains the IE *RadioBearerConfig*:

- to be sent to the UE, used to (re-)configure the SCG RB configuration upon SCG establishment or modification, as generated (entirely) by the (target) SgNB or SeNB. In this case, the SN sets the *RadioBearerConfig* in accordance with clause 6, e.g. regarding the "Need" or "Cond" statements.

or

- including the current SCG RB configuration of the UE, when provided in response to a query from MN or in SN triggered SN change or in SN triggered SN release or bearer type change between SN terminated bearer to MN terminated bearer in order to enable delta signaling by the MN or target SN. In this case, the SN sets the *RadioBearerConfig* in accordance with clause 11.2.3.

The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered SN change nor SN triggered SN release is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG RB (re)configuration.

scpac-ReferenceConfigurationSCG

Includes the reference configuration associated with the SCG for the candidate supporting subsequent CPAC.

| | |
|------------------------------------|---|
| selectedBandCombination | Indicates the band combination selected by SN in (NG)EN-DC, NE-DC, and NR-DC. The SN should inform the MN with this field whenever the band combination and/or feature set it selected for the SCG changes (i.e. even if the new selection concerns a band combination and/or feature set that is allowed by the <i>allowedBC-ListMRDC</i>) |
| selectedTOffset | Indicates the value used by the SN for scheduling SCG transmissions (i.e. $T_{proc,SCG}^{max}$, see TS 38.213 [13]). This field is used in NR-DC only when the fields <i>nrdc-PC-mode-FR1-r16</i> or <i>nrdc-PC-mode-FR2-r16</i> are set to dynamic. The SN can only indicate a value that is less than or equal to <i>maxTOffset</i> received from MN. This field is used in NR-DC only when MN has included the field <i>maxTOffset</i> in <i>CG-ConfigInfo</i> . Value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms0dot75</i> corresponds to 0.75 ms, value <i>ms1</i> corresponds to 1ms and so on. |
| servCellInfoListSCG-EUTRA | Indicates the carrier frequency and the transmission bandwidth of the serving cell(s) in the SCG in intra-band NE-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in NE-DC. |
| servCellInfoListSCG-NR | Indicates the frequency band indicator, carrier center frequency, UE specific channel bandwidth and SCS of the serving cell(s) in the SCG in intra-band (NG)EN-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in (NG)EN-DC. |
| subsequentCPAC-Information | Contains information about handling of stored subsequent CPAC configurations for the UE that the target secondary gNB suggests the master gNB to consider configuring for normal PSCell addition or change. It includes information about updates of execution conditions for the subsequent CPAC configurations that are to be kept at the PSCell addition/change. |
| successPSCell-Config | Include the successful PSCell change or addition report configuration in case of SN initiated PSCell change or CPC. The <i>thresholdPercentageT304-SCG</i> is not configured in this message. |
| twoPHRModeSCG | Indicates if the power headroom for SCG shall be reported as two PHRs (each PHR associated with a SRS resource set) is enabled or not. |
| twoSRS-MultipanelScheme | Indicates whether the indicated serving cell is configured with multiple panel simultaneous uplink transmission schemes of multipanelSchemeSDM or multipanelSchemeSFN corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'. |
| twoSRS-PUSCH-Repetition | Indicates whether the indicated serving cell is configured for PUSCH repetition corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'. |
| transmissionBandwidth-EUTRA | Indicates the transmission bandwidth on an E-UTRA carrier frequency as defined by the parameter Transmission Bandwidth Configuration "NRB" TS 36.104 [33]. The values rb6, rb15, rb25, rb50, rb75, rb100 indicate 6, 15, 25, 50, 75 and 100 resource blocks respectively. |
| ueAssistanceInformationSCG | Includes for each UE assistance feature associated with the SCG, the information last reported by the UE in the NR <i>UEAssistanceInformation</i> message for the SCG, if any. |

| <i>BandCombinationInfoSN</i> field descriptions | |
|--|--|
| <i>bandCombinationIndex</i> | In case of NR-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> . In case of NE-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationListNEDC-Only</i> . In case of (NG)EN-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationList-UplinkTxSwitch</i> . Band combination entries in <i>supportedBandCombinationList</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationListNEDC-Only</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationListNEDC-Only</i> increased by the number of entries in <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationList-UplinkTxSwitch</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList-UplinkTxSwitch</i> increased by the number of entries in <i>supportedBandCombinationList</i> . |
| <i>requestedFeatureSets</i> | The position in the <i>FeatureSetCombination</i> which identifies one <i>FeatureSetUplink/Downlink</i> for each band entry in the associated band combination |

| Conditional Presence | Explanation |
|-----------------------------|---|
| <i>FDD</i> | This field is mandatory present if dl-FreqInfo-NR is included and concerns an FDD carrier; otherwise the field is absent. |

– ***CG-ConfigInfo***

This message is used by master eNB or gNB to request the SgNB or SeNB to perform certain actions e.g. to establish, modify or release an SCG. The message may include additional information e.g. to assist the SgNB or SeNB to set the SCG configuration. It can also be used by a CU to request a DU to perform certain actions, e.g. to establish, or modify an MCG or SCG.

Direction: Master eNB or gNB to secondary gNB or eNB, alternatively CU to DU.

-- TAG-CG-CONFIG-INFO-STOP

-- ASN1STOP

| CG-ConfigInfo field descriptions | |
|---|---|
| affectedCarrierFreqCombList | This field is signalled upon MN not addressing IDC issue and contains the list of NR carrier frequency combinations reported by UE to MN for IDC problem caused by the NR-DC frequency combination. |
| affectedCarrierFreqRangeCombList | This field is signalled upon MN not addressing IDC issue and contains the list of NR carrier frequency range combinations reported by UE to MN for IDC problem caused by the NR-DC frequency combination. |
| alignedDRX-Indication | This field is signalled upon MN triggered CGI reporting by the UE that requires aligned DRX configurations between the MCG and the SCG (i.e. same DRX cycle and on-duration configured by MN completely contains on-duration configured by SN). |
| allowedAggregatedBandwidthSNList | A list of allowed maximum aggregated bandwidth at the SN side for the band combination included in the <i>allowedBC-ListMRDC</i> . This field is only used in NR-DC. |
| allowedBC-ListMRDC | A list of indices referring to band combinations in MR-DC capabilities from which SN is allowed to select the SCG band combination. Each entry refers to:
- a band combination numbered according to <i>supportedBandCombinationList</i> and <i>supportedBandCombinationList-UplinkTxSwitch</i> in the <i>UE-MRDC-Capability</i> (in case of (NG)EN-DC), or according to <i>supportedBandCombinationList</i> and <i>supportedBandCombinationListNEDC-Only</i> in the <i>UE-MRDC-Capability</i> (in case of NE-DC), or according to <i>supportedBandCombinationList</i> in the <i>UE-NR-Capability</i> (in case of NR-DC),
- and the Feature Sets allowed for each band entry. All MR-DC band combinations indicated by this field comprise the MCG band combination, which is a superset of the MCG band(s) selected by MN. |
| allowedL1-MeasConfigNRDC | Used to indicate the maximum number of allowed resources for L1 measurements to be configured for LTM at the SCG. This field is only used in NR-DC. |
| allowedLTM-ResourceConfigNRDC | Used to indicate the maximum number of allowed resources for configuring LTM at the SCG. This field is only used in NR-DC. |
| allowedReducedConfigForOverheating | Indicates the reduced configuration that the SCG is allowed to configure.
<i>reducedMaxCCs</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum number of downlink/uplink PSCell/SCells that the SCG is allowed to configure. This field is used in (NG)EN-DC and NR-DC.
<i>reducedMaxBW-FR1</i> and <i>reducedMaxBW-FR2</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum aggregated bandwidth across all downlink/uplink carriers of FR1 and FR2-1, respectively that the SCG is allowed to configure. <i>reducedMaxBW-FR2-2</i> in <i>allowedReducedConfigForOverheating-r17</i> indicates the maximum aggregated bandwidth across all downlink/uplink carriers of FR2-2 that the SCG is allowed to configure. This field is only used in NR-DC.
<i>reducedMaxMIMO-LayersFR1</i> and <i>reducedMaxMIMO-LayersFR2</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum number of downlink/uplink MIMO layers of each serving cell operating on FR1 and FR2-1, respectively that the SCG is allowed to configure. <i>reducedMaxMIMO-LayersFR2-2</i> in <i>allowedReducedConfigForOverheating-r17</i> indicates the maximum number of downlink/uplink MIMO layers of each serving cell operating on FR2-2 that the SCG is allowed to configure. This field is only used in NR-DC. |
| allowedResourceConfigNRDC | Used to indicate the maximum number of resources reserved for the SCG. This field is only used in NR-DC. |
| candidateCellInfoListMN, candidateCellInfoListSN | Contains information regarding cells that the master node or the source node suggests the target gNB or DU to consider configuring. In case of MN initiated CPA, CPC or CHO with candidate SCG(s), the field <i>candidateCellInfoListMN</i> contains information regarding cells that the MN suggests the candidate target secondary node to consider configuring for MN initiated CPA, CPC, CHO with candidate SCG(s), or subsequent CPAC.
For (NG)EN-DC, including CSI-RS measurement results in <i>candidateCellInfoListMN</i> is not supported in this version of the specification. For NR-DC, including SSB and/or CSI-RS measurement results in <i>candidateCellInfoListMN</i> is supported. |
| candidateCellInfoListMN-EUTRA, candidateCellInfoListSN-EUTRA | Includes the <i>MeasResultList3EUTRA</i> as specified in TS 36.331 [10]. Contains information regarding cells that the master node or the source node suggests the target secondary eNB to consider configuring. These fields are only used in NE-DC. |

| | |
|--|--|
| candidateCellListCPC | Contains information regarding cells that the source secondary node suggests the candidate target secondary node to consider configuring for SN initiated Conditional PSCell Change (CPC) or SN initiated inter-SN subsequent CPAC. |
| configRestrictInfo | Includes fields for which SgNB is explicitly indicated to observe a configuration restriction. |
| drx-ConfigMCG | This field contains the complete DRX configuration of the MCG. This field is only used in NR-DC. |
| drx-InfoMCG | This field contains the DRX long and short cycle configuration of the MCG. This field is used in (NG)EN-DC and NE-DC. |
| drx-InfoMCG2 | This field contains the <i>drx-onDurationTimer</i> configuration of the MCG. This field is only used in (NG)EN-DC. |
| dummy, dummy1 | These fields are not used in the specification and SN ignores the received value(s). |
| fr-InfoListMCG | Contains information of FR information of serving cells that include PCell and SCell(s) configured in MCG. |
| fr1-Carriers-MCG, fr2-Carriers-MCG | Indicates the number of FR1 or FR2 serving cells configured in MCG. |
| idc-TDM-Assistance | This field is signalled upon MN not addressing IDC issue and contains IDC TDM assistance information reported by UE to MN for IDC problem. |
| interFreqNoGap | Indicates that the field <i>interFrequencyConfig-NoGap-r16</i> has been included within the <i>MeasConfig</i> IE generated by the MN. |
| lowMobilityEvaluationConnectedInPCell | Indicates if low mobility criterion has been configured in NR PCell. |
| maxInterFreqMeasIdentitiesSCG | Indicates the maximum number of allowed measurement identities that the SCG is allowed to configure for inter-frequency measurement. The maximum value for this field is 10. If the field is absent, the SCG is allowed to configure inter-frequency measurements up to the maximum value. This field is only used in NR-DC. |
| maxIntraFreqMeasIdentitiesSCG | Indicates the maximum number of allowed measurement identities that the SCG is allowed to configure for intra-frequency measurement on each serving frequency. The maximum value for this field is 9 (in case of (NG)EN-DC or NR-DC) or 10 (in case of NE-DC). If the field is absent, the SCG is allowed to configure intra-frequency measurements up to the maximum value on each serving frequency. |
| maxMeasCLI-ResourceSCG | Indicates the maximum number of CLI RSSI resources that the SCG is allowed to configure. |
| maxMeasFreqsSCG | Indicates the maximum number of NR inter-frequency carriers the SN is allowed to configure with PSCell for measurements. |
| maxMeasSRS-ResourceSCG | Indicates the maximum number of SRS resources that the SCG is allowed to configure for CLI measurement. |
| maxNumberCPCCandidates | Indicates the maximum numbers of conditional reconfigurations the SN is allowed to configure for SN initiated CPC. Value 0 indicates that the SN is not allowed to configure SN initiated CPC. If the field is absent, the SN is allowed to configure up to <i>maxNrofCondCells-r16</i> conditional reconfigurations for SN-initiated CPC. |
| maxNumberEHC-ContextsSN | Indicates the maximum number of EHC contexts allowed to the SN terminated bearer. The field indicates the number of contexts in addition to CID = "all zeros", as specified in TS 38.323 [5]. |
| maxNumberLTM-CandidatesSCG | Indicates the maximum number of LTM candidate configurations that the SN is allowed to configure. If the field is absent the SN is not allowed to configure LTM candidate configurations. This field is only used in NR-DC. |

| | |
|---|---|
| maxNumberROHC-ContextSessionsSN | Indicates the maximum number of ROHC context sessions allowed to SN terminated bearer, excluding context sessions that leave all headers uncompressed. |
| maxNumberUDC-DRB | Indicates the maximum number of UDC DRBs allowed to SN terminated bearer. This field is used in NGEN-DC, NR-DC and NE-DC. |
| maxToffset | Indicates the maximum Toffset value the SN is allowed to use for scheduling SCG transmissions (see TS 38.213 [13]). This field is used in NR-DC only when the fields <i>nrdc-PC-mode-FR1-r16</i> or <i>nrdc-PC-mode-FR2-r16</i> are set to dynamic. Value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms0dot75</i> corresponds to 0.75 ms, value <i>ms1</i> corresponds to 1 ms and so on. |
| measuredFrequenciesMN | Used by MN to indicate a list of frequencies measured by the UE. |
| measGapConfig | Indicates the FR1 and perUE measurement gap configuration configured by MN. |
| measGapConfigFR2 | Indicates the FR2 measurement gap configuration configured by MN. |
| mcg-RB-Config | Contains all of the fields in the IE <i>RadioBearerConfig</i> used in MN, used by the SN to support delta configuration to UE (i.e. when MN does not use full configuration option), for bearer type change between MN terminated bearer with NR PDCP to SN terminated bearer. It is also used to indicate the PDCP duplication related information for MN terminated split bearer (whether duplication is configured and if so, whether it is initially activated) in SN Addition/Modification procedure. Otherwise, this field is absent. |
| measResultReportCGI, measResultReportCGI-EUTRA | Used by MN to provide SN with CGI-Info for the cell as per SN's request. In this version of the specification, the <i>measResultReportCGI</i> is used for (NG)EN-DC and NR-DC and the <i>measResultReportCGI-EUTRA</i> is used only for NE-DC. |
| measResultSCG-EUTRA | This field includes the <i>MeasResultSCG-FailureMRDC</i> IE as specified in TS 36.331 [10]. This field is only used in NE-DC. |
| measResultSFTD-EUTRA | SFTD measurement results between the PCell and the E-UTRA PScell in NE-DC. This field is only used in NE-DC. |
| nrdc-AssistanceInfo | Contains the IDC assistance information for MR-DC reported by the UE (see TS 36.331 [10]). |
| musim-CapRestrictionInfo | Indicates the UE's preference on SCell(s) or PSCell to be released, serving cell(s) with restricted capability, band(s) or combination(s) of bands with restricted capability, or band(s) or band combination(s) to be avoided for UE temporary capabilities restriction purpose with the <i>musim-candidateBandList-r18</i> only for <i>musim-AffectedBandsList-r18</i> and <i>musim-AvoidedBandsList-r18</i> . All fields in <i>musim-CapRestriction-r18</i> can be sent from MN to SN, i.e., it is up to MN implementation to decide which field(s) need to be sent. |
| musim-GapConfigInfo | Indicates the MUSIM gap configuration configured by MN. |
| nrdc-PC-mode-FR1 | Indicates the uplink power sharing mode that the UE uses in NR-DC FR1 (see TS 38.213 [13], clause 7.6). |
| nrdc-PC-mode-FR2 | Indicates the uplink power sharing mode that the UE uses in NR-DC FR2 (see TS 38.213 [13], clause 7.6). |
| overheatingAssistanceSCG | Contains the UE's preference on reduced configuration for NR SCG to address overheating. This field is only used in (NG)EN-DC. |
| overheatingAssistanceSCG-FR2-2 | Contains the UE's preference on reduced configuration for NR SCG on FR2-2 to address overheating. This field is only used in (NG)EN-DC. |
| p-maxEUTRA | Indicates the maximum total transmit power to be used by the UE in the E-UTRA cell group (see TS 36.104 [33]). This field is used in (NG)EN-DC and NE-DC. |

| | |
|-------------------------------------|--|
| p-maxNR-FR1 | For (NG)EN-DC and NE-DC, the field indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 1 (FR1) (see TS 38.104 [12]). For NR-DC, it indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 1 (FR1) (see TS 38.104 [12]) the UE can use in NR SCG. |
| p-maxUE-FR1 | Indicates the maximum total transmit power to be used by the UE across all serving cells in frequency range 1 (FR1). |
| p-maxNR-FR1-MCG | Indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 1 (FR1) (see TS 38.104 [12]) the UE can use in NR MCG. This field is only used in NR-DC. |
| p-maxNR-FR2-SCG | Indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 2 (FR2) (see TS 38.104 [12]) the UE can use in NR SCG. |
| p-maxUE-FR2 | Indicates the maximum total transmit power to be used by the UE across all serving cells in frequency range 2 (FR2). |
| p-maxNR-FR2-MCG | Indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 2 (FR2) (see TS 38.104 [12]) the UE can use in NR MCG. |
| pdcch-BlindDetectionSCG | Indicates the maximum value of the reference number of cells for PDCCH blind detection allowed to be configured for the SCG. |
| ph-InfoMCG | Power headroom information in MCG that is needed in the reception of PHR MAC CE in SCG. |
| ph-SupplementaryUplink | Power headroom information for supplementary uplink. For UE in (NG)EN-DC, this field is absent. |
| ph-Type1or3 | Type of power headroom for a serving cell in MCG (PCell and activated SCells). type1 refers to type 1 power headroom, type3 refers to type 3 power headroom. (See TS 38.321 [3]). |
| ph-Uplink | Power headroom information for uplink. |
| powerCoordination-FR1 | Indicates the maximum power that the UE can use in FR1. |
| powerCoordination-FR2 | Indicates the maximum power that the UE can use in frequency range 2 (FR2). This field is only used in NR-DC. |
| scgFailureInfo | Contains SCG failure type and measurement results. In case the sender has no measurement results available, the sender may include one empty entry (i.e. without any optional fields present) in <i>measResultPerMOList</i> . This field is used in (NG)EN-DC and NR-DC. |
| scg-RB-Config | Contains all of the fields in the IE RadioBearerConfig used in SN, used to allow the target SN to use delta configuration to the UE, e.g. during SN change. The field is signalled upon change of SN unless MN uses full configuration option. Otherwise, the field is absent. |
| scpac-ReferenceConfiguration | Includes the reference configuration associated with the SCG for the candidate supporting subsequent CPAC. |
| selectedBandEntriesMNLList | A list of indices referring to the position of a band entry selected by the MN, in each band combination entry in <i>allowedBC-ListMRDC</i> IE. <i>BandEntryIndex</i> 0 identifies the first band in the <i>bandList</i> of the <i>BandCombination</i> , <i>BandEntryIndex</i> 1 identifies the second band in the <i>bandList</i> of the <i>BandCombination</i> , and so on. This <i>selectedBandEntriesMNLList</i> includes the same number of entries, and listed in the same order as in <i>allowedBC-ListMRDC</i> . The SN uses this information to determine which bands out of the NR band combinations in <i>allowedBC-ListMRDC</i> it can configure in SCG in NR-DC. The SN can use this information to determine for which band pair(s) it should check <i>SimultaneousRxTxPerBandPair</i> . |

| | |
|--|---|
| <i>servCellIndexRangeSCG</i> | Range of serving cell indices that SN is allowed to configure for SCG serving cells. |
| <i>servCellInfoListMCG-EUTRA</i> | Indicates the carrier frequency and the transmission bandwidth of the serving cell(s) in the MCG in intra-band (NG)EN-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in (NG)EN-DC. |
| <i>servCellInfoListMCG-NR</i> | Indicates the frequency band indicator, carrier center frequency, UE specific channel bandwidth and SCS of the serving cell(s) in the MCG in intra-band NE-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in NE-DC. |
| <i>servFrequenciesMN-NR</i> | Indicates the frequency of all serving cells that include PCell and SCell(s) with SSB configured in MCG. This field is only used in NR-DC. <i>servFrequenciesMN-NR</i> indicates <i>absoluteFrequencySSB</i> . |
| <i>sftdFrequencyList-NR</i> | Includes a list of SSB frequencies. Each entry identifies the SSB frequency of a PSCell, which corresponds to one <i>MeasResultCellSFTD-NR</i> entry in the <i>MeasResultCellListSFTD-NR</i> . |
| <i>sftdFrequencyList-EUTRA</i> | Includes a list of E-UTRA frequencies. Each entry identifies the carrier frequency of a PSCell, which corresponds to one <i>MeasResultSFTD-EUTRA</i> entry in the <i>MeasResultCellListSFTD-EUTRA</i> . |
| <i>sidelinkUEInformationEUTRA</i> | This field contains the E-UTRA <i>SidelinkUEInformation</i> message as specified in TS 36.331 [10]. |
| <i>sidelinkUEInformationNR</i> | This field contains the NR <i>SidelinkUEInformationNR</i> message. |
| <i>sourceConfigSCG</i> | Includes all of the current SCG configurations used by the target SN to build delta configuration to be sent to UE, e.g. during SN change. The field contains the <i>RRCReconfiguration</i> message which may include <i>secondaryCellGroup</i> , <i>measConfig</i> , and <i>conditionalReconfiguration</i> . The field is signalled upon change of SN, unless MN uses full configuration option. Otherwise, the field is absent. |
| <i>sourceConfigSCG-EUTRA</i> | Includes the E-UTRA <i>RRCConnectionReconfiguration</i> message as specified in TS 36.331 [10]. In this version of the specification, the E-UTRA RRC message can only include the field <i>scg-Configuration</i> . In this version of the specification, this field is absent when master gNB uses full configuration option. This field is only used in NE-DC. |
| <i>subsequentCPAC-Candidates</i> | Includes the subsequent CPAC candidate PSCells that the UE has stored in MCG <i>VarConditionalReconfig</i> . |
| <i>twoPHRModeMCG</i> | Indicates if the power headroom for MCG shall be reported as two PHRs (each PHR associated with a SRS resource set) is enabled or not. |
| <i>twoSRS-PUSCH-Repetition</i> | Indicates whether the indicated serving cell is configured for PUSCH repetition corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'. |
| <i>twoSRS-MultipanelScheme</i> | Indicates whether the indicated serving cell is configured with multiple panel simultaneous uplink transmission schemes of <i>multipanelSchemeSDM</i> or <i>multipanelSchemeSFN</i> corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'. |
| <i>ueAssistanceInformationSourceSCG</i> | Includes for each UE assistance feature associated with the SCG, the information last reported by the UE in the NR <i>UEAssistanceInformation</i> message for the source SCG, if any. |

ue-CapabilityInfo

Contains the IE *UE-CapabilityRAT-ContainerList* supported by the UE (see NOTE 3). A gNB that retrieves MRDC related capability containers ensures that the set of included MRDC containers is consistent w.r.t. the feature set related information.

BandCombinationInfo* field descriptions**allowedFeatureSetsList***

Defines a subset of the entries in a *FeatureSetCombination*. Each index identifies a position in the *FeatureSetCombination*, which corresponds to one *FeatureSetUplink/Downlink* for each band entry in the associated band combination.

bandCombinationIndex

In case of NR-DC, this field indicates the position of a band combination in the *supportedBandCombinationList*. In case of NE-DC, this field indicates the position of a band combination in the *supportedBandCombinationList* and/or *supportedBandCombinationListNEDC-Only*. In case of (NG)EN-DC, this field indicates the position of a band combination in the *supportedBandCombinationList* and/or *supportedBandCombinationList-UplinkTxSwitch*. Band combination entries in *supportedBandCombinationList* are referred by an index which corresponds to the position of a band combination in the *supportedBandCombinationList*. Band combination entries in *supportedBandCombinationListNEDC-Only* are referred by an index which corresponds to the position of a band combination in the *supportedBandCombinationListNEDC-Only* increased by the number of entries in *supportedBandCombinationList*. Band combination entries in *supportedBandCombinationList-UplinkTxSwitch* are referred by an index which corresponds to the position of a band combination in the *supportedBandCombinationList-UplinkTxSwitch* increased by the number of entries in *supportedBandCombinationList*.

AllowedAggregatedBandwidth* field descriptions**AllowedAggregatedBandwidth***

Indicates the allowed maximum aggregated bandwidth at the SN side.

- *allowedAggBW-FDD-DL/UL-r17* indicates the allowed maximum aggregated bandwidth across FDD DL/UL CCs in SCG;
- *allowedAggBW-TDD-DL/UL-r17* indicates the allowed maximum aggregated bandwidth across TDD DL/UL CCs in SCG;
- *allowedAggBW-TotalDL/UL-r17* indicates the allowed maximum aggregated bandwidth across all DL/UL CCs in SCG.

bandCombinationIndex

This field indicates the position of a band combination in the *supportedBandCombinationList*. Band combination entries in *supportedBandCombinationList* are referred by an index which corresponds to the position of a band combination in the *supportedBandCombinationList*. Band combination entries in *supportedBandCombinationList-UplinkTxSwitch* are referred by an index which corresponds to the position of a band combination in the *supportedBandCombinationList-UplinkTxSwitch* increased by the number of entries in *supportedBandCombinationList*.

| Conditional Presence | Explanation |
|----------------------|---|
| SN-AddMod | The field is mandatory present upon SN addition and SN change. It is optionally present upon SN modification and inter-MN handover without SN change. Otherwise, the field is absent. |

NOTE 3: The following table indicates per MN RAT and SN RAT whether RAT capabilities are included or not in *ue-CapabilityInfo*.

| MN RAT | SN RAT | NR capabilities | E-UTRA capabilities | MR-DC capabilities |
|--------|--------|--|--|--|
| E-UTRA | NR | Need not be included if the UE Radio Capability ID as specified in 23.502 [43] is used. Included otherwise | Not included | Need not be included if the UE Radio Capability ID as specified in 23.502 [43] is used. Included otherwise |
| NR | E-UTRA | Not included | Need not be included if the UE Radio Capability ID as specified in 23.502 [43] is used. Included otherwise | Need not be included if the UE Radio Capability ID as specified in 23.502 [43] is used. Included otherwise |
| NR | NR | Need not be included if the UE Radio Capability ID as specified in 23.502 [43] is used. Included otherwise | Not included | Not included |

– *MeasurementTimingConfiguration*

The *MeasurementTimingConfiguration* message is used to convey assistance information for measurement timing and to indicate which neighbour cell SSB is CD-SSB. The other indicated SSB can be considered as the NCD-SSB in use.

Direction: en-gNB to eNB, eNB to en-gNB, gNB to gNB, ng-eNB to gNB, gNB to ng-eNB, ng-eNB to ng-eNB, gNB DU to gNB CU, and gNB CU to gNB DU.

| <i>MeasTiming</i> field descriptions | |
|--|--|
| <i>carrierFreq, ssbSubcarrierSpacing</i> | Indicates the frequency and subcarrier spacing of the SS block of the cell for which this message is included, or of other SS blocks within the same carrier. |
| <i>ssb-MeasurementTimingConfiguration</i> | Indicates the SMTC which can be used to search for SSB of the cell for which the message is included. When the message is included in "Served NR Cell Information" (see TS 36.423 [37]), "Served Cell Information NR" (see TS 38.423 [35]), or "Served Cell Information" (see TS 38.473 [36]), the timing is based on the cell for which the message is included. When the message is included in "NR Neighbour Information" (see TS 36.423 [37]), or "Served Cell Information" (see TS 38.423 [35]), the timing is based on the cell indicated in the "Served NR Cell Information" or "Served Cell Information NR" with which the "NR Neighbour Information" or "Neighbour Information NR" is provided. When the message is included in "CU to DU RRC Information", the timing is based on the cell indicated by SpCell ID with which the message is included. If the field is provided by an NTN cell, the offset (derived from parameter <i>periodicityAndOffset</i>) is based on the assumption that the NTN payload to gNB propagation delay of the cell for which the message is included equals to 0 ms. |
| <i>ss-RSSI-Measurement</i> | Provides the configuration which can be used for RSSI measurements of the cell for which the message is included. |

| <i>MeasurementTimingConfiguration</i> field descriptions | |
|---|--|
| <i>campOnFirstSSB</i> | Value <i>true</i> indicates that the SSB indicated in the first instance of <i>MeasTiming</i> in the <i>measTiming</i> list can be used for camping and for a PCell configuration (i.e. in <i>spCellConfigCommon</i> of the <i>masterCellGroup</i>) and to indicate which neighbour cell SSB is CD-SSB and which one is NCD-SSB in use. |
| <i>csi-RS-CellMobility</i> | Indicates the CSI-RS configuration of the cell for which this message is included. The timing of the CSI-RS resources is based on the SSB indicated by <i>refSSBFreq</i> . |
| <i>csi-RS-SubcarrierSpacing</i> | Indicates the subcarrier spacing of the CSI-RS resources included in <i>csi-rs-CellMobility</i> . |
| <i>measTiming</i> | A list of SMTC information, SSB RSSI measurement information and associated NR frequency exchanged via EN-DC X2 Setup, EN-DC Configuration Update, Xn Setup and NG-RAN Node Configuration Update procedures, or F1 messages between gNB DU and gNB CU. |
| <i>physCellId</i> | Physical Cell Identity of the SSB on the ARFCN indicated by <i>carrierFreq</i> . |
| <i>psCellOnlyOnFirstSSB</i> | Value <i>true</i> indicates that only the SSB indicated in the first instance of <i>MeasTiming</i> in the <i>measTiming</i> list can be used for a PSCell configuration (i.e. in <i>spCellConfigCommon</i> of the <i>secondaryCellGroup</i>). |
| <i>ssb-ToMeasure</i> | The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). |

– *UERadioPagingInformation*

This message is used to transfer radio paging information, covering both upload to and download from the 5GC, and between gNBs.

Direction: gNB to/ from 5GC and gNB to/from gNB

```

| <i>UERadioPagingInformation</i> field descriptions | |
|---|---|
| <i>supportedBandListNRForPaging</i> | Indicates the UE supported NR frequency bands which are derived by the gNB from <i>UE-NR-Capability</i> . |
| <i>dl-SchedulingOffset-PDSCH-TypeA-FDD-FR1</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type A in FDD FR1. |
| <i>dl-SchedulingOffset-PDSCH-TypeA-FDD-FR2-NTN</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type A in FDD FR2-NTN. |
| <i>dl-SchedulingOffset-PDSCH-TypeA-TDD-FR1</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type A in TDD FR1. |
| <i>dl-SchedulingOffset-PDSCH-TypeA-TDD-FR2</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type A in TDD FR2. |
| <i>dl-SchedulingOffset-PDSCH-TypeB-FDD-FR1</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type B in FDD FR1. |
| <i>dl-SchedulingOffset-PDSCH-TypeB-FDD-FR2-NTN</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type B in FDD FR2-NTN. |
| <i>dl-SchedulingOffset-PDSCH-TypeB-TDD-FR1</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type B in TDD FR1. |
| <i>dl-SchedulingOffset-PDSCH-TypeB-TDD-FR2</i> | Indicates whether the UE supports DL scheduling slot offset (K0) greater than 0 for PDSCH mapping type B in TDD FR2. |
| <i>halfDuplexFDD-TypeA-eRedCap</i> | Indicates whether the (e)RedCap UE only supports half-duplex operation for FDD in the indicated band(s). |
| <i>inactiveStatePO-Determination</i> | Indicates whether the UE supports to use the same i_s to determine PO in RRC_INACTIVE state as in RRC_IDLE state. |
| <i>numberOfRxERedCap</i> | Indicates the number of Rx branches supported by an eRedCap UE. |
| <i>numberOfRxRedCap</i> | Indicates the number of Rx branches supported by a RedCap UE. |
| <i>supportOf2RxXR</i> | Indicates whether the UE is a 2Rx XR UE. |
| <i>ue-RadioPagingInfo</i> | The field is used to transfer UE capability information used for paging. The gNB generates the ue-RadioPagingInfo and the contained UE capability information is absent when not supported by the UE. |

UERadioAccessCapabilityInformation-IEs field descriptions

ue-RadioAccessCapabilityInfo

Including NR, MR-DC, E-UTRA radio access capabilities. A gNB that retrieves MRDC related capability containers ensures that the set of included MRDC containers is consistent w.r.t. the feature set related information.

11.2.3 Mandatory information in inter-node RRC messages

For the AS-Config transferred within the *HandoverPreparationInformation*:

- The source node shall include all fields necessary to reflect the current AS configuration of the UE, except for the fields *sourceSCG-NR-Config*, *sourceSCG-EUTRA-Config* and *sourceRB-SN-Config*, which can be omitted in case the source MN did not receive the latest configuration from the source SN. For *RRCReconfiguration* included in the field *rrcReconfiguration*, *ReconfigurationWithSync* is included with only the mandatory subfields (e.g. *newUE-Identity* and *t304*) and *ServingCellConfigCommon*;
- Need codes or conditions specified for subfields according to IEs defined in clause 6 do not apply. I.e. some fields shall be included regardless of the "Need" or "Cond" e.g. *discardTimer*;
- Based on the received AS configuration, the target node can indicate the delta (difference) to the current AS configuration (as included in *HandoverCommand*) to the UE. The fields *newUE-Identity* and *t304* included in *ReconfigurationWithSync* are not used for delta configuration purpose.

The *candidateCellInfoListSN(-EUTRA)* in *CG-Config* and the *candidateCellInfoListMN(-EUTRA)/candidateCellInfoListSN(-EUTRA)* in *CG-ConfigInfo* need not be included in procedures that do not involve a change of node.

For fields *scg-CellGroupConfig*, *scg-CellGroupConfigEUTRA* and *scg-RB-Config* in *CG-Config* (sent upon SN initiated SN change or other conditions as specified in field descriptions) and fields *mcg-RB-Config*, *scg-RB-Config* and *sourceConfigSCG* in *CG-ConfigInfo* (sent upon change of SN):

- The source node shall include all fields necessary to reflect the current AS configuration of the UE, unless stated otherwise in the field description. For *RRCReconfiguration* included in the field *scg-CellGroupConfig* in *CG-Config*, *ReconfigurationWithSync* is included with only the mandatory subfields (e.g. *newUE-Identity* and *t304*) and *ServingCellConfigCommon*;
- Need codes or conditions specified for subfields according to IEs defined in clause 6 do not apply;
- Based on the received AS configuration, the target node can indicate the delta (difference) as compared to the current AS configuration to the UE. The fields *newUE-Identity* and *t304* in *ReconfigurationWithSync* are always included by the target node, i.e. they are not used for delta configuration purpose to UE.

For fields in *CG-Config* and *CG-ConfigInfo* listed below, absence of the field means that the receiver maintains the values informed via the previous message. Note that every time there is a change in the configuration covered by a listed field, the MN or SN shall include the field and it shall provide the full configuration provided by that field unless stated otherwise. Otherwise, if there is no change, the field can be omitted:

- *configRestrictInfo*;
- *gapPurpose*;
- *measGapConfig* (for which delta signaling applies);
- *measGapConfigFR2* (for which delta signaling applies);
- *measResultCellListSFTD*;
- *measResultSFTD-EUTRA*;
- *sftdFrequencyList-EUTRA*;
- *sftdFrequencyList-NR*;
- *ue-CapabilityInfo*;
- *servFrequenciesMN-NR*;
- *musim-GapConfigInfo-r18*;
- *musim-CapRestrictionInfo-r18*.

For other fields in *CG-Config* and *CG-ConfigInfo*, the sender shall always signal the appropriate value even if same as indicated in the previous inter-node message, unless explicitly stated otherwise.

11.3 Inter-node RRC information element definitions

- L1-MeasConfigNRDC

The IE *L1-MeasConfigNRDC* is used to indicate or request a maximum value that can be used by the SN in NR-DC to configure L1 measurement related to LTM at the SCG. Each value is equal to or lower than the value of the corresponding field in the UE capability, as reported by the UE, unless specified otherwise. The value indicated by each field is applicable to all BCs within the field *allowedBC-ListMRDC*.

— *LTM-ResourceConfigNRDC*

The IE *LTM-ResourceConfigNRDC* is used to indicate or request a maximum value that can be used by the SN in NR-DC to configure LTM related configuration at the SCG e.g., number of TCI states to be configured and activated, and number of LTM candidates on which to trigger the early UL synchronization. Each value is equal to or lower than the value of the corresponding field in the UE capability, as reported by the UE, unless specified otherwise. The value indicated by each field is applicable to all BCs within the field *allowedBC-ListMRDC*.

12 Processing delay requirements for RRC procedures

The UE performance requirements for RRC procedures are specified in the following tables. The performance requirement is expressed as the time in [ms] from the end of reception of the network -> UE message on the UE physical layer up to when the UE shall be ready for the reception of uplink grant for the UE -> network response message with no access delay other than the TTI-alignment (e.g. excluding delays caused by scheduling, the random access procedure or physical layer synchronisation). In case the RRC procedure triggers BWP switching, the RRC procedure delay is the value defined in the following table plus the BWP switching delay defined in TS 38.133 [14], clause 8.6.3.

Figure 12.1-1: Illustration of RRC procedure delay

Table 12.1-1: UE performance requirements for RRC procedures for UEs

| Procedure title: | Network -> UE | UE -> Network | Value [ms] | Notes |
|--|-----------------------------------|-----------------------------------|---------------------------|-----------------------------------|
| RRC Connection Control Procedures | | | | |
| RRC reconfiguration | <i>RRCReconfiguration</i> | <i>RRCReconfigurationComplete</i> | 10 | |
| RRC reconfiguration (scell addition/release) | <i>RRCReconfiguration</i> | <i>RRCReconfigurationComplete</i> | 16 | |
| RRC reconfiguration (LTE/NR SCG establishment/ modification/ release) | <i>RRCReconfiguration</i> | <i>RRCReconfigurationComplete</i> | 16 | |
| RRC reconfiguration (Intra-NR mobility with LTE/NR SCG establishment/ modification/ release) | <i>RRCReconfiguration</i> | <i>RRCReconfigurationComplete</i> | 16 | |
| RRC reconfiguration | <i>DLDedicatedMessage Segment</i> | <i>RRCReconfigurationComplete</i> | $16 + (N_{seg} - 1) * 10$ | Nseg
is number of RRC segments |
| RRC setup | <i>RRCSetup</i> | <i>RRCSetupComplete</i> | 10 | |
| RRC Release | <i>RRCRelease</i> | | NA | |
| RRC re-establishment | <i>RRCReestablishment</i> | <i>RRCReestablishmentComplete</i> | 10 | |

| Procedure title: | Network -> UE | UE -> Network | Value [ms] | Notes |
|---|----------------------------------|---|---------------------------|---|
| RRC resume | <i>RRCResume</i> | <i>RRCResumeComplete</i> | 6 or 10 | <p>Value=6 applies for a UE supporting reduced CP latency for the case of <i>RRCResume</i> message only including MAC and PHY configuration, reestablishPDCP and reestablishRLC for SRB2, multicast MRB(s) and DRB(s), and no DRX, SPS, configured grant, CA or MIMO re-configuration will be triggered by this message. Further, the UL grant for transmission of <i>RRCResumeComplete</i> and the data is transmitted over common search space with DCI format 0_0. In this scenario, the RRC procedure delay [ms] can extend beyond the reception of the UL grant, up to 7 ms.</p> <p>For other cases, Value = 10 applies.</p> |
| RRC resume (MCG SCell addition/restoration/release) | <i>RRCResume</i> | <i>RRCResumeComplete</i> | 16 | |
| RRC resume (SCG establishment/restoration/release) | <i>RRCResume</i> | <i>RRCResumeComplete</i> | 16 | |
| RRC resume | <i>DLDedicatedMessageSegment</i> | <i>RRCResumeComplete</i> | $16 + (N_{seg} - 1) * 10$ | N_{seg} is number of RRC segments |
| Initial AS security activation | <i>SecurityModeCommand</i> | <i>SecurityModeComplete/SecurityModeFailure</i> | 5 | |
| Inter RAT mobility | | | | |

| Procedure title: | Network -> UE | UE -> Network | Value [ms] | Notes |
|---------------------------------------|--|------------------------------------|-------------------------|--|
| Handover to NR | <i>RRCReconfiguration</i>
(sent by other RAT) | <i>RRCReconfigurationComplete</i> | NA | The performance of this procedure is specified in TS 36.133 [40] clauses 5.3.4.2, 5.3.4A.2 and 5.3.5.2 in case of handover from E-UTRA to NR. |
| Handover from NR | <i>MobilityFromNRComm and</i> | | NA | The performance of this procedure is specified in TS 38.133 [14], clauses 6.1.2.1.2 and 6.1.2.2.2. |
| Other procedures | | | | |

| UE capability transfer | <i>UECapabilityEnquiry</i> | <i>UECapabilityInformation</i> | 80 | |
| UE capability transfer | <i>UECapabilityEnquiry</i> | <i>ULDedicatedMessageSegment</i> | 80 | Applicable when UL RRC segmentation is enabled by the field <i>rrc-SegAllowed</i> . |
| UE capability transfer | <i>UECapabilityEnquiry</i> | <i>ULDedicatedMessageSegment</i> | 560+m ax (0, Nseg-7)*80 | Applicable when UL RRC segmentation is enabled by the field <i>rrc-MaxCapaSegAllowed</i> . Nseg is the value indicated by <i>rrc-MaxCapaSegAllowed</i> . |
| Counter check | <i>CounterCheck</i> | <i>CounterCheckResponse</i> | 5 | |
| UE information | <i>UEInformationRequest</i> | <i>UEInformationResponse</i> | 15 | |
| DL Information transfer MR-DC | <i>DLInformationTransfer MRDC</i> | | NA | The UE shall apply the performance requirements of the RRC message included within the <i>DLInformationTransfer MRDC</i> message. |
| IAB other information | | <i>IABOtherInformation</i> | NA | |
| Sidelink UE information | | <i>SidelinkUEInformationNR</i> | NA | |
| UE Positioning assistance information | | <i>UEPositioningAssistanceInfo</i> | NA | |

Annex A (informative): Guidelines mainly on use of ASN.1

A.1 Introduction

The following clauses contain guidelines for the specification of RRC protocol data units (PDUs) with ASN.1.

A.2 Procedural specification

A.2.1 General principles

The procedural specification provides an overall high level description regarding the UE behaviour in a particular scenario.

It should be noted that most of the UE behaviour associated with the reception of a particular field is covered by the applicable parts of the PDU specification. The procedural specification may also include specific details of the UE behaviour upon reception of a field, but typically this should be done only for cases that are not easy to capture in the PDU clause e.g. general actions, more complicated actions depending on the value of multiple fields.

Likewise, the procedural specification need not specify the UE requirements regarding the setting of fields within the messages that are sent to the network i.e. this may also be covered by the PDU specification.

A.2.2 More detailed aspects

The following more detailed conventions should be used:

- Bullets:
 - Capitals should be used in the same manner as in other parts of the procedural text i.e. in most cases no capital applies since the bullets are part of the sentence starting with 'The UE shall:'
 - All bullets, including the last one in a clause, should end with a semi-colon i.e. an ';'.
- Conditions:
 - Whenever multiple conditions apply, a semi-colon should be used at the end of each conditions with the exception of the last one, i.e. as in 'if cond1, or cond2.'

A.3 PDU specification

A.3.1 General principles

A.3.1.1 ASN.1 clauses

The RRC PDU contents are formally and completely described using abstract syntax notation (ASN.1), see X.680 [6], X.681 [7].

The complete ASN.1 code is divided into a number of ASN.1 clauses in the specifications. In order to facilitate the extraction of the complete ASN.1 code from the specification, each ASN.1 clause begins with the following:

- a first text paragraph consisting entirely of an *ASN.1 start tag*, which consists of a double hyphen followed by a single space and the text string "ASN1START" (in all upper case letters);
- a second text paragraph consisting entirely of a *block start tag* is included, which consists of a double hyphen followed by a single space and the text string "TAG-NAME-START" (in all upper case letters), where the "NAME" refers to the main name of the paragraph (in all upper-case letters).

Similarly, each ASN.1 clause ends with the following:

- a first text paragraph consisting entirely of a *blockstop tag*, which consists of a double hyphen followed by a single space and the text string "TAG-NAME-STOP" (in all upper-case letters), where the "NAME" refers to the main name of the paragraph (in all upper-case letters);
- a second text paragraph consisting entirely of an *ASN.1 stop tag*, which consists of a double hyphen followed by a single space and the text "ASN1STOP" (in all upper case letters).

This results in the following tags:

```
-- ASN1START
-- TAG-NAME-START

-- TAG-NAME-STOP
-- ASN1STOP
```

The text paragraphs containing either of the start and stop tags should not contain any ASN.1 code significant for the complete description of the RRC PDU contents. The complete ASN.1 code may be extracted by copying all the text paragraphs between an ASN.1 start tag and the following ASN.1 stop tag in the order they appear, throughout the specification.

NOTE: A typical procedure for extraction of the complete ASN.1 code consists of a first step where the entire RRC PDU contents description (ultimately the entire specification) is saved into a plain text (ASCII) file format, followed by a second step where the actual extraction takes place, based on the occurrence of the ASN.1 start and stop tags.

A.3.1.2 ASN.1 identifier naming conventions

The naming of identifiers (i.e., the ASN.1 field and type identifiers) should be based on the following guidelines:

- Message (PDU) identifiers should be ordinary mixed case without hyphenation. These identifiers, *e.g.*, the *RRConnectionModificationCommand*, should be used for reference in the procedure text. Abbreviations should be avoided in these identifiers and abbreviated forms of these identifiers should not be used.
- Type identifiers other than PDU identifiers should be ordinary mixed case, with hyphenation used to set off acronyms only where an adjacent letter is a capital, *e.g.*, *EstablishmentCause*, *SelectedPLMN* (not *Selected-PLMN*, since the "d" in "Selected" is lowercase), *InitialUE-Identity* and *MeasSFN-SFN-TimeDifference*.
- Field identifiers shall start with a lowercase letter and use mixed case thereafter, *e.g.*, *establishmentCause*. If a field identifier begins with an acronym (which would normally be in upper case), the entire acronym is lowercase (*plmn-Identity*, not *pLMN-Identity*). The acronym is set off with a hyphen (*ue-Identity*, not *ueIdentity*), in order to facilitate a consistent search pattern with corresponding type identifiers.
- Identifiers should convey the meaning of the identifier and should avoid adding unnecessary postfixes (*e.g.* abstractions like 'Info') for the name.
- Identifiers that are likely to be keywords of some language, especially widely used languages, such as C++ or Java, should be avoided to the extent possible.
- Identifiers, other than PDU identifiers, longer than 25 characters should be avoided where possible. It is recommended to use abbreviations, which should be done in a consistent manner *i.e.* use 'Meas' instead of 'Measurement' for all occurrences. Examples of typical abbreviations are given in table A.3.1.2.1-1 below.
- *For future extension:* When an extension is introduced a suffix is added to the identifier of the concerned ASN.1 field and/or type. A suffix of the form "-rX" is used, with X indicating the release, for ASN.1 fields or types introduced in a later release (*i.e.* a release later than the original/first release of the protocol) as well as for ASN.1 fields or types for which a revision is introduced in a later release replacing a previous version, *e.g.*, *Foo-r9* for the Rel-9 version of the ASN.1 type *Foo*. A suffix of the form "-rXb" is used for the first revision of a field that it appears in the same release (X) as the original version of the field, "-rXc" for a second intra-release revision and so on. A suffix of the form "-vXYZ" is used for ASN.1 fields or types that only are an extension of a corresponding earlier field or type (see clause A.4), *e.g.*, *AnElement-v10b0* for the extension of the ASN.1 type *AnElement* introduced in version 10.11.0 of the specification. A number 0...9, 10, 11, *etc.* is used to represent the first part of the version number, indicating the release of the protocol. Lower case letters *a*, *b*, *c*, *etc.* are used to represent the second (and third) part of the version number if they are greater than 9. In the procedural specification, in field descriptions as well as in headings suffices are not used, unless there is a clear need to distinguish the extension from the original field.
- More generally, in case there is a need to distinguish different variants of an ASN.1 field or IE, a suffix should be added at the end of the identifiers *e.g.* *MeasObjectUTRA*, *ConfigCommon*. When there is no particular need to distinguish the fields (*e.g.* because the field is included in different IEs), a common field identifier name may be used. This may be attractive *e.g.* in case the procedural specification is the same for the different variants.
- It should be avoided to use field identifiers with the same name within the elements of a CHOICE, including using a CHOICE inside a SEQUENCE (to avoid certain compiler errors).

Table A.3.1.2-1: Examples of typical abbreviations used in ASN.1 identifiers

| Abbreviation | Abbreviated word |
|---------------------|-------------------------|
| Config | Configuration |
| DL | Downlink |
| Ext | Extension |
| Freq | Frequency |
| Id | Identity |
| Ind | Indication |
| Meas | Measurement |
| MIB | MasterInformationBlock |
| Neigh | Neighbour(ing) |
| Param(s) | Parameter(s) |
| Phys | Physical |
| PCI | Physical Cell Id |
| Proc | Process |
| Reconfig | Reconfiguration |
| Reest | Re-establishment |
| Req | Request |
| Rx | Reception |
| Sched | Scheduling |
| SIB | SystemInformationBlock |
| Sync | Synchronisation |
| Thr | Threshold |
| Tx | Transmission |
| UL | Uplink |

NOTE: The table A.3.1.2.1-1 is not exhaustive. Additional abbreviations may be used in ASN.1 identifiers when needed.

A.3.1.3 Text references using ASN.1 identifiers

A text reference into the RRC PDU contents description from other parts of the specification is made using the ASN.1 field identifier of the referenced type. The ASN.1 field and type identifiers used in text references should be in the *italic font style*. The "do not check spelling and grammar" attribute in Word should be set. Quotation marks (i.e., "") should not be used around the ASN.1 field or type identifier.

A reference to an RRC PDU should be made using the corresponding ASN.1 field identifier followed by the word "message", e.g., a reference to the *RRCRelease* message.

A reference to a specific part of an RRC PDU, or to a specific part of any other ASN.1 type, should be made using the corresponding ASN.1 field identifier followed by the word "field", e.g., a reference to the *prioritisedBitRate* field in the example below.

```
-- /example/ ASN1START
LogicalChannelConfig ::= SEQUENCE {
    ul-SpecificParameters
        SEQUENCE {
            priority
                Priority,
```

```

prioritisedBitRate
bucketSizeDuration
logicalChannelGroup
}
      OPTIONAL
}

-- ASN1STOP

```

NOTE: All the ASN.1 start tags in the ASN.1 clauses, used as examples in this annex to the specification, are deliberately distorted, in order not to include them when the ASN.1 description of the RRC PDU contents is extracted from the specification.

A reference to a specific type of information element should be made using the corresponding ASN.1 type identifier preceded by the acronym "IE", e.g., a reference to the IE *LogicalChannelConfig* in the example above.

References to a specific type of information element should only be used when those are generic, i.e., without regard to the particular context wherein the specific type of information element is used. If the reference is related to a particular context, e.g., an RRC PDU type (message) wherein the information element is used, the corresponding field identifier in that context should be used in the text reference.

A reference to a specific value of an ASN.1 field should be made using the corresponding ASN.1 value without using quotation marks around the ASN.1 value, e.g., 'if the *status* field is set to value *true*'.

A.3.2 High-level message structure

Within each logical channel type, the associated RRC PDU (message) types are alternatives within a CHOICE, as shown in the example below.

```

-- /example/ ASN1START

DL-DCCH-Message ::= SEQUENCE {
  message
    DL-DCCH-MessageType
}

DL-DCCH-MessageType ::= CHOICE {
  c1
    CHOICE {
      dlInformationTransfer
        DLInformationTransfer,
      handoverFromEUTRAPreparationRequest
        HandoverFromEUTRAPreparationRequest,
      mobilityFromEUTRACommand
        MobilityFromEUTRACommand,
      rrcConnectionReconfiguration
        RRCConnectionReconfiguration,
      rrcConnectionRelease
        RRCCConnectionRelease,
      securityModeCommand
        SecurityModeCommand,
      ueCapabilityEnquiry
        UECapabilityEnquiry,
      spare1 NULL
    },
  messageClassExtension SEQUENCE {}
}

-- ASN1STOP

```

A nested two-level CHOICE structure is used, where the alternative PDU types are alternatives within the inner level *c1* CHOICE.

Spare alternatives (i.e., *spare1* in this case) may be included within the *c1* CHOICE to facilitate future extension. The number of such spare alternatives should not extend the total number of alternatives beyond an integer-power-of-two number of alternatives (i.e., eight in this case).

Further extension of the number of alternative PDU types is facilitated using the *messageClassExtension* alternative in the outer level CHOICE.

A.3.3 Message definition

Each PDU (message) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

RRConnectionReconfiguration ::= SEQUENCE {
    rrc-TransactionIdentifier          RRC-TransactionIdentifier,
    criticalExtensions                CHOICE {
        c1                           CHOICE {
            rrcConnectionReconfiguration-r8      RRConnectionReconfiguration-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture           SEQUENCE {}
    }
}

RRConnectionReconfiguration-r8-IEs ::= SEQUENCE {
    -- Enter the IEs here.
    ...
}

-- ASN1STOP
```

Hooks for *critical* and *non-critical* extension should normally be included in the PDU type specification. How these hooks are used is further described in clause A.4.

Critical extensions are characterised by a redefinition of the PDU contents and need to be governed by a mechanism for protocol version agreement between the encoder and the decoder of the PDU, such that the encoder is prevented from sending a critically extended version of the PDU type, which is not comprehended by the decoder.

Critical extension of a PDU type is facilitated by a two-level CHOICE structure, where the alternative PDU contents are alternatives within the inner level *c1* CHOICE. Spare alternatives (i.e., *spare3* down to *spare1* in this case) may be included within the *c1* CHOICE. The number of spare alternatives to be included in the original PDU specification should be decided case by case, based on the expected rate of critical extension in the future releases of the protocol.

Further critical extension, when the spare alternatives from the original specifications are used up, is facilitated using the *criticalExtensionsFuture* in the outer level CHOICE.

In PDU types where critical extension is not expected in the future releases of the protocol, the inner level *c1* CHOICE and the spare alternatives may be excluded, as shown in the example below.

```
-- /example/ ASN1START
```

```

RRCConnectionReconfigurationComplete ::= SEQUENCE {
    rrc-TransactionIdentifier          RRC-TransactionIdentifier,
    criticalExtensions                CHOICE {
        rrcConnectionReconfigurationComplete-r8
            RRCConnectionReconfigurationComplete-r8-IEs,
        criticalExtensionsFuture         SEQUENCE {}
    }
}

RRCConnectionReconfigurationComplete-r8-IEs ::= SEQUENCE {
    -- Enter the fields here.
    ...
}

-- ASN1STOP

```

Non-critical extensions are characterised by the addition of new information to the original specification of the PDU type. If not comprehended, a non-critical extension may be skipped by the decoder, whilst the decoder is still able to complete the decoding of the comprehended parts of the PDU contents.

Non-critical extensions at locations other than the end of the message or other than at the end of a field contained in a BIT or OCTET STRING are facilitated by use of the ASN.1 extension marker "...". The original specification of a PDU type should normally include the extension marker at the end of the sequence of information elements contained.

Non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING may be facilitated by use of an empty sequence that is marked OPTIONAL e.g. as shown in the following example:

```

-- /example/ ASN1START

RRCMessage-r8-IEs ::= SEQUENCE {
    field1
    field2
    InformationElement1,
    InformationElement2,
    nonCriticalExtension      SEQUENCE {}           OPTIONAL
}

-- ASN1STOP

```

The ASN.1 clause specifying the contents of a PDU type may be followed by a *field description* table where a further description of, e.g., the semantic properties of the fields may be included. The general format of this table is shown in the example below. The field description table is absent in case there are no fields for which further description needs to be provided e.g. because the PDU does not include any fields, or because an IE is defined for each field while there is nothing specific regarding the use of this IE that needs to be specified.

| %PDU-TypeIdentifier% field descriptions | |
|---|--------------------|
| %field identifier% | Field description. |
| %field identifier% | Field description. |

The field description table has one column. The header row shall contain the ASN.1 type identifier of the PDU type.

The following rows are used to provide field descriptions. Each row shall include a first paragraph with a *field identifier* (in ***bold and italic*** font style) referring to the part of the PDU to which it applies. The following paragraphs at the same row may include (in regular font style), e.g., semantic description, references to other specifications and/or specification of value units, which are relevant for the particular part of the PDU.

The parts of the PDU contents that do not require a field description shall be omitted from the field description table.

A.3.4 Information elements

Each IE (information element) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

PRACH-ConfigSIB ::= SEQUENCE {
    rootSequenceIndex,
    prach-ConfigInfo
}

PRACH-Config ::= SEQUENCE {
    rootSequenceIndex,
    prach-ConfigInfo
} OPTIONAL -- Need N

PRACH-ConfigInfo ::= SEQUENCE {
    prach-ConfigIndex,
    highSpeedFlag,
    zeroCorrelationZoneConfig
}

-- ASN1STOP
```

IEs should be introduced whenever there are multiple fields for which the same set of values apply. IEs may also be defined for other reasons e.g. to break down a ASN.1 definition in to smaller pieces.

A group of closely related IE type definitions, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in this example, are preferably placed together in a common ASN.1 clause. The IE type identifiers should in this case have a common base, defined as the *generic type identifier*. It may be complemented by a suffix to distinguish the different variants. The "*PRACH-Config*" is the generic type identifier in this example, and the "*SIB*" suffix is added to distinguish the variant. The clause heading and generic references to a group of closely related IEs defined in this way should use the generic type identifier.

The same principle should apply if a new version, or an extension version, of an existing IE is created for *critical* or *non-critical* extension of the protocol (see clause A.4). The new version, or the extension version, of the IE is included in the same ASN.1 clause defining the original. A suffix is added to the type identifier, using the naming conventions defined in clause A.3.1.2, indicating the release or version of the where the new version, or extension version, was introduced.

Local IE type definitions, like the IE *PRACH-ConfigInfo* in the example above, may be included in the ASN.1 clause and be referenced in the other IE types defined in the same ASN.1 clause. The use of locally defined IE types should be encouraged, as a tool to break up large and complex IE type definitions. It can improve the readability of the code.

There may also be a benefit for the software implementation of the protocol end-points, as these IE types are typically provided by the ASN.1 compiler as independent data elements, to be used in the software implementation.

An IE type defined in a local context, like the IE *PRACH-ConfigInfo*, should not be referenced directly from other ASN.1 clauses in the RRC specification. An IE type which is referenced in more than one ASN.1 clause should be defined in a separate clause, with a separate heading and a separate ASN.1 clause (possibly as one in a set of closely related IE types, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in the example above). Such IE types are also referred to as 'global IEs'.

NOTE: Referring to an IE type, that is defined as a local IE type in the context of another ASN.1 clause, does not generate an ASN.1 compilation error. Nevertheless, using a locally defined IE type in that way makes the IE type definition difficult to find, as it would not be visible at an outline level of the specification. It should be avoided.

The ASN.1 clause specifying the contents of one or more IE types, like in the example above, may be followed by a *field description* table, where a further description of, e.g., the semantic properties of the fields of the information elements may be included. This table may be absent, similar as indicated in clause A.3.3 for the specification of the PDU type. The general format of the *field description* table is the same as shown in clause A.3.3 for the specification of the PDU type.

A.3.5 Fields with optional presence

A field with optional presence may be declared with the keyword DEFAULT. It identifies a default value to be assumed, if the sender does not include a value for that field in the encoding:

```
-- /example/ ASN1START

PreambleInfo ::= SEQUENCE {
    numberOfRA-Preambles      INTEGER (1..64)           DEFAULT 1,
    ...
}

-- ASN1STOP
```

Alternatively, a field with optional presence may be declared with the keyword OPTIONAL. It identifies a field for which a value can be omitted. The omission carries semantics, which is different from any normal value of the field:

```
-- /example/ ASN1START

PRACH-Config ::= SEQUENCE {
    rootSequenceIndex      INTEGER (0..1023),
    prach-ConfigInfo       PRACH-ConfigInfo           OPTIONAL -- Need N
}

-- ASN1STOP
```

The semantics of an optionally present field, in the case it is omitted, should be indicated at the end of the paragraph including the keyword OPTIONAL, using a short comment text with a need code. The need code includes the keyword "Need", followed by one of the predefined semantics tags (S, M, N or R) defined in clause 6.1. If the semantics tag S is used, the semantics of the absent field are further specified either in the field description table following the ASN.1 clause, or in procedure text.

The addition of OPTIONAL keywords for capability groups is based on the following guideline. If there is more than one field in the lower level IE, then OPTIONAL keyword is added at the group level. If there is only one field in the lower level IE, OPTIONAL keyword is not added at the group level.

A.3.6 Fields with conditional presence

A field with conditional presence is declared with the keyword OPTIONAL. In addition, a short comment text shall be included at the end of the paragraph including the keyword OPTIONAL. The comment text includes the keyword "Cond", followed by a condition tag associated with the field ("UL" in this example):

```
-- /example/ ASN1START
LogicalChannelConfig ::= SEQUENCE {
    ul-SpecificParameters   SEQUENCE {
        priority           INTEGER (0),
        ...
    }                      OPTIONAL
}
-- ASN1STOP
```

-- Cond UL

When conditionally present fields are included in an ASN.1 clause, the field description table after the ASN.1 clause shall be followed by a *conditional presence* table. The conditional presence table specifies the conditions for including the fields with conditional presence in the particular ASN.1 clause.

| Conditional presence | Explanation |
|----------------------|--|
| UL | Specification of the conditions for including the field associated with the condition tag = "UL". Semantics in case of optional presence under certain conditions may also be specified. |

The conditional presence table has two columns. The first column (heading: "Conditional presence") contains the condition tag (in *italic* font style), which links the fields with a condition tag in the ASN.1 clause to an entry in the table. The second column (heading: "Explanation") contains a text specification of the conditions and requirements for the presence of the field. The second column may also include semantics, in case of an optional presence of the field, under certain conditions i.e. using the same predefined tags as defined for optional fields in A.3.5.

Conditional presence should primarily be used when presence of a field depends on the presence and/or value of other fields within the same message. If the presence of a field depends on whether another feature/function has been configured, while this function can be configured independently e.g. by another message and/or at another point in time, the relation is best reflected by means of a statement in the field description table.

If the ASN.1 clause does not include any fields with conditional presence, the conditional presence table shall not be included.

Whenever a field is only applicable in specific cases e.g. TDD, use of conditional presence should be considered.

A.3.7 Guidelines on use of lists with elements of SEQUENCE type

Where an information element has the form of a list (the SEQUENCE OF construct in ASN.1) with the type of the list elements being a SEQUENCE data type, an information element shall be defined for the list elements even if it would not otherwise be needed.

For example, a list of PLMN identities with reservation flags is defined as in the following example:

```
-- /example/ ASN1START

PLMN-IdentityInfoList ::=      SEQUENCE (SIZE (1..6)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::=          SEQUENCE {
    plmn-Identity,
    cellReservedForOperatorUse
}

-- ASN1STOP
```

rather than as in the following (bad) example, which may cause generated code to contain types with unpredictable names:

```
-- /bad example/ ASN1START

PLMN-IdentityList ::=          SEQUENCE (SIZE (1..6)) OF SEQUENCE {
    plmn-Identity,
    cellReservedForOperatorUse
}

-- ASN1STOP
```

A.3.8 Guidelines on use of parameterised SetupRelease type

The usage of the parameterised *SetupRelease* type is like a function call in programming languages where the element type parameter is passed as a parameter. The parameterised type only implies a textual change in abstract syntax where all references to the parameterised type are replaced by the compiler with the release/setup choice. Two examples of the usage are shown below:

```
-- /example/ ASN1START

RRCMessages-rX-IEs ::= SEQUENCE {
    field-rX           SetupRelease { IE-rX }           OPTIONAL,   -- Need M
    ...
}

RRCMessages-rX-IEs ::= SEQUENCE {
    field-rX           SetupRelease { Element-rX }       OPTIONAL,   -- Need M
}

Element-rX ::= SEQUENCE {
    field1-rX          IE1-rX,
    field2-rX          IE2-rX
}                                     OPTIONAL           -- Need N
                                         OPTIONAL           -- Need M

-- /example/ ASN1STOP
```

The *SetupRelease* is always be used with only named IEs, i.e. the example below is not allowed:

```
-- /example/ ASN1START

RRCMessage-rX-IEs ::= SEQUENCE {
    field-rX      SetupRelease { SEQUENCE {
        field1-rX      IE1-rX,
        field2-rX      IE2-rX
    }                                         OPTIONAL, -- Need N
}                                         OPTIONAL, -- Need M
}

-- /example/ ASN1STOP
```

Typically, a field defined using the parameterized *SetupRelease* type does not require procedural or field description text that refers to the *setup* or *release* values. If such a field anyway requires procedural text for specific actions, the field is referred to using the values defined for the type itself, namely, "setup" and "release". For example, procedural text for *field-rX* above could be as follows:

- 1> if *field-rX* is set to "setup":
- 2> do something;
- 1> else (*field-rX* is set to "release"):
- 2> release *field-rX* (if appropriate).

A.3.9 Guidelines on use of ToAddModList and ToReleaseList

In order to benefit from delta signalling when modifying lists with many and/or large elements, so-called add/mod- and release- lists should be used. Instead of a single list containing all elements of the list, the ASN.1 provides two lists. One list is used to convey the actual elements that are to be added to the list or modified in the list. The second list conveys only the identities (IDs) of the list elements that are to be released from the list. In other words, the ASN.1 defines only means to signal modifications to a list maintained in the receiver (typically the UE). An example is provided below:

```
-- /example/ ASN1START

AnExampleIE ::=          SEQUENCE {
    elementsToAddModList   SEQUENCE (SIZE (1..maxNrofElements)) OF Element
    elementsToReleaseList  SEQUENCE (SIZE (1..maxNrofElements)) OF ElementId
    ...
}

Element ::=                SEQUENCE {
    elementId,
    aField           INTEG ER (0..16777215),
    anotherField     OCTET STRING,
    ...
}
```

```

}

ElementId ::=          INTEGER (0..maxNrofElements-1)
maxNrofElements      ::= 50
maxNrofElements-1    ::= 49

-- /example/ ASN1STOP

```

As can be seen, the elements of the list must contain an identity (INTEGER) that identifies the elements unambiguously upon addition, modification and removal. It is recommended to define an IE for that identifier (here ElementId) so that it can be used both for a field inside the element as well as in the *elementsToReleaseList*.

Both lists should be made OPTIONAL and flagged as "Need N". The need code reflects that the UE does not maintain the received lists as such but rather updates its configuration using the information therein. In other words, it is not possible to provide via delta signalling an update to a previously signalled *elementsToAddModList* or *elementsToReleaseList* (which Need M would imply). The update is always in relation to the UE's internal configuration.

Note that the release of a field (a list element as well as any other field) releases all its sub-fields (sub-fields configured by *elementsToAddModList* and any other sub-field).

If no procedural text is provided for a set of *ToAddModList* and *ToReleaseList*, the following generic procedure applies:

The UE shall:

- 1> for each *ElementId* in the *elementsToReleaseList*:
 - 2> if the current UE configuration includes an *Element* with the given *ElementId*:
 - 3> release the *Element* from the current UE configuration;
- 1> for each *Element* in the *elementsToAddModList*:
 - 2> if the current UE configuration includes an *Element* with the given *ElementId*:
 - 3> modify the configured *Element* in accordance with the received *Element*;
 - 2> else:
 - 3> add received *Element* to the UE configuration.

A.3.10 Guidelines on use of lists (without *ToAddModList* and *ToReleaseList*)

As per clause 6.1.3, when using lists without the *ToAddModList* and *ToReleaseList* structure, the contents of the lists are always replaced. To illustrate this, an example is provided below:

```

-- /example/ ASN1START
-- TAG_EXAMPLE_LISTS_START

```

```

AnExampleIE ::= SEQUENCE {
    elementList           SEQUENCE (SIZE (1..maxNrofElements)) OF Element
                           OPTIONAL, -- Need M
    ...
    [
        elementListExt-v2030 SEQUENCE (SIZE (1..maxNrofElementsExt)) OF Element
                           OPTIONAL, -- Need M
    ]
}

Element ::= SEQUENCE {
    useFeatureX          BOOLEAN,
    aField                INTEGER (0..127)
    anotherField          INTEGER (0..127)
                           OPTIONAL, -- Need M
    ...
}

maxNrofElements         INTEGER ::= 8
maxNrofElements-1       INTEGER ::= 7
maxNrofElementsExt      INTEGER ::= 8
maxNrofElementsExt-1    INTEGER ::= 7
                           OPTIONAL, -- Need R

-- TAG_EXAMPLE_LISTS_STOP
-- /example/ ASN1STOP

```

As can be seen, the *elementList* list itself uses Need M, but each list entry *Element* contains mandatory, Need M and Need R fields. If the list is first signalled to UE with 3 entries, and subsequently again with 2 entries, UE shall retain only the latter list, i.e. the list with 2 elements will completely replace the list with 3 elements. That also means that the field *aField* will be treated as if it was newly created, i.e. network must include it if it wishes UE to utilize the field even if it was previously signalled. This also implies that the Need M field (*aField*) will be treated in the same way as the Need R field (*anotherField*), i.e. delta signalling is not applied and the network has to signal the field to ensure UE does not release the value (which is why Need M should not normally be used in the entries of these lists).

A.4 Extension of the PDU specifications

A.4.1 General principles to ensure compatibility

It is essential that extension of the protocol does not affect interoperability i.e. it is essential that implementations based on different versions of the RRC protocol are able to interoperate. In particular, this requirement applies for the following kind of protocol extensions:

- Introduction of new PDU types (i.e. these should not cause unexpected behaviour or damage).
- Introduction of additional fields in an extensible PDUs (i.e. it should be possible to ignore uncomprehended extensions without affecting the handling of the other parts of the message).
- Introduction of additional values of an extensible field of PDUs. If used, the behaviour upon reception of an uncomprehended value should be defined.

It should be noted that the PDU extension mechanism may depend on the logical channel used to transfer the message e.g. for some PDUs an implementation may be aware of the protocol version of the peer in which case selective ignoring of extensions may not be required.

The non-critical extension mechanism is the primary mechanism for introducing protocol extensions i.e. the critical extension mechanism is used merely when there is a need to introduce a 'clean' message version. Such a need appears when the last message version includes a large number of non-critical extensions, which results in issues like readability, overhead associated with the extension markers. The critical extension mechanism may also be considered when it is complicated to accommodate the extensions by means of non-critical extension mechanisms.

A.4.2 Critical extension of messages and fields

The mechanisms to critically extend a message are defined in A.3.3. There are both "outer branch" and "inner branch" mechanisms available. The "outer branch" consists of a CHOICE having the name *criticalExtensions*, with two values, *c1* and *criticalExtensionsFuture*. The *criticalExtensionsFuture* branch consists of an empty SEQUENCE, while the *c1* branch contains the "inner branch" mechanism.

The "inner branch" structure is a CHOICE with values of the form "*MessageName-rX-IEs*" (e.g., "RRCConnectionReconfiguration-r8-IEs") or "spareX", with the spare values having type NULL. The "-rX-IEs" structures contain the *complete* structure of the message IEs for the appropriate release; i.e., the critical extension branch for the Rel-10 version of a message includes all Rel-8 and Rel-9 fields (that are not obviated in the later version), rather than containing only the additional Rel-10 fields.

The following guidelines may be used when deciding which mechanism to introduce for a particular message, i.e. only an 'outer branch', or an 'outer branch' in combination with an 'inner branch' including a certain number of spares:

- For certain messages, e.g. initial uplink messages, messages transmitted on a broadcast channel, critical extension may not be applicable.
- An outer branch may be sufficient for messages not including any fields.
- The number of spares within inner branch should reflect the likelihood that the message will be critically extended in future releases (since each release with a critical extension for the message consumes one of the spare values). The estimation of the critical extension likelihood may be based on the number, size and changeability of the fields included in the message.
- In messages where an inner branch extension mechanism is available, all spare values of the inner branch should be used before any critical extensions are added using the outer branch.

The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release

```
-- /example/ ASN1START                                -- Original release
RRCMessage ::= SEQUENCE {
    rrc-TransactionIdentifier,
    criticalExtensions CHOICE {
        c1 CHOICE {
            RRCMessage-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture SEQUENCE {}
    }
}
```

```
-- ASN1STOP
```

```
-- /example/ ASN1START          -- Later release

RRCMessage ::= SEQUENCE {
    rrc-TransactionIdentifier,
    criticalExtensions CHOICE {
        c1           CHOICE {
            RRCMessage-r8-IEs,
            RRCMessage-r10-IEs,
            RRCMessage-r11-IEs,
            RRCMessage-r14-IEs
        },
        later         CHOICE {
            c2           CHOICE {
                RRCMessage-r16-IEs,
                spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL,
                spare3 NULL, spare2 NULL, spare1 NULL
            },
            criticalExtensionsFuture SEQUENCE {}
        }
    }
}

-- ASN1STOP
```

It is important to note that critical extensions may also be used at the level of individual fields i.e. a field may be replaced by a critically extended version. When sending the extended version, the original version may also be included (e.g. original field is mandatory, E-UTRAN is unaware if UE supports the extended version). In such cases, a UE supporting both versions may be required to ignore the original field. The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release.

```
-- /example/ ASN1START          -- Original release

RRCMessage ::= SEQUENCE {
    rrc-TransactionIdentifier,
    criticalExtensions CHOICE {
        c1           CHOICE {
            RRCMessage-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture SEQUENCE {}
    }
}

RRCMessage-rN-IEs ::= SEQUENCE {
    field1-rN          ENUMERATED {
        value1, value2, value3, value4}      OPTIONAL, -- Need N
    field2-rN          InformationElement2-rN   OPTIONAL, -- Need N
    nonCriticalExtension RRCConnectionReconfiguration-vMxy-IEs OPTIONAL
}
```

```
RCCConnectionReconfiguration-vMxy-IEs ::= SEQUENCE {
    field2-rM
    nonCriticalExtension
}
-- ASN1STOP
```

InformationElement2-rM
SEQUENCE {}

OPTIONAL, -- Cond NoField2rN
OPTIONAL

| Conditional presence | Explanation |
|----------------------|--|
| NoField2rN | The field is optionally present, need N, if field2-rN is absent. Otherwise the field is absent |

Finally, it is noted that a critical extension may be introduced in the same release as the one in which the original field was introduced e.g. to correct an essential ASN.1 error. In such cases a UE capability may be introduced, to assist the network in deciding whether or not to use the critical extension.

In the case of list fields (SEQUENCE OF types in ASN.1) using the ToAddMod/ToRelease construction, the use of critical extensions to increase the size of a list should be avoided; that is, replacing the original list field by a new field also used to signal entries previously covered by the original field (i.e. extensions done according to the following example) should be avoided:

```
-- /example/ ASN1START          -- Discouraged example

ContainingStructure ::=           SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement   OPTIONAL, -- Need N
    ...
    [[
        listElementToAddModList-rN  SEQUENCE (SIZE (1..maxNrofListElements-rN)) OF ListElement   OPTIONAL -- Need N
    ]]
}-- ASN1STOP
```

Instead, a non-critical list extension mechanism should typically be used, such that the extension field only adds the new entries of the list. This approach is further described in clause A.4.3.6.

If the critical extension mechanism for a list is used, it should be clarified in the field description that the two versions of the list are not configured together, and that the network should release the contents of the original version when configuring the replacement version.

A.4.3 Non-critical extension of messages

A.4.3.1 General principles

The mechanisms to extend a message in a non-critical manner are defined in A.3.3. W.r.t. the use of extension markers, the following additional guidelines apply:

- When further non-critical extensions are added to a message that has been critically extended, the inclusion of these non-critical extensions in earlier critical branches of the message should be avoided when possible.

- The extension marker ("...") is the primary non-critical extension mechanism that is used but empty sequences may be used if length determinant is not required.
Examples of cases where a length determinant is not required:
 - at the end of a message;
 - at the end of a structure contained in a BIT STRING or OCTET STRING.
- When an extension marker is available, non-critical extensions are preferably placed at the location (e.g. the IE) where the concerned parameter belongs from a logical/functional perspective (referred to as the '*default extension location*').
- It is desirable to aggregate extensions of the same release or version of the specification into a group, which should be placed at the lowest possible level.
- In specific cases it may be preferable to place extensions elsewhere (referred to as the '*actual extension location*') e.g. when it is possible to aggregate several extensions in a group. In such a case, the group should be placed at the lowest suitable level in the message.
- In case placement at the default extension location affects earlier critical branches of the message, locating the extension at a following higher level in the message should be considered.
- In case an extension is not placed at the default extension location, an IE should be defined. The IE's ASN.1 definition should be placed in the same ASN.1 clause as the default extension location. In case there are intermediate levels in-between the actual and the default extension location, an IE may be defined for each level. Intermediate levels are primarily introduced for readability and overview. Hence intermediate levels need not always be introduced e.g. they may not be needed when the default and the actual extension location are within the same ASN.1 clause.

A.4.3.2 Further guidelines

Further to the general principles defined in the previous clause, the following additional guidelines apply regarding the use of extension markers:

- Extension markers within SEQUENCE:
 - Extension markers are primarily, but not exclusively, introduced at the higher nesting levels.
 - Extension markers are introduced for a SEQUENCE comprising several fields as well as for information elements whose extension would result in complex structures without it (e.g. re-introducing another list).
 - Extension markers are introduced to make it possible to maintain important information structures e.g. parameters relevant for one particular RAT.
 - Extension markers are also used for size critical messages (i.e. messages on BCCH, BR-BCCH, PCCH and CCCH), although introduced somewhat more carefully.
 - The extension fields introduced (or frozen) in a specific version of the specification are grouped together using double brackets.
- Extension markers within ENUMERATED:
 - Spare values may be used until the number of values reaches the next power of 2, while the extension marker caters for extension beyond that limit, given that the use of spare values in a later Release is possible without any error cases.
 - A suffix of the form "vXYZ" is used for the identifier of each new value, e.g. "value-vXYZ".

- Extension markers within CHOICE:
 - Extension markers are introduced when extension is foreseen and when comprehension is not required by the receiver i.e. behaviour is defined for the case where the receiver cannot comprehend the extended value (e.g. ignoring an optional CHOICE field). It should be noted that defining the behaviour of a receiver upon receiving a not comprehended choice value is not required if the sender is aware whether or not the receiver supports the extended value.
 - A suffix of the form "vXYZ" is used for the identifier of each new choice value, e.g. "choice-vXYZ".

Non-critical extensions at the end of a message/ of a field contained in an OCTET or BIT STRING:

- When a nonCriticalExtension is actually used, a "Need" code should not be provided for the field, which always is a group including at least one extension and a field facilitating further possible extensions. For simplicity, it is recommended not to provide a "Need" code when the field is not actually used either.

Further, more general, guidelines:

- In case a need code is not provided for a group, a "Need" code is provided for all individual extension fields within the group i.e. including for fields that are not marked as OPTIONAL. The latter is to clarify the action upon absence of the whole group.

A.4.3.3 Typical example of evolution of IE with local extensions

The following example illustrates the use of the extension marker for a number of elementary cases (sequence, enumerated, choice). The example also illustrates how the IE may be revised in case the critical extension mechanism is used.

NOTE In case there is a need to support further extensions of release n while the ASN.1 of release (n+1) has been frozen, without requiring the release n receiver to support decoding of release (n+1) extensions, more advanced mechanisms are needed e.g. including multiple extension markers.

```
-- /example/ ASN1START

InformationElement1 ::= SEQUENCE {
  field1          ENUMERATED {
    value1, value2, value3, value4-v880,
    ..., value5-v960 },
  field2          CHOICE {
    field2a        BOOLEAN,
    field2b        InformationElement2b,
    ...,
    field2c-v960   InformationElement2c-r9
  },
  ...
  [[
    field3-r9      InformationElement3-r9     OPTIONAL    -- Need R
  ]],
  [[
    field3-v9a0    InformationElement3-v9a0   OPTIONAL,
    field4-r9      InformationElement4       OPTIONAL    -- Need R
  ]]
}

InformationElement1-r10 ::= SEQUENCE {
```

```

field1          ENUMERATED {
                  value1, value2, value3, value4-v880,
                  value5-v960, value6-v1170, spare2, spare1, ... },
field2          CHOICE {
                  BOOLEAN,
                  InformationElement2b,
                  InformationElement2c-r9,
...,
                  INTEGER (0..63)
},
field3-r9        InformationElement3-r10      OPTIONAL, -- Need R
field4-r9        InformationElement4      OPTIONAL, -- Need R
field5-r10       BOOLEAN,                 OPTIONAL, -- Need R
field6-r10       InformationElement6-r10    OPTIONAL, -- Need R
...
[[                InformationElement3-v1170    OPTIONAL -- Need R
]]
}

-- ASN1STOP

```

Some remarks regarding the extensions of *InformationElement1* as shown in the above example:

- The *InformationElement1* is initially extended with a number of non-critical extensions. In release 10 however, a critical extension is introduced for the message using this IE. Consequently, a new version of the IE *InformationElement1* (i.e. *InformationElement1-r10*) is defined in which the earlier non-critical extensions are incorporated by means of a revision of the original field.
- The *value4-v880* is replacing a spare value defined in the original protocol version for *field1*. Likewise *value6-v1170* replaces *spare3* that was originally defined in the r10 version of *field1*.
- Within the critically extended release 10 version of *InformationElement1*, the names of the original fields/IEs are not changed, unless there is a real need to distinguish them from other fields/IEs. E.g. the *field1* and *InformationElement4* were defined in the original protocol version (release 8) and hence not tagged. Moreover, the *field3-r9* is introduced in release 9 and not re-tagged; although, the *InformationElement3* is also critically extended and therefore tagged *InformationElement3-r10* in the release 10 version of *InformationElement1*.

A.4.3.4 Typical examples of non critical extension at the end of a message

The following example illustrates the use of non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING i.e. when an empty sequence is used.

```

-- /example/ ASN1START

RRCMessage-r8-IES ::= SEQUENCE {
                  field1           InformationElement1,
                  field2           InformationElement2,
                  field3           InformationElement3
                  nonCriticalExtension RRCMessage-v860-IES
                  OPTIONAL, -- Need N
                  OPTIONAL
}

```

```

}

RRCMessage-v860-IEs ::= SEQUENCE {
    field4-v860           OPTIONAL,   -- Need S
    field5-v860           OPTIONAL,   -- Cond C54
    nonCriticalExtension  OPTIONAL
}

RRCMessage-v940-IEs ::= SEQUENCE {
    field6-v940           OPTIONAL,   -- Need R
    nonCriticalExtensions OPTIONAL
}

-- ASN1STOP

```

Some remarks regarding the extensions shown in the above example:

- The *InformationElement4* is introduced in the original version of the protocol (release 8) and hence no suffix is used.

A.4.3.5 Examples of non-critical extensions not placed at the default extension location

The following example illustrates the use of non-critical extensions in case an extension is not placed at the default extension location.

- ***ParentIE-WithEM***

The IE *ParentIE-WithEM* is an example of a high level IE including the extension marker (EM). The root encoding of this IE includes two lower level IEs *ChildIE1-WithoutEM* and *ChildIE2-WithoutEM* which not include the extension marker. Consequently, non-critical extensions of the Child-IEs have to be included at the level of the Parent-IE.

The example illustrates how the two extension IEs *ChildIE1-WithoutEM-vNx0* and *ChildIE2-WithoutEM-vNx0* (both in release N) are used to connect non-critical extensions with a default extension location in the lower level IEs to the actual extension location in this IE.

***ParentIE-WithEM* information element**

```

-- /example/ ASN1START

ParentIE-WithEM ::= SEQUENCE {
    -- Root encoding, including:
    childIE1-WithoutEM      OPTIONAL,   -- Need N
    childIE2-WithoutEM      OPTIONAL,   -- Need N
    ...
    [ [
        childIE1-WithoutEM-vNx0  OPTIONAL,   -- Need N
        childIE2-WithoutEM-vNx0  OPTIONAL,   -- Need N
    ] ]
}

-- ASN1STOP

```

Some remarks regarding the extensions shown in the above example:

- The fields *childIE1-WithoutEM-vNx0* may not really need to be optional (depends on what is defined at the next lower level).
- In general, especially when there are several nesting levels, fields should be marked as optional only when there is a clear reason.

– *ChildIE1-WithoutEM*

The IE *ChildIE1-WithoutEM* is an example of a lower level IE, used to control certain radio configurations including a configurable feature which can be setup or released using the local IE *ChIE1-ConfigurableFeature*. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature. The example is based on the following assumptions:

- When initially configuring as well as when modifying the new field, the original fields of the configurable feature have to be provided also i.e. as if the extended ones were present within the setup branch of this feature.
- When the configurable feature is released, the new field should be released also.
- When omitting the original fields of the configurable feature the UE continues using the existing values (which is used to optimise the signalling for features that typically continue unchanged upon handover).
- When omitting the new field of the configurable feature the UE releases the existing values and discontinues the associated functionality (which may be used to support release of unsupported functionality upon handover to an eNB supporting an earlier protocol version).

The above assumptions, which affect the use of conditions and need codes, may not always apply. Hence, the example should not be re-used blindly.

***ChildIE1-WithoutEM* information element**

```
-- /example/ ASN1START

ChildIE1-WithoutEM ::=      SEQUENCE {
  -- Root encoding, including:
  chIE1-ConfigurableFeature      ChIE1-ConfigurableFeature      OPTIONAL      -- Need N
}

ChildIE1-WithoutEM-vNx0 ::=      SEQUENCE {
  chIE1-ConfigurableFeature-vNx0      ChIE1-ConfigurableFeature-vNx0  OPTIONAL      -- Cond ConfigF
}

ChIE1-ConfigurableFeature ::=      CHOICE {
  release
  setup
    -- Root encoding
}
  NULL,
  SEQUENCE {

ChIE1-ConfigurableFeature-vNx0 ::=      SEQUENCE {
  chIE1-NewField-rN      INTEGER (0..31)
}
```

-- ASN1STOP

| Conditional presence | Explanation |
|----------------------|--|
| ConfigF | The field is optional present, need R, in case of chIE1-ConfigurableFeature is included and set to "setup"; otherwise the field is absent and the UE shall delete any existing value for this field. |

— ChildIE2-WithoutEM

The IE *ChildIE2-WithoutEM* is an example of a lower level IE, typically used to control certain radio configurations. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature.

ChildIE2-WithoutEM information element

```
-- /example/ ASN1START

ChildIE2-WithoutEM ::= CHOICE {
    release
    setup
        -- Root encoding
    }
}

ChildIE2-WithoutEM-vNx0 ::= SEQUENCE {
    chIE2-NewField-rN
        INTEGER (0..31)
        OPTIONAL -- Cond ConfigF
}

-- ASN1STOP
```

| Conditional presence | Explanation |
|----------------------|--|
| ConfigF | The field is optional present, need R, in case of chIE2-ConfigurableFeature is included and set to "setup"; otherwise the field is absent and the UE shall delete any existing value for this field. |

A.4.3.6 Non-critical extensions of lists with ToAddMod/ToRelease

When the size of a list using the ToAddMod/ToRelease construction is extended and/or fields are added to the list element structure, the list should be non-critically extended in accordance with the following general principles:

- When only the size of the list is extended, this extension is reflected in a non-critical extension of the list, with a "SizeExt" suffix added to the end of the field name (before the -vNxy suffix). The differential size of the extended list uses the suffix "Diff". A new ToRelease list is needed, and its range should include only the increase in list size. In many cases, extending the list size will also require an extended list element ID type to account for the increased size of the list; in these cases the element type will need to be extended to include the extended element ID, resulting in a more complex extension (see example 3 for further discussion of this case). The field

description table should indicate that the UE considers the original list and the extension list as a single list; thus entries added with the original list can be modified by the extension list (or removed by the extension of the ToRelease list), or vice versa. The result is as shown in the following example:

```
-- /example 1/ ASN1START

ContainingStructure ::= SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement      OPTIONAL, -- Need N
    listElementToReleaseList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementId     OPTIONAL, -- Need N
    ...
    [
        -- Non-critical extension lists
        listElementToAddModListSizeExt-vNxy   SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement      OPTIONAL, -- Need N
        listElementToReleaseListSizeExt-vNxy  SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId     OPTIONAL, -- Need N
    ]
}
-- ASN1STOP
```

- When fields are added to the list element structure, an extension marker should normally be used if available. If no extension marker is available or if overhead or other considerations prevent using the extension marker, an extension structure should be created for the new fields, with the suffix "Ext" added to the end of the field name and the element structure type name (before the -vNxy suffix), and a parallel ToAddMod list introduced to hold the new structures, also with the "Ext" suffix. The field description table should indicate that the parallel list contains the same number of entries, and in the same order, as the original list. No new ToRelease list is typically needed (unless the list element ID type changes). It should typically be ensured that the contained fields in the "Ext" elements are releasable without release and add of the entire list element; this can, for instance, be ensured by having the new fields be OPTIONAL Need R. If multiple extensions of the same list are needed, the version suffix should distinguish the lists (e.g. *listElementToAddModListExt-vNwz* added after *listElementToAddModListExt-vNxy*). The result is as shown in the following example:

```
-- /example 2/ ASN1START

ContainingStructure ::= SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement      OPTIONAL, -- Need N
    listElementToReleaseList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementId     OPTIONAL, -- Need N
    ...
    [
        -- Parallel list
        listElementToAddModListExt-vNxy   SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vNxy    OPTIONAL, -- Need N
    ],
    [
        -- Second parallel list from a later spec version
        listElementToAddModListExt-vNwz   SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vNwz    OPTIONAL, -- Need N
    ]
}

ListElement ::= SEQUENCE {
    elementId,
    field1
    field2
}
```

```

ListElementExt-vNxy ::= SEQUENCE {
    field3-rN
}                                BIT STRING (SIZE (8))                                OPTIONAL      -- Need R

ListElementExt-vNwz ::= SEQUENCE {
    field4-rN
}                                INTEGER (0..255)                                OPTIONAL      -- Need R

-- ASN1STOP

```

- When the size of a list is extended and fields are added to the list element structure, an extension marker should normally be used for the added fields if available, and the list extended with the non-critical mechanism as described in example 1 above. Note that if the list element ID type changes in this case, the new ID can be added after the extension marker, and the entries of the size-extended ToRelease list should have the type of the new ID (e.g. *ListElementId-vNxy*). If no extension marker is available or if overhead or other considerations prevent using the extension marker, an extension structure should be created for the new fields and a parallel list with ToAddMod introduced to hold the extension structures, as in the second example above, for entries of the original list and for entries of the extension list holding new entries. The field description table should indicate that the parallel list contains the same number of entries, and in the same order, as the concatenation of the original list and the extension list. An extended ToRelease list is needed, but no additional parallel ToRelease list is needed (i.e. there is no *listElementToReleaseListExt-vNxy* in the example below), as the original and extended ToRelease lists suffice to release any element of the combined list. The extended element ID type should be captured as a non-critical extension of the original element ID type, with the field description indicating that if the extended ID is present, the original ID is ignored. The result is as shown in the following example:

```

-- /example 3/ ASN1START

ContainingStructure ::= SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement          OPTIONAL,   -- Need N
    listElementToReleaseList     SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementId        OPTIONAL,   -- Need N
    ...
    [
    -- Non-critical extension lists
    listElementToAddModListSizeExt-vNxy SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement      OPTIONAL,   -- Need N
    listElementToReleaseListSizeExt-vNxy SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId-vNxy  OPTIONAL,   -- Need N
    -- Parallel list with maxNrofListElements-rN = maxNrofListElements + maxNrofListElementsDiff-rN
    listElementToAddModListExt-vNxy    SEQUENCE (SIZE (1..maxNrofListElements-rN)) OF ListElementExt-vNxy    OPTIONAL,   -- Need N
    ]
}

ListElement ::= SEQUENCE {
    elementId,
    field1
    field2
}                                INTEGER (0..3),
                                         ENUMERATED { value1, value2, value3 }

ListElementExt-vNxy ::= SEQUENCE {
    -- Field description should indicate that if the elementId-vNxy is present, the elementId (without suffix) is ignored
    elementId-vNxy
    field3-rN
}                                ListElementId-vNxy                                OPTIONAL,   -- Need S
                                         BIT STRING (SIZE (8))                                OPTIONAL      -- Need R

ListElementId ::= INTEGER (0..maxNrofListElements-1)

ListElementId-vNxy ::= INTEGER (maxNrofListElements..maxNrofListElements-1-rN)

```

-- ASN1STOP

- When different extensions are made to a list in separate releases, the extension mechanisms described above may interact. In case fields are added in Rel-M (*listElementToAddModListExt-vMxy*) and later the list size is extended in Rel-N (*listElementToAddModListSizeExt-vNwz*), the size-extended list in Rel-N should be a single list extending the combination of *listElementToAddModList* and *listElementToAddModListExt-vMxy*. This requires creating a new type (*ListElement-rN*) to contain the combined fields of *ListElement* and *ListElementExt-vMxy*. A corresponding ToRelease list is needed. The result is as shown in the following example:

```
-- /example 4/ ASN1START

ContainingStructure ::= SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement           OPTIONAL, -- Need N
    listElementToReleaseList     SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementId        OPTIONAL, -- Need N
    ...
    [
        -- Parallel list (Rel-M)
        listElementToAddModListExt-vMxy   SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vMxy   OPTIONAL -- Need N
    ],
    [
        -- Size-extended list (Rel-N) with maxNrofListElements-rN = maxNrofListElements + maxNrofListElementsDiff-rN
        listElementToAddModListSizeExt-vNwz SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement-rN   OPTIONAL, -- Need N
        listElementToReleaseListSizeExt-vNwz SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId-vNwz   OPTIONAL -- Need N
    ]
}

ListElement ::= SEQUENCE {
    elementId,
    field1
    field2
}
ListElementExt-vMxy ::= SEQUENCE {
    field3-rM
        BIT STRING (SIZE (8))                                         OPTIONAL -- Need R
}
ListElement-rN ::= SEQUENCE {
    elementId-vNwz,
    field1
    field2
    field3-rN
        BIT STRING (SIZE (8))                                         OPTIONAL -- Need R
}
ListElementId ::= INTEGER (0..maxNrofListElements-1)
ListElementId-vNwz ::= INTEGER (maxNrofListElements..maxNrofListElementsDiff-1-rN)
-- ASN1STOP
```

A.5 Guidelines regarding inclusion of transaction identifiers in RRC messages

The following rules provide guidance on which messages should include a Transaction identifier

- 1: DL messages on CCCH that move UE to RRC-IDLE should not include the RRC transaction identifier.
- 2: All network initiated DL messages by default should include the RRC transaction identifier.
- 3: All UL messages that are direct response to a DL message with an RRC Transaction identifier should include the RRC Transaction identifier.
- 4: All UL messages that require a direct DL response message should include an RRC transaction identifier.
- 5: All UL messages that are not in response to a DL message nor require a corresponding response from the network should not include the RRC Transaction identifier.

A.6 Guidelines regarding use of need codes

The following rule provides guidance for determining need codes for optional downlink fields:

- if the field needs to be stored by the UE (i.e. maintained) when absent:
 - use Need M (=Maintain);
- else, if the field needs to be released by the UE when absent:
 - use Need R (=Release);
- else, if UE shall take no action when the field is absent (i.e. UE does not even need to maintain any existing value of the field):
 - use Need N (=None);
- else (UE behaviour upon absence does not fit any of the above conditions):
 - use Need S (=Specified);
 - specify the UE behaviour upon absence of the field in the procedural text or in the field description table.

A.7 Guidelines regarding use of conditions

Conditions are primarily used to specify network restrictions, for which the following types can be distinguished:

- Message Contents related constraints e.g. that a field B is mandatory present if the same message includes field A and when it is set value X.

- Configuration Constraints e.g. that a field D can only be signalled if field C is configured and set to value Y. (i.e. regardless of whether field C is present in the same message or previously configured).

The use of these conditions is illustrated by an example.

```
-- /example/ ASN1START

RRCMessage-IEs ::= SEQUENCE {
    fieldA                  FieldA      OPTIONAL,   -- Need M
    fieldB                  FieldB      OPTIONAL,   -- Cond FieldAsetToX
    fieldC                  FieldC      OPTIONAL,   -- Need M
    fieldD                  FieldD      OPTIONAL,   -- Cond FieldCsetToY
    nonCriticalExtension    SEQUENCE { }  OPTIONAL
}

-- /example/ ASN1STOP
```

| Conditional presence | Explanation |
|----------------------|--|
| <i>FieldAsetToX</i> | The field is mandatory present if fieldA is included and set to valueX. Otherwise the field is optionally present, need R. |
| <i>FieldCsetToY</i> | The field is optionally present, need M, if fieldC is configured and set to valueY. Otherwise the field is absent and the UE does not maintain the value |

A.8 Miscellaneous

The following miscellaneous convention should be used:

- UE capabilities: TS 38.306 [26] specifies that the network should in general respect the UE's capabilities. Hence there is no need to include statement clarifying that the network, when setting the value of a certain configuration field, shall respect the related UE capabilities unless there is a particular need e.g. particularly complicated cases.
- UE capabilities: If a UE capability for a feature requires at least FR1/FR2 or at least FDD/TDD differentiation, it is defined in per band signaling (under *BandNR* in *RF-Parameters*) in the ASN.1, i.e. no new UE capabilities is defined in the FR1/FR2 and FDD/TDD differentiation capability signaling branches.

Annex B (informative): RRC Information

B.1 Protection of RRC messages

The following list provides information which messages can be sent (unprotected) prior to AS security activation and which messages can be sent unprotected after AS security activation. Those messages indicated "-" in "P" column should never be sent unprotected by gNB or UE. Further requirements are defined in the procedural text.

P...Messages that can be sent (unprotected) prior to AS security activation

A – I...Messages that can be sent without integrity protection after AS security activation

A – C...Messages that can be sent unciphered after AS security activation

NA... Message can never be sent after AS security activation

| Message | P | A-I | A-C | Comment |
|---------------------------------------|--------|-----|-----|---|

B.2 Description of BWP configuration options

There are two possible ways to configure BWP#0 (i.e. the initial BWP) for a UE:

- 1) Configure *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon*, but do not configure dedicated configurations in *BWP-DownlinkDedicated* or *BWP-UplinkDedicated* in *ServingCellConfig*.
- 2) Configure both *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon* and configure dedicated configurations in at least one of *BWP-DownlinkDedicated* or *BWP-UplinkDedicated* in *ServingCellConfig*.

The same way of configuration is used for UL BWP#0 and DL BWP#0 if both are configured.

With the first option (illustrated by figure B2-1 below), the BWP#0 is not considered to be an RRC-configured BWP, i.e., UE only supporting one BWP can still be configured with BWP#1 in addition to BWP#0 when using this configuration. The BWP#0 can still be used even if it does not have the dedicated configuration, albeit in a more limited manner since only the SIB1-defined configurations are available. For example, only DCI format 1_0 can be used with BWP#0 without dedicated configuration, so changing to another BWP requires RRCReconfiguration since DCI format 1_0 doesn't support DCI-based switching.

Figure B2-1: BWP#0 configuration without dedicated configuration

With the second option (illustrated by figure B2-2 below), the BWP#0 is considered to be an RRC-configured BWP, i.e. UE only supporting one BWP cannot be configured with BWP#1 in addition to BWP#0 when using this configuration. However, UE supporting more than one BWP can still switch to and from BWP#0 e.g. via DCI normally, and there are no explicit limitations to using the BWP#0 (compared to the first option).

Figure B2-2: BWP#0 configuration with dedicated configuration

For BWP#0, the *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon* should match the parameters configured by MIB and SIB1 (if provided) in the corresponding serving cell.

If an RedCap-specific initial DL BWP is configured, for BWP switching, the BWP #0 always maps to the RedCap-specific initial DL BWP. If a RedCap-specific initial UL BWP is configured, for BWP switching on NUL, the BWP #0 always maps to the RedCap-specific initial UL BWP, for BWP switching on SUL, the BWP#0 always maps to the initial UL BWP.

Annex C (normative):List of CRs Containing Early Implementable Features and Corrections

This annex lists the Change Requests (CRs) whose changes may be implemented by a UE of an earlier release than which the CR was approved in (i.e. CRs that contain on their coversheets the sentence "Implementation of this CR from Rel-N will not cause interoperability issues").

Table C-1: List of CRs Containing Early Implementable Features and Corrections

| TDoc Number (RP-xxxxxx): CR Title | CR Number(s) | CR Revision Number(s) | Earliest Implementable Release | Additional Information |
|---|---------------------|------------------------------|---------------------------------------|---|
| RP-200335: Correction on usage of access category 2 for UAC for RNA update | 1141 | 2 | Release 15 | |
| RP-201185: Introduction of signalling for high-speed train scenarios | 1464 | 5 | Release 15 | |
| RP-201216: Release-16 UE capabilities based on RAN1, RAN4 feature lists and RAN2 | 1665 | 2 | Release 15 | Early implementation part is referring to the aspect covered by
<ul style="list-style-type: none"> - R2-2006203: Extension of CSI-RS capabilities per codebook type - R2-2006360: Intraband EN_DC power class expansion for 29 dBm |

| RP-233890: PTM retransmission reception for multicast DRX with HARQ feedback disabled [PTM_ReTx_Mcast_HARQ_Disb] | 4504 | - | Release 17 | |
| RP-240667: UE capability for Enhanced channel raster | 4445 | 3 | Release 16 | |
| RP-240658: Introduction of TxDiversity for 2Tx capability | 4639 | 2 | Release 17 | |
| RP-241543: Introduction of barring exemption for RedCap UEs for emergency calls | 4570 | 4 | Release 17 | |
| RP-241543: Correction on Redcap 1 Rx and 2 Rx barring | 4632 | 5 | Release 17 | |
| RP-241544: Correction on TRS in idle and inactive | 4755 | 3 | Release 17 | |
| RP-241544: Clarification RLM/BFD relaxation and short DRX | 4771 | 2 | Release 17 | |
| RP-233915: Introduction of further measurement gap enhancements | 4063 | 6 | Release 17 | Early implementation part is referring to all aspects other than effective measurement window. Early implementation also includes the corresponding capability of R2-2311897 (within CR 4510 of RP-233940). |
| RP-243227: Introduction of network signalling of maximum number of UL segments [Max-RRC-SegUL] | 5004 | 3 | Release 16 | |
| RP-243233: Correction on deprioritisationTimer | 5170 | 2 | Release 15 | |

Annex D (normative):UE requirements on ASN.1 comprehension

This clause specifies UE requirements regarding the ASN.1 transfer syntax support, i.e. the ASN.1 definitions to be comprehended by the UE.

A UE that indicates release X in field *accessStratumRelease* shall comprehend the entire transfer syntax (ASN.1) of release X, in particular at least the first version upon ASN.1 freeze. The UE is however not required to support dedicated signalling related transfer syntax associated with optional features it does not support.

In case a UE that indicates release X in field *accessStratumRelease* supports a feature specified in release Y, which is later than release X, (i.e. early UE implementation) additional requirements apply. The UE obviously also has to support the ASN.1 parts related to indicating support of the feature (in UE capabilities).

Critical extensions (dedicated signaling)

If the early implemented feature involves one or more critical extensions in dedicated signalling, the UE shall comprehend the parts of the transfer syntax (ASN.1) of release Y that are related to the feature implemented early. This, in particular, concerns the ASN.1 parts related to configuration of the feature.

If configuration of an early implemented feature introduced in release Y involves a message or field that has been critically extended, the UE shall support configuration of all features supported by the UE that are associated with sub-fields of this critical extension. Apart from the early implemented feature(s), the UE needs, however, not to support functionality beyond what is defined in the release the UE indicates in access stratum release.

Let's consider the example of a UE indicating value X in field *accessStratumRelease* that supports the features A1, A3, and A5, associated with fields *fieldA1*, *fieldA3* and *fieldA5* of *InformationElementA* (see ASN.1 below).

The feature A5 implemented early is associated with *fieldA5*, and can only be configured by the -rY version of *InformationElementA*. In such case, the UE should support configuration of all the features A1, A3 and A5 associated with fields *fieldA1*, *fieldA3* and *fieldA5* by the -rY version of *InformationElementA*.

If, however, one of the features was modified, e.g. the feature A3 associated with *fieldA3*, the network should assume the UE only supports the feature A3 according to the release it indicated in field *accessStratumRelease* (i.e. X).

The UE is neither required to support the additional code-point (*n80-vY0*) nor the additional sub-field (*fieldA3c-rY*).

```

InformationElementA-rX ::= SEQUENCE {
    fieldA1-rX           OPTIONAL, -- Need N
    fieldA2-rX           OPTIONAL, -- Need R
    fieldA3-rX           OPTIONAL, -- Need R
}
InformationElementA-rY ::= SEQUENCE {
    fieldA1-rY           OPTIONAL, -- Need N
    fieldA2-rY           OPTIONAL, -- Need R
    fieldA3-rY           OPTIONAL, -- Need R
    fieldA4-rY           OPTIONAL, -- Need R
    fieldA5-rY           OPTIONAL, -- Need R
}
InformationElementA3-rX ::= SEQUENCE {
    fieldA3a-rX          OPTIONAL, -- Need N
}

```

```

    fieldA3b-rX           ENUMERATED {n10, n20, n40}      OPTIONAL   -- Need R
}

InformationElementA3-rY ::= SEQUENCE {
    fieldA3a-rY           InformationElementA3a-rX      OPTIONAL,  -- Need N
    fieldA3b-rY           ENUMERATED {n10, n20, n40, n80-vY0} OPTIONAL,  -- Need R
    fieldA3c-rY           InformationElementA3c-rY      OPTIONAL,  -- Need R
}

```

Non-critical extensions (dedicated and broadcast signaling)

If the early implemented feature involves one or more non-critical extensions, the UE shall comprehend the parts of the transfer syntax (ASN.1) of release Y that are related to the feature implemented early.

If the early implemented feature involves one or more non-critical extensions in dedicated signaling, the network does not include extensions introduced after the release X that are not the parts related to the feature which the UE indicates early support of in UE capabilities. The UE shall anyway comprehend the parts of the transfer syntax (ASN.1) which indicate absence of such extensions.

If the early implemented feature involves one or more non-critical extensions in system information, the SIB(s) containing the release Y fields related to the early implemented features may also include other extensions introduced after the release X that are not the parts related to the feature which the UE supports. The UE shall comprehend such intermediate fields (but again is not required to support the functionality associated with these intermediate fields, in case this concerns optional features not supported by the UE).
