If the field is absent, the UE applies the (default) value of 0 dB for S <sub>intraSearchQ</sub> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>s-NonIntraSearchP</b>                       | Parameter "S <sub>nonIntraSearchP</sub> " in TS 38.304 [20]. If this field is absent, the UE applies the (default) value of infinity for S <sub>nonIntraSearchP</sub> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>s-NonIntraSearchQ</b>                       | Parameter "S <sub>nonIntraSearchQ</sub> " in TS 38.304 [20]. If the field is absent, the UE applies the (default) value of 0 dB for S <sub>nonIntraSearchQ</sub> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>s-SearchDeltaP</b>                          | Parameter "S <sub>SearchDeltaP</sub> " in TS 38.304 [20]. Value dB3 corresponds to 3 dB, dB6 corresponds to 6 dB and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>s-SearchDeltaP-Stationary</b>               | Parameter "S <sub>SearchDeltaP-Stationary</sub> " in TS 38.304 [20]. Value dB2 corresponds to 2 dB, dB3 corresponds to 3 dB and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>s-SearchThresholdP, s-SearchThresholdP2</b> | Parameters "S <sub>SearchThresholdP</sub> " and "S <sub>SearchThresholdP2</sub> " in TS 38.304 [20]. The network configures s-SearchThresholdP and s-SearchThresholdP2 to be less than or equal to s-IntraSearchP and s-NonIntraSearchP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>s-SearchThresholdQ, s-SearchThresholdQ2</b> | Parameters "S <sub>SearchThresholdQ</sub> " and "S <sub>SearchThresholdQ2</sub> " in TS 38.304 [20]. The network configures s-SearchThresholdQ and s-SearchThresholdQ2 to be less than or equal to s-IntraSearchQ and s-NonIntraSearchQ.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>smtc</b>                                    | Measurement timing configuration for intra-frequency measurement. If this field is absent, the UE assumes that SSB periodicity is 5 ms for the intra-frequency cells. If the field is broadcast by an NTN cell, the offset (derived from parameter <i>periodicityAndOffset</i> ) is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual offset based on the actual propagation delay difference.                                                                                                                                                                                                                                                                                                                                                               |
| <b>smtc2-LP</b>                                | Measurement timing configuration for intra-frequency neighbour cells with a Long Periodicity (LP) indicated by periodicity in smtc2-LP. The timing offset and duration are equal to the offset and duration indicated in smtc in <i>intraFreqCellReselectionInfo</i> . The periodicity in smtc2-LP can only be set to a value strictly larger than the periodicity in smtc in <i>intraFreqCellReselectionInfo</i> (e.g. if smtc indicates sf20 the Long Periodicity can only be set to sf40, sf80 or sf160, if smtc indicates sf160, smtc2-LP cannot be configured). The pci-List, if present, includes the physical cell identities of the intra-frequency neighbour cells with Long Periodicity. If smtc2-LP is absent, the UE assumes that there are no intra-frequency neighbour cells with a Long Periodicity. This field is not configured together with smtc4list. |
| <b>smtc4list</b>                               | Measurement timing configuration list for NTN deployments. The offset of each SSB-MTC4 in smtc4list is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual offset based on the actual propagation delay difference. For a UE that supports less SMTCs than what is included in this list, it is up to the UE to select which SMTCs to consider.                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>SIB2 field descriptions</b>      |                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ssb-PositionQCL-Common</b>       | Indicates the QCL relation between SS/PBCH blocks for intra-frequency neighbor cells as specified in TS 38.213 [13], clause 4.1.                                       |
| <b>ssb-ToMeasure</b>                | The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). When the field is absent the UE measures on all SS-blocks.               |
| <b>stationaryMobilityEvaluation</b> | Indicates the criteria for a UE to detect stationary mobility, in order to relax measurement requirements for cell reselection (see TS 38.304 [20], clause 5.2.4.9.0). |
| <b>t-ReselectionNR</b>              | Parameter "Treselection <sub>NR</sub> " in TS 38.304 [20].                                                                                                             |
| <b>t-ReselectionNR-SF</b>           | Parameter "Speed dependent ScalingFactor for Treselection <sub>NR</sub> " in TS 38.304 [20]. If the field is absent, the UE behaviour is specified in TS 38.304 [20].  |
| <b>threshServingLowP</b>            | Parameter "Thresh <sub>Serving, LowP</sub> " in TS 38.304 [20].                                                                                                        |
| <b>threshServingLowQ</b>            | Parameter "Thresh <sub>Serving, LowQ</sub> " in TS 38.304 [20].                                                                                                        |
| <b>t-SearchDeltaP</b>               | Parameter "T <sub>SearchDeltaP</sub> " in TS 38.304 [20]. Value in seconds. Value s5 means 5 seconds, value s10 means 10 seconds and so on.                            |
| <b>t-SearchDeltaP-Stationary</b>    | Parameter "T <sub>SearchDeltaP-Stationary</sub> " in TS 38.304 [20]. Value in seconds. Value s5 means 5 seconds, value s10 means 10 seconds and so on.                 |

| Conditional Presence   | Explanation                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>HSDN</i>            | The field is optionally present, Need R, if <i>speedStateReselectionPars</i> is present; otherwise the field is not present.                                |
| <i>SharedSpectrum</i>  | This field is mandatory present if this intra-frequency operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.               |
| <i>SharedSpectrum2</i> | This field is optionally present if this intra-frequency operates with shared spectrum channel access in FR2-2, Need R.<br>Otherwise, it is absent, Need R. |

## – SIB3

*SIB3* contains neighbouring cell related information relevant only for intra-frequency cell re-selection. The IE includes cells with specific re-selection parameters as well as exclude-listed cells.

| <b>SIB3 field descriptions</b>     |                                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessMode2</b>          | If present, this field indicates that intra-frequency neighbor cells apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the intra-frequency neighbor cells do not apply any channel access procedure. |
| <b>intraFreqAllowedCellList</b>    | List of allow-listed intra-frequency neighbouring cells, see TS 38.304 [20], clause 5.2.4.                                                                                                                                                                                                                    |
| <b>intraFreqCAG-CellList</b>       | List of intra-frequency neighbouring CAG cells (as defined in TS 38.304 [20]) per PLMN.                                                                                                                                                                                                                       |
| <b>intraFreqExcludedCellList</b>   | List of exclude-listed intra-frequency neighbouring cells.                                                                                                                                                                                                                                                    |
| <b>intraFreqNeighCellList</b>      | List of intra-frequency neighbouring cells with specific cell re-selection parameters. If <i>intraFreqNeighCellList-v1610</i> is present, it shall contain the same number of entries, listed in the same order as in <i>intraFreqNeighCellList</i> (without suffix).                                         |
| <b>intraFreqNeighHSDN-CellList</b> | List of intra-frequency neighbouring HSDN cells as specified in TS 38.304 [20].                                                                                                                                                                                                                               |
| <b>plmn-IdentityIndex</b>          | Index of the PLMN across the <i>plmn-IdentityInfoList</i> and <i>nqn-IdentityInfoList</i> fields included in SIB1.                                                                                                                                                                                            |
| <b>q-OffsetCell</b>                | Parameter "Qoffset <sub>s,n</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                        |
| <b>q-QualMinOffsetCell</b>         | Parameter "Qqualminoffsetcell" in TS 38.304 [20]. Actual value Q <sub>qualminoffsetcell</sub> = field value [dB].                                                                                                                                                                                             |
| <b>q-RxLevMinOffsetCell</b>        | Parameter "Qrxlevminoffsetcell" in TS 38.304 [20]. Actual value Q <sub>rxlevminoffsetcell</sub> = field value * 2 [dB].                                                                                                                                                                                       |
| <b>q-RxLevMinOffsetCellSUL</b>     | Parameter "QrxlevminoffsetcellSUL" in TS 38.304 [20]. Actual value Q <sub>rxlevminoffsetcellSUL</sub> = field value * 2 [dB].                                                                                                                                                                                 |
| <b>ssb-PositionQCL</b>             | Indicates the QCL relation between SS/PBCH blocks for a specific intra-frequency neighbor cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the value signalled by <i>ssb-PositionQCL-Common</i> in SIB2 for the indicated cell.                               |

| Conditional Presence   | Explanation                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SharedSpectrum2</i> | The field is optional present, Need R, if this intra-frequency or neighbor cell operates with shared spectrum channel access. Otherwise, it is absent, Need R. |

## – SIB4

*SIB4* contains information relevant for inter-frequency cell re-selection (i.e. information about other NR frequencies and inter-frequency neighbouring cells relevant for cell re-selection), which can also be used for NR idle/inactive measurements. The IE includes cell re-selection parameters common for a frequency as well as cell specific re-selection parameters.

| <b><i>absThreshSS-BlocksConsolidation</i></b> | Threshold for consolidation of L1 measurements per RS index. If the field is absent, the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>accessAllowed2RxXR</i></b>              | Indicates if the cells on the frequency support 2Rx XR UEs. If present, 2Rx XR UEs shall consider only these NR frequencies in cell reselection evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>channelAccessMode2</i></b>              | If present, this field indicates that the neighbor cells on the inter-frequency apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the neighbor cells on the inter-frequency do not apply any channel access procedure.                                                                                                                                                                                                                                                                                          |
| <b><i>deriveSSB-IndexFromCell</i></b>         | This field indicates whether the UE may use the timing of any detected cell on that frequency to derive the SSB index of all neighbour cells on that frequency. If this field is set to <i>true</i> , the UE assumes SFN and frame boundary alignment across cells on the neighbor frequency as specified in TS 38.133 [14].                                                                                                                                                                                                                                                                                             |
| <b><i>dl-CarrierFreq</i></b>                  | This field indicates center frequency of the SS block of the neighbour cells, where the frequency corresponds to a GSCN value as specified in TS 38.101-1 [15] or TS 38.101-5 [75].<br>For a neighbouring carrier frequency when <i>dl-CarrierFreq-r18</i> is included, the network sets the corresponding value of <i>dl-CarrierFreq</i> (without suffix) to 250, and the UE applies <i>dl-CarrierFreq-r18</i> instead of <i>dl-CarrierFreq</i> (without suffix). In such case, if the UE does not support the GSCN value corresponding to the <i>dl-CarrierFreq-r18</i> , it ignores the corresponding neighbour cell. |
| <b><i>eRedCapAccessAllowed</i></b>            | Indicates whether eRedCap UEs are allowed to access cells on the frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>frequencyBandList</i></b>               | Indicates the list of frequency bands for which the NR cell reselection parameters apply. For a neighbouring carrier frequency when <i>frequencyBandList-r18</i> is included, the network sets the corresponding value of <i>freqBandIndicatorNR</i> in <i>frequencyBandList</i> (without suffix) to 200, and the UE applies <i>frequencyBandList-r18</i> instead of <i>frequencyBandList</i> (without suffix).                                                                                                                                                                                                          |
| <b><i>frequencyBandListAerial</i></b>         | Indicates the list of frequency bands for aerial operation for which the NR cell reselection parameters apply. The UE behaviour in case the field is absent is described in clause 5.2.2.4.5.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>highSpeedMeasInterFreq</i></b>          | If the field is set to <i>true</i> and UE supports high speed inter-frequency IDLE/INACTIVE measurements, the UE shall apply the enhanced inter-frequency RRM requirements on the inter-frequency carrier to support high speed up to 500 km/h in RRC_IDLE/RRC_INACTIVE as specified in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                  |
| <b><i>interFreqAllowedCellList</i></b>        | List of allow-listed inter-frequency neighbouring cells, see TS 38.304 [20], clause 5.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>interFreqCAG-CellList</i></b>           | List of inter-frequency neighbouring CAG cells (as defined in TS 38.304 [20] per PLMN).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>interFreqCarrierFreqList</i></b>        | List of neighbouring carrier frequencies and frequency specific cell re-selection information. If <i>interFreqCarrierFreqList-v1610</i> , <i>interFreqCarrierFreqList-v1700</i> , <i>interFreqCarrierFreqList-v1720</i> , <i>interFreqCarrierFreqList-v1730</i> , <i>interFreqCarrierFreqList-v1760</i> or <i>interFreqCarrierFreqInfo-v1800</i> are present, they shall contain the same number of entries, listed in the same order as in <i>interFreqCarrierFreqList</i> (without suffix).                                                                                                                            |
| <b><i>interFreqExcludedCellList</i></b>       | List of exclude-listed inter-frequency neighbouring cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>interFreqNeighCellList</i></b>          | List of inter-frequency neighbouring cells with specific cell re-selection parameters. If <i>interFreqNeighCellList-v1610</i> is present, it shall contain the same number of entries, listed in the same order as in <i>interFreqNeighCellList</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>interFreqNeighHSDN-CellList</i></b>     | List of inter-frequency neighbouring HSDN cells as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mobileIAB-CellList</i></b>              | Contains a PCI range on which mobile IAB cells may be deployed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>SIB4 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>mobileIAB-Freq</b>          | If present, it indicates that a mobile IAB node may be deployed on the inter-frequency carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>nrofSS-BlocksToAverage</b>  | Number of SS blocks to average for cell measurement derivation. If the field is absent, the UE uses the measurement quantity as specified in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>plmn-IdentityIndex</b>      | Index of the PLMN across the <i>plmn-IdentityInfoList</i> and <i>npln-IdentityInfoList</i> fields included in SIB1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>p-Max</b>                   | Value in dBm applicable for the neighbouring NR cells on this carrier frequency. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if <i>p-Max</i> is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79].                                                                                                                                                                               |
| <b>q-OffsetCell</b>            | Parameter "Qoffset <sub>ts,n</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>q-OffsetFreq</b>            | Parameter "Qoffset <sub>frequency</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>q-QualMin</b>               | Parameter "Qqualmin" in TS 38.304 [20]. If the field is absent, the UE applies the (default) value of negative infinity for Qqualmin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>q-QualMinOffsetCell</b>     | Parameter "Qqualminoffsetcell" in TS 38.304 [20]. Actual value Qqualminoffsetcell = field value [dB].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>q-RxLevMin</b>              | Parameter "Qrxlevmin" in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>q-RxLevMinsUL</b>           | Parameter "Qrxlevmin" in TS 38.304 [20].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>redCapAccessAllowed</b>     | Indicates whether RedCap UEs are allowed to access cells on the frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>smtc</b>                    | Measurement timing configuration for inter-frequency measurement. If this field is absent, the UE assumes that SSB periodicity is 5 ms in this frequency. If the field is broadcast by an NTN cell, the offset (derived from parameter <i>periodicityAndOffset</i> ) is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual offset based on the actual propagation delay difference.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>smtc2-LP</b>                | Measurement timing configuration for inter-frequency neighbour cells with a Long Periodicity (LP) indicated by periodicity in <i>smtc2-LP</i> . The timing offset and duration are equal to the offset and duration indicated in <i>smtc</i> in <i>InterFreqCarrierFreqInfo</i> . The periodicity in <i>smtc2-LP</i> can only be set to a value strictly larger than the periodicity in <i>smtc</i> in <i>InterFreqCarrierFreqInfo</i> (e.g. if <i>smtc</i> indicates sf20 the Long Periodicity can only be set to sf40, sf80 or sf160, if <i>smtc</i> indicates sf160, <i>smtc2-LP</i> cannot be configured). The <i>pci-List</i> , if present, includes the physical cell identities of the inter-frequency neighbour cells with Long Periodicity. If <i>smtc2-LP</i> is absent, the UE assumes that there are no inter-frequency neighbour cells with a Long Periodicity. This field is not configured together with <i>smtc4list</i> . |
| <b>smtc4list</b>               | Measurement timing configuration list for NTN deployments. The offset of each SSB-MTC4 in <i>smtc4list</i> is based on the assumption that the gNB-UE propagation delay difference between the serving cell and neighbour cells equals to 0 ms, and UE can adjust the actual offset based on the actual propagation delay difference. For a UE that supports less SMTCs than what is included in this list, it is up to the UE to select which SMTCs to consider.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>SIB4 field descriptions</b> |                                                                                                                                                                                                                                                                        |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ssb-PositionQCL</b>         | Indicates the QCL relation between SS/PBCH blocks for a specific neighbor cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the common value signalled by <i>ssb-PositionQCL-Common</i> in SIB4 for the indicated cell. |
| <b>ssb-PositionQCL-Common</b>  | Indicates the QCL relation between SS/PBCH blocks for inter-frequency neighbor cells as specified in TS 38.213 [13], clause 4.1.                                                                                                                                       |
| <b>ssb-ToMeasure</b>           | The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). When the field is absent the UE measures on all SS-blocks.                                                                                                               |
| <b>ssbSubcarrierSpacing</b>    | Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                           |
| <b>threshX-HighP</b>           | Parameter "Thresh <sub>X, HighP</sub> " in TS 38.304 [20].                                                                                                                                                                                                             |

| <b>threshX-LowP</b>            | Parameter "Thresh <sub>X, LowP</sub> " in TS 38.304 [20].                                                                                                                                                                                                              |
| <b>threshX-LowQ</b>            | Parameter "Thresh <sub>X, LowQ</sub> " in TS 38.304 [20].                                                                                                                                                                                                              |
| <b>tn-ArealdList</b>           | List of TN area identifiers. The associated coverage information is provided in SIB25.                                                                                                                                                                                 |
| <b>t-ReselectionNR</b>         | Parameter "Treselection <sub>NR</sub> " in TS 38.304 [20].                                                                                                                                                                                                             |
| <b>t-ReselectionNR-SF</b>      | Parameter "Speed dependent ScalingFactor for Treselection <sub>NR</sub> " in TS 38.304 [20]. If the field is absent, the UE behaviour is specified in TS 38.304 [20].                                                                                                  |

| Conditional Presence   | Explanation                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LessThan5MHz</i>    | The field is mandatory present if the <i>carrierBandwidth</i> in SIB1 indicates UL or DL transmission bandwidth other than 15 PRB and the corresponding neighbour cell(s) support(s) 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Otherwise, the field is optional, Need R. |
| <i>Mandatory</i>       | The field is mandatory present in SIB4.                                                                                                                                                                                                                                                                                                                         |
| <i>RSRQ</i>            | The field is mandatory present if <i>threshServingLowQ</i> is present in SIB2; otherwise it is absent.                                                                                                                                                                                                                                                          |
| <i>SharedSpectrum</i>  | This field is mandatory present if this inter-frequency operates with shared spectrum channel access. Otherwise, it is absent, Need R.                                                                                                                                                                                                                          |
| <i>SharedSpectrum2</i> | The field is optional present, Need R, if this inter-frequency or neighbor cell operates with shared spectrum channel access. Otherwise, it is absent, Need R.                                                                                                                                                                                                  |

## — SIB5

SIB5 contains information relevant only for inter-RAT cell re-selection i.e. information about E-UTRA frequencies and E-UTRAs neighbouring cells relevant for cell re-selection. The IE includes cell re-selection parameters common for a frequency.

**SIB5 information element**

| <b>SIB5 field descriptions</b>      |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierFreqListEUTRA</b>         | List of carrier frequencies of E-UTRA. If the <i>carrierFreqListEUTRA-v1610</i> / <i>carrierFreqListEUTRA-v1700</i> / <i>carrierFreqListEUTRA-v1800</i> is present, it shall contain the same number of entries, listed in the same order as in the <i>carrierFreqListEUTRA</i> (without suffix).                                          |
| <b>dummy</b>                        | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                    |
| <b>eutra-ExcludedCellList</b>       | List of exclude-listed E-UTRA neighbouring cells.                                                                                                                                                                                                                                                                                          |
| <b>eutra-FreqNeighHSDN-CellList</b> | List of neighbouring EUTRA HSDN cells as specified in TS 36.304 [27].                                                                                                                                                                                                                                                                      |
| <b>eutra-multiBandInfoList</b>      | Indicates the list of frequency bands in addition to the band represented by <i>carrierFreq</i> for which cell reselection parameters are common, and a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values, as defined in TS 36.101 [22], table 6.2.4-1, for the frequency bands in <i>eutra-multiBandInfoList</i> |
| <b>highSpeedEUTRACarrier</b>        | If the field is present, the UE shall apply the enhanced NR-EUTRA inter-RAT measurement requirements to support high speed up to 500 km/h as specified in TS 38.133 [14] to the E-UTRA carrier.                                                                                                                                            |
| <b>idleModeMeasVoiceFallback</b>    | Indicates whether E-UTRA idle/inactive measurements and reporting for EPS fallback can be used.                                                                                                                                                                                                                                            |
| <b>p-MaxEUTRA</b>                   | The maximum allowed transmission power in dBm on the (uplink) carrier frequency, see TS 36.304 [27].                                                                                                                                                                                                                                       |
| <b>q-QualMin</b>                    | Parameter " <i>Q<sub>qualmin</sub></i> " in TS 36.304 [27]. Actual value <i>Q<sub>qualmin</sub></i> = field value [dB].                                                                                                                                                                                                                    |
| <b>q-QualMinOffsetCell</b>          | Parameter " <i>Q<sub>qualminoffsetcell</sub></i> " in TS 36.304 [27]. Actual value <i>Q<sub>qualminoffsetcell</sub></i> = field value [dB].                                                                                                                                                                                                |
| <b>q-RxLevMin</b>                   | Parameter " <i>Q<sub>rxlevmin</sub></i> " in TS 36.304 [27]. Actual value <i>Q<sub>rxlevmin</sub></i> = field value * 2 [dBm].                                                                                                                                                                                                             |
| <b>q-RxLevMinOffsetCell</b>         | Parameter " <i>Q<sub>rxlevminoffsetcell</sub></i> " in TS 36.304 [27]. Actual value <i>Q<sub>rxlevminoffsetcell</sub></i> = field value * 2 [dB].                                                                                                                                                                                          |
| <b>t-ReselectionEUTRA</b>           | Parameter "Treselection <sub>EUTRA</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                              |
| <b>threshX-High</b>                 | Parameter "Thresh <sub>X, HighP</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                 |
| <b>threshX-HighQ</b>                | Parameter "Thresh <sub>X, HighQ</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                 |
| <b>threshX-Low</b>                  | Parameter "Thresh <sub>X, LowP</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                  |
| <b>threshX-LowQ</b>                 | Parameter "Thresh <sub>X, LowQ</sub> " in TS 38.304 [20].                                                                                                                                                                                                                                                                                  |
| <b>tn-ArealdList</b>                | List of TN area identifiers. The associated coverage information is provided in SIB25.                                                                                                                                                                                                                                                     |
| <b>t-ReselectionEUTRA-SF</b>        | Parameter "Speed dependent ScalingFactor for Treselection <sub>EUTRA</sub> " in TS 38.304 [20]. If the field is absent, the UE behaviour is specified in TS 38.304 [20].                                                                                                                                                                   |

| Conditional Presence | Explanation                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------|
| RSRQ                 | The field is mandatory present if the <i>threshServingLowQ</i> is present in <i>SIB2</i> ; otherwise it is absent. |

## — *SIB6*

*SIB6* contains an ETWS primary notification.

### ***SIB6* information element**

```
-- ASN1START
-- TAG-SIB6-START

SIB6 ::= {
 messageIdentifier SEQUENCE {
 BIT STRING (SIZE (16)),
 BIT STRING (SIZE (16)),
 OCTET STRING (SIZE (2)),
 OCTET STRING OPTIONAL,
 ...
 }
-- TAG-SIB6-STOP
-- ASN1STOP
```

| <b><i>SIB6</i> field descriptions</b> |                                                                                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b><i>messageIdentifier</i></b>       | Identifies the source and type of ETWS notification.                                                                        |
| <b><i>serialNumber</i></b>            | Identifies variations of an ETWS notification.                                                                              |
| <b><i>warningType</i></b>             | Identifies the warning type of the ETWS primary notification and provides information on emergency user alert and UE popup. |

## — *SIB7*

*SIB7* contains an ETWS secondary notification.

### ***SIB7* information element**

```
-- ASN1START
-- TAG-SIB7-START

SIB7 ::= {
 messageIdentifier SEQUENCE {
 BIT STRING (SIZE (16)),
 BIT STRING (SIZE (16)),

 INTEGER (0..63),
 ...
 }
-- TAG-SIB7-STOP
-- ASN1STOP
```

```

warningMessageSegment OCTET STRING,
dataCodingScheme OCTET STRING (SIZE (1))
lateNonCriticalExtension OCTET STRING
...
}

-- TAG-SIB7-STOP
-- ASN1STOP

```

| <b>SIB7 field descriptions</b>     |                                                                                                                                                                                                           |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dataCodingScheme</b>            | Identifies the alphabet/coding and the language applied variations of an ETWS notification.                                                                                                               |
| <b>messageIdentifier</b>           | Identifies the source and type of ETWS notification.                                                                                                                                                      |
| <b>serialNumber</b>                | Identifies variations of an ETWS notification.                                                                                                                                                            |
| <b>warningMessageSegment</b>       | Carries a segment of the Warning Message Contents IE.                                                                                                                                                     |
| <b>warningMessageSegmentNumber</b> | Segment number of the ETWS warning message segment contained in the SIB. A segment number of zero corresponds to the first segment, A segment number of one corresponds to the second segment, and so on. |
| <b>warningMessageSegmentType</b>   | Indicates whether the included ETWS warning message segment is the last segment or not.                                                                                                                   |

| Conditional Presence | Explanation                                                                          |
|----------------------|--------------------------------------------------------------------------------------|
| Segment1             | The field is mandatory present in the first segment of SIB7, otherwise it is absent. |

## — SIB8

SIB8 contains a CMAS notification.

### SIB8 information element

```

-- ASN1START
-- TAG-SIB8-START

SIB8 ::= SEQUENCE {
 messageIdentifier BIT STRING (SIZE (16)),
 serialNumber BIT STRING (SIZE (16)),
 warningMessageSegmentType ENUMERATED {notLastSegment, lastSegment},
 warningMessageSegmentNumber INTEGER (0..63),
 warningMessageSegment OCTET STRING,
 dataCodingScheme OCTET STRING (SIZE (1))
 OPTIONAL, -- Cond Segment1
 warningAreaCoordinatesSegment OCTET STRING
 OPTIONAL, -- Need R
 lateNonCriticalExtension OCTET STRING
 OPTIONAL,
...
}
```

```
}
```

```
-- TAG-SIB8-STOP
-- ASN1STOP
```

| <b>SIB8 field descriptions</b>       |                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dataCodingScheme</b>              | Identifies the alphabet/coding and the language applied variations of a CMAS notification.                                                                                                                                                                                                                                                            |
| <b>messageIdentifier</b>             | Identifies the source and type of CMAS notification.                                                                                                                                                                                                                                                                                                  |
| <b>serialNumber</b>                  | Identifies variations of a CMAS notification.                                                                                                                                                                                                                                                                                                         |
| <b>warningAreaCoordinatesSegment</b> | If present, carries a segment, with one or more octets, of the geographical area where the CMAS warning message is valid as defined in [28]. The first octet of the first <i>warningAreaCoordinatesSegment</i> is equivalent to the first octet of Warning Area Coordinates IE defined in and encoded according to TS 23.041 [29] and so on.          |
| <b>warningMessageSegment</b>         | Carries a segment, with one or more octets, of the <i>Warning Message Contents</i> IE defined in TS 38.413 [42]. The first octet of the <i>Warning Message Contents</i> IE is equivalent to the first octet of the <i>CB data</i> IE defined in and encoded according to TS 23.041 [29], clause 9.4.2.2.5, and so on.                                 |
| <b>warningMessageSegmentNumber</b>   | Segment number of the CMAS warning message segment contained in the SIB. A segment number of zero corresponds to the first segment, one corresponds to the second segment, and so on. If warning area coordinates are provided for the warning message, then this field applies to both warning message segment and warning area coordinates segment. |
| <b>warningMessageSegmentType</b>     | Indicates whether the included CMAS warning message segment is the last segment or not. If warning area coordinates are provided for the warning message, then this field applies to both warning message segment and warning area coordinates segment.                                                                                               |

| Conditional Presence | Explanation                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------|
| Segment1             | The field is mandatory present in the first segment of <i>SIB8</i> , otherwise it is absent. |

## — **SIB9**

*SIB9* contains information related to GPS time and Coordinated Universal Time (UTC). The UE may use the parameters provided in this system information block to obtain the UTC, the GPS and the local time.

NOTE: The UE may use the time information for numerous purposes, possibly involving upper layers e.g. to assist GPS initialisation, to synchronise the UE clock.

### **SIB9 information element**

```
-- ASN1START
-- TAG-SIB9-START

| <b>dayLightSavingTime</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |  |  |
| Indicates if and how daylight-saving time (DST) is applied to obtain the local time. The semantics are the same as the semantics of the <i>Daylight Saving Time</i> IE in TS 24.501 [23] and TS 24.008 [38]. The first/leftmost bit of the bit string contains the b2 of octet 3 and the second bit of the bit string contains b1 of octet 3 in the value part of the <i>Daylight Saving Time</i> IE in TS 24.008 [38].                                                                                                                                                                                                                                                                                                                                                                                       |  |  |  |
| <b>eventID-TSS</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |
| This field indicates the status of the 5G access stratum time distribution parameter Clock Quality Reporting Control Information as defined in TS 23.501 [32].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |  |
| <b>leapSeconds</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |
| Number of leap seconds offset between GPS Time and UTC. UTC and GPS time are related i.e. GPS time -leapSeconds = UTC time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |  |
| <b>localTimeOffset</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |  |  |  |
| Offset between UTC and local time in units of 15 minutes. Actual value = field value * 15 minutes. Local time of the day is calculated as UTC time + localTimeOffset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |  |  |
| <b>timeInfoUTC</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |
| Coordinated Universal Time corresponding to the SFN boundary at or immediately after the ending boundary of the SI-window in which SIB9 is transmitted. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE. The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900). See NOTE 1. This field is excluded when determining changes in system information, i.e. changes of timeInfoUTC should neither result in system information change notifications nor in a modification of valueTag in SIB1. |  |  |  |

NOTE 1: The UE may use this field together with the *leapSeconds* field to obtain GPS time as follows: GPS Time (in seconds) = timeInfoUTC (in seconds) - 2,524,953,600 (seconds) + leapSeconds, where 2,524,953,600 is the number of seconds between 00:00:00 on Gregorian calendar date 1 January, 1900 and 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time).

## - SIB10

SIB10 contains the HRNNs of the NPNs listed in SIB1.

### SIB10 information element

-- ASN1START

```
-- TAG-SIB10-START

SIB10-r16 ::= SEQUENCE {
 hrnn-List-r16 HRNN-List-r16
 lateNonCriticalExtension OCTET STRING
 ...
}

HRNN-List-r16 ::= SEQUENCE (SIZE (1..maxNPN-r16)) OF HRNN-r16

HRNN-r16 ::= SEQUENCE {
 hrnn-r16
 OCTET STRING (SIZE(1.. maxHRNN-Len-r16))
} OPTIONAL -- Need R

}

-- TAG-SIB10-STOP
-- ASN1STOP
```

#### SIB10 field descriptions

##### **HRNN-List**

The same amount of HRNN (see TS 23.003 [21]) elements as the number of NPNS in SIB 1 are included. The n-th entry of *HRNN-List* contains the human readable network name of the n-th NPN of SIB1. The *hrnn* in the corresponding entry in *HRNN-List* is absent if there is no HRNN associated with the given NPN.

## — SIB11

*SIB11* contains information related to idle/inactive measurements.

#### SIB11 information element

```
-- ASN1START
-- TAG-SIB11-START

SIB11-r16 ::= SEQUENCE {
 measIdleConfigSIB-r16
 lateNonCriticalExtension
 OCTET STRING
 ...
}

-- TAG-SIB11-STOP
-- ASN1STOP
```

#### SIB11 field descriptions

##### **measIdleConfigSIB**

Indicates measurement configuration to be stored and used by the UE while in RRC\_IDLE or RRC\_INACTIVE.

## — SIB12

SIB12 contains NR sidelink communication/discovery configuration.

### SIB12 information element

```

-- ASN1START
-- TAG-SIB12-START

SIB12-r16 ::= SEQUENCE {
 segmentNumber-r16 INTEGER (0..63),
 segmentType-r16 ENUMERATED {notLastSegment, lastSegment},
 segmentContainer-r16 OCTET STRING
}

| <b>segmentContainer</b>                                            | This field includes a segment of the encoded <i>SIB12-IEs</i> . The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB12 is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>segmentNumber</b>                                               | This field identifies the sequence number of a segment of <i>SIB12-IEs</i> . A segment number of zero corresponds to the first segment, A segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>segmentType</b>                                                 | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>si-CSI-Acquisition</b>                                          | This field indicates whether CSI reporting is enabled in sidelink unicast. If not set, SL CSI reporting is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>si-DRX-ConfigCommonGC-BC</b>                                    | This field indicates the sidelink DRX configuration for groupcast and broadcast communication, as specified in TS 38.321 [3]. This field, if present, also indicates the gNB is capable of sidelink DRX.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>si-EUTRA-AnchorCarrierFreqList</b>                              | This field indicates the EUTRA anchor carrier frequency list, which can provide the NR sidelink communication configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>si-FreqInfoList, si-FreqInfoListSizeExt, si-FreqInfoListExt</b> | This field indicates the NR sidelink communication/discovery configuration on some carrier frequency (ies). In this release, only one entry can be configured in <i>si-FreqInfoList</i> . More entries can be configured in <i>si-FreqInfoListSizeExt</i> . If network includes <i>si-FreqInfoListExt</i> , it includes the same number of entries, and listed in the same order, as in <i>si-FreqInfoList</i> together with <i>si-FreqInfoListSizeExt</i> . The first entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>si-FreqInfoList</i> broadcast in <i>SIB12</i> , the second entry corresponds to the AdditionalSpectrumEmission of the frequency of first entry in <i>si-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> , the third entry corresponds to the AdditionalSpectrumEmission of the frequency of second entry in <i>si-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on. |
| <b>si-L2U2N-Relay</b>                                              | This field indicates the support of NR sidelink Layer-2 U2N relay operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>si-NonRelayDiscovery</b>                                        | This field indicates the support of NR sidelink non-relay discovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>si-NR-AnchorCarrierFreqList</b>                                 | This field indicates the NR anchor carrier frequency list, which can provide the NR sidelink communication/discovery configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>si-OffsetDFN</b>                                                | Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>si-RadioBearerConfigList</b>                                    | This field indicates one or multiple sidelink radio bearer configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>SIB12 field descriptions</b>                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b>                                        | This field includes a segment of the encoded <i>SIB12-IEs</i> . The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB12 is broadcast.                                                                                                                                                                                                                                                      |
| <b>segmentNumber</b>                                           | This field identifies the sequence number of a segment of <i>SIB12-IEs</i> . A segment number of zero corresponds to the first segment, A segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                          |
| <b>segmentType</b>                                             | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>si-CSI-Acquisition</b>                                      | This field indicates whether CSI reporting is enabled in sidelink unicast. If not set, SL CSI reporting is disabled.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>si-RLC-BearerConfigList, si-RLC-BearerConfigListSizeExt</b> | This field indicates one or multiple sidelink RLC bearer configurations. For L2 U2U operation, <i>si-RLC-BearerConfigList</i> also indicates the PC5 Relay RLC Channel configurations.                                                                                                                                                                                                                                                                                                                                 |
| <b>si-SSB-PriorityNR</b>                                       | This field indicates the priority of NR sidelink SSB transmission and reception.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>si-SyncFreqList</b>                                         | Indicates a list of candidate carrier frequencies that can be used for the synchronisation of NR sidelink communication. For <i>SL-Freq-Id-r16</i> , the value 1 corresponds to the frequency of first entry in <i>si-FreqInfoList</i> broadcast in <i>SIB12</i> , the value 2 corresponds to the frequency of first entry in <i>si-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> , the value 3 corresponds to the frequency of second entry in <i>si-FreqInfoListSizeExt</i> broadcast in <i>SIB12</i> and so on. |
| <b>si-SyncTxMultiFreq</b>                                      | Indicates that the UE transmits S-SSB on multiple carrier frequencies for NR sidelink communication. If this field is absent, the UE transmits S-SSB only on the synchronisation carrier frequency.                                                                                                                                                                                                                                                                                                                    |
| <b>t400</b>                                                    | Indicates the value for timer T400 as described in clause 7.1. Value <i>ms100</i> corresponds to 100 ms, value <i>ms200</i> corresponds to 200 ms and so on.                                                                                                                                                                                                                                                                                                                                                           |
| <b>t400-U2U</b>                                                | Indicates the value for timer T400 to be applied for end-to-end PC5 connection in sidelink U2U relay operation as described in clause 7.1. Value <i>ms200</i> corresponds to 200 ms, value <i>ms400</i> corresponds to 400 ms and so on.                                                                                                                                                                                                                                                                               |

## — SIB13

SIB13 contains configurations of V2X sidelink communication defined in TS 36.331 [10].

|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>commonPLMNsWithDisasterCondition</b> | A list of PLMN(s) for which disaster condition applies and that disaster inbound roaming is accepted, which can be commonly applicable to the PLMNs sharing the cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>applicableDisasterInfoList</b>       | A list indicating the applicable disaster roaming information for the networks indicated in <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList-r16</i> . The network indicates in this list one entry for each entry of <i>plmn-IdentityInfoList</i> , followed by one entry for each entry of <i>npn-IdentityInfoList-r16</i> , meaning that this list will have as many entries as the number of entries of the combination of <i>plmn-IdentityInfoList</i> and <i>npn-IdentityInfoList-r16</i> . The first entry in this list indicates the disaster roaming information applicable for the network(s) in the first entry of <i>plmn-IdentityInfoList/npn-IdentityInfoList-r16</i> , the second entry in this list indicates the disaster roaming information applicable for the network(s) in the second entry of <i>plmn-IdentityInfoList/npn-IdentityInfoList-r16</i> , and so on. Each entry in this list can either be having the value <i>noDisasterRoaming</i> , <i>disasterRelatedIndication</i> , <i>commonPLMNs</i> , or <i>dedicatedPLMNs</i> . If an entry in this list takes the value <i>noDisasterRoaming</i> , disaster inbound roaming is not allowed in this network(s). If an entry in this list takes the value <i>disasterRelatedIndication</i> , the meaning of this field for this network(s) is as specified for "disaster related indication" in TS 23.122 [74], clause 4.4.3.1.1. If an entry in this list takes the value <i>commonPLMNs</i> , the PLMN(s) with disaster conditions indicated in the field <i>commonPLMNsWithDisasterCondition</i> apply for this network(s). If an entry in this list contains the value <i>dedicatedPLMNs</i> , the listed PLMN(s) are the PLMN(s) with disaster conditions that the network(s) corresponding to this entry accepts disaster inbound roammers from. For SNPNs, the network indicates the value <i>noDisasterRoaming</i> . |

## — SIB16

SIB16 contains configurations of slice-based cell reselection information.

### **SIB16 information element**

```

-- ASN1START
-- TAG-SIB16-START

SIB16-r17 ::= SEQUENCE {
 freqPriorityListSlicing-r17 FreqPriorityListSlicing-r17 OPTIONAL, -- Need R

| <b>SIB17 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b>         | This field includes a segment of the encoded <i>SIB17-IEs</i> . The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when <i>SIB17</i> is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>segmentNumber</b>            | This field identifies the sequence number of a segment of <i>SIB17-IEs</i> . A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>segmentType</b>              | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>trs-ResourceSetConfig</b>    | RS configuration of TRS occasion(s) for idle/inactive UE(s), in terms of a list of N $\geq$ 1 NZP TRS resource set(s). The maximum number of TRS resource sets configured by higher layer is 64. If a TRS resource is configured, the L1 based availability indication is always enabled based on that configuration. A UE which acquired <i>SIB17</i> with a TRS configuration but did not yet receive an associated L1-based availability indication considers the configured TRS as unavailable. If SIB scheduling indicates that <i>SIB17</i> has changed, the UE considers its configured TRS(s) as unavailable until it receives the associated L1-based availability indication(s). |
| <b>validityDuration</b>         | The valid time duration for L1 availability indication, time unit is one default paging cycle. When the field is absent, UE assumes a default time duration to be 2 default paging cycles. The field is only valid while the UE has a valid <i>SIB17</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>TRS-ResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>firstOFDMSymbolInTimeDomain</b>        | The index of the first OFDM symbol in the PRB used for TRS in a slot. The field indicates the first symbol in a slot for the first TRS resource within the slot, and the symbol for the second TRS resource in the same slot can be derived implicitly with symbol index as <i>firstOFDMSymbolInTimeDomain</i> +4.                                                                                                                                                                                                                           |
| <b>frequencyDomainAllocation</b>          | Indicates the offset of the first RE to RE#0 in a RB in row1 in table 7.4.1.5.3-1 for frequency domain allocation within a physical resource block (TS 38.211 [16], clause 7.4.1.5.3).                                                                                                                                                                                                                                                                                                                                                       |
| <b>indBitID</b>                           | The index of the associated bit in TRS availability indication field in DCI. Each TRS resource set is configured with an ID i for the association with (i+1)-th indication bit in TRS availability indication field in DCI.                                                                                                                                                                                                                                                                                                                  |
| <b>nrofRBs</b>                            | Number of PRBs across which corresponding TRS resource spans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>nrofResources</b>                      | The number of TRS resources for a TRS resource set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>periodicityAndOffset</b>               | The periodicity and slot offset (slot) for periodic TRS. It is used to determine the location of the first slot of TRS resource set. The periodicity value <i>slots10</i> corresponds to 10 slots, value <i>slots20</i> corresponds to 20 slots, and so on. Only the following values of the periodicity are used: 10 slots (SCS 15 kHz), 20 slots (SCS 15 and 30 kHz) and 40 slots (SCS 15, 30 and 60 kHz) and 80 slots (SCS 15, 30, 60, 120 kHz).                                                                                          |
| <b>powerControlOffsetSS</b>               | Power offset (dB) of NZP CSI-RS RE to SSS RE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>scramblingID-Info</b>                  | One or more scrambling IDs are configured for a TRS resource set. If a common scrambling ID is configured, it applies to all the TRS resources within the TRS resource set. Otherwise, each TRS resource within the TRS resource set is provided with a scrambling ID. If the number of TRS resources for the TRS resource set is 2, <i>scramblingIDperResourceListWith2-r17</i> is configured, while <i>scramblingIDperResourceListWith4-r17</i> is configured for the case that the number of TRS resources for the TRS resource set is 4. |
| <b>ssb-Index</b>                          | The index of reference SSB with which quasi-collocation information is provided as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>startingRB</b>                         | The PRB index where corresponding TRS resource starts in relation to common resource block #0 (CRB#0) on the common resource block grid.                                                                                                                                                                                                                                                                                                                                                                                                     |

## — **SIB17bis**

*SIB17bis* contains configurations of TRS resources for idle/inactive UEs. *SIB17bis* is optionally scheduled if *SIB17* is not scheduled.

| <b>SIB17bis field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b>            | This field includes a segment of the encoded <i>SIB17bis-IEs</i> . The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when <i>SIB17bis</i> is broadcast.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>segmentNumber</b>               | This field identifies the sequence number of a segment of <i>SIB17bis-IEs</i> . A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>segmentType</b>                 | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>trs-ResourceSetConfig</b>       | RS configuration of TRS occasion(s) for idle/inactive UE(s), in terms of a list of N>=1 NZP TRS resource set(s). The maximum number of TRS resource sets configured by higher layer is 64. If a TRS resource is configured, the L1 based availability indication is always enabled based on that configuration. A UE which acquired <i>SIB17bis</i> with a TRS configuration but did not yet receive an associated L1-based availability indication considers the configured TRS as unavailable. If SIB scheduling indicates that <i>SIB17bis</i> has changed, the UE considers its configured TRS(s) from <i>SIB17bis</i> as unavailable until it receives the associated L1-based availability indication(s). |

| <b>SIB17bis field descriptions</b> |                                                                                                                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b>            | This field includes a segment of the encoded SIB17bis-IEs. The size of the included segment in this container should be small enough that the SIB message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB17bis is broadcast. |
| <b>segmentNumber</b>               | This field identifies the sequence number of a segment of SIB17bis-IEs. A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.                                                        |
| <b>segmentType</b>                 | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                   |
| <b>validityDuration</b>            | The valid time duration for L1 availability indication, time unit is one default paging cycle. When the field is absent, UE assumes a default time duration to be 2 default paging cycles. The field is only valid while the UE has a valid SIB17bis.           |

| <b>TRS-ResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>firstOFDMSymbolInTimeDomain</b>        | The index of the first OFDM symbol in the PRB used for TRS in a slot. The field indicates the first symbol in a slot for the first TRS resource within the slot, and the symbol for the second TRS resource in the same slot can be derived implicitly with symbol index as <i>firstOFDMSymbolInTimeDomain</i> +4.                                                                                                                                                                                                                                |
| <b>frequencyDomainAllocation</b>          | Indicates the offset of the first RE to RE#0 in a RB in row1 in table 7.4.1.5.3-1 for frequency domain allocation within a physical resource block (TS 38.211 [16], clause 7.4.1.5.3).                                                                                                                                                                                                                                                                                                                                                            |
| <b>indBitID</b>                           | The index of the associated bit in TRS availability indication field in DCI. Each TRS resource set is configured with an ID <i>i</i> for the association with ( <i>i</i> +1)-th indication bit in TRS availability indication field in DCI.                                                                                                                                                                                                                                                                                                       |
| <b>nrofRBs</b>                            | Number of PRBs across which corresponding TRS resource spans.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>nrofResources</b>                      | The number of TRS resources for a TRS resource set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>periodicityAndOffset</b>               | The periodicity and slot offset (slot) for periodic TRS. It is used to determine the location of the first slot of TRS resource set. The periodicity value <i>slots10</i> corresponds to 10 slots, value <i>slots20</i> corresponds to 20 slots, and so on. Only the following values of the periodicity are used: 10 slots (SCS 15 kHz), 20 slots (SCS 15 and 30 kHz), 40 slots (SCS 15, 30 and 60 kHz), 80 slots (SCS 15, 30, 60 and 120 kHz), 160 slots (SCS 30, 60 and 120 kHz), 320 slots (SCS 60 and 120 kHz), and 640 slots (SCS 120 kHz). |
| <b>powerControlOffsetSS</b>               | Power offset (dB) of NZP CSI-RS RE to SSS RE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>scramblingID-Info</b>                  | One or more scrambling IDs are configured for a TRS resource set. If a common scrambling ID is configured, it applies to all the TRS resources within the TRS resource set. Otherwise, each TRS resource within the TRS resource set is provided with a scrambling ID. If the number of TRS resources for the TRS resource set is 2, <i>scramblingIDperResourceListWith2-r18</i> is configured, while <i>scramblingIDperResourceListWith4-r18</i> is configured for the case that the number of TRS resources for the TRS resource set is 4.      |
| <b>ssb-Index</b>                          | The index of reference SSB with which quasi-collocation information is provided as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>startingRB</b>                         | The PRB index where corresponding TRS resource starts in relation to common resource block #0 (CRB#0) on the common resource block grid.                                                                                                                                                                                                                                                                                                                                                                                                          |

## — SIB18

SIB18 contains Group IDs for Network selection (GINs) to support access using credentials from a Credentials Holder or to support UE onboarding.

### SIB18 information element

```
-- ASN1START
-- TAG-SIB18-START

SIB18-r17 ::= SEQUENCE {
 gin-ElementList-r17 SEQUENCE (SIZE (1..maxGIN-r17)) OF GIN-Element-r17 OPTIONAL, -- Need R
 gins-PerSNPN-List-r17 SEQUENCE (SIZE (1..maxNPN-r16)) OF GINs-PerSNPN-r17 OPTIONAL, -- Need S
 lateNonCriticalExtension OCTET STRING OPTIONAL,
}
...
}

GIN-Element-r17 ::= SEQUENCE {
 plmn-Identity-r17 PLMN-Identity,
 nid-List-r17 SEQUENCE (SIZE (1..maxGIN-r17)) OF NID-r16
}
}

GINs-PerSNPN-r17 ::= SEQUENCE {
 supportedGINS-r17 BIT STRING (SIZE (1..maxGIN-r17)) OPTIONAL -- Need R
}
}
-- TAG-SIB18-STOP
-- ASN1STOP
```

### SIB18 field descriptions

#### *gin-ElementList*

The *gin-ElementList* contains one or more GIN elements. Each GIN element contains either one GIN, which is identified by a PLMN ID and a NID, or multiple GINs that share the same PLMN ID. The total number of GINs indicated does not exceed maxGIN-r17. The GIN index  $m$  is defined as  $d_1+d_2+\dots+d_{(n-1)}+i$  for the GIN included in the  $n$ -th entry of the *gin-ElementList* and the  $i$ -th entry of its corresponding *GIN-Element*, where  $d(k)$  is the number of GIN index values used in the  $k$ -th *gin-ElementList* entry.

#### *gins-PerSNPN-List*

Indicates the supported GINs for each SNPN. The network includes the same number of entries as the number of SNPNs in *snpn-AccessInfoList* provided in SIB1, and the  $n$ -th entry in this list corresponds to the  $n$ -th SNPN listed in *snpn-AccessInfoList* provided in SIB1. The network configures this field only if the cell broadcasts more than one SNPN in SIB1. If this field is absent, as in case of a single SNPN broadcasted in SIB1, the UE shall associate all GINs in *gin-ElementList* to that SNPN.

### GINs-PerSNPN field descriptions

#### *supportedGINS*

Indicates the GINs which are supported by the given SNPN. The first/leftmost bit corresponds to the GIN with GIN index 1, the second bit corresponds to the GIN with GIN index 2 and so on. A bit set to 1 indicates that the GIN is supported by the SNPN. If the field is not present, then the corresponding SNPN does not support any GINs.

## — SIB19

SIB19 contains satellite assistance information for NTN access.

**SIB19 information element**

```

-- ASN1START

|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>distanceThresh</b>                                      | Distance from the serving cell reference location and is used in location-based measurement initiation in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20]. Each step represents 50m. This field is only present in an NTN cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>movingReferenceLocation</b>                             | Reference location of the serving cell of an NTN Earth-moving cell at a time reference. It is used in the evaluation of <i>eventD2</i> and <i>condEventD2</i> criteria for the serving cell in RRC_CONNECTED, and location-based measurement initiation in RRC_IDLE and RRC_INACTIVE when <i>distanceThresh</i> is also configured, as defined in TS 38.304 [20]. The time reference of this field is indicated by <i>epochTime</i> in <i>ntn-Config</i> of the serving cell. This field is excluded when determining changes in system information, i.e., changes to <i>movingReferenceLocation</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> . This field is only present in an NTN cell. |
| <b>ntn-Config</b>                                          | Provides parameters needed for the UE to access NR via NTN access such as Ephemeris data, common TA parameters, k_offset, validity duration for UL sync information and epoch time. In a TN cell, this field is only present in <i>ntn-NeighCellConfigList</i> and <i>ntn-NeighCellConfigListExt</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ntn-NeighCellConfigList, ntn-NeighCellConfigListExt</b> | Provides a list of NTN neighbour cells including their <i>ntn-Config</i> , carrier frequency and <i>PhysCellId</i> . This set includes all elements of <i>ntn-NeighCellConfigList</i> and all elements of <i>ntn-NeighCellConfigListExt</i> . If <i>ntn-Config</i> is absent for an entry in <i>ntn-NeighCellConfigListExt</i> , the <i>ntn-Config</i> provided in the entry at the same position in <i>ntn-NeighCellConfigList</i> applies. Network provides <i>ntn-Config</i> for the first entry of <i>ntn-NeighCellConfigList</i> . If the <i>ntn-Config</i> is absent for any other entry in <i>ntn-NeighCellConfigList</i> , the <i>ntn-Config</i> provided in the previous entry in <i>ntn-NeighCellConfigList</i> applies.                                         |
| <b>referenceLocation</b>                                   | Reference location of the serving cell provided via NTN (quasi-)Earth fixed cell and is used in location-based measurement initiation in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20]. This field is only present in an NTN cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>satSwitchWithReSync</b>                                 | Provides parameters for the target satellite required to perform satellite switch with resynchronization. This field is only present in an NTN cell and its presence indicates that satellite switch without PCI change is supported in the cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>t-Service</b>                                           | Indicates the time information on when a cell provided via NTN is going to stop serving the area it is currently covering. This field applies for both service link switches in NTN quasi-Earth fixed cell and feeder link switches for both NTN quasi-Earth fixed and Earth-moving cell. The field indicates a time in multiples of 10 ms after 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900). The exact stop time is between the time indicated by the value of this field minus 1 and the time indicated by the value of this field. The reference point for <i>t-Service</i> is the uplink time synchronization reference point of the cell. This field is only present in an NTN cell. |

| <b>NTN-CovEnh field descriptions</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>numberOfMsg4HARQ-ACK-Repetitions</b> | The number of repetition slots for PUCCH transmission with HARQ-ACK information for Msg4, see clause 9.2.6 in TS 38.213 [13]. The first/leftmost bit corresponds to the repetition factor 1, the second bit corresponds to the repetition factor 2, the third bit corresponds to the repetition factor 4, and the last/rightmost bit corresponds to the repetition factor 8. The repetition factor 1 shall be indicated together with at least one other repetition factor. |
| <b>rsrp-ThresholdMsg4HARQ-ACK</b>       | This threshold is used by the UE for determining the configuration of the MAC entity for PUCCH repetition for Msg4 HARQ-ACK, as specified in clause 6.2.1 in TS 38.321 [3].                                                                                                                                                                                                                                                                                                 |

| <b>SatSwitchWithReSync field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ssb-TimeOffset</b>                         | Indicates the time offset of the SSB from target satellite at its uplink time synchronization reference point with respect to the SSB from source satellite at its uplink time synchronization reference point. The starting boundaries of SFN0 of the source satellite and the target satellite are aligned at the uplink time synchronization reference point. The value is given in number of subframes and can only be configured as 5 subframes or multiples of 5 subframes.                                                                                                                          |
| <b>t-ServiceStart</b>                         | Indicates the time information on when the target satellite is going to start serving the area currently covered by the serving satellite. The field indicates a time in multiples of 10 ms after 00:00:00 on Gregorian calendar date 1 <sup>st</sup> January 1900 (midnight between Sunday, December 31, 1899, and Monday, January 1, 1900). The exact start time is between the time indicated by the value of this field minus 1 and the time indicated by the value of this field. The reference point for t-ServiceStart is the uplink time synchronization reference point of the serving satellite. |

## — *SIB20*

*SIB20* contains the information required to acquire the MCCH/MTCH configuration for MBS broadcast.

| <b>SIB20 field descriptions</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cfr-ConfigMCCH-MTCH</b>            | Common frequency resource used for MCCH and MTCH reception. If the field is absent, the CFR for broadcast has the same location and size as CORESET#0 and PDSCH configuration of MCCH is the same as PDSCH configuration provided in <i>initialDownlinkBWP</i> in <i>SIB1</i> .                                                                                                                                                                                                              |
| <b>cfr-ConfigMCCH-MTCH-RedCap</b>     | Common frequency resource used for MCCH and MTCH reception for (e)RedCap UEs. If the field is absent, the (e)RedCap UE can use <i>cfr-ConfigMCCH-MTCH</i> if the UE supports the configured bandwidth.                                                                                                                                                                                                                                                                                       |
| <b>mcch-ConfigRedcap</b>              | Indicates MBS broadcast MCCH configuration for (e)Redcap UEs. If the field is absent, the (e)RedCap UE can use <i>mcch-Config</i> if the UE supports the bandwidth configured by <i>cfr-ConfigMCCH-MTCH</i> .                                                                                                                                                                                                                                                                                |
| <b>mcch-ModificationPeriod</b>        | Defines periodically appearing boundaries, i.e. radio frames for which SFN mod <i>mcch-ModificationPeriod</i> = 0. The contents of different transmissions of MCCH information can only be different if there is at least one such boundary in-between them. Value rf2 corresponds to two radio frames, value rf4 corresponds to four radio frames and so on.                                                                                                                                |
| <b>mcch-RepetitionPeriodAndOffset</b> | Defines the length and the offset of the MCCH repetition period. rf1 corresponds to a repetition period length of one radio frame, rf2 corresponds to a repetition period length of two radio frames and so on. The corresponding integer value indicates the offset of the repetition period in the number of radio frames. MCCH is scheduled in the MCCH transmission window starting from each radio frame for which: SFN mod repetition period length = offset of the repetition period. |
| <b>mcch-WindowDuration</b>            | Indicates, starting from the slot indicated by <i>mcch-WindowStartSlot</i> , the duration in slots during which MCCH may be scheduled. Absence of this field means that MCCH is only scheduled in the slot indicated by <i>mcch-WindowStartSlot</i> . The network always configures <i>mcch-WindowDuration</i> to be shorter or equal to the length of MCCH repetition period.                                                                                                               |
| <b>mcch-WindowStartSlot</b>           | Indicates the slot in which MCCH transmission window starts.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## — SIB21

*SIB21* contains the mapping between the current and/or neighbouring carrier frequencies and MBS Frequency Selection Area Identities (FSAI).

### **SIB21 information element**

```

-- ASN1START
-- TAG-SIB21-START

```

```

SIB21-r17 ::= SEQUENCE {

| <b>SIB23 field descriptions</b> |                                                                                                                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>segmentContainer</b>         | This field includes a segment of the encoded <i>SIB23-IEs</i> . The size of the included segment in this container should be small enough that the SI message size is less than or equal to the maximum size of a NR SI, i.e. 2976 bits when SIB23 is broadcast. |
| <b>segmentNumber</b>            | This field identifies the sequence number of a segment of <i>SIB23-IEs</i> . A segment number of zero corresponds to the first segment, a segment number of one corresponds to the second segment, and so on.                                                    |
| <b>segmentType</b>              | This field indicates whether the included segment is the last segment or not.                                                                                                                                                                                    |
| <b>si-PosConfigCommonNR</b>     | This field indicates the NR sidelink positioning configuration.                                                                                                                                                                                                  |

| <b>SL-PosConfigCommonNR field descriptions</b> |                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>si-PosFreqInfoList</b>                      | This field indicates the NR sidelink positioning carrier frequencies for SL-PRS transmission and reception. In this release, only one entry of <i>SL-FreqConfigCommon</i> is included in the list.      |
| <b>si-PosMeasConfigCommon</b>                  | This field indicates the measurement configurations (e.g. RSRP) for NR sidelink positioning.                                                                                                            |
| <b>si-PosNR-AnchorCarrierFreqList</b>          | This field indicates the NR anchor carrier frequency list, which can provide the NR sidelink positioning configurations.                                                                                |
| <b>si-PosOffsetDFN</b>                         | Indicates the timing offset for the UE to determine DFN timing when GNSS is used for timing reference. Value 1 corresponds to 0.001 milliseconds, value 2 corresponds to 0.002 milliseconds, and so on. |
| <b>si-PosSSB-PriorityNR</b>                    | This field indicates the priority of NR sidelink SSB transmission and reception.                                                                                                                        |
| <b>si-PosUE-SelectedConfig</b>                 | Indicates the configuration used for UE autonomous resource selection.                                                                                                                                  |

## — **SIB24**

*SIB24* contains the information required to acquire the multicast MCCH/MTCH configuration for MBS multicast reception in RRC\_INACTIVE.

### **SIB24 information element**

```
-- ASN1START
-- TAG-SIB24-START

SIB24-r18 ::= SEQUENCE {
 multicastMCCH-Config-r18 OPTIONAL, -- Need S
 cfr-ConfigMCCH-MTCH-r18 OPTIONAL, -- Need S
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 ...
}

-- TAG-SIB24-STOP
```

-- ASN1STOP

| <b>SIB24 field descriptions</b>                                                                                                                                                                                                                                                                                               |  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>cfr-ConfigMCCH-MTCH</b>                                                                                                                                                                                                                                                                                                    |  |
| Common frequency resource used for multicast MCCH and/or multicast MTCH reception. If the field is absent, the CFR for multicast has the same location and size as CORESET#0 and PDSCH configuration of multicast MCCH, if present, is the same as PDSCH configuration provided in <i>initialDownlinkBWP</i> in <i>SIB1</i> . |  |
| <b>multicastMCCH-Config</b>                                                                                                                                                                                                                                                                                                   |  |
| Indicates MCCH configuration for MBS multicast reception in RRC_INACTIVE. This field is always included if it is provided via broadcast signalling in <i>SIB24</i> .                                                                                                                                                          |  |

## — SIB25

*SIB25* contains TN coverage information to assist neighbour cell measurements for the UEs in an NTN cell.

### **SIB25 information element**

```
-- ASN1START
-- TAG-SIB25-START

SIB25-r18 ::= SEQUENCE {
 coverageAreaInfoList-r18
 lateNonCriticalExtension
 OCTET STRING
 ...
}

CoverageAreaInfoList-r18 ::= SEQUENCE (SIZE (1..maxTN-AreaInfo-r18)) OF CoverageAreaInfo-r18

CoverageAreaInfo-r18 ::= SEQUENCE {
 tn-AreaId-r18,
 tn-ReferenceLocation-r18
 tn-DistanceRadius-r18
 INTEGER(0..65535)
}

-- TAG-SIB25-STOP
-- ASN1STOP
```

| <b>SIB25 field descriptions</b>                                                                                                                                                     |  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>coverageAreaInfoList</b>                                                                                                                                                         |  |
| Contains a list of TN coverage area's information to assist skipping TN measurements for NTN UEs in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20].                        |  |
| <b>tn-DistanceRadius</b>                                                                                                                                                            |  |
| Distance from the TN coverage area reference location. It is used for skipping TN measurements in RRC_IDLE and RRC_INACTIVE, as defined in TS 38.304 [20]. Each step represents 1m. |  |

If the field is absent, the posSIB is cell specific.                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>encrypted</i></b>                                 | The presence of this field indicates that the <i>pos-sib-type</i> is encrypted as specified in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>gnss-id</i></b>                                   | The presence of this field indicates that the positioning SIB type is for a specific GNSS. Indicates a specific GNSS (see also TS 37.355 [49])                                                                                                                                                                                                                                                                                                                   |
| <b><i>posSchedulingInfoList</i></b>                     | List of scheduling information for SI messages. If <i>si-SchedulingInfo-v1700</i> is present, the network ensures that the total number of SI messages in the concatenated list of SI messages configured by <i>posSchedulingInfoList</i> in <i>posSI-SchedulingInfo</i> and SI messages containing type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> does not exceed the limit of <i>maxSI-Message</i> .                     |
| <b><i>posSI-BroadcastStatus</i></b>                     | Indicates if the SI message is being broadcasted or not. Change of <i>posSI-BroadcastStatus</i> should not result in system information change notifications in Short Message transmitted with P-RNTI over DCI (see clause 6.5). The value of the indication is valid until the end of the BCCH modification period when set to <i>broadcasting</i> .                                                                                                            |
| <b><i>posSI-RequestConfig</i></b>                       | Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                                                                     |
| <b><i>posSI-RequestConfigMSG1-Repetition</i></b>        | Configuration of Msg1 repetition resources on NUL that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                              |
| <b><i>posSI-RequestConfigRedCap</i></b>                 | Configuration of Msg1 resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                        |
| <b><i>posSI-RequestConfigRedCap-MSG1-Repetition</i></b> | Configuration of Msg1 repetition resources for <i>initialUplinkBWP-RedCap</i> that the (e)RedCap UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.        |
| <b><i>posSI-RequestConfigSUL</i></b>                    | Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> .                                                                                                                                                                     |
| <b><i>posSI-RequestConfigSUL-MSG1-Repetition</i></b>    | Configuration of Msg1 repetition resources on SUL that the UE uses for requesting SI-messages for which <i>posSI-BroadcastStatus</i> or <i>si-BroadcastStatus</i> of the type2 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> , if present, is set to <i>notBroadcasting</i> . This field is only applicable when Msg1 repetition resources can be used for requesting SI-messages.                                              |
| <b><i>posSIB-MappingInfo</i></b>                        | List of the posSIBs mapped to this <i>SystemInformation</i> message.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>posSibType</i></b>                                | The positioning SIB type is defined in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>posSI-Periodicity</i></b>                         | Periodicity of the SI-message in radio frames, such that rf8 denotes 8 radio frames, rf16 denotes 16 radio frames, and so on. If the <i>offsetToSI-Used</i> is configured, the <i>posSI-Periodicity</i> of rf8 cannot be used.                                                                                                                                                                                                                                   |
| <b><i>offsetToSI-Used</i></b>                           | This field, if present, indicates that all the SI messages in <i>posSchedulingInfoList</i> are scheduled with an offset of 8 radio frames compared to SI messages in <i>schedulingInfoList</i> . <i>offsetToSI-Used</i> may be present only if the shortest configured SI message periodicity for SI messages in <i>schedulingInfoList</i> is 80ms. If SI offset is used, this field is present in each of the SI messages in the <i>posSchedulingInfoList</i> . |

***sbas-id***

The presence of this field indicates that the positioning SIB type is for a specific SBAS. Indicates a specific SBAS (see also TS 37.355 [49]).

| Conditional presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <i>SUL-MSG-1</i>     | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> , and if <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>posSchedulingInfoList</i> or if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message containing type2 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise. |
| <i>REDCAP-MSG-1</i>  | The field is optionally present, Need R, if <i>initialUplinkBWP-RedCap</i> is configured in <i>UplinkConfigCommonSIB</i> , and if <i>posSI-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>posSchedulingInfoList</i> or if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message containing type2 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.  |

— ***SIBpos***

The IE *SIBpos* contains positioning assistance data as defined in TS 37.355 [49].

***SIBpos* information element**

```
-- ASN1START
-- TAG-SIPOS-START

SIBpos-r16 ::= SEQUENCE {
 assistanceDataSIB-Element-r16 OCTET STRING,
 lateNonCriticalExtension OCTET STRING OPTIONAL,
 ...
}

-- TAG-SIPOS-STOP
-- ASN1STOP
```

***SIBpos* field descriptions*****assistanceDataSIB-Element***

Parameter *AssistanceDataSIBElement* defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.

### 6.3.2 Radio resource control information elements

— ***AdditionalPCIIndex***

The IE *AdditionalPCIIndex* identifies an additional physical cell identity (PCI) configured with *additionalPCI-ToAddModList-r17* in *ServingCellConfig*.

### ***AdditionalPCIIndex* information element**

```
-- ASN1START
-- TAG-ADDITIONALPCIINDEX-START

AdditionalPCIIndex-r17 ::= INTEGER(1..maxNrofAdditionalPCI-r17)

-- TAG-ADDITIONALPCIINDEX-STOP
-- ASN1STOP
```

#### ***AdditionalSpectrumEmission***

The IE *AdditionalSpectrumEmission* is used to indicate emission requirements to be fulfilled by the UE (see TS 38.101-1 [15], clause 6.2.3/6.2A.3, TS 38.101-2 [39], clause 6.2.3/6.2A.3, and TS 38.101-5 [75], clause 6.2.3). If an extension is signalled using the extended value range (as defined by the IE *AdditionalSpectrumEmission-v1760*), the corresponding original field, using the value range as defined by the IE *AdditionalSpectrumEmission* (without suffix) shall be set to value 7.

### ***AdditionalSpectrumEmission* information element**

```
-- ASN1START
-- TAG-ADDITIONALSPECTRUMEMISSION-START

AdditionalSpectrumEmission ::= INTEGER (0..7)
AdditionalSpectrumEmission-v1760 ::= INTEGER (8..39)
AdditionalSpectrumEmission-r18 ::= INTEGER (0..39)

-- TAG-ADDITIONALSPECTRUMEMISSION-STOP
-- ASN1STOP
```

#### ***AdvancedReceiver-MU-MIMO***

The IE *AdvancedReceiver-MU-MIMO* is used to provide a set of assistance information for R-ML (reduced complexity ML) receivers with enhanced inter-user interference suppression for MU-MIMO transmissions.

### ***AdvancedReceiver-MU-MIMO* information element**

```
-- ASN1START
-- TAG-ADVANCEDRECEIVER-MU-MIMO-START

AdvancedReceiver-MU-MIMO-r18 ::= SEQUENCE {
 precodingAndResourceAllocation-r18 BOOLEAN
 pdsch-TimeDomainAllocation-r18 BOOLEAN
 mcs-Table-r18 ENUMERATED {qam1024, qam256, qam64, spare1}
 advReceiver-MU-MIMO-DCI-1-1-r18 ENUMERATED {enabled}
 ...
} OPTIONAL, -- Need M
 OPTIONAL, -- Need M
 OPTIONAL, -- Need R
 OPTIONAL, -- Need R
```

-- TAG-ADVANCEDRECEIVER-MU-MIMO-STOP  
-- ASN1STOP

| <b><i>AdvancedReceiver-MU-MIMO field descriptions</i></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b><i>advReceiver-MU-MIMO-DCI-1-1</i></b>                 | Configure the presence of the co-scheduled UE information field in DCI format 1_1 (see TS 38.212 [17], clause 7.3.1.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>mcs-Table</i></b>                                   | Indicates the MCS table with the highest modulation order among all MCS tables configured to the co-scheduled UE(s), which has the same DMRS sequence as the target UE.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>pdsch-TimeDomainAllocation</i></b>                  | If the field is set to true, the UE can assume the time domain resource assignment for PDSCH symbols of all the co-scheduled UE(s), which has the same DMRS sequence as the target UE, is same as the target UE.<br>If the field is set to false, the UE can not assume the time domain resource assignment for PDSCH symbols of all the co-scheduled UE(s), which has the same DMRS sequence as the target UE, is same as the target UE.                                                                                                                                                                       |
| <b><i>precodingAndResourceAllocation</i></b>              | If the field is set to true, the UE can assume the precoding and resource allocation of the co-scheduled UE are the same in the PRG-level grid configured to the target UE when PRG=2 or 4, when the target UE and any co-scheduled UEs are in different CDM groups and with the same DMRS sequence.<br>If the field is set to false, the UE can not assume the precoding or resource allocation of the co-scheduled UE is the same in the PRG-level grid configured to the target UE when PRG=2 or 4, when the target UE and any co-scheduled UEs are in different CDM groups and with the same DMRS sequence. |

NOTE: the same DMRS sequence represents the same root DMRS sequence  $r(n)$ , see TS 38.211 [16], clause 7.4.1.1.1.

## — *Aerial-Config*

The IE *Aerial-Config* provides configuration parameters for aerial UE.

### ***Aerial-Config* information element**

```
-- ASN1START
-- TAG-AERIAL-CONFIG-START

Aerial-Config-r18 ::= SEQUENCE {
 flightPathUpdateThrConfig-r18 SEQUENCE {
 flightPathUpdateDistanceThr-r18 SetupRelease { FlightPathUpdateDistanceThr-r18 } OPTIONAL, -- Need M
 flightPathUpdateTimeThr-r18 SetupRelease { FlightPathUpdateTimeThr-r18 } OPTIONAL, -- Need M
 }
 ...
}

FlightPathUpdateDistanceThr-r18 ::= INTEGER (0..1023)
FlightPathUpdateTimeThr-r18 ::= INTEGER (0..16383)

-- TAG-AERIAL-CONFIG-STOP
-- ASN1STOP
```

| <b><i>Aerial-Config</i> field descriptions</b> |                                                                                                             |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b><i>flightPathUpdateDistanceThr</i></b>      | Distance threshold for triggering flight path update indication. Actual value is 5 x field value in meters. |
| <b><i>flightPathUpdateTimeThr</i></b>          | Time threshold for triggering flight path update indication. Value in seconds.                              |

### — *Alpha*

The IE *Alpha* defines possible values of a the pathloss compensation coefficient for uplink power control. Value *alpha0* corresponds to the value 0, Value *alpha04* corresponds to the value 0.4, Value *alpha05* corresponds to the value 0.5 and so on. Value *alpha1* corresponds to value 1. See also clause 7.1 of TS 38.213 [13].

```
-- ASN1START
-- TAG-ALPHA-START

Alpha ::= ENUMERATED {alpha0, alpha04, alpha05, alpha06, alpha07, alpha08, alpha09, alpha1}

-- TAG-ALPHA-STOP
-- ASN1STOP
```

### — *Altitude*

The IE *Altitude* is used to indicate altitude relative to sea level. The actual value is the field value in meters.

#### ***Altitude* information element**

```
-- ASN1START
-- TAG-ALTITUDE-START

Altitude-r18 ::= INTEGER (minAltitude-r18..maxAltitude-r18)

-- TAG-ALTITUDE-STOP
-- ASN1STOP
```

### — *AMF-Identifier*

The IE *AMF-Identifier* (AMFI) comprises of an AMF Region ID, an AMF Set ID and an AMF Pointer as specified in TS 23.003 [21], clause 2.10.1.

#### ***AMF-Identifier* information element**

```
-- ASN1START
-- TAG-AMF-IDENTIFIER-START
```

```

AMF-Identifier ::= BIT STRING (SIZE (24))

-- TAG-AMF-IDENTIFIER-STOP
-- ASN1STOP

```

### ***ARFCN-ValueEUTRA***

The IE *ARFCN-ValueEUTRA* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) E-UTRA carrier frequency, as defined in TS 36.101 [22].

#### ***ARFCN-ValueEUTRA* information element**

```

-- ASN1START
-- TAG-ARFCN-VALUEEUTRA-START

ARFCN-ValueEUTRA ::= INTEGER (0..maxEARFCN)

-- TAG-ARFCN-VALUEEUTRA-STOP
-- ASN1STOP

```

### ***ARFCN-ValueNR***

The IE *ARFCN-ValueNR* is used to indicate the ARFCN applicable for a downlink, uplink or bi-directional (TDD) NR global frequency raster, as defined in TS 38.101-1 [15], TS 38.101-2 [39] and TS 38.101-5 [75], clause 5.4.2.

```

-- ASN1START
-- TAG-ARFCN-VALUENR-START

ARFCN-ValueNR ::= INTEGER (0..maxNARFCN)

-- TAG-ARFCN-VALUENR-STOP
-- ASN1STOP

```

### ***ARFCN-ValueUTRA-FDD***

The IE *ARFCN-ValueUTRA-FDD* is used to indicate the ARFCN applicable for a downlink (Nd, FDD) UTRA-FDD carrier frequency, as defined in TS 25.331 [45].

#### ***ARFCN-ValueUTRA-FDD* information element**

```

-- ASN1START
-- TAG-ARFCN-ValueUTRA-FDD-START

ARFCN-ValueUTRA-FDD-r16 ::= INTEGER (0..16383)

```

```
-- TAG-ARFCN-ValueUTRA-FDD-STOP
-- ASN1STOP
```

## - *ATG-Config*

The IE *ATG-Config* provides parameters needed for the UE to access NR via ATG access.

### **ATG-Config information element**

```
-- ASN1START
-- TAG-ATG-CONFIG-START

ATG-Config-r18 ::= SEQUENCE {
 atg-gNB-Location-r18 OPTIONAL, -- Need R
 height-gNB-r18 OPTIONAL, -- Need R
 cellSpecificKoffset-r18 OPTIONAL, -- Need R
 ta-ReportATG-r18 OPTIONAL, -- Need R
}

-- TAG-ATG-CONFIG-STOP
-- ASN1STOP
```

| <b>ATG-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>atg-gNB-Location</b>              | Indicates the BS location for ATG access.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cellSpecificKoffset</b>           | Scheduling offset used for the timing relationships that are modified for ATG. Unit in slot.                                                                                                                                                                                                                                                                                                                                                      |
| <b>height-gNB</b>                    | Indicates the height of the BS for ATG access relative to the sea level. Unit in meter.                                                                                                                                                                                                                                                                                                                                                           |
| <b>ta-ReportATG</b>                  | When this field is included in SIB22, it indicates reporting of timing advanced is enabled during Random Access due to RRC connection establishment or RRC connection resume, and during RRC connection reestablishment. When this field is included in <i>ServingCellConfigCommon</i> within dedicated signalling, it indicates TA reporting is enabled during Random Access due to reconfiguration with sync (see TS 38.321 [3], clause 5.4.8). |

## - *AvailabilityCombinationsPerCell*

The IE *AvailabilityCombinationsPerCell* is used to configure the *AvailabilityCombinations* applicable for a cell of the IAB DU (see TS 38.213 [13], clause 14). Note that the IE *AvailabilityCombinationsPerCellIndex* can only be configured up to 511.

### **AvailabilityCombinationsPerCell information element**

| <b><i>availabilityCombinationId</i></b>                  | This ID is used in the DCI Format 2_5 payload to dynamically select this <i>AvailabilityCombination</i> , see TS 38.213 [13], clause 14.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>resourceAvailability</i></b>                       | Indicates the resource availability of soft symbols for a set of consecutive slots in the time domain. The meaning of this field is described in TS 38.213 [13], Table 14.3. If included in <i>RB-SetGroup</i> within <i>AvailabilityCombinationRB-Groups-r17</i> , it indicates the availability of soft resources for an RB set group. If included in <i>AvailabilityCombinationRB-Groups-r17</i> when the <i>rb-SetGroups</i> is not configured, it indicates the availability of soft resources in one or multiple slots for all RB sets of a DU cell. |

| <b><i>AvailabilityCombinationsPerCell</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>iab-DU-CellIdentity</i></b>                                | The ID of the IAB-DU cell for which the <i>availabilityCombinations</i> are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>positionInDCI-AI</i></b>                                   | The (starting) position (bit) of the <i>availabilityCombinationId</i> for the indicated IAB-DU cell ( <i>iab-DU-CellIdentity</i> ) within the DCI payload. If <i>positionInDCI-AI-RBGroups</i> is not configured, it applies to the <i>availabilityCombinationId</i> included in <i>availabilityCombinations</i> and in <i>availabilityCombinationsRB-Groups</i> . If <i>positionInDCI-AI-RBGroups</i> is configured, it applies to the <i>availabilityCombinationId</i> included in <i>availabilityCombinations</i> . |
| <b><i>positionInDCI-AI-RBGroups</i></b>                          | The (starting) position (bit) of the <i>availabilityCombinationId</i> associated to the <i>availabilityCombinationsRB-Groups</i> for the indicated IAB-DU cell ( <i>iab-DU-CellIdentity</i> ) within the DCI payload.                                                                                                                                                                                                                                                                                                  |

| <b><i>AvailabilityCombinationRB-Groups</i></b> field descriptions |                                                                                                                   |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b><i>rb-SetGroups</i></b>                                        | Indicates the RB set groups configured for the availability combination. Each group includes consecutive RB sets. |
| <b><i>rb-Sets</i></b>                                             | Indicates the one or more RB set indexes associated to one or more RB sets configured for one RB set group.       |

## – *AvailabilityIndicator*

The IE *AvailabilityIndicator* is used to configure monitoring a PDCCCH for Availability Indicators (AI).

### ***AvailabilityIndicator*** information element

```
-- ASN1START
-- TAG-AVAILABILITYINDICATOR-START

AvailabilityIndicator-r16 ::= SEQUENCE {
 ai-RNTI-r16 AI-RNTI-r16,
 dci-PayloadSizeAI-r16 INTEGER (1..maxAI-DCI-PayloadSize-r16),
 availableCombToAddModList-r16 SEQUENCE (SIZE(1..maxNrofDUCells-r16)) OF AvailabilityCombinationsPerCell-r16 OPTIONAL, -- Need N
 availableCombToReleaseList-r16 SEQUENCE (SIZE(1..maxNrofDUCells-r16)) OF AvailabilityCombinationsPerCellIndex-r16 OPTIONAL, -- Need N
 ...
}

AI-RNTI-r16 ::= RNTI-Value

-- TAG-AVAILABILITYINDICATOR-STOP
-- ASN1STOP
```

| <b>AvailabilityIndicator field descriptions</b> |                                                                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>ai-RNTI</b>                                  | Used by an IAB-MT for detection of DCI format 2_5 indicating <i>AvailabilityCombinationId</i> for an IAB-DU's cells. |
| <b>availableCombToAddModList</b>                | A list of <i>availabilityCombinations</i> to add for the IAB-DU's cells. (see TS 38.213 [13], clause 14).            |
| <b>availableCombToReleaseList</b>               | A list of <i>availabilityCombinations</i> to release for the IAB-DU's cells. (see TS 38.213 [13], clause 14).        |
| <b>dci-PayloadSizeAI</b>                        | Total length of the DCI payload scrambled with ai-RNTI (see TS 38.213 [13]).                                         |

### *BAP-RoutingID*

The IE *BAP-RoutingID* is used for IAB-node to configure the BAP Routing ID.

#### **BAP-RoutingID information element**

```
-- ASN1START
-- TAG-BAPROUTINGID-START

BAP-RoutingID-r16 ::= SEQUENCE {
 bap-Address-r16 BIT STRING (SIZE (10)),
 bap-PathId-r16 BIT STRING (SIZE (10))
}

-- TAG-BAPROUTINGID-STOP
-- ASN1STOP
```

| <b>BAP-RoutingID field descriptions</b> |                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------|
| <b>bap-Address</b>                      | The ID of a destination IAB-node or IAB-donor-DU used in the BAP header. |
| <b>bap-PathId</b>                       | The ID of a path used in the BAP header.                                 |

### *BeamFailureRecoveryConfig*

The IE *BeamFailureRecoveryConfig* is used to configure the UE with RACH resources and candidate beams for beam failure recovery in case of beam failure detection. See also TS 38.321 [3], clause 5.1.1.

#### **BeamFailureRecoveryConfig information element**

| <b><i>BeamFailureRecoveryConfig</i></b> field descriptions      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>beamFailureRecoveryTimer</i></b>                          | Timer for beam failure recovery timer. Upon expiration of the timer the UE does not use CFRA for BFR. Value in ms. Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>candidateBeamRSList, candidateBeamRSListExt-v1610</i></b> | Set of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery and the associated RA parameters. This set includes all elements of <i>candidateBeamRSList</i> (without suffix) and all elements of <i>candidateBeamRSListExt-v1610</i> . The UE maintains <i>candidateBeamRSList</i> and <i>candidateBeamRSListExt-v1610</i> separately: Receiving <i>candidateBeamRSListExt-v1610</i> set to <i>release</i> releases only the entries that were configured by <i>candidateBeamRSListExt-v1610</i> , and receiving <i>candidateBeamRSListExt-v1610</i> set to <i>setup</i> replaces only the entries that were configured by <i>candidateBeamRSListExt-v1610</i> with the newly signalled entries. The network configures these reference signals to be within the linked DL BWP (i.e., within the DL BWP with the same <i>bwp-Id</i> ) of the UL BWP in which the <i>BeamFailureRecoveryConfig</i> is provided. |
| <b><i>msg1-SubcarrierSpacing</i></b>                            | Subcarrier spacing for contention free beam failure recovery (see TS 38.211 [16], clause 5.3.2). Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>rsrp-ThresholdSSB</i></b>                                 | L1-RSRP threshold used for determining whether a candidate beam may be used by the UE to attempt contention free random access to recover from beam failure (see TS 38.213 [13], clause 6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>ra-prioritization</i></b>                                 | Parameters which apply for prioritized random access procedure for BFR (see TS 38.321 [3], clause 5.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>ra-PrioritizationTwoStep</i></b>                          | Parameters which apply for prioritized 2-step random access procedure for BFR (see TS 38.321 [3], clause 5.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>ra-ssb-OccasionMaskIndex</i></b>                          | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>rach-ConfigBFR</i></b>                                    | Configuration of random access parameters for BFR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>recoverySearchSpaceId</i></b>                             | Search space to use for BFR RAR. The network configures this search space to be within the linked DL BWP (i.e., within the DL BWP with the same <i>bwp-Id</i> ) of the UL BWP in which the <i>BeamFailureRecoveryConfig</i> is provided. The CORESET associated with the recovery search space cannot be associated with another search space. Network always configures the UE with a value for this field when contention free random access resources for BFR are configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>rootSequenceIndex-BFR</i></b>                             | PRACH root sequence index (see TS 38.211 [16], clause 6.3.3.1) for beam failure recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b><i>ssb-perRACH-Occasion</i></b>                              | Number of SSBs per RACH occasion for CF-BFR, see TS 38.213 [13], clause 8.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>BFR-CSIRS-Resource field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-RS</b>                                | The ID of a NZP-CSI-RS-Resource configured in the CSI-MeasConfig of this serving cell. This reference signal determines a candidate beam for beam failure recovery (BFR).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ra-OccasionList</b>                       | RA occasions that the UE shall use when performing BFR upon selecting the candidate beam identified by this CSI-RS. The network ensures that the RA occasion indexes provided herein are also configured by prach-ConfigurationIndex and msg1-FDM. Each RACH occasion is sequentially numbered, first, in increasing order of frequency resource indexes for frequency multiplexed PRACH occasions; second, in increasing order of time resource indexes for time multiplexed PRACH occasions within a PRACH slot and Third, in increasing order of indexes for PRACH slots.<br>If the field is absent the UE uses the RA occasion associated with the SSB that is QCLED with this CSI-RS. |
| <b>ra-PreambleIndex</b>                      | The RA preamble index to use in the RA occasions associated with this CSI-RS. If the field is absent, the UE uses the preamble index associated with the SSB that is QCLED with this CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>BFR-SSB-Resource field descriptions</b> |                                                                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>ra-PreambleIndex</b>                    | The preamble index that the UE shall use when performing BFR upon selecting the candidate beams identified by this SSB. |
| <b>ssb</b>                                 | The ID of an SSB transmitted by this serving cell. It determines a candidate beam for beam failure recovery (BFR).      |

## — *BeamFailureRecoveryRSConfig*

The IE *BeamFailureRecoveryRSConfig* is used to configure the UE with candidate beams for beam failure recovery in case of beam failure detection. See also TS 38.321 [3], clause 5.17.

### ***BeamFailureRecoveryRSConfig* information element**

```
-- ASN1START
-- TAG-BEAMFAILURERECOVERYRSCONFIG-START

BeamFailureRecoveryRSConfig-r16 ::= SEQUENCE {
 rsrp-ThresholdBFR-r16 RSRP-Range OPTIONAL, -- Need M
 candidateBeamRS-List-r16 SEQUENCE (SIZE(1..maxNrofCandidateBeams-r16)) OF CandidateBeamRS-r16 OPTIONAL, -- Need M
 ...
 [[
 candidateBeamRS-List2-r17 SEQUENCE (SIZE(1..maxNrofCandidateBeams-r16)) OF CandidateBeamRS-r16 OPTIONAL -- Need R
]]
}
-- TAG-BEAMFAILURERECOVERYRSCONFIG-STOP
-- ASN1STOP
```

| <b><i>BeamFailureRecoveryRSConfig</i></b> field descriptions |                                                                                                                                                                                                                                          |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>candidateBeamRS-List</i></b>                           | A list of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery. The network always configures this parameter in every instance of this IE.                                                                 |
| <b><i>candidateBeamRS-List2</i></b>                          | A list of reference signals (CSI-RS and/or SSB) identifying the candidate beams for recovery.                                                                                                                                            |
| <b><i>rsrp-ThresholdBFR</i></b>                              | L1-RSRP threshold used for determining whether a candidate beam may be included by the UE in MAC CE for BFR (see TS 38.321 [3] and TS 38.213 [13], clause 6). The network always configures this parameter in every instance of this IE. |

— ***BetaOffsets***

The IE *BetaOffsets* is used to configure beta-offset values, see TS 38.213 [13], clause 9.3.

***BetaOffsets* information element**

```
-- ASN1START
-- TAG-BETA OFFSETS-START

BetaOffsets ::= SEQUENCE {
 betaOffsetACK-Index1 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetACK-Index2 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetACK-Index3 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetCSI-Part1-Index1 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetCSI-Part1-Index2 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetCSI-Part2-Index1 INTEGER(0..31) OPTIONAL, -- Need S
 betaOffsetCSI-Part2-Index2 INTEGER(0..31) OPTIONAL, -- Need S
}
-- TAG-BETA OFFSETS-STOP
-- ASN1STOP
```

| <b>BetaOffsets field descriptions</b> |                                                                                                                          |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>betaOffsetACK-Index1</b>           | Up to 2 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.            |
| <b>betaOffsetACK-Index2</b>           | Up to 11 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.           |
| <b>betaOffsetACK-Index3</b>           | Above 11 bits HARQ-ACK (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 11.           |
| <b>betaOffsetCSI-Part1-Index1</b>     | Up to 11 bits of CSI part 1 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b>betaOffsetCSI-Part1-Index2</b>     | Above 11 bits of CSI part 1 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b>betaOffsetCSI-Part2-Index1</b>     | Up to 11 bits of CSI part 2 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |
| <b>betaOffsetCSI-Part2-Index2</b>     | Above 11 bits of CSI part 2 bits (see TS 38.213 [13], clause 9.3). When the field is absent the UE applies the value 13. |

- **BetaOffsetsCrossPri**

The IE *BetaOffsetsCrossPri* is used to configure beta-offset values for cross-priority HARQ-ACK multiplexing on PUSCH.

#### **BetaOffsetsCrossPri information element**

```
-- ASN1START
-- TAG-BETAOFFSETSCROSSPRI-START

BetaOffsetsCrossPri-r17 ::= SEQUENCE (SIZE(3)) OF INTEGER(0..31)

-- TAG-BETAOFFSETSCROSSPRI-STOP
-- ASN1STOP
```

- **BH-LogicalChannelIdentity**

The IE *BH-LogicalChannelIdentity* is used to identify a logical channel between an IAB-node and its parent IAB-node or IAB-donor-DU.

#### **BH-LogicalChannelIdentity information element**

```
-- ASN1START
-- TAG-BHLOGICALCHANNELIDENTITY-START

BH-LogicalChannelIdentity-r16 ::= CHOICE {
 bh-LogicalChannelIdentity-r16 LogicalChannelIdentity,
 bh-LogicalChannelIdentityExt-r16 BH-LogicalChannelIdentity-Ext-r16
}
-- TAG-BHLOGICALCHANNELIDENTITY-STOP
```

-- ASN1STOP

| <b><i>BH-LogicalChannelIdentity</i> field descriptions</b> |                                      |
|------------------------------------------------------------|--------------------------------------|
| <b><i>bh-LogicalChannelIdentity</i></b>                    | ID used for the MAC logical channel. |
| <b><i>bh-LogicalChannelIdentityExt</i></b>                 | ID used for the MAC logical channel. |

### – *BH-LogicalChannelIdentity-Ext*

The IE *BH-LogicalChannelIdentity-Ext* is used to identify a logical channel between an IAB-node and its parent node.

#### ***BH-LogicalChannelIdentity-Ext* information element**

```
-- ASN1START
-- TAG-BHLOGICALCHANNELIDENTITYEXT-START
BH-LogicalChannelIdentity-Ext-r16 ::= INTEGER (320.. maxLC-ID-Iab-r16)
-- TAG-BHLOGICALCHANNELIDENTITYEXT-STOP
-- ASN1STOP
```

### – *BH-RLC-ChannelConfig*

The IE *BH-RLC-ChannelConfig* is used to configure an RLC entity, a corresponding logical channel in MAC for BH RLC channel between IAB-node and its parent node.

#### ***BH-RLC-ChannelConfig* information element**

```
-- ASN1START
-- TAG-BHRLCCHANNELCONFIG-START
BH-RLC-ChannelConfig-r16 ::= SEQUENCE {
 bh-LogicalChannelIdentity-r16 BH-LogicalChannelIdentity-r16 OPTIONAL, -- Cond LCH-SetupOnly
 bh-RLC-ChannelID-r16 BH-RLC-ChannelID-r16,

| <b><i>BH-RLC-ChannelConfig</i></b> field descriptions |                                                                                                                            |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b><i>bh-LogicalChannelIdentity</i></b>               | Indicates the logical channel id for BH RLC channel of the IAB-node.                                                       |
| <b><i>bh-RLC-ChannelID</i></b>                        | Indicates the BH RLC channel in the link between IAB-MT of the IAB-node and IAB-DU of the parent IAB-node or IAB-donor-DU. |
| <b><i>reestablishRLC</i></b>                          | Indicates that RLC should be re-established.                                                                               |
| <b><i>rlc-Config</i></b>                              | Determines the RLC mode (UM, AM) and provides corresponding parameters.                                                    |

| Conditional Presence | Explanation                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LCH-Setup</i>     | This field is mandatory present upon creation of a new logical channel for a BH RLC channel. It is optionally present, Need M, otherwise. |
| <i>LCH-SetupOnly</i> | This field is mandatory present upon creation of a new logical channel for a BH RLC channel. It is absent, Need M otherwise.              |

### – ***BH-RLC-ChannelID***

The IE ***BH-RLC-ChannelID*** is used to identify a BH RLC channel in the link between IAB-MT of the IAB-node and IAB-DU of the parent IAB-node or IAB-donor-DU.

#### ***BH-RLC-ChannelID*** information element

```
-- ASN1START
-- TAG-BHRLCCHANNELID-START

BH-RLC-ChannelID-r16 ::= BIT STRING (SIZE (16))

-- TAG-BHRLCCHANNELID-STOP
-- ASN1STOP
```

### – ***BSR-Config***

The IE ***BSR-Config*** is used to configure buffer status reporting.

#### ***BSR-Config*** information element

```
-- ASN1START
-- TAG-BSR-CONFIG-START

BSR-Config ::= SEQUENCE {
 periodicBSR-Timer ENUMERATED { sf1, sf5, sf10, sf16, sf20, sf32, sf40, sf64,

|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b><i>logicalChannelSR-DelayTimer</i></b>   | Value in number of subframes. Value sf20 corresponds to 20 subframes, sf40 corresponds to 40 subframes, and so on.      |
| <b><i>periodicBSR-Timer</i></b>             | Value in number of subframes. Value sf1 corresponds to 1 subframe, value sf5 corresponds to 5 subframes and so on.      |
| <b><i>retxBSR-Timer</i></b>                 | Value in number of subframes. Value sf10 corresponds to 10 subframes, value sf20 corresponds to 20 subframes and so on. |

## — ***BWP***

The IE ***BWP*** is used to configure generic parameters of a bandwidth part as defined in TS 38.211 [16], clause 4.5, and TS 38.213 [13], clause 12.

For each serving cell the network configures at least an initial downlink bandwidth part and one (if the serving cell is configured with an uplink) or two (if using supplementary uplink (SUL)) initial uplink bandwidth parts. Furthermore, the network may configure additional uplink and downlink bandwidth parts for a serving cell.

The uplink and downlink bandwidth part configurations are divided into common and dedicated parameters.

### ***BWP information element***

```
-- ASN1START
-- TAG-BWP-START

BWP ::= SEQUENCE {
 locationAndBandwidth INTEGER (0..37949),
 subcarrierSpacing SubcarrierSpacing,
 cyclicPrefix ENUMERATED { extended }
} OPTIONAL -- Need R

-- TAG-BWP-STOP
-- ASN1STOP
```

| <b>BWP field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cyclicPrefix</b>           | Indicates whether to use the extended cyclic prefix for this bandwidth part. If not set, the UE uses the normal cyclic prefix. Normal CP is supported for all subcarrier spacings and slot formats. Extended CP is supported only for 60 kHz subcarrier spacing. (see TS 38.211 [16], clause 4.2). Except for SUL, the network ensures the same cyclic prefix length is used in active DL BWP and active UL BWP within a serving cell. If RedCap-specific initial DL BWP is configured, the network ensures the same cyclic prefix length is configured for initial DL BWP and RedCap-specific initial DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>locationAndBandwidth</b>   | Frequency domain location and bandwidth of this bandwidth part. The value of the field shall be interpreted as resource indicator value (RIV) as defined TS 38.214 [19] with assumptions as described in TS 38.213 [13], clause 12, i.e. setting $N_{\text{BWP}}^{\text{size}}$ =275. The first PRB is a PRB determined by <i>subcarrierSpacing</i> of this BWP and <i>offsetToCarrier</i> (configured in <i>SCS-SpecificCarrier</i> contained within <i>FrequencyInfoDL</i> / <i>FrequencyInfoUL</i> / <i>FrequencyInfoUL-SIB</i> / <i>FrequencyInfoDL-SIB</i> within <i>ServingCellConfigCommon</i> / <i>ServingCellConfigCommonSIB</i> ) corresponding to this subcarrier spacing. In case of TDD, a BWP-pair (UL BWP and DL BWP with the same <i>bwp-Id</i> ) must have the same center frequency (see TS 38.213 [13], clause 12)                                                                                                                                                                                                                                                                                                                         |
| <b>subcarrierSpacing</b>      | Subcarrier spacing to be used in this BWP for all channels and reference signals unless explicitly configured elsewhere. Corresponds to subcarrier spacing according to TS 38.211 [16], table 4.2-1. The value <i>kHz15</i> corresponds to $\mu=0$ , value <i>kHz30</i> corresponds to $\mu=1$ , and so on.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>For the initial DL BWP and operation in licensed spectrum this field has the same value as the field <i>subCarrierSpacingCommon</i> in <i>MIB</i> of the same serving cell. Except for SUL, the network ensures the same subcarrier spacing is used in active DL BWP and active UL BWP within a serving cell. For the initial DL BWP and operation with shared spectrum channel access, the value of this field corresponds to the subcarrier spacing of the SSB associated to the initial DL BWP. If RedCap-specific initial DL BWP is configured, the network ensures the same subcarrier spacing is configured for initial DL BWP and RedCap-specific initial DL BWP. |

## — *BWP-Downlink*

The IE *BWP-Downlink* is used to configure an additional downlink bandwidth part (not for the initial BWP).

### **BWP-Downlink information element**

```
-- ASN1START
-- TAG-BWP-DOWNLINK-START

BWP-Downlink ::= SEQUENCE {
 bwp-Id,
 bwp-Common,
 bwp-Dedicated
 ...
}
-- TAG-BWP-DOWNLINK-STOP
-- ASN1STOP
```

|                                                                                                                                      |                                                                                              |

|--------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|

| <b>BWP-Downlink field descriptions</b>                                                                                                                                                                                                                                                                                                |  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>bwp-Id</b><br>An identifier for this bandwidth part. Other parts of the RRC configuration use the <i>BWP-Id</i> to associate themselves with a particular bandwidth part.<br>The network configures the BWPs with consecutive IDs from 1. The Network does not include the value 0, since value 0 is reserved for the initial BWP. |  |

| Conditional Presence | Explanation                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>SetupOtherBWP</i> | The field is mandatory present upon configuration of a new DL BWP. The field is optionally present, Need M, otherwise. |

### - *BWP-DownlinkCommon*

The IE *BWP-DownlinkCommon* is used to configure the common parameters of a downlink BWP. They are "cell specific" and the network ensures the necessary alignment with corresponding parameters of other UEs. The common parameters of the initial bandwidth part of the PCell are also provided via system information. For all other serving cells, the network provides the common parameters via dedicated signalling.

#### **BWP-DownlinkCommon information element**

```

| <b>beamFailureRecoverySCellConfig</b>           | Configuration of candidate RS for beam failure recovery on SCells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>beamFailureRecoverySpCellConfig</b>          | Configuration of candidate RS for beam failure recovery on the SpCell. This field can only be configured when <i>beamFailure-r17</i> is configured in <i>RadioLinkMonitoringConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cfr-ConfigMulticast</b>                      | UE specific common frequency resource configuration for MBS multicast for one dedicated BWP. This field can be configured within at most one serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>dl-PPW-PreConfigToAddModList</b>             | Indicates a list of DL-PRS processing window configurations to be added or modified for the dedicated DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>dl-PPW-PreConfigToReleaseList</b>            | Indicates a list of DL-PRS processing window configurations to be released for the dedicated DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>harq-FeedbackEnablingforSPSactive</b>        | If enabled, UE reports ACK/NACK for the first SPS PDSCH after activation, regardless of if HARQ feedback is enabled or disabled for the HARQ process corresponding to the first SPS PDSCH after activation. Otherwise, UE follows configuration of HARQ feedback enabled/disabled for the HARQ process corresponding to the first SPS PDSCH after activation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nonCellDefiningSSB</b>                       | If configured, the UE operating in this BWP uses this SSB for the purposes for which it would otherwise have used the CD-SSB of the serving cell (e.g. obtaining sync, measurements, RLM, BFD, beam management). Furthermore, other parts of the BWP configuration that refer to an SSB (e.g. the "SSB" configured in the <i>QCL-Info</i> IE; the "ssb-Index" configured in the <i>RadioLinkMonitoringRS</i> ; <i>CFRA-SSB-Resource</i> ; <i>PRACH-ResourceDedicatedBFR</i> ) refer implicitly to this NCD-SSB. The NCD-SSB has the same values for the properties (e.g., <i>ssb-PositionsInBurst</i> , <i>PCI</i> , <i>ssb-PBCH-BlockPower</i> ) of the corresponding CD-SSB apart from the values of the properties configured in the <i>NonCellDefiningSSB-r17</i> IE. In the MIB associated with this NCD-SSB, the <i>systemFrameNumber</i> field indicates the frame boundary and frame number of the NCD-SSB. The <i>subCarrierSpacingCommon</i> and <i>dmrs-TypeA-Position</i> field in the MIBs associated with CD-SSB and NCD-SSB in the same cell are configured with the same values, respectively. |
| <b>pdcch-Config</b>                             | UE specific PDCCH configuration for one BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pdsch-Config</b>                             | UE specific PDSCH configuration for one BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>preConfGapStatus</b>                         | Indicates whether the pre-configured measurement gaps (i.e. the gaps configured with <i>preConfigInd</i> ) are activated or deactivated upon the switch to this BWP. If this field is configured, the UE shall apply network-controlled mechanism for activation and deactivation of the pre-configured measurement gaps, otherwise the UE shall apply the autonomous activation/deactivation mechanism, as specified in TS 38.133 [14]. The first/leftmost bit corresponds to the measurement gap with gap ID 1, the second bit corresponds to measurement gap with gap ID 2, and so on. Value 0 indicates that the corresponding pre-configured measurement gap is deactivated while value 1 indicates that the corresponding pre-configured measurement gap is activated. The UE shall ignore the bit if the corresponding measurement gap is not a pre-configured measurement gap.                                                                                                                                                                                                                         |
| <b>servingCellMO</b>                            | <i>measObjectIId</i> of the <i>MeasObjectNR</i> in <i>MeasConfig</i> which is associated to the serving cell. For this <i>MeasObjectNR</i> , the following relationship applies between this <i>MeasObjectNR</i> and <i>nonCellDefiningSSB</i> in <i>BWP-DownlinkDedicated</i> of the associated downlink BWP: if <i>ssbFrequency</i> is configured, its value is the same as the <i>absoluteFrequencySSB</i> in the <i>nonCellDefiningSSB</i> . If the field is present in a downlink BWP and the BWP is activated, the UE uses this measurement object for serving cell measurements (e.g., including those used in measurement report triggering events), otherwise, the UE uses the <i>servingCellMO</i> in <i>ServingCellConfig</i> IE.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>sps-Config</b>                               | UE specific SPS (Semi-Persistent Scheduling) configuration for one BWP. Except for reconfiguration with sync, the NW does not reconfigure <i>sps-Config</i> when there is an active configured downlink assignment (see TS 38.321 [3]). However, the NW may release the <i>sps-Config</i> at any time. Network can only configure SPS in one BWP using either this field or <i>sps-ConfigToAddModList</i> . Network does not configure SPS in one BWP using this field and <i>sps-ConfigMulticastToAddModList-r17</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>sps-ConfigDeactivationStateList</b>          | Indicates a list of the deactivation states in which each state can be mapped to a single or multiple SPS configurations to be deactivated, see clause 10.2 in TS 38.213 [13]. If a state is mapped to multiple SPS configurations, each of these SPS configurations is configured with the same <i>harq-CodebookID</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sps-ConfigToAddModList</b>                                                                                                                                                                                                                                                                                                                     |
| Indicates a list of one or more DL SPS configurations to be added or modified in one BWP. Except for reconfiguration with sync, the NW does not reconfigure a SPS configuration when it is active (see TS 38.321 [3]).                                                                                                                            |
| <b>sps-ConfigToReleaseList</b>                                                                                                                                                                                                                                                                                                                    |
| Indicates a list of one or more DL SPS configurations to be released. The NW may release a SPS configuration at any time.                                                                                                                                                                                                                         |
| <b>radioLinkMonitoringConfig</b>                                                                                                                                                                                                                                                                                                                  |
| UE specific configuration of radio link monitoring for detecting cell- and beam radio link failure occasions. The maximum number of failure detection resources should be limited up to 8 for both cell and beam radio link failure detection. For SCells, only periodic 1-port CSI-RS can be configured in IE <i>RadioLinkMonitoringConfig</i> . |
| <b>sl-PDCCH-Config</b>                                                                                                                                                                                                                                                                                                                            |
| Indicates the UE specific PDCCH configurations for receiving the SL grants (via SL-RNTI or SL-CS-RNTI) for NR sidelink communication/discovery.                                                                                                                                                                                                   |
| <b>sl-V2X-PDCCH-Config</b>                                                                                                                                                                                                                                                                                                                        |
| Indicates the UE specific PDCCH configurations for receiving SL grants (i.e. sidelink SPS) for V2X sidelink communication.                                                                                                                                                                                                                        |

| <b>TCI-InDCI field descriptions</b>   |                                                                                                                                                                                                                        |

## – *BWP-Id*

The IE *BWP-Id* is used to refer to Bandwidth Parts (BWP). The initial BWP (including RedCap-specific initial BWP, if configured) is referred to by *BWP-Id* 0. The other BWPs are referred to by *BWP-Id* 1 to *maxNrofBWPs*.

### ***BWP-Id* information element**

```
-- ASN1START
-- TAG-BWP-ID-START

BWP-Id ::= INTEGER (0 .. maxNrofBWPs)

-- TAG-BWP-ID-STOP
-- ASN1STOP
```

## – *BWP-Uplink*

The IE *BWP-Uplink* is used to configure an additional uplink bandwidth part (not for the initial BWP).

### ***BWP-Uplink* information element**

```
-- ASN1START
-- TAG-BWP-UPLINK-START

BWP-Uplink ::= SEQUENCE {
 bwp-Id,
 bwp-Common
 bwp-Dedicated
 ...
}

-- TAG-BWP-UPLINK-STOP
-- ASN1STOP
```

| <b><i>BWP-Uplink</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bwp-Id</b>                               | An identifier for this bandwidth part. Other parts of the RRC configuration use the <i>BWP-Id</i> to associate themselves with a particular bandwidth part.<br>The network configures the BWPs with consecutive IDs from 1. The Network does not include the value 0, since value 0 is reserved for the initial BWP. |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                     |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------|
| <i>SetupOtherBWP</i>        | The field is mandatory present upon configuration of a new UL BWP. The field is optionally present, Need M, otherwise. |

## – *BWP-UplinkCommon*

The IE *BWP-UplinkCommon* is used to configure the common parameters of an uplink BWP. They are "cell specific" and the network ensures the necessary alignment with corresponding parameters of other UEs. The common parameters of the initial bandwidth part of the PCell, excluding *additionalRACH-perPCI-ToAddModList* and *additionalRACH-perPCI-ToReleaseList*, are also provided via system information. For all other serving cells, the network provides the common parameters via dedicated signalling.

|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalRACH-ConfigList</b>                                               | List of feature or feature combination-specific RACH configurations, i.e. the RACH configurations configured in addition to the one configured by <i>rach-ConfigCommon</i> and by <i>msgA-ConfigCommon</i> . The network associates all possible preambles of an additional RACH configuration to one or more feature(s) or feature combination(s). The network does not configure this list to have more than 16 entries. If both <i>rach-ConfigCommon</i> and <i>msgA-ConfigCommon</i> are configured for a specific <i>FeatureCombination</i> , the network always provides them in the same <i>additionalRACH-Config</i> .                                                                                                                                                                                                                                                            |
| <b>additionalRACH-perPCI-ToAddModList, additionalRACH-perPCI-ToReleaseList</b> | List of RACH configurations for the additional PCIs. The RACH configuration for an additional PCI is applied for Random Access procedure initiated by PDCCH order towards to the additional PCI, as specified in TS 38.321 clause 5.1.1b. This list includes the same number of elements like <i>additionalPCI-ToAddModList</i> for this serving cell and the <i>n</i> -th element of this list is for the PCI in the <i>n</i> -th element of <i>additionalPCI-ToAddModList</i> . Either the network does not configure any RACH configuration for any additional PCI, or the network configures a RACH configuration for each additional PCI. When the network releases an additional PCI of a serving cell, the network also explicitly releases the associated random access configuration in every UL BWP of the serving cell. This configuration may be different for different UEs. |
| <b>enableRA-PrioritizationForSlicing</b>                                       | Indicates whether or not the <i>ra-PrioritizationForSlicing</i> / <i>ra-PrioritizationForSlicingTwoStep</i> should override the <i>ra-PrioritizationForAccessIdentity</i> . The field is applicable only when the UE is configured by upper layers with both NSAG and Access Identity 1 or 2. If value <i>TRUE</i> is configured, the UE should only apply the <i>ra-PrioritizationForSlicing</i> / <i>ra-PrioritizationForSlicingTwoStep</i> . If value <i>FALSE</i> is configured, the UE should only apply <i>ra-PrioritizationForAccessIdentity</i> . If the field is absent, whether to use <i>ra-PrioritizationForSlicing</i> / <i>ra-PrioritizationForSlicingTwoStep</i> or <i>ra-PrioritizationForAccessIdentity</i> is up to UE implementation.                                                                                                                                  |
| <b>mcs-Msg3-Repetitions</b>                                                    | Configuration of eight candidate MCS indexes for PUSCH transmission scheduled by RAR UL grant and DCI format 0_0 with CRC scrambled by TC-RNTI. Only the first 4 configured or default MCS indexes are used for PUSCH transmission scheduled by RAR UL grant. This field is only applicable when the UE selects Random Access resources indicating Msg3 repetition in this BWP. If this field is absent when the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i> , the UE shall apply the values {0, 1, 2, 3, 4, 5, 6, 7} (see TS 38.214 [19], clause 6.1.4).                                                                                                                                                                                                                                                             |
| <b>msgA-ConfigCommon</b>                                                       | Configuration of the cell specific PRACH and PUSCH resource parameters for transmission of MsgA in 2-step random access type procedure. The NW can configure <i>msgA-ConfigCommon</i> only for UL BWPs if the linked DL BWPs (same bwp-Id as UL-BWP) are the initial DL BWPs or DL BWPs containing the SSB associated to the initial DL BWP or DL BWPs associated with <i>nonCellDefiningSSB</i> or, for (e)RedCap UEs, the RedCap-specific initial downlink BWP. The network configures <i>msgA-ConfigCommon</i> (without suffix) and/or <i>msgA-ConfigCommon-r17</i> , whenever it configures contention free 2-step random access, the UE then applies the corresponding configuration depending on the RACH resource set selected upon RACH initialization, as specified in TS 38.321 [3].                                                                                            |
| <b>numberOfMsg3RepetitionsList</b>                                             | The number of repetitions for PUSCH transmission scheduled by RAR UL grant and DCI format 0_0 with CRC scrambled by TC-RNTI. This field is only applicable when the UE selects Random Access resources indicating Msg3 repetition in this BWP. If this field is absent when the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i> , the UE shall apply the values {n1, n2, n3, n4} (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>preambleTransMax-Msg1-Repetition</b>                                        | Max number of transmissions of MSG1 repetitions number (2, 4 and 8) performed before switching to higher repetition number (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when more than one repetition numbers are configured in shared RO. If the field is absent, switching from lower repetition number to higher repetition number is not allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>pucch-ConfigCommon</b>                                                      | Cell specific parameters for the PUCCH of this BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

***rach-ConfigCommon***

Configuration of cell specific random access parameters which the UE uses for contention based and contention free random access as well as for contention based beam failure recovery in this BWP. The NW configures SSB-based RA (and hence *RACH-ConfigCommon*) only for UL BWPs if the linked DL BWPs (same *bwp-Id* as UL-BWP) are the initial DL BWPs or DL BWPs containing the SSB associated to the initial DL BWP or DL BWPs associated with *nonCellDefiningSSB* or, for (e)RedCap UEs, the RedCap-specific initial downlink BWP. The network configures *rach-ConfigCommon* (without suffix) and/or *rach-ConfigCommon-r17*, whenever it configures contention free 4-step random access (e.g. for reconfiguration with sync or for beam failure recovery or PDCCH order), the UE then applies the corresponding configuration depending on the RACH resource set selected upon RACH initialization, as specified in TS 38.321 [3]. For RedCap-specific initial uplink BWP, *rach-ConfigCommon* is always configured when *msgA-ConfigCommon* is configured in this BWP.

***rach-ConfigCommonIAB***

Configuration of cell specific random access parameters for the IAB-MT. The IAB specific IAB RACH configuration is used by IAB-MT, if configured.

***rsrp-ThresholdMsg1-RepetitionNum2, rsrp-ThresholdMsg1-RepetitionNum4, rsrp-ThresholdMsg1-RepetitionNum8***

Threshold used by the UE for determining whether to select resources indicating Msg1 repetition number 2, 4 or 8 in this BWP, as specified in TS 38.321 [3]. The value applies to all the BWPs and all RACH configurations. For a given MSG1 repetition number, this corresponding field is mandatory if both set(s) of Random Access resources with MSG1 repetition indication associated with this MSG1 repetition number and set(s) of Random Access resources without MSG1 repetition indication are configured in the BWP, or if the set(s) of Random Access resources with MSG1 repetition indication associated with this MSG1 repetition number and set(s) of Random Access resources with MSG1 repetition indication associated with a lower repetition number are configured in the BWP. It is absent otherwise.

***rsrp-ThresholdMsg3***

Threshold used by the UE for determining whether to select resources indicating Msg3 repetition in this BWP, as specified in TS 38.321 [3]. The field is mandatory if both set(s) of Random Access resources with MSG3 repetition indication and set(s) of Random Access resources without MSG3 repetition indication are configured in the BWP. It is absent otherwise.

***useInterlacePUCCH-PUSCH***

If the field is present, the UE uses uplink frequency domain resource allocation Type 2 for cell-specific PUSCH, e.g., PUSCH scheduled by RAR UL grant (see TS 38.213 [13] clause 8.3 and TS 38.214 [19], clause 6.1.2.2) and uses interlaced PUCCH Format 0 and 1 for cell-specific PUCCH (see TS 38.213 [13], clause 9.2.1).

| Conditional Presence  | Explanation                                                                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Msg1Rep1</i>       | This field is optionally present, Need R, if the set(s) of Random Access resources with MSG1 repetition indication are configured in the <i>BWP-UplinkCommon</i> . It is absent otherwise.                                                               |
| <i>Msg3Rep</i>        | This field is optionally present, Need S, if the set(s) of Random Access resources with MSG3 repetition indication are configured in the <i>BWP-UplinkCommon</i> . It is absent otherwise.                                                               |
| <i>RA-PrioSliceAI</i> | The field is optionally present in <i>SIB1</i> , Need R, if both parameters <i>ra-PrioritizationForAccessIdentity</i> and the <i>ra-PrioritizationForSlicing/ra-PrioritizationForSlicingTwoStep</i> are present in <i>SIB1</i> . It is absent otherwise. |
| <i>SpCellOnly2</i>    | The field is optionally present, Need M, in the <i>BWP-UplinkCommon</i> of an SpCell. It is absent otherwise.                                                                                                                                            |
| <i>2TA-Only</i>       | The field is optionally present, Need N in the <i>BWP-UplinkCommon</i> if <i>additionalPCI-ToAddModList</i> is present in <i>ServingCellConfig</i> and if <i>tag2</i> is present in <i>ServingCellConfig</i> . It is absent otherwise.                   |

- ***BWP-UplinkDedicated***

The IE *BWP-UplinkDedicated* is used to configure the dedicated (UE specific) parameters of an uplink BWP.

| <b>beamFailureRecoveryConfig</b>                       | Configuration of beam failure recovery. If <i>supplementaryUplink</i> is present, the field is present only in one of the uplink carriers, either UL or SUL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>configuredGrantConfig</b>                           | A Configured-Grant of type1 or type2. It may be configured for UL or SUL but in case of type1 not for both at a time. Except for reconfiguration with sync, the NW does not reconfigure <i>configuredGrantConfig</i> when there is an active configured uplink grant Type 2 (see TS 38.321 [3]). However, the NW may release the <i>configuredGrantConfig</i> at any time. Network can only configure configured grant in one BWP using either this field or <i>configuredGrantConfigToAddModList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>configuredGrantConfigToAddModList</b>               | Indicates a list of one or more configured grant configurations to be added or modified for one BWP. Except for reconfiguration with sync, the NW does not reconfigure a Type 2 configured grant configuration when it is active (see TS 38.321 [3]). The network configures multiple CG configurations for one BWP with either all configurations or no configuration configured with <i>cg-RetransmissionTimer-r16</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>configuredGrantConfigToReleaseList</b>              | Indicates a list of one or more UL Configured Grant configurations to be released. The NW may release a configured grant configuration at any time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>configuredGrantConfigType2DeactivationStateList</b> | Indicates a list of the deactivation states in which each state can be mapped to a single or multiple Configured Grant type 2 configurations to be deactivated when the corresponding deactivation DCI is received, see clause 7.3.1 in TS 38.212 [17] and clause 10.2 in TS 38.213 [13].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cp-ExtensionC2, cp-ExtensionC3</b>                  | Configures the cyclic prefix (CP) extension (see TS 38.211 [16], clause 5.3.1). For 15 kHz SCS, {1..28} are valid for both <i>cp-ExtensionC2</i> and <i>cp-ExtensionC3</i> . For 30 kHz SCS, {1..28} are valid for <i>cp-ExtensionC2</i> and {2..28} are valid for <i>cp-ExtensionC3</i> . For 60 kHz SCS, {2..28} are valid for <i>cp-ExtensionC2</i> and {3..28} are valid for <i>cp-ExtensionC3</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>lbt-FailureRecoveryConfig</b>                       | Configures parameters used for detection of consistent uplink LBT failures for operation with shared spectrum channel access, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pathlossReferenceRSToAddModList</b>                 | A list of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for path loss estimation for PUSCH, PUCCH and SRS for unified TCI state operation. If <i>unifiedTCI-StateType</i> is not configured for the serving cell, no element in this list is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pucch-Config</b>                                    | PUCCH configuration for one BWP of the normal UL or SUL of a serving cell. If the UE is configured with SUL, the network configures PUCCH only on the BWPs of one of the uplinks (normal UL or SUL). The network configures <i>PUCCH-Config</i> at least on non-initial BWP(s) for SpCell and on all BWP(s) for PUCCH SCell. If supported by the UE, the network may configure at most one additional SCell of a cell group with <i>PUCCH-Config</i> (i.e. PUCCH SCell). If PUCCH cell switching is supported by the UE, the network may configure two TDD serving cells with <i>PUCCH-Config</i> within each PUCCH group. For supporting PUCCH cell switching in the PUCCH group with the SpCell, the TDD SpCell and one TDD SCell shall have <i>PUCCH-Config</i> on their normal UL. For supporting PUCCH cell switching in the PUCCH group with only SCells, two TDD SCells shall have <i>PUCCH-Config</i> on their normal UL.<br>In (NG)EN-DC and NE-DC, the NW configures at most one serving cell per frequency range with PUCCH. In (NG)EN-DC and NE-DC, if two PUCCH groups are configured, the serving cells of the NR PUCCH group in FR2 use the same numerology. For NR-DC, the maximum number of PUCCH groups in each cell group is one, and only the same numerology is supported for the cell group with carriers only in FR2.<br>The NW may configure PUCCH for a BWP when setting up the BWP. The network may also add/remove the <i>pucch-Config</i> in an <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> (for SpCell or PUCCH SCell) or with SCell release and add (for PUCCH SCell) to move the PUCCH between the UL and SUL carrier of one serving cell. In other cases, only modifications of a previously configured <i>pucch-Config</i> are allowed.<br>If one (S)UL BWP of a serving cell is configured with PUCCH, all other (S)UL BWPs must be configured with PUCCH, too. |
| <b>pucch-ConfigurationList</b>                         | PUCCH configurations for two simultaneously constructed HARQ-ACK codebooks (see TS 38.213 [13], clause 9.1). Different PUCCH Resource IDs are configured in different <i>PUCCH-Config</i> within the <i>pucch-ConfigurationList</i> if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pucch-ConfigurationListMulticast1</b>               | PUCCH configurations for two simultaneously constructed HARQ-ACK codebooks for MBS multicast (see TS 38.213, clause 9).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b><i>pusch-Config</i></b>            | PUSCH configuration for one BWP of the normal UL or SUL of a serving cell. If the UE is configured with SUL and if it has a <i>PUSCH-Config</i> for both UL and SUL, an UL/SUL indicator field in DCI indicates which of the two to use. See TS 38.212 [17], clause 7.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>pucch-ConfigMulticast1</i></b>  | PUCCH configuration for the HARQ-ACK codebook for MBS multicast when multicast feedback is not configured with a priority value (see TS 38.213 [13], clause 9). If the field is not configured, <i>pucch-Config</i> applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>pucch-ConfigMulticast2</i></b>  | PUCCH configuration for the NACK-only feedback for MBS multicast when multicast feedback is not configured with a priority value (see TS 38.213 [13], clause 9). If the field is not configured, <i>pucch-Config</i> applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>si-PUCCH-Config</i></b>         | Indicates the UE specific PUCCH configurations used for the HARQ-ACK feedback reporting for NR sidelink communication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>srs-Config</i></b>              | Uplink sounding reference signal configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>ul-powerControl</i></b>         | Configures power control parameters for PUCCH, PUSCH and SRS when UE is configured with <i>unifiedTCI-StateType</i> for this serving cell. For each serving cell, <i>ul-powerControl</i> is either configured in all <i>BWP-UplinkDedicated</i> or it is not configured in any <i>BWP-UplinkDedicated</i> . When <i>unifiedTCI-StateRef</i> in the <i>BWP-UplinkDedicated</i> or in the <i>PDSCH-Config</i> if the <i>unifiedTCI-StateType</i> is set to <i>joint</i> , of a serving cell refers to another serving cell, <i>ul-powerControl</i> is either configured in all <i>BWP-UplinkDedicated</i> of these two serving cells or it is not configured in any <i>BWP-UplinkDedicated</i> of these two serving cells. |
| <b><i>ul-TCI-StateList</i></b>        | Indicates the applicable UL TCI states for PUCCH, PUSCH and SRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>ul-TCI-ToAddModList</i></b>     | Indicates a list of UL TCI states.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>unifiedTCI-StateRef</i></b>     | Provides the serving cell and UL BWP where UL TCI states applicable to this UL BWP are defined. The value of <i>unifiedTCI-StateType</i> of current serving cell is the same in the serving cell indicated by <i>unifiedTCI-StateRef</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>useInterlacePUCCH-PUSCH</i></b> | If the field is present, the UE uses uplink frequency domain resource allocation Type 2 for PUSCH (see TS 38.213 [13], clause 8.3 and TS 38.214 [19], clause 6.1.2.2) and uses interlaced PUCCH Format 0, 1, 2, and 3 for PUCCH (see TS 38.213 [13], clause 9.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Conditional Presence | Explanation                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>NoTCI-PC</i>      | The field is mandatory present if <i>unifiedTCI-StateType</i> is configured for this serving cell and <i>ul-powerControl</i> is not configured for any UL TCI state or joint TCI state of this serving cell. Otherwise it is absent, Need R |
| <i>SpCellOnly</i>    | The field is optionally present, Need M, in the <i>BWP-UplinkDedicated</i> of an SpCell. It is absent otherwise.                                                                                                                            |

NOTE 1: In case of *RRCReconfiguration* with *reconfigurationWithSync*, the UE performs a MAC reset, which involves releasing the PUCCH-CSI/SRS/SR configuration in accordance with clause 5.3.12 and TS 38.321 [3], clauses 5.12 and 5.2. Hence, for these parts of the dedicated radio resource configuration, delta signalling is not supported in the message when *reconfigurationWithSync* is included.

## – *CandidateBeamRS*

The IE *CandidateBeamRS* includes candidate beams for beam failure recovery in case of beam failure detection. See also TS 38.321 [3], clause 5.17.

***CandidateBeamRS* information element**

```
-- ASN1START

| <b>CandidateTCI-State field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pathlossReferenceRS-Id</b>                | Indicates a <i>PathlossReferenceRS</i> of the candidate that includes this <i>CandidateTCI-State</i> and it refers to one of the <i>PathlossReferenceRS</i> configured within <i>LTM-TCI-Info</i> . In this version of the specification only SSB can be included as reference signal when <i>PathlossReferenceRS</i> is included within a <i>CandidateTCI-State</i> IE.      |
| <b>qcl-Type1, qcl-Type2</b>                  | QCL information for the TCI state.                                                                                                                                                                                                                                                                                                                                            |
| <b>tci-StateId</b>                           | The ID number of the TCI state.                                                                                                                                                                                                                                                                                                                                               |
| <b>ul-PowerControl</b>                       | Indicates the UL power control parameters for PUSCH, PUCCH, and SRS of the candidate that includes this <i>CandidateTCI-State</i> . This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the <i>SpCellConfig</i> of the <i>Itm-CandidateConfig</i> in the <i>LTM-Candidate</i> where the <i>Itm-TCI-Info</i> is configured. |

| <b>LTM-QCL-Info field descriptions</b> |                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>referenceSignal</b>                 | The field <i>csi-RS-Index</i> refers to one of the <i>NZP-CSI-RS-Resource</i> configured within <i>LTM-TCI-Info</i> . |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>2TA</i>           | This field is mandatory present if <i>tag2</i> is present in the <i>SpCellConfig</i> in <i>Itm-CandidateConfig</i> and <i>unifiedTCI-StateType</i> in the <i>Itm-TCI-Info</i> within <i>LTM-Candidate</i> is set to <i>joint</i> . It is absent, Need R, otherwise.                                                      |
| <i>Joint</i>         | This field is mandatory present, if <i>unifiedTCI-StateType</i> in the <i>Itm-TCI-Info</i> within <i>LTM-Candidate</i> is set to <i>joint</i> . It is absent, Need R, otherwise.                                                                                                                                         |
| <i>Joint2</i>        | This field is mandatory present if <i>unifiedTCI-StateType</i> in the <i>Itm-TCI-Info</i> within <i>LTM-Candidate</i> is set to <i>joint</i> and <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of the <i>SpCellConfig</i> in <i>Itm-CandidateConfig</i> . It is absent, Need R, otherwise. |

## – CandidateTCI-UL-State

The IE *CandidateTCI-UL-State* defines an uplink TCI states configuration.

| <b>CandidateTCI-UL-State field descriptions</b> |                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-RS-Index</b>                             | Indicates an NZP-CSI-RS-Resource of the LTM candidate that includes this CandidateTCI-UL-State.                                                                                                                                                                                                                                          |
| <b>pathlossReferenceRS-Id</b>                   | Indicates a PathlossReferenceRS of the LTM candidate that includes this CandidateTCI-UL-State and it refers to one of the PathlossReferenceRS configured within LTM-TCI-Info. In this version of the specification, only SSB can be included as reference signal when PathlossReferenceRS is included within a CandidateTCI-UL-State IE. |
| <b>referenceSignal</b>                          | Reference signal with which spatial relation information is provided. The field csi-RS-Index refers to one of the NZP-CSI-RS-Resource configured within LTM-TCI-Info.                                                                                                                                                                    |
| <b>ssb-Index</b>                                | The index of a SSB/PBCH block as indicated in Itm-SSB-Config of the LTM candidate that includes this CandidateTCI-UL-State.                                                                                                                                                                                                              |
| <b>tci-UL-StateID</b>                           | The ID number of the uplink TCI state.                                                                                                                                                                                                                                                                                                   |
| <b>ul-PowerControl</b>                          | Indicates the UL power control parameters for PUSCH, PUCCH, and SRS of the candidate that includes this CandidateTCI-UL-State. This field refers to an element in the list configured using uplink-PowerControlToAddModList in the SpCellConfig of the Itm-CandidateConfig in the LTM-Candidate where the Itm-TCI-Info is configured.    |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2TA                  | This field is mandatory present if tag2 is present in the SpCellConfig in Itm-CandidateConfig. It is absent, Need R, otherwise.                                                                                                                                    |
| separateTCI          | This field is mandatory present if unifiedTCI-StateType in the Itm-TCI-Info within LTM-Candidate is set to separate and ul-powerControl is not configured in any BWP-Uplink-Dedicated of the SpCellConfig in Itm-CandidateConfig. It is absent, Need R, otherwise. |

| <b>cellReservedForFutureUse</b>                 | Indicates whether the cell is reserved, as defined in 38.304 [20] for future use. The field is applicable to all PLMNs and NPNs. This field is ignored by IAB-MT and NCR-MT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>cellReservedForOtherUse</b>                  | Indicates whether the cell is reserved, as defined in 38.304 [20]. The field is applicable to all PLMNs. This field is ignored by IAB-MT and NCR-MT for cell barring determination, but still considered by NPN capable IAB-MT and NPN capable NCR-MT for determination of an NPN-only cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>npn-IdentityInfoList</b>                     | <p>The <i>npn-IdentityInfoList</i> is used to configure a set of <i>NPN-IdentityInfo</i> elements. Each of those elements contains a list of one or more NPN Identities and additional information associated with those NPNs. The total number of PLMNs (identified by a PLMN identity in <i>plmn -IdentityList</i>), PNI-NPNs (identified by a PLMN identity and a CAG-ID), and SNPNs (identified by a PLMN identity and a NID) together in the <i>PLMN-IdentityInfoList</i> and <i>NPN-IdentityInfoList</i> does not exceed 12, except for the NPN-only cells. A PNI-NPN and SNPN can be included only once, and in only one entry of the <i>NPN-IdentityInfoList</i>. In case of NPN-only cells the <i>PLMN-IdentityList</i> contains a single element that does not count to the limit of 12 and the <i>cellIdentity</i> of the first entry of the <i>PLMN-IdentityInfoList</i> is set to the same value as the <i>cellIdentity-r16</i> of the first entry of the <i>NPN-IdentityInfoList</i>. The NPN index is defined as <math>B+c_1+c_2+\dots+c_{(n-1)}+d_1+d_2+\dots+d_{(m-1)}+e(i)</math> for the NPN identity included in the <i>n</i>-th entry of <i>NPN-IdentityInfoList</i> and in the <i>m</i>-th entry of <i>npn-IdentityList</i> within that <i>NPN-IdentityInfoList</i> entry, and the <i>i</i>-th entry of its corresponding <i>NPN-Identity</i>, where</p> <ul style="list-style-type: none"> <li>- <i>B</i> is the index used for the last PLMN in the <i>PLMN-IdentityInfoList</i>, in NPN-only cells <i>B</i> is considered 0;</li> <li>- <i>c(j)</i> is the number of NPN index values used in the <i>j</i>-th <i>NPN-IdentityInfoList</i> entry;</li> <li>- <i>d(k)</i> is the number of NPN index values used in the <i>k</i>-th <i>npn-IdentityList</i> entry within the <i>n</i>-th <i>NPN-IdentityInfoList</i> entry;</li> <li>- <i>e(i)</i> is <ul style="list-style-type: none"> <li>- <i>i</i> if the <i>n</i>-th entry of <i>NPN-IdentityInfoList</i> entry is for SNPN(s);</li> <li>- 1 if the <i>n</i>-th entry of <i>NPN-IdentityInfoList</i> entry is for PNI-NPN(s).</li> </ul> </li> </ul> |
| <b>plmn-IdentityInfoList</b>                    | <p>The <i>plmn-IdentityInfoList</i> is used to configure a set of <i>PLMN-IdentityInfo</i> elements. Each of those elements contains a list of one or more PLMN Identities and additional information associated with those PLMNs. A PLMN-identity can be included only once, and in only one entry of the <i>PLMN-IdentityInfoList</i>. The PLMN index is defined as <math>b_1+b_2+\dots+b_{(n-1)}+i</math> for the PLMN included at the <i>n</i>-th entry of <i>PLMN-IdentityInfoList</i> and the <i>i</i>-th entry of its corresponding <i>PLMN-IdentityInfo</i>, where <i>b(j)</i> is the number of <i>PLMN-Identity</i> entries in each <i>PLMN-IdentityInfo</i>, respectively.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>snpn-AccessInfoList</b>                      | This list provides access related information for each SNPN in <i>npn-IdentityInfoList</i> , see TS 23.501 [32]. The <i>n</i> -th entry of the list contains the access related information of the <i>n</i> -th SNPN in <i>npn-IdentityInfoList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>SNPN-AccessInfo field descriptions</b> |                                                                                                                                                                                                                        |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>extCH-Supported</b>                    | Indicates whether the SNPN supports access using credentials from a Credentials Holder as specified in TS 23.501 [32].                                                                                                 |
| <b>extCH-WithoutConfigAllowed</b>         | Indicates whether the SNPN allows registration attempts with credentials from a Credentials Holder from UEs that are not explicitly configured to select the SNPN as specified in TS 23.501 [32].                      |
| <b>imsEmergencySupportForSNPN</b>         | Indicates whether the SNPN supports IMS emergency bearer services for UEs in limited service mode in the cell. If absent, IMS emergency call is not supported by the SNPN in the cell for UEs in limited service mode. |
| <b>onboardingEnabled</b>                  | Indicates whether the onboarding SNPN allows registration for onboarding in the cell as specified in TS 23.501 [32].                                                                                                   |

## – *CellAccessRelatedInfo-EUTRA-5GC*

The IE *CellAccessRelatedInfo-EUTRA-5GC* indicates cell access related information for an LTE cell connected to 5GC.

***CellAccessRelatedInfo-EUTRA-5GC*** information element

```
-- ASN1START
-- TAG-CELLACCESSRELATEDINFOEUTRA-5GC-START

CellAccessRelatedInfo-EUTRA-5GC ::= SEQUENCE {
 plmn-IdentityList-eutra-5gc PLMN-IdentityList-EUTRA-5GC,
 trackingAreaCode-eutra-5gc TrackingAreaCode,

 },
 cellDTX-DRX-SlotOffset-r18 INTEGER (0..31),
 cellDTX-DRX-ConfigType-r18 ENUMERATED {dtx, drx, dtxdrx},
 cellDTX-DRX-ActivationStatus-r18 ENUMERATED {activated, deactivated}
 OPTIONAL -- Need N
 }
}

-- TAG-CELLDTX-DRX-CONFIG-STOP
-- ASN1STOP
```

| <b>CellDTX-DRX-Config field descriptions</b> |                                                                                                                                                                                                                |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellDTX-DRX-CycleStartOffset</b>          | Indicates cellDTX-DRX-Cycle in ms and cellDTX-DRX-StartOffset in multiples of 1 ms.<br>The configured cellDTX-DRX-Cycle is an integer multiple of configured drx-longCycle or vice versa.                      |
| <b>cellDTX-DRX-onDurationTimer</b>           | Value in multiples of 1/32 ms (subMilliSeconds) or in ms (milliSecond). For the latter, value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, and so on.                                               |
| <b>cellDTX-DRX-SlotOffset</b>                | Value in 1/32 ms. Value 0 corresponds to 0 ms, value 1 corresponds to 1/32 ms, value 2 corresponds to 2/32 ms, and so on.                                                                                      |
| <b>cellDTX-DRX-ActivationStatus</b>          | Initial activation status of cell DTX/DRX indicating whether the UE shall activate the configuration according to the received parameters. This field is only used upon setup of a cell DTX/DRX configuration. |
| <b>cellDTX-DRX-ConfigType</b>                | Indicates whether the configuration is for cell DTX only, cell DRX only, or joint cell DTX/DRX configuration.                                                                                                  |

## – *CellGroupConfig*

The *CellGroupConfig* IE is used to configure a master cell group (MCG) or secondary cell group (SCG). A cell group comprises of one MAC entity, a set of logical channels with associated RLC entities and of a primary cell (SpCell) and one or more secondary cells (SCells). For an NCR-MT, the *CellGroupConfig* IE is also used to provide the configuration of side control information for the NCR-Fwd access link.

| <i>AutonomousDenialParamters</i> field descriptions |                                                                                                                                                                                             |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>autonomousDenialSlots</b>                        | Indicates the maximum number of the UL slots for which the UE is allowed to deny any UL transmission. Value <i>n2</i> corresponds to 2 slots, value <i>n5</i> to 5 slots and so on.         |
| <b>autonomousDenialValidity</b>                     | Indicates the validity period over which the UL autonomous denial slots shall be counted. Value <i>n200</i> corresponds to 200 slots, value <i>n500</i> corresponds to 500 slots and so on. |

| CC-State field descriptions |                                                                                                        |
|-----------------------------|--------------------------------------------------------------------------------------------------------|
| <b><i>dlCarrier</i></b>     | Indicates DL carrier activation state for this carrier and the related active BWP Index, if activated. |
| <b><i>ulCarrier</i></b>     | Indicates UL carrier activation state for this carrier and the related active BWP Index, if activated. |

| <b>CellGroupConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bap-Address</b>                        | BAP address of the parent node in cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>bh-RLC-ChannelToAddModList</b>         | Configuration of the backhaul RLC entities and the corresponding MAC Logical Channels to be added and modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>bh-RLC-ChannelToReleaseList</b>        | List of the backhaul RLC entities and the corresponding MAC Logical Channels to be released.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>f1c-TransferPath</b>                   | The F1-C transfer path that an EN-DC IAB-MT should use for transferring F1-C packets to the IAB-donor-CU. If IAB-MT is configured with <i>lte</i> , IAB-MT can only use LTE leg for F1-C transfer. If IAB-MT is configured with <i>nr</i> , IAB-MT can only use NR leg for F1-C transfer. If IAB-MT is configured with <i>both</i> , it is up to IAB-MT to select an LTE leg or a NR leg for F1-C transfer. If the field is not configured, the IAB node uses the NR leg as the default one.                                                                                                                                                                                                                                 |
| <b>f1c-TransferPathNRDC</b>               | The F1-C transfer path that an NR-DC IAB-MT should use for transferring F1-C packets to the IAB-donor-CU. If IAB-MT is configured with <i>mcg</i> , IAB-MT can only use the MCG for F1-C transfer. If IAB-MT is configured with <i>scg</i> , IAB-MT can only use the SCG for F1-C transfer. If IAB-MT is configured with <i>both</i> , it is up to IAB-MT to select the MCG or the SCG for F1-C transfer.                                                                                                                                                                                                                                                                                                                    |
| <b>mac-CellGroupConfig</b>                | MAC parameters applicable for the entire cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ncr-FwdConfig</b>                      | Configuration of side control information for the NCR-Fwd access link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>nonCollocatedTypeMRDC</b>              | This field is only present for a UE configured with <i>maxMIMO-Layers</i> with value less than or equal to 2 for all corresponding serving cells, in case of TDD-TDD inter-band (NG) EN-DC with overlapping or partially overlapping bands. If this field is present, the UE applies (NG)EN-DC MTTD/MRTD according to clause 7.5.3/7.6.3 in TS 38.133 [14] and inter-band RF requirements (i.e. Type 1 UE requirement). If this field is absent, the UE applies (NG)EN-DC MTTD/MRTD according to clause 7.5.2/7.6.2 in TS 38.133 [14] and inter-band RF requirements (i.e. Type 2 UE requirement) when indicating support of <i>interBandMRDC-WithOverlapDL-Bands-r16</i> .                                                  |
| <b>nonCollocatedTypeNR-CA</b>             | This field is only present for a UE configured with <i>maxMIMO-Layers</i> with value less than or equal to 2 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA. If this field is present, the UE applies MRTD according to Table 7.6.4-1 in TS 38.133 [14] and UE RF requirements for intra-band NR-CA except for 7.10A in TS 38.101-1 [15] (i.e. Type 1 UE requirement). If this field is absent, the UE applies MTTD/MRTD requirements according to Table 7.5.4-1/Table 7.6.4-2 in TS 38.133 [14] and UE RF requirements for intra-band non-collocated NR-CA including 7.10A in TS 38.101-1 [15] (i.e. Type 2 UE requirement) when indicating support of <i>intraBandNR-CA-non-collocated-r18</i> . |
| <b>npn-IdentityInfoList</b>               | This field is used to transfer <i>npn-IdentityInfoList</i> in <i>SIB1</i> of the SCell. The UE uses this field to translate the <i>plmn-Index</i> in MCCH of SCell to SNPN Identity. If this field and <i>plmn-IdentityInfoList</i> are both absent, the UE uses the <i>npn-IdentityInfoList</i> in <i>SIB1</i> of the PCell.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>plmn-IdentityInfoList</b>              | This field is used to transfer <i>plmn-IdentityInfoList</i> in <i>SIB1</i> of the SCell. The UE uses this field to translate the <i>plmn-Index</i> in MCCH of SCell to PLMN Identity. If this field and <i>npn-IdentityInfoList</i> are both absent, the UE uses the <i>plmn-IdentityInfoList</i> in <i>SIB1</i> of the PCell.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>prioSCellPRACH-OverSP-PeriodicSRS</b>  | When configured, the UE applies UL power control prioritization by prioritizing PRACH transmission on SCell over semi-persistent and/or periodic SRS transmission as defined in clause 7.5 of TS 38.213 [13].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>rlc-BearerToAddModList</b>             | Configuration of the MAC Logical Channel, the corresponding RLC entities and association with radio bearers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>reportUplinkTxDirectCurrent</b>        | Enables reporting of uplink and supplementary uplink Direct Current location information upon BWP configuration and reconfiguration. This field is only present when the BWP configuration is modified or any serving cell is added or removed. This field is absent in the IE <i>CellGroupConfig</i> when provided as part of <i>RRSetup</i> message. If UE is configured with SUL carrier, UE reports both UL and SUL Direct Current locations.                                                                                                                                                                                                                                                                            |

***reportUplinkTxDirectCurrentMoreCarrier***

Enables reporting of uplink Direct Current location information when the UE is configured with intra-band CA. This field is absent in the IE *CellGroupConfig* when provided as part of *RRCSsetup* message. The UE only reports the uplink Direct Current location information that are related to the indicated cc-*CombinationList*. The network does not include carriers which locate in DL only spectrum described in TS 38.101-2 [39], clause 5.3A.4 and defined by Fsd according to Table 5.3A.4-3 in FR2 in the *IntraBandCC-CombinationReqList*. I.e. DL-only carrier in FR2 frequency spectrum is not used to calculate the default DC location.

***reportUplinkTxDirectCurrentTwoCarrier***

Enables reporting of uplink Direct Current location information when the UE is configured with uplink intra-band CA with two carriers. This field is absent in the IE *CellGroupConfig* when provided as part of *RRCSsetup* message.

***rlc-BearerToReleaseListExt***

List of the RLC entities and the corresponding MAC Logical Channels to be released for multicast MRBs.

***rlmInSyncOutOfSyncThreshold***

BLER threshold pair index for IS/OOS indication generation, see TS 38.133 [14]. *n1* corresponds to the value 1. When the field is absent, the UE applies the value 0. Whenever this is reconfigured, UE resets N310 and N311, and stops T310, if running. Network does not include this field.

***sCellSIB20***

This field is used to transfer SIB20 of the SCell in order to allow the UE for MBS broadcast reception on SCell. The network configures this field only for a single SCell at a time.

***sCellToAddModList***

List of secondary serving cells (SCells) to be added or modified.

***sCellToReleaseList***

List of secondary serving cells (SCells) to be released.

***simultaneousSpatial-UpdatedList1, simultaneousSpatial-UpdatedList2***

List of serving cells which can be updated simultaneously for spatial relation with a MAC CE. The *simultaneousSpatial-UpdatedList1* and *simultaneousSpatial-UpdatedList2* shall not contain same serving cells. Network should not configure serving cells that are configured with a BWP with two different values for the *coresetPoolIndex* in these lists.

***simultaneousTCI-UpdateList1, simultaneousTCI-UpdateList2***

List of serving cells which can be updated simultaneously for TCI relation with a MAC CE. The *simultaneousTCI-UpdateList1* and *simultaneousTCI-UpdateList2* shall not contain same serving cells. Network should not configure serving cells that are configured with a BWP with two different values for the *coresetPoolIndex* in these lists.

***simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3, simultaneousU-TCI-UpdateList4***

List of serving cells for which the Unified TCI States Activation/Deactivation MAC CE, the Enhanced Unified TCI States Activation/Deactivation MAC CE for Joint TCI States or the Enhanced Unified TCI States Activation/Deactivation MAC CE for Separate TCI States apply simultaneously, as specified in TS 38.321 [3] clauses 6.1.3.47, 6.1.3.70 and 6.1.3.71, respectively. The different lists shall not contain same serving cells. Network only configures in these lists serving cells that are configured with *unifiedTCI-StateType*. Network should not configure serving cells that are configured with a BWP with different number of *coresetPoolIndexes* in the same list.

***spCellConfig***

Parameters for the SpCell of this cell group (PCell of MCG or PSCell of SCG).

***uplinkTxSwitchingOption***

Indicates which option is configured for dynamic UL Tx switching for inter-band UL CA or (NG)EN-DC. The field is set to *switchedUL* if network configures option 1 as specified in TS 38.214 [19], or *dualUL* if network configures option 2 as specified in TS 38.214 [19]. Network always configures UE with a value for this field in inter-band UL CA case and (NG)EN-DC case where UE supports dynamic UL Tx switching.

***uplinkTxSwitchingPowerBoosting***

Indicates whether the UE is allowed to enable 3dB boosting on the maximum output power for transmission on carrier2 under the operation state in which 2-port transmission can be supported on carrier2 for inter-band UL CA case with dynamic UL Tx switching as defined in TS 38.101-1 [15]. Network can only configure this field for dynamic UL Tx switching in inter-band UL CA case with power Class 3 as defined in TS 38.101-1 [15].

***uplinkTxSwitching-2T-Mode***

Indicates 2Tx-2Tx switching mode is configured for inter-band UL CA or SUL, in which the switching gap duration for a triggered uplink switching (as specified in TS 38.214 [19]) is equal to the switching time capability value reported for the switching mode.

If this field is absent and *uplinkTxSwitching* is configured, it is interpreted that 1Tx-2Tx UL Tx switching is configured as specified in TS 38.214 [19]. In this case, there is one uplink (or one uplink band in case of intra-band) configured with *uplinkTxSwitching*, on which the maximum number of antenna ports among all configured P-SRS/A-SRS and activated SP-SRS resources should be 1 and non-codebook based UL MIMO is not configured.

***uplinkTxSwitching-DualUL-TxState***

Indicates the state of Tx chains if the state of Tx chains after the UL Tx switching is not unique (as specified in TS 38.214 [19]) in case of 2Tx-2Tx switching is configured and *uplinkTxSwitchingOption* is set to *dualUL*. Value *oneT* indicates 1Tx is assumed to be supported on the carriers on each band, value *twoT* indicates 2Tx is assumed to be supported on that carrier.

This field applies for all band pairs if *uplinkTxSwitchingMoreBands* is configured.

***uplinkTxSwitchingMoreBands***

Indicates UL band list, band pair list and other configurations for ULTx switching.

***uu-RelayRLC-ChannelToAddModList***

List of the Uu RLC entities and the corresponding MAC Logical Channels to be added or modified.

***uu-RelayRLC-ChannelToReleaseList***

List of the Uu RLC entities and the corresponding MAC Logical Channels to be released.

***DeactivatedSCG-Config* field descriptions*****bfd-and-RLM***

If the field is set to *true*, the UE shall perform RLM and BFD on the PSCell when the SCG is deactivated and the network ensures that *beamFailure-r17* is not configured in the *radioLinkMonitoringConfig* of the DL BWP of the PSCell in which the UE performs BFD. If set to *false*, the UE is not required to perform RLM and BFD on the PSCell when the SCG is deactivated.

***DAPS-UplinkPowerConfig* field descriptions*****p-DAPS-Source***

The maximum total transmit power to be used by the UE in the source cell group during DAPS handover.

***p-DAPS-Target***

The maximum total transmit power to be used by the UE in the target cell group during DAPS handover.

***uplinkPowerSharingDAPS-Mode***

Indicates the uplink power sharing mode that the UE uses in DAPS handover (see TS 38.213 [13]).

***GoodServingCellEvaluation* field descriptions*****offset***

The parameter "X" (dB) for the good serving cell quality criterion in RRC\_CONNECTED, for a cell operating in FR1 and FR2, respectively. If this field is absent, the UE applies the (default) value of 0 dB for "X".

| <b>IAB-ResourceConfig field descriptions</b> |                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>iab-ResourceConfigID</b>                  | This ID is used to indicate the specific resource configuration addressed by the MAC CEs specified in TS 38.321 [3].                                                                                                                                          |
| <b>periodicitySlotList</b>                   | Indicates the periodicity in ms of the list of slot indexes indicated in <i>slotList</i> .                                                                                                                                                                    |
| <b>slotList</b>                              | Indicates the list of slot indexes to which the information indicated in the specific MAC CE applies to, as specified in TS 38.321 [3]. The values of the entries in the <i>slotList</i> are strictly less than the value of the <i>periodicitySlotList</i> . |
| <b>slotListSubcarrierSpacing</b>             | Subcarrier spacing used as reference for the <i>slotList</i> configuration.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120 or 480 kHz                                |

| <b>RACH-LessHO field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ssb-Index</b>                      | This field indicates a beam that the UE should use in the target cell to monitor PDCCH for initial uplink transmission, see TS 38.321 [3]. The network configures this field when <i>cg-RRC-Configuration</i> is not configured for the initial uplink transmission in RACH-less handover in NTN or in case this cell is not a mobile IAB cell.                                                                                                                                                                                                                                                   |
| <b>targetNTA</b>                      | This field refers to the timing adjustment, see TS 38.213 [13] and TS 38.321 [3], indicating the $N_{TA}$ value which the UE shall use for the target PTAG of handover. The value zero corresponds to $N_{TA}=0$ , while the value <i>source</i> corresponds to the $N_{TA}$ value of the source PTAG indicated by the <i>tag-Id</i> . Only value <i>source</i> is configured by the network in case source cell is a mobile IAB cell. In this version of the specification, the network shall always configure this field if <i>rach-LessHO</i> is part of an <i>RRCReconfiguration</i> message. |
| <b>tci-StateID</b>                    | This field indicates a beam that the UE should use in the target cell to monitor PDCCH for initial uplink transmission and also indicates the TCI state information to be used in the target cell. The network configures this field in case this cell is not a NTN cell.                                                                                                                                                                                                                                                                                                                         |

| <b>ReconfigurationWithSync field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>rach-ConfigDedicated</b>                       | Random access configuration to be used for the reconfiguration with sync (e.g. handover). The UE performs the RA according to these parameters in the <i>firstActiveUplinkBWP</i> (see <i>UplinkConfig</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>sl-IndirectPathMaintain</b>                    | Indicates that the L2 U2N Remote UE keeps the PC5 connection with its connected L2 U2N Relay UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>smtc</b>                                       | The SSB periodicity/offset/duration configuration of target cell for NR PSCell change and NR PCell change. The network sets the <i>periodicityAndOffset</i> to indicate the same periodicity as <i>ssb-periodicityServingCell</i> in <i>spCellConfigCommon</i> or sets to the same periodicity as <i>ssb-Periodicity-r17</i> in <i>nonCellDefiningSSB-r17</i> if the first active DL BWP included in this RRC message is configured with <i>nonCellDefiningSSB-r17</i> .<br>For case of NR PCell change, the <i>smtc</i> is based on the timing reference of (source) PCell. For case of NR PSCell change, it is based on the timing reference of source PSCell. If both this field and <i>targetCellSMTC-SCG</i> are absent, the UE uses the SMTC in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing, as configured before the reception of the RRC message. If the first active DL BWP included in this RRC message is configured with <i>nonCellDefiningSSB-r17</i> , this field corresponds to the NCD-SSB indicated by <i>nonCellDefiningSSB-r17</i> , otherwise, this field corresponds to the CD-SSB indicated by <i>absoluteFrequencySSB</i> in <i>frequencyInfoDL</i> . |

| <i>ReportUplinkTxDirectCurrentMoreCarrier</i> field descriptions |                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IntraBandCC-Combination</b>                                   | Indicates the state of the carriers and BWPs indexes of the carriers in a CC combination, each carrier in this combination corresponds to an entry in <i>servCellIndexList</i> with same order. This IE shall have the same size as <i>servCellIndexList</i> . |
| <b>IntraBandCC-CombinationReqList</b>                            | Indicates the list of the requested carriers/BWPs combinations for an intra-band CA component.                                                                                                                                                                 |
| <b>servCellIndexList</b>                                         | indicates the list of cell index for an intra-band CA component.                                                                                                                                                                                               |

| <i>SCellConfig</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>goodServingCellEvaluationBFD</b>   | Indicates the criterion for a UE to detect the good serving cell quality for BFD relaxation in an SCell in RRC_CONNECTED. This field is always configured when the network enables BFD relaxation for the UE in this SCell. This field is absent if <i>failureDetectionSetN</i> is present for the SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>preConfGapStatus</b>               | Indicates whether the pre-configured measurement gaps (i.e. the gaps configured with <i>preConfigInd</i> ) are activated or deactivated while this SCell is deactivated. If this field is configured, the UE shall apply network-controlled mechanism for activation and deactivation of the pre-configured measurement gaps, otherwise the UE shall apply the autonomous activation/deactivation mechanism, as specified in TS 38.133 [14]. The first/leftmost bit corresponds to the measurement gap with gap ID 1, the second bit corresponds to measurement gap with gap ID 2, and so on. Value 0 indicates that the corresponding pre-configured measurement gap is deactivated while value 1 indicates that the corresponding pre-configured measurement gap is activated. The UE shall ignore the bit if the corresponding measurement gap is not a pre-configured measurement gap.                        |
| <b>sCellState</b>                     | Indicates whether the SCell shall be considered to be in activated state upon SCell configuration. If the field is included for an SCell configured with TRS for fast activation of the SCell, such TRS is not used for the corresponding SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>secondaryDRX-GroupConfig</b>       | The field is used to indicate whether the SCell belongs to the secondary DRX group. All serving cells in the secondary DRX group shall belong to one Frequency Range and all serving cells in the default DRX group shall belong to another Frequency Range. If <i>drx-ConfigSecondaryGroup</i> is configured, the field is optionally present. The network always includes the field if the field was previously configured for this SCell and the SCell remains in the secondary DRX group. Removal of an individual SCell from the secondary DRX group is supported by using an SCell release and addition. Otherwise, if <i>drx-ConfigSecondaryGroup</i> is not configured, the field is absent and the UE shall release the field. The UE shall also release the field if <i>drx-ConfigSecondaryGroup</i> is released without including <i>sCellToAddModList</i> .                                           |
| <b>smtc</b>                           | The SSB periodicity/offset/duration configuration of target cell for NR SCell addition. The network sets the <i>periodicityAndOffset</i> to indicate the same periodicity as <i>ssb-periodicityServingCell</i> in <i>sCellConfigCommon</i> . The <i>smtc</i> is based on the timing of the SpCell of associated cell group. In case of inter-RAT handover to NR, the timing reference is the NR PCell. In case of intra-NR PCell change (standalone NR) or NR PSCell change (EN-DC), the timing reference is the target SpCell. If the field is absent and <i>absoluteFrequencySSB</i> is included, the UE uses the SMTTC in the <i>measObjectNR</i> having the same SSB frequency and subcarrier spacing, as configured before the reception of the RRC message. If the SCell is an SSB-less SCell (i.e., the IE <i>absoluteFrequencySSB</i> in <i>ServingCellConfigCommon</i> is absent), this field is absent. |

| <b><i>SpCellConfig</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>deactivatedSCG-Config</i></b>           | Configuration applicable when the SCG is deactivated. The network always configures this field before or when indicating that the SCG is deactivated in an <i>RRCReconfiguration</i> , <i>RRCResume</i> , E-UTRA <i>RRCConnectionReconfiguration</i> or E-UTRA <i>RRCConnectionResume</i> message.                                                                                                                                                                                                                                                         |
| <b><i>goodServingCellEvaluationBFD</i></b>    | Indicates the criterion for a UE to detect the good serving cell quality for BFD relaxation in the SpCell in RRC_CONNECTED. The field is always configured when the network enables BFD relaxation for the UE in this SpCell. This field is absent if <i>failureDetectionSetN</i> is present for the SpCell.                                                                                                                                                                                                                                               |
| <b><i>goodServingCellEvaluationRLM</i></b>    | Indicates the criterion for a UE to detect the good serving cell quality for RLM relaxation in the SpCell in RRC_CONNECTED. The field is always configured when the network enables RLM relaxation for the UE in this SpCell.                                                                                                                                                                                                                                                                                                                              |
| <b><i>lowMobilityEvaluationConnected</i></b>  | Indicates the criterion for a UE to detect low mobility in RRC_CONNECTED in an SpCell. The <i>s-SearchDeltaP-Connected</i> is the parameter "S <sub>SearchDeltaP-connected</sub> ". Value dB3 corresponds to 3 dB, dB6 corresponds to 6 dB and so on. The <i>t-SearchDeltaP-Connected</i> is the parameter "T <sub>SearchDeltaP-Connected</sub> ". Value s5 means 5 seconds, value s10 means 10 seconds and so on. Low mobility criterion is configured in NR PCell for the case of NR SA/ NR CA/ NE-DC/NR-DC, and in the NR PSCell for the case of EN-DC. |
| <b><i>reconfigurationWithSync</i></b>         | Parameters for the synchronous reconfiguration to the target SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>rlf-TimersAndConstants</i></b>          | Timers and constants for detecting and triggering cell-level radio link failure. For the SCG, <i>rlf-TimersAndConstants</i> can only be set to <i>setup</i> and is always included at SCG addition.                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>servCellIndex</i></b>                   | Serving cell ID of a PSCell. The PCell of the Master Cell Group uses ID = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>SL-PathSwitchConfig</i></b> field descriptions |                                                                              |
|------------------------------------------------------|------------------------------------------------------------------------------|
| <b><i>targetRelayUE-Identity</i></b>                 | Indicates the L2 source ID of the target L2 U2N Relay UE during path switch. |
| <b><i>t420</i></b>                                   | Indicates the timer value of <i>T420</i> to be used during path switch.      |

| <b><i>UplinkTxSwitchingMoreBands</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>uplinkTxSwitchingBandList</i></b>                     | Indicates the NR frequency band number of the UL bands for UL Tx switching. If the UE needs to determine location of switching period as specified in TS 38.101-1 [15], the UE considers that the bands are listed in decreasing order of priority, i.e. the first/leftmost entry corresponds to the band with the highest priority, the next entry corresponds to the band with the second highest priority, and so on. The last entry corresponds to the band with the lowest priority. |
| <b><i>uplinkTxSwitchingBandPairList</i></b>                 | Indicates the band pairs involved in UL Tx switching, as well as the per band pair configurations.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>uplinkTxSwitchingAssociatedBandDualUL-List</i></b>    | Indicates the associated band for the transmitting band indicated by <i>transmitBand</i> which the transmitting carrier(s) is on as specified in TS 38.214 [19], clause 6.1.6. The network ensures that each band pair of a transmitting band and an associated band supports the <i>dualUL</i> switching option.                                                                                                                                                                         |
| <b><i>UplinkTxSwitchingBandIndex</i></b>                    | The value n indicates the band included at the n-th entry of <i>uplinkTxSwitchingBandList</i> .                                                                                                                                                                                                                                                                                                                                                                                           |

| <i>UplinkTxSwitchingBandPairConfig</i> field descriptions |                                                                                                                                                                                                                                          |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bandInfoUL1, bandInfoUL2</i></b>                    | Indicates the band index for a band pair. The value n indicates the band included at the n-th entry of <i>uplinkTxSwitchingBandList</i> .                                                                                                |
| <b><i>switching2T-Mode</i></b>                            | Indicates 2Tx-2Tx switching mode is configured to the band pair.<br>If this field is absent when uplink Tx switching is configured, it is interpreted that 1Tx-2Tx/1Tx-1Tx UL Tx switching is configured as specified in TS 38.214 [19]. |
| <b><i>switchingOptionConfigForBandPair</i></b>            | Indicates the switching option for the band pair as specified in TS 38.214 [19], clause 6.1.6.                                                                                                                                           |
| <b><i>switchingPeriodConfigForBandPair</i></b>            | Indicates the value of switching period for the band pair as specified in TS 38.214 [19], clause 6.1.6. Value <i>n35us</i> represents 35 us, <i>n140us</i> represents 140us. If the field is absent, 210 us is applied.                  |

| Conditional Presence               | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>2Tx</i>                         | The field is optionally present, Need R, if <i>uplinkTxSwitching</i> is configured; otherwise it is absent, Need R.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>BWP-Reconfig</i>                | The field is optionally present, Need N, if the BWPs are reconfigured or if serving cells are added or removed. | <i>SCG-Opt</i>                     | The field is optionally present, Need M, in an <i>SpCellConfig</i> for the PSCell. It is absent otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

NOTE: In case of change of AS security key derived from S-K<sub>gNB</sub>/S-K<sub>eNB</sub>, if *reconfigurationWithSync* is not included in the *masterCellGroup*, the network releases all existing MCG RLC bearers associated with a radio bearer with *keyToUse* set to *secondary*. In case of change of AS security key derived from K<sub>gNB</sub>/K<sub>eNB</sub>, if *reconfigurationWithSync* is not included in the *secondaryCellGroup*, the network releases all existing SCG RLC bearers associated with a radio bearer with *keyToUse* set to *master*.

### – *CellGroupId*

The IE *CellGroupId* is used to identify a cell group. Value 0 identifies the master cell group. Other values identify secondary cell groups. In this version of the specification only values 0 and 1 are supported.

#### ***CellGroupId* information element**

```
-- ASN1START
-- TAG-CELLGROUPID-START

CellGroupId ::= INTEGER (0.. maxSecondaryCellGroups)

-- TAG-CELLGROUPID-STOP
-- ASN1STOP
```

### – *CellIdentity*

The IE *CellIdentity* is used to unambiguously identify a cell within a PLMN/SNPN.

#### ***CellIdentity* information element**

```
-- ASN1START
-- TAG-CELLIDENTITY-START

CellIdentity ::= BIT STRING (SIZE (36))

-- TAG-CELLIDENTITY-STOP
-- ASN1STOP
```

### – *CellReselectionPriority*

The IE *CellReselectionPriority* concerns the absolute priority of the concerned carrier frequency, as used by the cell reselection procedure. Corresponds to parameter "priority" in TS 38.304 [20]. Value 0 means lowest priority. The UE behaviour for the case the field is absent, if applicable, is specified in TS 38.304 [20].

***CellReselectionPriority* information element**

```
-- ASN1START
-- TAG-CELLRESELECTIONPRIORITY-START

CellReselectionPriority ::= INTEGER (0..7)

-- TAG-CELLRESELECTIONPRIORITY-STOP
-- ASN1STOP
```

***CellReselectionSubPriority***

The IE *CellReselectionSubPriority* indicates a fractional value to be added to the value of *cellReselectionPriority* to obtain the absolute priority of the concerned carrier frequency for E-UTRA and NR. Value *oDot2* corresponds to 0.2, value *oDot4* corresponds to 0.4 and so on.

***CellReselectionSubPriority* information element**

```
-- ASN1START
-- TAG-CELLRESELECTIONSUBPRIORITY-START

CellReselectionSubPriority ::= ENUMERATED {oDot2, oDot4, oDot6, oDot8}

-- TAG-CELLRESELECTIONSUBPRIORITY-STOP
-- ASN1STOP
```

***CFR-ConfigMulticast***

The IE *CFR-ConfigMulticast* indicates UE specific common frequency resource configuration for multicast for one dedicated BWP.

***CFR-ConfigMulticast* information element**

```
-- ASN1START
-- TAG-CFR-CONFIGMULTICAST-START

CFR-ConfigMulticast-r17 ::= SEQUENCE {
 locationAndBandwidthMulticast-r17
 pdcch-ConfigMulticast-r17
 pdsch-ConfigMulticast-r17
 sps-ConfigMulticastToAddModList-r17
 sps-ConfigMulticastToReleaseList-r17
}
 INTEGER (0..37949) OPTIONAL, -- Need S
 PDCCH-Config OPTIONAL, -- Need M
 PDSCH-Config OPTIONAL, -- Need M
 SPS-ConfigMulticastToAddModList-r17 OPTIONAL, -- Need N
 SPS-ConfigMulticastToReleaseList-r17 OPTIONAL, -- Need N

SPS-ConfigMulticastToAddModList-r17 ::= SEQUENCE (SIZE (1..8)) OF SPS-Config
SPS-ConfigMulticastToReleaseList-r17 ::= SEQUENCE (SIZE (1..8)) OF SPS-ConfigIndex-r16

-- TAG-CFR-CONFIGMULTICAST-STOP
```

-- ASN1STOP

| <b>CFR-ConfigMulticast field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>locationAndBandwidthMulticast</b>          | Frequency domain location and bandwidth for MBS multicast. The value of the field shall be interpreted as resource indicator value (RIV) as defined in TS 38.214 [19] with assumptions as described in TS 38.213 [13], clause 12, i.e. setting <code>Nsize_BWP=275</code> . The first PRB is a PRB determined by <code>subcarrierSpacing</code> of the associated BWP and <code>offsetToCarrier</code> corresponding to this subcarrier spacing. If not configured, the UE applies the value of <code>locationAndBandwidth</code> of the DL BWP in which the <code>cfr-ConfigMulticast</code> is configured. |
| <b>pdcch-ConfigMulticast</b>                  | UE specific group-common PDCCH configuration for MBS multicast for one CFR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pdsch-ConfigMulticast</b>                  | UE specific group-common PDSCH configuration for MBS multicast for one CFR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>sps-ConfigMulticastToAddModList</b>        | Indicates a list of one or more DL SPS configurations for MBS multicast.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>sps-ConfigMulticastToReleaseList</b>       | Indicates a list of one or more DL SPS configurations to be released. The NW may release a SPS configuration at any time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## – *CGI-InfoEUTRA*

The IE CGI-InfoEUTRA indicates EUTRA cell access related information, which is reported by the UE as part of E-UTRA report CGI procedure.

### **CGI-InfoEUTRA information element**

```
-- ASN1START
-- TAG-CGI-INFOEUTRA-START

CGI-InfoEUTRA ::= SEQUENCE {
 cgi-info-EPC OPTIONAL,
 cgi-info-EPC-legacy OPTIONAL,
 cgi-info-EPC-list OPTIONAL,
 CellAccessRelatedInfo-EUTRA-EPC,
 Sequence (SIZE (1..maxPLMN)) OF CellAccessRelatedInfo-EUTRA-EPC
 Sequence (SIZE (1..maxPLMN)) OF CellAccessRelatedInfo-EUTRA-5GC
 FreqBandIndicatorEUTRA,
 MultiBandInfoListEUTRA
 ENUMERATED {true}
}

-- TAG-CGI-INFOEUTRA-STOP
-- ASN1STOP
```

## – *CGI-InfoEUTRALogging*

The IE CGI-InfoEUTRALogging indicates EUTRA cell related information, which is reported by the UE as part of RLF reporting procedure.

***CGI-InfoEUTRALogging* information element**

```
-- ASN1START
-- TAG-CGI-INFOEUTRALOGGING-START

CGI-InfoEUTRALogging ::= SEQUENCE {
 plmn-Identity-eutra-5gc PLMN-Identity
 trackingAreaCode-eutra-5gc TrackingAreaCode
 cellIdentity-eutra-5gc BIT STRING (SIZE (28))
 plmn-Identity-eutra-epc PLMN-Identity
 trackingAreaCode-eutra-epc BIT STRING (SIZE (16))
 cellIdentity-eutra-epc BIT STRING (SIZE (28))
}

-- TAG-CGI-INFOEUTRALOGGING-STOP
-- ASN1STOP
```

| <b>CGI-InfoEUTRALogging field descriptions</b>                |                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity-eutra-epc, cellIdentity-eutra-5GC</b>         | Unambiguously identify a cell within the context of the PLMN. It belongs the first PLMN entry of <i>plmn-IdentityList</i> (when connected to EPC) or of <i>plmn-IdentityList-r15</i> (when connected to 5GC) in <i>SystemInformationBlockType1</i> .                                               |
| <b>plmn-Identity-eutra-epc, plmn-Identity-eutra-5GC</b>       | Identifies the PLMN of the cell for the reported <i>cellIdentity</i> : the first PLMN entry of <i>plmn-IdentityList</i> (when connected to EPC) or of <i>plmn-IdentityList-r15</i> (when connected to 5GC) in <i>SystemInformationBlockType1</i> that contained the reported <i>cellIdentity</i> . |
| <b>trackingAreaCode-eutra-epc, trackingAreaCode-eutra-5gc</b> | Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity-eutra-epc, cellIdentity-eutra-5GC</i> belongs.                                                                                                                                                                         |

***CGI-InfoNR***

The IE *CGI-InfoNR* indicates cell access related information, which is reported by the UE as part of report CGI procedure.

***CGI-InfoNR* information element**

```
-- ASN1START
-- TAG-CGI-INFO-NR-START

CGI-InfoNR ::= SEQUENCE {
 plmn-IdentityInfoList PLMN-IdentityInfoList
 frequencyBandList MultiFrequencyBandListNR
 nosIB1 OPTIONAL,
 SEQUENCE {
 ssb-SubcarrierOffset INTEGER (0..15),
 pdccch-ConfigSIB1 PDCCH-ConfigSIB1
 }
 ...
 [[
 npn-IdentityInfoList-r16 NPN-IdentityInfoList-r16
]],
 []
}
```

```

cellReservedForOtherUse-r16 ENUMERATED {true} OPTIONAL
]
}

-- TAG-CGI-INFO-NR-STOP
-- ASN1STOP

```

| CGI-InfoNR field descriptions  |                                                                                                                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>noSIB1</b>                  | Contains <i>ssb-SubcarrierOffset</i> and <i>pdcch-ConfigSIB1</i> fields acquired by the UE from <i>MIB</i> of the cell for which report CGI procedure was requested by the network in case <i>SIB1</i> was not broadcast by the cell. |
| <b>cellReservedForOtherUse</b> | Contains <i>cellReservedForOtherUse</i> field acquired by the UE that supports <i>nr-CGI-Reporting-NPN</i> from <i>SIB1</i> of the cell for which report CGI procedure was requested by the network.                                  |

## – CGI-Info-Logging

The IE *CGI-Info-Logging* indicates the NR Cell Global Identifier (NCGI) for logging purposes (e.g. RLF report), the globally unique identity, and the TAC information of a cell in NR.

### CGI-Info-Logging information element

```

-- ASN1START
-- TAG-CGI-INFO-LOGGING-START

CGI-Info-Logging-r16 ::= SEQUENCE {
 plmn-Identity-r16 PLMN-Identity,
 cellIdentity-r16 CellIdentity,
 trackingAreaCode-r16 TrackingAreaCode OPTIONAL
}

-- TAG-CGI-INFO-LOGGING-STOP
-- ASN1STOP

```

| CGI-Info-Logging field descriptions |                                                                                                                                                                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIdentity</b>                 | Unambiguously identify a cell within the context of the PLMN. It belongs the first <i>PLMN-IdentityInfo</i> IE of <i>PLMN-IdentityInfoList</i> in <i>SIB1</i> .                                                                     |
| <b>plmn-Identity</b>                | Identifies the PLMN of the cell for the reported <i>cellIdentity</i> : the first PLMN entry of <i>plmn-IdentityList</i> (in SIB1) in the instance of <i>PLMN-IdentityInfoList</i> that contained the reported <i>cellIdentity</i> . |
| <b>trackingAreaCode</b>             | Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                      |

- ***CLI-RSSI-Range***

The IE *CLI-RSSI-Range* specifies the value range used in CLI-RSSI measurements and thresholds. The integer value for CLI-RSSI measurements is according to Table 10.1.22.2.2-1 in TS 38.133 [14].

#### ***CLI-RSSI-Range* information element**

```
-- ASN1START

The first value <i>m0</i> means that the first slot for which the CSI corresponds to is the slot where the CSI reference resource is located at.<br>For the other three candidate values ( <i>n0</i> , <i>n1</i> , <i>n2</i> ), then the first slot for which the CSI corresponds to is given by <i>l= n+delta</i> , where delta can take on values of 0, 1, 2 and <i>n</i> the slot in which CSI is reported.                                                                                                                                                                                                                                                                                                                             |

| Field describes the size of the window of FD basis for FeType-II port selection codebook for Doppler CSI. For M=2, N=2,4 (see TS 38.214 [19], clause 5.2.2.2.9)                                                                                                         |

| <b>TD-DD-Config field descriptions</b>                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>aperiodicResourceOffset</b><br>Offset m (in slots) between two consecutive aperiodic CSI-RS resources. See TS 38.214 [19], clause 5.2.1.4.                                                                                                                                                                                                     |
| <b>tdCQI</b><br>Number of TD CQIs (X) in each SB and ref slot(s) + ref W2(s).<br>1-1: 1 TD CQI, ref = 1st slot and 1st W2<br>1-2: 1 TD CQI, ref = 1st and last slots, and 1st and last W2<br>2: 2 TD CQIs<br>(see TS 38.214 [19], clause 5.2.1.4).                                                                                                |
| <b>unitDurationDD</b><br>DD/TD unit duration (in slots), for AP-CSI-RS only. Note: For P/SP-CSI-RS, d is set to CSI-RS periodicity (see TS 38.214 [19], clause 5.2.1.4). If the value of <i>aperiodicResourceOffset</i> is '1', network configures value 'm1' for this field. Value m1 corresponds to 1 slot and value m2 corresponds to 2 slots. |
| <b>vectorLengthDD</b><br>Doppler-/time-domain (DD/TD) basis vector length; See TS 38.214 [19], clause 5.2.1.4.                                                                                                                                                                                                                                    |

## – **CommonLocationInfo**

The IE *CommonLocationInfo* is used to transfer detailed location information available at the UE to correlate measurements and UE position information.

### **CommonLocationInfo** information element

-- ASN1START  
-- TAG-COMMONLOCATIONINFO-START

```

CommonLocationInfo-r16 ::= SEQUENCE {
 gnss-TOD-msec-r16 OCTET STRING OPTIONAL,
 locationTimestamp-r16 OCTET STRING OPTIONAL,
 locationCoordinate-r16 OCTET STRING OPTIONAL,
 locationError-r16 OCTET STRING OPTIONAL,
 locationSource-r16 OCTET STRING OPTIONAL,
 velocityEstimate-r16 OCTET STRING OPTIONAL
}

-- TAG-COMMONLOCATIONINFO-STOP
-- ASN1STOP

```

| <b><i>CommonLocationInfo</i> field descriptions</b> |                                                                                                                                                     |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>gnss-TOD-msec</i></b>                         | Parameter type <i>gnss-TOD-msec</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.         |
| <b><i>locationTimeStamp</i></b>                     | Parameter type <i>DisplacementTimeStamp</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. |
| <b><i>locationCoordinate</i></b>                    | Parameter type <i>LocationCoordinates</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.   |
| <b><i>locationError</i></b>                         | Parameter <i>LocationError</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.              |
| <b><i>locationSource</i></b>                        | Parameter <i>LocationSource</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.             |
| <b><i>velocityEstimate</i></b>                      | Parameter type <i>Velocity</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.              |

### – *CondReconfigId*

The IE *CondReconfigId* is used to identify a CHO, CPA, CPC, subsequent CPAC, or CHO with candidate SCG(s) configuration.

#### ***CondReconfigId* information element**

```

-- ASN1START
-- TAG-CONDRECONFIGID-START

CondReconfigId-r16 ::= INTEGER (1.. maxNrofCondCells-r16)

-- TAG-CONDRECONFIGID-STOP
-- ASN1STOP

```

### – *CondReconfigToAddModList*

The IE *CondReconfigToAddModList* concerns a list of conditional reconfigurations to add or modify, with for each entry the *condReconfigId* and the associated fields.

***CondReconfigToAddModList* information element**

```

-- ASN1START
-- TAG-CONDRECONFIGTOADDMODLIST-START

CondReconfigToAddModList-r16 ::= SEQUENCE (SIZE (1.. maxNrofCondCells-r16)) OF CondReconfigToAddMod-r16

CondReconfigToAddMod-r16 ::= SEQUENCE {
 condReconfigId-r16,
 condExecutionCond-r16
 condRRCReconfig-r16
 ...
 [
 condExecutionCondSCG-r17
],
 [
 condExecutionCondPSCell-r18
 subsequentCondReconfig-r18
 securityCellSetId-r18
 scpac-ConfigComplete-r18
]
}
}

CondReconfigExecCondSCG-r17 ::= SEQUENCE (SIZE (1..2)) OF MeasId

SubsequentCondReconfig-r18 ::= SEQUENCE {

-- ASN1STOP

```

| <b>CondReconfigToAddMod field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>condExecutionCond</b>                       | The execution condition that needs to be fulfilled in order to trigger the execution of a conditional reconfiguration for CHO, CPA, intra-SN CPC without MN involvement, MN initiated inter-SN CPC, MN initiated subsequent CPAC, or SN initiated intra-SN subsequent CPAC without MN involvement. When configuring 2 triggering events (Meas Ids) for a candidate cell, the network ensures that both refer to the same <i>measObject</i> . Except for CHO with only event <i>condEventD1</i> , or <i>condEventD2</i> , or <i>condEventT1</i> , if the network configures <i>condEventD1</i> or <i>condEventD2</i> or <i>condEventT1</i> for a candidate cell, the network configures a second triggering event <i>condEventA3</i> , <i>condEventA4</i> or <i>condEventA5</i> for the same candidate cell. The network configures at most one from <i>condEventD1</i> , <i>condEventD2</i> or <i>condEventT1</i> for the same candidate cell. For CPA, MN-initiated inter-SN CPC, and for MN initiated subsequent CPAC, the network only indicates MeasId(s) associated with <i>condEventA4</i> . For intra-SN CPC and for SN initiated intra-SN subsequent CPAC without MN involvement, the network only indicates MeasId(s) associated with <i>condEventA3</i> or <i>condEventA5</i> . |
| <b>condExecutionCondPSCell</b>                 | The execution condition that needs to be fulfilled for the associated PSCell in order to trigger the execution of a conditional reconfiguration for CHO with candidate SCG(s). The Meas Ids refer to the <i>measConfig</i> associated with the MCG. When configuring 2 triggering events (Meas Ids) for a candidate cell, network ensures that both refer to the same <i>measObject</i> . The network only indicates MeasId(s) associated with <i>condEventA4</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>condExecutionCondSCG</b>                    | Contains execution condition that needs to be fulfilled in order to trigger the execution of a conditional reconfiguration for SN initiated inter-SN CPC, SN initiated inter-SN subsequent CPAC, or SN initiated intra-SN subsequent CPAC with MN involvement. The Meas Ids refer to the <i>measConfig</i> associated with the SCG. When configuring 2 triggering events (Meas Ids) for a candidate cell, network ensures that both refer to the same <i>measObject</i> . For each <i>condReconfigId</i> , the network always configures either <i>condExecutionCond</i> or <i>condExecutionCondSCG</i> (not both). The network only indicates MeasId(s) associated with <i>condEventA3</i> or <i>condEventA5</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>condRRCReconfig</b>                         | The RRCReconfiguration message to be applied when the condition(s) are fulfilled. The <i>RRCReconfiguration</i> message contained in <i>condRRCReconfig</i> cannot contain the field <i>conditionalReconfiguration</i> or the field <i>daps-Config</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>securityCellSetId</b>                       | This field is used to determine whether the UE should perform security update when conditional reconfiguration containing <i>subsequentCondReconfig</i> is executed. If the field <i>servingSecurityCellSetId</i> is configured in <i>conditionalReconfiguration</i> , this field is configured for all the candidate configurations for subsequent CPAC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>subsequentCondReconfig</b>                  | Contains the execution conditions that need to be fulfilled in order to trigger the execution of a subsequent CPAC. If the field is configured, the configuration of candidate PSCells for subsequent CPAC is supported. The subsequent execution condition is used for conditional reconfiguration evaluation for other candidate cells when the <i>RRCReconfiguration</i> message contained in <i>condRRCReconfig</i> has been applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>CondExecutionCondToAddMod field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>subsequentCondExecutionCond</b>                  | The execution condition that needs to be fulfilled in order to trigger the subsequent execution of a conditional reconfiguration for SN initiated intra-SN subsequent CPAC without MN involvement. When configuring 2 triggering events (Meas Ids) for a candidate cell, the network ensures that both refer to the same <i>measObject</i> . The network only indicates MeasId(s) associated with <i>condEventA3</i> or <i>condEventA5</i> .                                                                                                                                            |
| <b>subsequentCondExecutionCondSCG</b>               | Contains execution condition that needs to be fulfilled in order to trigger the subsequent execution of a conditional reconfiguration for SN initiated inter-SN subsequent CPAC, SN initiated intra-SN subsequent CPAC with MN involvement, or MN initiated subsequent CPAC. The Meas Ids refer to the <i>measConfig</i> associated with the SCG. When configuring 2 triggering events (Meas Ids) for a candidate cell, network ensures that both refer to the same <i>measObject</i> . The network only indicates MeasId(s) associated with <i>condEventA3</i> or <i>condEventA5</i> . |

| Conditional Presence           | Explanation                                                                                                                                                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>condReconfigAdd</i>         | The field is mandatory present when a <i>condReconfigId</i> is being added. Otherwise the field is optional, need M.                                                                                                                   |
| <i>condReconfigCHO-WithSCG</i> | This field is optional present, need M, if the <i>RRCCoreConfiguration</i> message contained in corresponding <i>condRRCCoreConfig</i> includes the <i>nr-SCG</i> and <i>condExecutionCond</i> is configured. Otherwise, it is absent. |
| <i>CPAC</i>                    | The field is optionally present, need M, when the conditional reconfiguration includes at least one candidate PSCell supporting subsequent CPAC. Otherwise, the field is absent, need R.                                               |

### – *ConditionalReconfiguration*

The IE *ConditionalReconfiguration* is used to add, modify and release the configuration of conditional reconfiguration.

| <b><i>ConditionalReconfiguration</i></b> field descriptions |                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>attemptCondReconfig</i></b>                           | If present, the UE shall perform conditional reconfiguration if selected cell is a target candidate cell and it is the first cell selection after failure as described in clause 5.3.7.3.                                                                      |
| <b><i>condReconfigToAddModList</i></b>                      | List of the configuration of candidate SpCells to be added or modified for CHO, CPA or CPC.                                                                                                                                                                    |
| <b><i>condReconfigToRemoveList</i></b>                      | List of the configuration of candidate SpCells to be removed.                                                                                                                                                                                                  |
| <b><i>cpac-ReferenceConfiguration</i></b>                   | Includes the reference configuration for the candidate supporting subsequent CPAC.                                                                                                                                                                             |
| <b><i>servingSecurityCellSetId</i></b>                      | This field identifies the security cell set for serving PSCell. The network does not provide this field for the conditional reconfiguration(s) generated by the SN.                                                                                            |
| <b><i>sk-counterConfiguration</i></b>                       | Includes a list of <i>sk-Counter</i> from which the UE should select the <i>sk-counter</i> used to derive S-K <sub>gNB</sub> for inter-SN subsequent CPAC. The network does not provide this field for the conditional reconfiguration(s) generated by the SN. |

| Conditional Presence | Explanation                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>CHO</i>           | The field is optional present, Need R, if the UE is configured with at least a candidate SpCell for CHO. Otherwise the field is not present. |

## – *ConfiguredGrantConfig*

The IE *ConfiguredGrantConfig* is used to configure uplink transmission without dynamic grant according to two possible schemes. The actual uplink grant may either be configured via RRC (*type1*) or provided via the PDCCH (addressed to CS-RNTI) (*type2*). Multiple Configured Grant configurations may be configured in one BWP of a serving cell.

This field is configured only if <i>phy-PriorityIndex-r16</i> is configured with value <i>p1</i> .<br>The field <i>cg-betaOffsetsCrossPri1</i> indicates multiplexing HP HARQ-ACK in LP CG-PUSCH. This field is configured only if <i>phy-PriorityIndex-r16</i> is configured with value <i>p0</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>cg-COT-SharingList</b>                               | Indicates a table for COT sharing combinations (see 37.213 [48], clause 4.1.3). One row of the table can be set to noCOT-Sharing to indicate that there is no channel occupancy sharing. If the <i>cg-RetransmissionTimer-r16</i> is configured and the UE operates as an initiating device in semi-static channel access mode (see TS 37.213 [48], clause 4.3), then <i>cg-COT-SharingList-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cg-COT-SharingOffset</b>                             | Indicates the offset from the end of the slot where the COT sharing indication in UCI is enabled where the offset in symbols is equal to $14^*n$ , where <i>n</i> is the signaled value for <i>cg-COT-SharingOffset</i> . Applicable when <i>ul-toDL-COT-SharingED-Threshold-r16</i> is not configured (see 37.213 [48], clause 4.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>cg-DMRS-Configuration</b>                            | DMRS configuration (see TS 38.214 [19], clause 6.1.2.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cg-minDFI-Delay</b>                                  | Indicates the minimum duration (in unit of symbols) from the ending symbol of the PUSCH to the starting symbol of the PDCCH containing the downlink feedback indication (DFI) carrying HARQ-ACK for this PUSCH. The HARQ-ACK received before this minimum duration is not considered as valid for this PUSCH (see TS 38.213 [13], clause 10.5). The following minimum duration values are supported, depending on the configured subcarrier spacing [symbols]:<br>15 kHz: 7, $m^*14$ , where <i>m</i> = {1, 2, 3, 4}<br>30 kHz: 7, $m^*14$ , where <i>m</i> = {1, 2, 3, 4, 5, 6, 7, 8}<br>60 kHz: 7, $m^*14$ , where <i>m</i> = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16}<br>120 kHz: 7, $m^*14$ , where <i>m</i> = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32}<br>480 kHz: $m^*14$ , where <i>m</i> = {2, 4, 8, 12, 16, 20, 24, 28, 32, 36, 40, 44, 48, 52, 56, 60, 64, 68, 72, 76, 80, 84, 88, 92, 96, 100, 104, 108, 112, 116, 120, 124, 128}<br>960 kHz: $m^*14$ , where <i>m</i> = {4, 8, 16, 24, 32, 40, 48, 56, 64, 72, 80, 88, 96, 104, 112, 120, 128, 136, 144, 152, 160, 168, 176, 184, 192, 200, 208, 216, 224, 232, 240, 248, 256} |
| <b>cg-nrofPUSCH-InSlot</b>                              | Indicates the number of consecutive PUSCH configured to CG within a slot where the SLIV indicating the first PUSCH and additional PUSCH appended with the same length (see TS 38.214 [19], clause 6.1.2.3). The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>cg-nrofSlots</b>                                     | Indicates the number of allocated slots in a configured grant periodicity following the time instance of configured grant offset (see TS 38.214 [19], clause 6.1.2.3). <i>cg-nrofSlots-r17</i> is only applicable for operation with shared spectrum channel access in FR2-2. When <i>cg-nrofSlots-r17</i> is configured, the UE shall ignore <i>cg-nrofSlots-r16</i> . The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

***cg-RetransmissionTimer***

Indicates the initial value of the configured retransmission timer (see TS 38.321 [3]) in multiples of periodicity. The value of *cg-RetransmissionTimer* is always less than or equal to the value of *configuredGrantTimer*. This field is always configured together with *harq-ProcID-Offset*. This field is not configured for operation in licensed spectrum or simultaneously with *harq-ProcID-Offset2*. The network does not configure this field for CG-SDT.

***cg-SDT-PeriodicityExt***

This field is used to calculate the periodicity for UL transmission without UL grant for type 1 (see TS 38.321 [3], clause 5.8.2) for extended CG-SDT periodicities. If this field is present, the fields *periodicity* and *periodicityExt* are ignored.

The following periodicities are supported depending on the configured subcarrier spacing [symbols]:

|                       |                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------|
| 15 kHz:               | $n^{*}14^{*}1280$ , where $n=\{1, 2, 4, 8, 48, 96, 240, 472, 944, 1408, 2816\}$                     |
| 30 kHz:               | $n^{*}14^{*}1280$ , where $n=\{2, 4, 8, 16, 96, 192, 480, 944, 1888, 2816, 5632\}$                  |
| 60 kHz with normal CP | $n^{*}14^{*}1280$ , where $n=\{4, 8, 16, 32, 192, 384, 960, 1888, 3776, 5632, 11264\}$              |
| 60 kHz with ECP:      | $n^{*}12^{*}1280$ , where $n=\{4, 8, 16, 32, 192, 384, 960, 1888, 3776, 5632, 11264\}$              |
| 120 kHz:              | $n^{*}14^{*}1280$ , where $n=\{8, 16, 32, 64, 384, 768, 1920, 3776, 7552, 11264, 22528\}$           |
| 480 kHz:              | $n^{*}14^{*}1280$ , where $n=\{32, 64, 128, 256, 1536, 3072, 7680, 15104, 30208, 45056, 90112\}$    |
| 960 kHz:              | $n^{*}14^{*}1280$ , where $n=\{64, 128, 256, 512, 3072, 6144, 15360, 30208, 60416, 90112, 180224\}$ |

***cg-StartingOffsets***

This field is not applicable for a UE which is allowed to operate as an initiating device in semi-static channel access mode, i.e., not applicable for a UE configured with UE FFP parameters (e.g. period, offset) regardless whether the UE would initiate its own COT or would share gNB's COT.

***cg-UCI-Multiplexing***

If present, this field indicates that in the case of PUCCH overlapping with CG-PUSCH(s) including CG-UCI within a PUCCH group, HARQ-ACK is multiplexed on the CG-PUSCH including CG-UCI (see TS 38.213 [13], clause 9).

***configuredGrantConfigIndex***

Indicates the index of the Configured Grant configurations within the BWP.

***configuredGrantConfigIndexMAC***

Indicates the index of the Configured Grant configurations within the MAC entity.

***disableCG-RetransmissionMonitoring***

When this field is configured, the UE does not start the *drx-HARQ-RTT-TimerUL* for PUSCH transmissions using configured uplink grants corresponding to this *ConfiguredGrantConfig*. See TS 38.321 [3], clause 5.7.

***configuredGrantTimer***

Indicates the initial value of the configured grant timer (see TS 38.321 [3]) in multiples of periodicity. When *cg-RetransmissionTimer* is configured, if HARQ processes are shared among different configured grants on the same BWP, *configuredGrantTimer* \* *periodicity* is set to the same value for the configurations that share HARQ processes on this BWP. The value of the extension *configuredGrantTimer* is 2 times the configured value.

***dmrs-SeqInitialization***

The network configures this field if *transformPrecoder* is disabled or when the value of *sdt-NrofDMRS-Sequences* is set to 1. Otherwise, the field is absent.

***frequencyDomainAllocation***

Indicates the frequency domain resource allocation, see TS 38.214 [19], clause 6.1.2, and TS 38.212 [17], clause 7.3.1).

***frequencyHopping***

The value *intraSlot* enables 'Intra-slot frequency hopping' and the value *interSlot* enables 'Inter-slot frequency hopping'. If the field is absent, frequency hopping is not configured. The field *frequencyHopping* applies to configured grant for 'pusch-RepTypeA' (see TS 38.214 [19], clause 6.3.1).

***frequencyHoppingOffset***

Frequency hopping offset used when frequency hopping is enabled (see TS 38.214 [19], clause 6.1.2 and clause 6.3).

***frequencyHoppingPUSCH-RepTypeB***

Indicates the frequency hopping scheme for Type 1 CG when *pusch-RepTypeIndicator* is set to 'pusch-RepTypeB' (see TS 38.214 [19], clause 6.1). The value *interRepetition* enables 'Inter-repetition frequency hopping', and the value *interSlot* enables 'Inter-slot frequency hopping'. If the field is absent, the frequency hopping is not enabled for Type 1 CG.

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>harq-ProcID-Offset</b>         | For operation with shared spectrum channel access configured with <i>cg-RetransmissionTimer-r16</i> , this configures the range of HARQ process IDs which can be used for this configured grant where the UE can select a HARQ process ID within [ <i>harq-ProcID-offset</i> , ..., ( <i>harq-ProcID-offset</i> + <i>nrofHARQ-Processes</i> – 1)]. <i>harq-ProcID-Offset-v1730</i> is only applicable for operation with shared spectrum channel access in FR2-2. If the field <i>harq-ProcID-Offset-v1730</i> is present, the UE shall ignore the <i>harq-ProcID-Offset-r16</i> . The network does not configure this field for CG-SDT. |
| <b>harq-ProcID-Offset2</b>        | Indicates the offset used in deriving the HARQ process IDs, see TS 38.321 [3], clause 5.4.1. This field is not configured together with <i>cg-RetransmissionTimer-r16</i> . If the field <i>harq-ProcID-Offset2-v1700</i> is present, the UE shall ignore the <i>harq-ProcID-Offset2-r16</i> .                                                                                                                                                                                                                                                                                                                                           |
| <b>mappingPattern</b>             | Indicates whether the UE should follow Cyclical mapping pattern or Sequential mapping pattern when two SRS resource sets are configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' for PUSCH transmission with a Type 1 configured grant and/or a Type 2 configured grant as described in clause 6.1.2.3 of TS 38.214 [19].                                                                                                                                                                                                                               |
| <b>mcs-Table</b>                  | Indicates the MCS table the UE shall use for PUSCH without transform precoding. If the field is absent the UE applies the value <i>qam64</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>mcs-TableTransformPrecoder</b> | Indicates the MCS table the UE shall use for PUSCH with transform precoding. If the field is absent the UE applies the value <i>qam64</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>mcsAndTBS</b>                  | The modulation order, target code rate and TB size (see TS 38.214 [19], clause 6.1.2). The NW does not configure the values 28~31 in this version of the specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nrofBitsInUTO-UCI</b>          | Indicates the number of bits in the UTO-UCI bitmap (see TS 38.212 [17], clause 6.2.7, 6.3.2, TS 38.213 [13], clause 9.3.1, TS 38.214 [19], clause 5.2.3). When this field is configured, UTO-UCI is enabled for the UE.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nrofHARQ-Processes</b>         | The number of HARQ processes configured. It applies for both Type 1 and Type 2. See TS 38.321 [3], clause 5.4.1. If the UE is configured with <i>nrofHARQ-Processes-v1700</i> , the UE shall ignore <i>nrofHARQ-Processes</i> (without suffix). The network sets the value of this field to 1 when <i>cg-LTM-Configuration</i> is configured.                                                                                                                                                                                                                                                                                            |
| <b>nrofSlotsInCG-Period</b>       | Number of consecutive slots for CG PUSCH transmission occasions in a period of a single CG PUSCH configuration, see TS 38.214 [19], clause 6.1. The network does not configure this field for operation on shared spectrum.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>pathlossReferenceIndex</b>     | Indicates the reference signal index used as PUSCH pathloss reference (see TS 38.213 [13], clause 7.1.1). In case of CG-SDT or if <i>cg-RRC-Configuration</i> is configured, the UE does not use this field.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>pathlossReferenceIndex2</b>    | Indicates the reference signal used as PUSCH pathloss reference for the second SRS resource set. When this field is present, <i>pathlossReferenceIndex</i> indicates the reference signal used as PUSCH pathloss reference for the first SRS resource set. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.                                                                                                                                                                                                                                                                                           |
| <b>p0-PUSCH-Alpha</b>             | Index of the <i>P0-PUSCH-AlphaSet</i> to be used for this configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>p0-PUSCH-Alpha2</b>            | Index of the <i>P0-PUSCH-AlphaSet</i> to be used for second SRS resource set. If this field is present, the <i>p0-PUSCH-Alpha</i> provides index for the <i>P0-PUSCH-AlphaSet</i> to be used for first SRS resource set.                                                                                                                                                                                                                                                                                                                                                                                                                 |

***periodicity***

Periodicity for UL transmission without UL grant for type 1 and type 2 (see TS 38.321 [3], clause 5.8.2).  
The following periodicities are supported depending on the configured subcarrier spacing [symbols]:

|                       |                                                                                                                       |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------|
| 15 kHz:               | 2, 7, n*14, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 320, 640}                                   |
| 30 kHz:               | 2, 7, n*14, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 256, 320, 640, 1280}                        |
| 60 kHz with normal CP | 2, 7, n*14, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 256, 320, 512, 640, 1280, 2560}             |
| 60 kHz with ECP:      | 2, 6, n*12, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 256, 320, 512, 640, 1280, 2560}             |
| 120 kHz:              | 2, 7, n*12, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 256, 320, 512, 640, 1024, 1280, 2560, 5120} |
| 480 and 960 kHz:      | n*14, where n={1, 2, 4, 5, 8, 10, 16, 20, 32, 40, 64, 80, 128, 160, 256, 320, 512, 640, 1024, 1280, 2560, 5120}       |

In case of SDT, the network does not configure periodicity values less than 5ms.

***periodicityExt***

This field is used to calculate the periodicity for UL transmission without UL grant for type 1 and type 2 (see TS 38.321 [3], clause 5.8.2). If this field is present, the UE shall ignore field *periodicity* (without suffix). Network does not configure *periodicityExt-r17* together with *periodicityExt-r16*.

The following periodicities are supported depending on the configured subcarrier spacing [symbols]:

|                        |                                                                                         |
|------------------------|-----------------------------------------------------------------------------------------|
| 15 kHz:                | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 640.   |
| 30 kHz:                | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 1280.  |
| 60 kHz with normal CP: | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 2560.  |
| 60 kHz with ECP:       | <i>periodicityExt</i> *12, where <i>periodicityExt</i> has a value between 1 and 2560.  |
| 120 kHz:               | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 5120.  |
| 480 kHz:               | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 20480. |
| 960 kHz:               | <i>periodicityExt</i> *14, where <i>periodicityExt</i> has a value between 1 and 40960. |

In case of SDT, the network does not configure periodicity values less than 5ms.

***phy-PriorityIndex***

Indicates the PHY priority of CG PUSCH at least for PHY-layer collision handling. Value *p0* indicates low priority and value *p1* indicates high priority. The network does not configure this for CG-SDT.

***powerControlLoopToUse***

Closed control loop to apply (see TS 38.213 [13], clause 7.1.1).

***powerControlLoopToUse2***

Closed control loop to apply to second SRS resource set (see TS 38.213 [13], clause 7.1.1). If this field is present, the *powerControlLoopToUse* applies to the first SRS resource set.

***precodingAndNumberOfLayers, precodingAndNumberOfLayers-v1850***

Indicates the precoding and number of layers (see TS 38.212 [17], clause 7.3.1.1.2, and TS 38.214 [19], clause 6.1.2.3). In case of CG-SDT or if *cg-RRC-Configuration* is configured, network sets this field to 1. Field *precodingAndNumberOfLayers-v1850* is only configured when *nrofSRS-Ports-n8* is configured. If the network configures *precodingAndNumberOfLayers-v1850*, the UE shall ignore *precodingAndNumberOfLayers* (without suffix).

***precodingAndNumberOfLayers2***

Indicates the precoding and number of layers for the second SRS resource set. When this field is present, *precodingAndNumberOfLayers* indicated the precoding and number of layers for the first SRS resource set. Network does not configure this field if *cg-RRC-Configuration* is configured.

***pusch-RepTypeIndicator***

Indicates whether UE follows the behavior for PUSCH repetition type A or the behavior for PUSCH repetition type B for each Type 1 configured grant configuration. The value *pusch-RepTypeA* enables the 'PUSCH repetition type A' and the value *pusch-RepTypeB* enables the 'PUSCH repetition type B' (see TS 38.214 [19], clause 6.1.2.3). The value *pusch-RepTypeB* is not configured simultaneously with *nrofSlotsInCG-Period-r18*. The network does not configure this field if *cg-RetransmissionTimer-r16* is configured for CG operation with shared spectrum channel access.

***rbg-Size***

Selection between configuration 1 and configuration 2 for RBG size for PUSCH. The UE does not apply this field if *resourceAllocation* is set to *resourceAllocationType1*. Otherwise, the UE applies the value *config1* when the field is absent. Note: *rbg-Size* is used when the *transformPrecoder* parameter is disabled.

|                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>repK-RV</b>                                            | The redundancy version (RV) sequence to use. See TS 38.214 [19], clause 6.1.2. The network configures this field if repetitions are used, i.e., if <i>repK</i> is set to <i>n2</i> , <i>n4</i> or <i>n8</i> . This field is not configured when <i>cg-RetransmissionTimer</i> is configured. Otherwise, the field is absent.                                                                                                                                      |
| <b>repK</b>                                               | Number of repetitions K, see TS 38.214 [19]. If the field <i>repK-v1710</i> is present, the UE shall ignore the <i>repK</i> (without suffix).                                                                                                                                                                                                                                                                                                                     |
| <b>resourceAllocation</b>                                 | Configuration of resource allocation type 0 and resource allocation type 1. For Type 1 UL data transmission without grant, <i>resourceAllocation</i> should be <i>resourceAllocationType0</i> or <i>resourceAllocationType1</i> .                                                                                                                                                                                                                                 |
| <b>rrc-ConfiguredUplinkGrant</b>                          | Configuration for "configured grant" transmission with fully RRC-configured UL grant (Type1). If this field is absent the UE uses UL grant configured by DCI addressed to CS-RNTI (Type2).                                                                                                                                                                                                                                                                        |
| <b>sequenceOffsetForRV</b>                                | Configures the RV offset for the starting RV for the first repetition (first actual repetition in PUSCH repetition Type B) towards the second 'SRS resource set' for PUSCH configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'.                                                                                                                                           |
| <b>srs-ResourceId</b>                                     | Indicates the associated SRS resource set for PUSCH+PUSCH simultaneous uplink transmission for CG-type 1 PUSCH. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.                                                                                                                                                                                                                                                               |
| <b>srs-ResourceIndicator, srs-ResourceIndicator-v1850</b> | Indicates the SRS resource to be used (see TS 38.212 [17], clause 7.3.1.1.2, and TS 38.214 [19], clause 6.1.2.3). The network does not configure this for CG-SDT or if <i>cg-RRC-Configuration</i> is configured. Field <i>srs-ResourceIndicator-v1850</i> is only configured when 8 antenna ports are configured (see TS 38.214 [19], clause 6.1.1.2). The network does not configure both <i>srs-ResourceIndicator</i> and <i>srs-ResourceIndicator-v1850</i> . |
| <b>srs-ResourceIndicator2</b>                             | Indicates the SRS resource to be used for the second SRS resource set. When this field is present, the <i>srs-ResourceIndicator</i> is used for the first SRS resource set. Network does not configure this field if <i>cg-RRC-Configuration</i> is configured.                                                                                                                                                                                                   |
| <b>startingFromRV0</b>                                    | This field is used to determine the initial transmission occasion of a transport block for a given RV sequence, see TS 38.214 [19], clause 6.1.2.3.1. The network does not configure this field if <i>cg-RetransmissionTimer-r16</i> is configured for CG operation.                                                                                                                                                                                              |
| <b>timeDomainAllocation, timeDomainAllocation-v1710</b>   | Indicates a combination of start symbol and length and PUSCH mapping type, see TS 38.214 [19], clause 6.1.2 and TS 38.212 [17], clause 7.3.1. If the field <i>timeDomainAllocation-v1710</i> is present, the UE shall ignore <i>timeDomainAllocation</i> field (without suffix).                                                                                                                                                                                  |
| <b>timeDomainOffset</b>                                   | Offset related to the reference SFN indicated by <i>timeReferenceSFN</i> , see TS 38.321 [3], clause 5.8.2. <i>timeDomainOffset-r17</i> is only applicable to 480 kHz and 960 kHz. If <i>timeDomainOffset-r17</i> is present, the UE shall ignore <i>timeDomainOffset</i> (without suffix).                                                                                                                                                                       |
| <b>timeReferenceHyperSFN</b>                              | Indicates H-SFN used for determination of the offset of a resource in time domain. The UE uses the closest H-SFN with the indicated number preceding the reception of the configured grant configuration, see TS 38.321 [3], clause 5.8.2. If the field <i>timeReferenceHyperSFN</i> is not present, the reference hyper SFN is 0.                                                                                                                                |
| <b>timeReferenceSFN</b>                                   | Indicates SFN used for determination of the offset of a resource in time domain. The UE uses the closest SFN with the indicated number preceding the reception of the configured grant configuration, see TS 38.321 [3], clause 5.8.2. If the field <i>timeReferenceSFN</i> is not present, the reference SFN is 0.                                                                                                                                               |
| <b>transformPrecoder</b>                                  | Enables or disables transform precoding for <i>type1</i> and <i>type2</i> . If the field is absent, the UE enables or disables transform precoding in accordance with the field <i>msg3-transformPrecoder</i> in <i>RACH-ConfigCommon</i> from <i>rach-ConfigCommon</i> included directly within BWP configuration (i.e., not included in <i>additionalRACH-ConfigList</i> ), see TS 38.214 [19], clause 6.1.3.                                                   |
| <b>uci-OnPUSCH</b>                                        | Selection between and configuration of dynamic and semi-static beta-offset. For Type 1 UL data transmission without grant, <i>uci-OnPUSCH</i> should be set to <i>semiStatic</i> . The network does not configure this for CG-SDT.                                                                                                                                                                                                                                |

| <b>CG-COT-Sharing field descriptions</b> |                                                                                                                                                                      |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>channelAccessPriority</b>             | Indicates the Channel Access Priority Class that the gNB can assume when sharing the UE initiated COT (see 37.213 [48], clause 4.1.3).                               |
| <b>duration</b>                          | Indicates the number of DL transmission slots within UE initiated COT (see 37.213 [48], clause 4.1.3).                                                               |
| <b>offset</b>                            | Indicates the number of DL transmission slots from the end of the slot where CG-UCI is detected after which COT sharing can be used (see 37.213 [48], clause 4.1.3). |

| <b>CG-StartingOffsets field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cg-StartingFullBW-InsideCOT</b>           | A set of configured grant PUSCH transmission starting offsets (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).               |
| <b>cg-StartingFullBW-OutsideCOT</b>          | A set of configured grant PUSCH transmission starting offset indices (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3).       |
| <b>cg-StartingPartialBW-InsideCOT</b>        | A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).  |
| <b>cg-StartingPartialBW-OutsideCOT</b>       | A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3). |

| <b><i>CG-SDT-Configuration and CG-RRC-Configuration field descriptions</i></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cg-RRC-RSRP-ThresholdSSB</i></b>                                         | An RSRP threshold configured for SSB selection for the CG as specified in TS 38.321 [3]. This field is absent in <i>cg-LTM-Configuration</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>cg-SDT-RetransmissionTimer, cg-RRC-RetransmissionTimer</i></b>           | Indicates the initial value of the configured grant retransmission timer used for the initial transmission of CG with CCCH (for CG-SDT) or DCCH message (see TS 38.321 [3]) in multiples of <i>periodicity</i> . The field <i>cg-RRC-RetransmissionTimer</i> is not configured together with the field <i>harq-ProID-Offset</i> for operations in unlicensed spectrum.                                                                                                                                                                                                                                                                                                                                  |
| <b><i>sdt-DMRS-Ports, rrc-DMRS-Ports</i></b>                                   | Indicates the set of DMRS ports for SSB to PUSCH mapping (see TS 38.213 [13]). The first (left-most / most significant) bit corresponds to DMRS port 0, the second most significant bit corresponds to DMRS port 1, and so on. A bit set to 1 indicates that this DMRS port is used for mapping. In case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                          |
| <b><i>sdt-NrofDMRS-Sequences, rrc-NrofDMRS-Sequences</i></b>                   | Indicates the number of DMRS sequences for SSB to PUSCH mapping (see TS 38.213 [13]). In case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>sdt-SSB-Subset, rrc-SSB-Subset</i></b>                                   | Indicates SSB subset for SSB to CG PUSCH mapping within one CG configuration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not included in the SSB subset for SSB to CG PUSCH mapping while value 1 indicates that the corresponding SS/PBCH block is included in SSB subset for SSB to CG PUSCH mapping. If this field is absent, UE assumes the SSB set includes all actually transmitted SSBs. In case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB. |
| <b><i>sdt-SSB-PerCG-PUSCH, rrc-SSB-PerCG-PUSCH</i></b>                         | The number of SSBs per CG PUSCH (see TS 38.213 [13]). Value one corresponds to 1 SSBs per CG PUSCH, value two corresponds to 2 SSBs per CG PUSCH and so on. In case of an RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>sdt-P0-PUSCH, rrc-P0-PUSCH</i></b>                                       | Indicates P0 value for PUSCH in steps of 1dB (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i> . This field is absent in <i>cg-LTM-Configuration</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sdt-Alpha, rrc-Alpha</i></b>                                             | Indicates alpha value for PUSCH. <i>alpha0</i> indicates value 0 is used, <i>alpha04</i> indicates value 4 is used and so on (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i> . This field is absent in <i>cg-LTM-Configuration</i> .                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                              |

| <i>LTM</i>                     | The field is optionally present, Need R, in an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE. Otherwise, the field is absent.                                                                                                                                                                                                        |
| <i>SRSsets</i>                 | This field is mandatory present when UE is configured with two SRS sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage codebook or non-codebook and none of <i>multipanelSchemeSDM</i> or <i>multipanelSchemeSFN</i> or <i>sTx-2Panel</i> is configured. Otherwise it is absent, Need R |

- ***ConfiguredGrantConfigIndex***

The IE *ConfiguredGrantConfigIndex* is used to indicate the index of one of multiple UL Configured Grant configurations in one BWP.

#### ***ConfiguredGrantConfigIndex* information element**

```
-- ASN1START
-- TAG-CONFIGUREDGRANTCONFIGINDEX-START

ConfiguredGrantConfigIndex-r16 ::= INTEGER (0.. maxNrofConfiguredGrantConfig-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEX-STOP
-- ASN1STOP
```

- ***ConfiguredGrantConfigIndexMAC***

The IE *ConfiguredGrantConfigIndexMAC* is used to indicate the unique Configured Grant configurations index per MAC entity.

#### ***ConfiguredGrantConfigIndexMAC* information element**

```
-- ASN1START
-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-START

ConfiguredGrantConfigIndexMAC-r16 ::= INTEGER (0.. maxNrofConfiguredGrantConfigMAC-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-STOP
-- ASN1STOP
```

- ***ConnEstFailureControl***

The IE *ConnEstFailureControl* is used to configure parameters for connection establishment failure control.

#### ***ConnEstFailureControl* information element**

```
-- ASN1START
-- TAG-CONNESTFAILURECONTROL-START

ConnEstFailureControl ::= SEQUENCE {
 connEstFailCount ENUMERATED {n1, n2, n3, n4},
 connEstFailOffsetValidity ENUMERATED {s30, s60, s120, s240, s300, s420, s600, s900},
 connEstFailOffset INTEGER (0..15)
} OPTIONAL -- Need S

-- TAG-CONNESTFAILURECONTROL-STOP
-- ASN1STOP
```

| <b><i>ConnEstFailureControl</i></b> field descriptions |                                                                                                                                                                                                          |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>connEstFailCount</i></b>                         | Number of times that the UE detects T300 expiry on the same cell before applying <i>connEstFailOffset</i> .                                                                                              |
| <b><i>connEstFailOffset</i></b>                        | Parameter "Qoffset <sub>temp</sub> " in TS 38.304 [20]. If the field is absent, the value of infinity shall be used for "Qoffset <sub>temp</sub> ".                                                      |
| <b><i>connEstFailOffsetValidity</i></b>                | Amount of time that the UE applies <i>connEstFailOffset</i> before removing the offset from evaluation of the cell. Value s30 corresponds to 30 seconds, value s60 corresponds to 60 seconds, and so on. |

## — *ControlResourceSet*

The IE *ControlResourceSet* is used to configure a time/frequency control resource set (CORESET) in which to search for downlink control information (see TS 38.213 [13], clause 10.1). For the UE not supporting *multipleCORESET* in FR1, in order to receive MBS multicast in CFR within the UE's active BWP, if a CORESET is not configured within the *PDCCH-ConfigMulticast*, the CORESET other than CORESET#0 configured within the UE's active BWP for scheduling unicast can be used for scheduling MBS multicast, and the CORESET is expected to be included completely within the CFR and the parameters configured in the CORESET are expected to be supported by the UE for MBS multicast.

| <b>ControlResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>applyIndicatedTCI-State</b>               | This field indicates, for PDCCH reception on this CORESET, if UE applies the first, the second, both or none "indicated" DL only TCI or joint TCI as specified in TS 38.213 [13], clause 10.1. Value <i>both</i> can be configured only if <i>sfnSchemePDCCH</i> is configured in the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cce-REG-MappingType</b>                   | Mapping of Control Channel Elements (CCE) to Resource Element Groups (REG) (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>controlResourceSetId</b>                  | Identifies the instance of the <i>ControlResourceSet</i> IE. Value 0 identifies the common CORESET configured in <i>MIB</i> and in <i>ServingCellConfigCommon</i> ( <i>controlResourceSetZero</i> ) and is hence not used here in the <i>ControlResourceSet</i> IE. Other values identify CORESETS configured by dedicated signalling or in <i>SIB1</i> or <i>SIB20</i> . The <i>controlResourceSetId</i> is unique among the BWPs of a serving cell.<br>If the field <i>controlResourceSetId-v1610</i> is present, the UE shall ignore the <i>controlResourceSetId</i> field (without suffix).                                                                                                                                                                                                                                     |
| <b>coresetPoolIndex</b>                      | The index of the CORESET pool for this CORESET as specified in TS 38.213 [13] (clauses 9 and 10) and TS 38.214 [19] (clauses 5.1 and 6.1). If the field is absent, the UE applies the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>duration</b>                              | Contiguous time duration of the CORESET in number of symbols (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>followUnifiedTCI-State</b>                | When set to enabled, for PDCCH reception on this CORESET, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>frequencyDomainResources</b>              | Frequency domain resources for the CORESET. Each bit corresponds a group of 6 RBs, with grouping starting from the first RB group in the BWP or MBS CFR where the CORESET is configured. When at least one search space is configured with <i>freqMonitorLocation-r16</i> , only the first $N_{\text{RBG}, \text{set}0}^{\text{size}}$ bits are valid (see TS 38.213 [13], clause 10.1). The first (left-most / most significant) bit corresponds to the first RB group in the BWP or MBS CFR where the CORESET is configured, and so on. A bit that is set to 1 indicates that this RB group belongs to the frequency domain resource of this CORESET. Bits corresponding to a group of RBs not fully contained in the bandwidth part within which the CORESET is configured are set to zero (see TS 38.211 [16], clause 7.3.2.2). |
| <b>interleaverSize</b>                       | Interleaver-size (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>pdcch-DMRS-ScramblingID</b>               | PDCCH DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.3.1). When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>precoderGranularity</b>                   | Precoder granularity in frequency domain (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>rb-Offset</b>                             | Indicates the RB level offset in units of RB from the first RB of the first 6RB group to the first RB of BWP (see 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>reg-BundleSize</b>                        | Resource Element Groups (REGs) can be bundled to create REG bundles. This parameter defines the size of such bundles (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>shiftIndex</b>                            | When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>tci-PresentInDCI</b>                      | This field indicates if TCI field is present or absent in DCI format 1_1, DCI format 1_3 and DCI format 4_2. When the field is absent the UE considers the TCI to be absent/disabled. In case of cross carrier scheduling, the network sets this field to enabled for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_1 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                                                                                                                              |
| <b>tci-PresentDCI-1-2</b>                    | Configures the number of bits for "Transmission configuration indicator" in DCI format 1_2. When the field is absent the UE applies the value of 0 bit for the "Transmission configuration indicator" in DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.5). In case of cross carrier scheduling, the network configures this field for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_2 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                            |

***tci-StatesPDCCH-ToAddList***

A subset of the TCI states defined in *pdsch-Config*, either with *tci-StatesToAddModList* or *dl-OrJointTCI-StateList*, included in the *BWP-DownlinkDedicated* corresponding to the serving cell and to the DL BWP to which the *ControlResourceSet* belong to. They are used for providing QCL relationships between the DL RS(s) in one RS Set (TCI-State) and the PDCCH DMRS ports (see TS 38.213 [13], clause 6.). The network configures at most *maxNrofTCI-StatesPDCCH* entries. The QCL relationships defined herein do not apply to MBS broadcast.

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FollowUTCI</i>        | The field is absent if the field <i>followUnifiedTCI-State</i> is present or if more than one value for the field <i>coresetPoolIndex</i> is configured in <i>controlResourceSet</i> for the same bandwidthpart. Otherwise, it is optionally present, Need R. |
| <i>NotSIB-initialBWP</i> | The field is absent in <i>SIB1/SIB20</i> and in the <i>PDCCH-ConfigCommon</i> of the initial BWP in <i>ServingCellConfigCommon</i> , if <i>SIB1/SIB20</i> is broadcasted. Otherwise, it is optionally present, Need N.                                        |

– ***ControlResourceSetId***

The *ControlResourceSetId* IE concerns a short identity, used to identify a control resource set within a serving cell. The *ControlResourceSetId* = 0 identifies the *ControlResourceSet#0* configured via PBCH (*MIB*) and in *controlResourceSetZero* (*ServingCellConfigCommon*). The ID space is used across the BWPs and MBS CFRs of a Serving Cell.

***ControlResourceSetId* information element**

```
-- ASN1START
-- TAG-CONTROLRESOURCESETID-START

ControlResourceSetId ::= INTEGER (0..maxNrofControlResourceSets-1)
ControlResourceSetId-r16 ::= INTEGER (0..maxNrofControlResourceSets-1-r16)
ControlResourceSetId-v1610 ::= INTEGER (maxNrofControlResourceSets..maxNrofControlResourceSets-1-r16)

-- TAG-CONTROLRESOURCESETID-STOP
-- ASN1STOP
```

– ***ControlResourceSetZero***

The IE *ControlResourceSetZero* is used to configure CORESET#0 of the initial BWP (see TS 38.213 [13], clause 13).

***ControlResourceSetZero* information element**

```
-- ASN1START
-- TAG-CONTROLRESOURCESETZERO-START

ControlResourceSetZero ::= INTEGER (0..15)

-- TAG-CONTROLRESOURCESETZERO-STOP
```

-- ASN1STOP

## - *CrossCarrierSchedulingConfig*

The IE *CrossCarrierSchedulingConfig* is used to specify the configuration when the cross-carrier scheduling is used in a cell.

### ***CrossCarrierSchedulingConfig* information element**

| <b>carrierIndicatorSizeDCI-0-2, carrierIndicatorSizeDCI-1-2</b> | Configures the number of bits for the field of carrier indicator in PDCCH DCI format 0_2/1_2. The field <i>carrierIndicatorSizeDCI-0-2</i> refers to DCI format 0_2 and the field <i>carrierIndicatorSizeDCI-1-2</i> refers to DCI format 1_2, respectively (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ccs-BlindDetectionSplit</b>                                  | Indicates the share of blind detection candidates and non-overlapping CCEs for PDCCH monitoring on an SpCell and an SCell when cross-carrier scheduling is configured from the SCell for the SpCell (see TS 38.213 [13], clause 10.1.1). The network only configures this field when it sets the field <i>other</i> for an SpCell, i.e., when it configures cross-carrier scheduling of the SpCell by a PDCCH on an SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>cif-Presence</b>                                             | The field is used to indicate whether carrier indicator field is present (value <i>true</i> ) or not (value <i>false</i> ) in PDCCH DCI formats, see TS 38.213 [13]. If <i>cif-Presence</i> is set to <i>true</i> , the CIF value indicating a grant or assignment for this cell is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>cif-InSchedulingCell</b>                                     | The field indicates the CIF value used in the scheduling cell to indicate a grant or assignment applicable for this cell, see TS 38.213 [13]. If configured for an SpCell, the non-fallback DCI formats on the SpCell include same number of CIF bits as the corresponding non-fallback DCI formats on the scheduling cell, and the CIF bits are considered reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>enableDefaultBeamForCCS</b>                                  | This field indicates whether default beam selection for cross-carrier scheduled PDSCH or aperiodic CSI-RS is enabled, see TS 38.214 [19]. If not present, the default beam selection behaviour is not applied, i.e. Rel-15 behaviour is applied. This field can only be configured in the cross-scheduled SCell or SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>other</b>                                                    | Parameters for cross-carrier scheduling. If configured for an SpCell, the SpCell can be scheduled by the PDCCH on another SCell as well as by the PDCCH on the SpCell. If configured for an SCell, the SCell is scheduled by a PDCCH on another cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>own</b>                                                      | Parameters for self-scheduling, i.e., a serving cell is scheduled by its own PDCCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>schedulingCellId</b>                                         | If configured for an SpCell, this field indicates which SCell, in addition to the SpCell, signals the downlink allocations and uplink grants, if applicable, for the concerned SpCell. If configured for an SCell, this field indicates which cell signals the downlink allocations and uplink grants, if applicable, for the concerned SCell. In case the UE is configured with DC, the scheduling cell is part of the same cell group (i.e. MCG or SCG) as the scheduled cell. In case the UE is configured with two PUCCH groups, the scheduling cell and the scheduled cell are within the same PUCCH group. If <i>drx-ConfigSecondaryGroup</i> is configured in the <i>MAC-CellGroupConfig</i> associated with this serving cell, the scheduling cell and the scheduled cell belong to the same Frequency Range. In addition, the serving cell with an aperiodic CSI trigger and the PUSCH resource scheduled for the report are on the same carrier and serving cell, but the cell for which CSI is reported may belong to the same or a different Frequency Range. The network should not trigger a CSI request for a serving cell in the other Frequency Range when that serving cell is outside Active Time. |

| Conditional Presence | Explanation                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| <i>CIF-PRESENCE</i>  | The field is mandatory present if the <i>cif-Presence</i> is set to <i>true</i> . The field is absent otherwise. |

## – *CSI-AperiodicTriggerStateList*

The *CSI-AperiodicTriggerStateList* IE is used to configure the UE with a list of aperiodic trigger states. Each codepoint of the DCI field "CSI request" is associated with one trigger state (see TS 38.321 [3], clause 6.1.3.13). Upon reception of the value associated with a trigger state, the UE will perform measurement of CSI-RS, CSI-IM and/or SSB (reference signals) and aperiodic reporting on L1 according to all entries in the *associatedReportConfigInfoList* for that trigger state.

| <b>ap-CSI-MultiplexingMode</b>                           | Indicates if the behavior of transmitting aperiodic CSI on the first PUSCH repetitions corresponding to two SRS resource sets configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage ' <i>codebook</i> ' or ' <i>noncodebook</i> ' is enabled or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>applyIndicatedTCI-State, applyIndicatedTCI-State2</b> | This field indicates, for an aperiodic CSI-RS resource set ( <i>perSet</i> ) or for CSI-RS resource ( <i>perResource</i> ), if UE applies the first or the second "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.2.1.5.1. The <i>applyIndicatedTCI-State</i> is for <i>ResourcesForChannel</i> , and <i>applyIndicatedTCI-State2</i> is for <i>ResourcesForChannels2</i> . When <i>applyIndicatedTCI-State</i> and <i>applyIndicatedTCI-State2</i> are absent, the UE shall use <i>qcl-info</i> for <i>ResourcesForChannel</i> and use <i>qcl-info2</i> for <i>ResourcesForChannel2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>csi-IM-ResourcesForInterference</b>                   | CSI-IM-ResourceSet for interference measurement. Entry number in <i>csi-IM-ResourceSetList</i> in the <i>CSI-ResourceConfig</i> indicated by <i>csi-IM-ResourcesForInterference</i> in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on). The indicated CSI-IM-ResourceSet should have exactly the same number of resources like the NZP-CSI-RS-ResourceSet indicated in <i>resourceSet</i> within nzp-CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-ReportSubConfigTriggerList</b>                    | A list of sub-configuration ID(s) of N sub-configurations out of L configured sub-configurations within a <i>CSI-ReportConfig</i> associated with a triggering state for aperiodic CSI reporting on PUSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>csi-SSB-ResourceSet, csi-SSB-ResourceSet2</b>         | CSI-SSB-ResourceSet for channel measurements. Entry number in <i>csi-SSB-ResourceSetList</i> in the <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>nzp-CSI-RS-ResourcesForInterference</b>               | NZP-CSI-RS-ResourceSet for interference measurement. Entry number in <i>nzp-CSI-RS-ResourceSetList</i> in the <i>CSI-ResourceConfig</i> indicated by <i>nzp-CSI-RS-ResourcesForInterference</i> in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>qcl-info, qcl-info2</b>                               | Fields <i>qcl-Info</i> and <i>qcl-Info2</i> are lists of references to TCI-States for providing the QCL source and QCL type for each NZP-CSI-RS-Resource listed in <i>nzp-CSI-RS-Resources</i> of the NZP-CSI-RS-ResourceSet, indicated by <i>resourceSet</i> within nzp-CSI-RS and by <i>resourceSet2</i> within nzp-CSI-RS2, respectively. Each <i>TCI-StateId</i> refers to the TCI-State which has this value for <i>tci-StateId</i> and is defined in <i>tci-StatesToAddModList</i> or in <i>dl-OrJointTCI-StateList</i> in the <i>PDSCH-Config</i> included in the <i>BWP-Downlink</i> corresponding to the serving cell and to the DL BWP to which the <i>resourcesForChannelMeasurement</i> (in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above) belong to. First entry in <i>qcl-info/qcl-info2</i> corresponds to first entry in <i>nzp-CSI-RS-Resources</i> of that NZP-CSI-RS-ResourceSet, second entry in <i>qcl-info/qcl-info2</i> corresponds to second entry in <i>nzp-CSI-RS-Resources</i> , and so on (see TS 38.214 [19], clause 5.2.1.5.1). When this field is absent for aperiodic CSI RS, and <i>applyIndicatedTCI-State</i> or <i>applyIndicatedTCI-State2</i> is not configured, the UE shall use QCL information included in the "indicated" DL only/Joint TCI state as specified in TS 38.214 [19]. |
| <b>reportConfigId</b>                                    | The <i>reportConfigId</i> of one of the <i>CSI-ReportConfigToAddMod</i> configured in <i>CSI-MeasConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>resourcesForChannel2</b>                              | Configures reference signals for channel measurement corresponding to the second resource set for L1-RSRP measurement as configured in IE <i>CSI-ResourceConfig</i> when <i>nrofReportedGroups-r17</i> is configured in IE <i>CSI-ReportConfig</i> . If this is present, network configures <i>csi-SSB-ResourceSetExt</i> instead of <i>csi-SSB-ResourceSet</i> and the UE ignores <i>csi-SSB-ResourceSet</i> in <i>resourcesForChannel</i> , and the <i>resourcesForChannel</i> configures the reference signals for channel measurement corresponding to the first resource set for L1-RSRP measurement (see TS 38.214 [19], clause 5.2.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>resourcesForChannelTDCP</b>                           | Configures reference signals for channel measurement corresponding to the second resource set and third resource set for TDCP reporting. All CSI resources of these two resource sets always share the same QCL-info with the resource sets indicated by <i>resourcesForChannel</i> as specified in TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>resourceSet, resourceSet2</b>                         | NZP-CSI-RS-ResourceSet for channel measurements. Entry number in <i>nzp-CSI-RS-ResourceSetList</i> in the <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> in the <i>CSI-ReportConfig</i> indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Conditional Presence       | Explanation                                                                                                                                                                                                                                                                                                                                                                    |

### — *CSI-FrequencyOccupation*

The IE *CSI-FrequencyOccupation* is used to configure the frequency domain occupation of a channel state information measurement resource (e.g. *NZP-CSI-RS-Resource*, *CSI-IM-Resource*).

#### ***CSI-FrequencyOccupation* information element**

```
-- ASN1START
-- TAG-CSI-FREQUENCYOCCUPATION-START

CSI-FrequencyOccupation ::= SEQUENCE {
 startingRB INTEGER (0..maxNrofPhysicalResourceBlocks-1),
 nrofRBs INTEGER (24..maxNrofPhysicalResourceBlocksPlus1),
 ...
}

-- TAG-CSI-FREQUENCYOCCUPATION-STOP
-- ASN1STOP
```

| <b><i>CSI-FrequencyOccupation</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>nrofRBs</i></b>                                    | Number of PRBs across which this CSI resource spans. Only multiples of 4 are allowed. The smallest configurable number is the minimum of 24 and the width of the associated BWP. If the configured value is larger than the width of the corresponding BWP, the UE shall assume that the actual CSI-RS bandwidth is equal to the width of the BWP. |
| <b><i>startingRB</i></b>                                 | PRB where this CSI resource starts in relation to common resource block #0 (CRB#0) on the common resource block grid. Only multiples of 4 are allowed (0, 4, ...)                                                                                                                                                                                  |

## — CSI-IM-Resource

The IE *CSI-IM-Resource* is used to configure one CSI Interference Management (IM) resource.

### CSI-IM-Resource information element

```
-- ASN1START
-- TAG-CSI-IM-RESOURCE-START

CSI-IM-Resource ::= SEQUENCE {
 csi-IM-ResourceId,
 csi-IM-ResourceElementPattern CHOICE {
 pattern0 {

 periodicityAndOffset CSI-FrequencyOccupation OPTIONAL, -- Need M
 CSI-ResourcePeriodicityAndOffset OPTIONAL, -- Cond PeriodicOrSemiPersistent
 ...
}

-- TAG-CSI-IM-RESOURCE-STOP
-- ASN1STOP
```

| <b>CSI-IM-Resource field descriptions</b>   |                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>csi-IM-ResourceElementPattern</i></b> | The resource element pattern (Pattern0 (2,2) or Pattern1 (4,1)) with corresponding parameters (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                  |
| <b><i>freqBand</i></b>                      | Frequency-occupancy of CSI-IM (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                                                  |
| <b><i>periodicityAndOffset</i></b>          | Periodicity and slot offset for periodic/semi-persistent CSI-IM. Network always configures the UE with a value for this field for periodic and semi-persistent CSI-IM-Resources (as indicated in CSI-ResourceConfig). A change of configuration between periodic or semi-persistent and aperiodic for a CSI-IM-Resource is not supported without a release and add. |
| <b><i>subcarrierLocation-p0</i></b>         | OFDM subcarrier occupancy of the CSI-IM resource for Pattern0 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                  |
| <b><i>subcarrierLocation-p1</i></b>         | OFDM subcarrier occupancy of the CSI-IM resource for Pattern1 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                  |
| <b><i>symbolLocation-p0</i></b>             | OFDM symbol location of the CSI-IM resource for Pattern0 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                       |
| <b><i>symbolLocation-p1</i></b>             | OFDM symbol location of the CSI-IM resource for Pattern1 (see TS 38.214 [19], clause 5.2.2.4)                                                                                                                                                                                                                                                                       |

| Conditional Presence            | Explanation                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent CSI-IM-Resources (as indicated in CSI-ResourceConfig). The field is absent otherwise. |

## – *CSI-IM-ResourceId*

The IE *CSI-IM-ResourceId* is used to identify one *CSI-IM-Resource*.

### ***CSI-IM-ResourceId* information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCEID-START

CSI-IM-ResourceId ::= INTEGER (0..maxNrofCSI-IM-Resources-1)

-- TAG-CSI-IM-RESOURCEID-STOP
-- ASN1STOP
```

## – *CSI-IM-ResourceSet*

The IE *CSI-IM-ResourceSet* is used to configure a set of one or more CSI Interference Management (IM) resources (their IDs) and set-specific parameters.

### ***CSI-IM-ResourceSet* information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCESET-START

CSI-IM-ResourceSet ::= SEQUENCE {
 csi-IM-ResourceSetId,
 csi-IM-Resources
 ...
}
-- TAG-CSI-IM-RESOURCESET-STOP
-- ASN1STOP
```

| <b><i>CSI-IM-ResourceSet</i> field descriptions</b> |                                                                                                   |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b><i>csi-IM-Resources</i></b>                      | CSI-IM-Resources associated with this <i>CSI-IM-ResourceSet</i> (see TS 38.214 [19], clause 5.2). |

## – *CSI-IM-ResourceSetId*

The IE *CSI-IM-ResourceSetId* is used to identify *CSI-IM-ResourceSets*.

**CSI-IM-ResourceSetId information element**

```
-- ASN1START
-- TAG-CSI-IM-RESOURCESETID-START

CSI-IM-ResourceSetId ::= INTEGER (0..maxNrofCSI-IM-ResourceSets-1)

-- TAG-CSI-IM-RESOURCESETID-STOP
-- ASN1STOP
```

***CSI-MeasConfig***

The IE *CSI-MeasConfig* is used to configure CSI-RS (reference signals) belonging to the serving cell in which *CSI-MeasConfig* is included, channel state information reports to be transmitted on PUCCH on the serving cell in which *CSI-MeasConfig* is included and channel state information reports on PUSCH triggered by DCI received on the serving cell in which *CSI-MeasConfig* is included. See also TS 38.214 [19], clause 5.2.

**CSI-MeasConfig information element**

```
-- ASN1START
-- TAG-CSI-MEASCONFIG-START

### – *CSI-ReportConfig*

The IE *CSI-ReportConfig* is used to configure a periodic or semi-persistent report sent on PUCCH on the cell in which the *CSI-ReportConfig* is included, or to configure a semi-persistent or aperiodic report sent on PUSCH triggered by DCI received on the cell in which the *CSI-ReportConfig* is included (in this case, the cell on which the report is sent is determined by the received DCI). See TS 38.214 [19], clause 5.2.1.

| <b>carrier</b>                             | Indicates in which serving cell the CSI-ResourceConfig indicated below are to be found. If the field is absent, the resources are on the same serving cell as this report configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>codebookConfig</b>                      | Codebook configuration for Type-1 or Type-2 including codebook subset restriction. Network can only configure one of <i>codebookConfig</i> , <i>codebookConfig-r16</i> or <i>codebookConfig-r17</i> or <i>codebookConfig-r18</i> in a <i>CSI-ReportConfig</i> . The network includes <i>codebookConfig-v1730</i> only if <i>codebookConfig-r17</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cqi-BitsPerSubband</b>                  | This field can only be present if <i>cqi-FormatIndicator</i> is set to <i>subbandCQI</i> . If the field is configured with <i>bits4</i> , the UE uses 4-bit sub-band CQI. If the field is not present and <i>cqi-FormatIndicator</i> is set to <i>subbandCQI</i> , the UE uses 2-bit sub-band differential CQI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cqi-FormatIndicator</b>                 | Indicates whether the UE shall report a single (wideband) or multiple (subband) CQI (see TS 38.214 [19], clause 5.2.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>cqi-Table</b>                           | Which CQI table to use for CQI calculation (see TS 38.214 [19], clause 5.2.2.1). For an (e)RedCap UE, CQI table 2 is only supported if the UE indicates support of 256QAM for PDSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>csi-IM-ResourcesForInterference</b>     | CSI IM resources for interference measurement. <i>csi-ResourceConfigId</i> of a <i>CSI-ResourceConfig</i> included in the configuration of the serving cell indicated with the field "carrier" above. The <i>CSI-ResourceConfig</i> indicated here contains only CSI-IM resources. The <i>bwp-Id</i> in that <i>CSI-ResourceConfig</i> is the same value as the <i>bwp-Id</i> in the <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> .                                                                                                                                                                                                                                                                                                                                                       |
| <b>csi-ReportingBand</b>                   | Indicates a contiguous or non-contiguous subset of subbands in the bandwidth part which CSI shall be reported for. Each bit in the bit-string represents one subband in order of frequency position in the BWP. The right-most bit in the bit string represents the lowest subband with the lowest frequency position in the BWP. The choice determines the number of subbands (subbands3 for 3 subbands, subbands4 for 4 subbands, and so on) (see TS 38.214 [19], clause 5.2.1.4). This field is absent if there are less than 24 PRBs (no sub band) and present otherwise (see TS 38.214 [19], clause 5.2.1.4).<br>NOTE: In TS 38.212 [17] clause 6.3.1.1.2 and TS 38.214 [19] clause 5.2.1.4, only subbands to be reported are numbered, e.g. subband #0 is the subband corresponding to the right-most bit set to 1. |
| <b>csi-ReportMode</b>                      | Configures the CSI report modes Mode1 or Mode 2 (see TS 38.214 [19], clause 5.2.1.4.2)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>csi-ReportSubConfigToAddModList</b>     | List of CSI-ReportSubConfiguration(s) in a CSI report configuration to add or modify. No simultaneous configuration of <i>portSubsetIndicator</i> and a list of nzp-CSI-RS-resources in a same CSI report sub-configuration. The number of elements in a list is at least 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>csi-ReportSubConfigToReleaseList</b>    | List of CSI-ReportSubConfiguration(s) in a CSI report configuration to release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>dummy</b>                               | This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>groupBasedBeamReporting</b>             | Turning on/off group beam based reporting (see TS 38.214 [19], clause 5.2.1.4). If <i>groupBasedBeamReporting</i> (without suffix) is set to disabled, <i>groupBasedBeamReporting-v1710</i> and <i>groupBasedBeamReporting-v1800</i> is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

***reportSlotOffsetList, reportSlotOffsetListDCI-0-1, reportSlotOffsetListDCI-0-2***

Timing offset Y for semi persistent reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the *pusch-TimeDomainAllocationList* in *PUSCH-Config*. A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on. The first report is transmitted in slot n+Y, second report in n+Y+P, where P is the configured periodicity.

Timing offset Y for aperiodic reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the *pusch-TimeDomainAllocationList* in *PUSCH-Config*. A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on (see TS 38.214 [19], clause 6.1.2.1).

The field *reportSlotOffsetListDCI-0-1* applies to DCI format 0\_1 and the field *reportSlotOffsetListDCI-0-2* applies to DCI format 0\_2 (see TS 38.214 [19], clause 6.1.2.1).

The fields *reportSlotOffsetList-r17*, *reportSlotOffsetListDCI-0-1-r17* and *reportSlotOffsetListDCI-0-2-r17* are only applicable for SCS 480 kHz and 960 kHz and if they are configured, the UE shall ignore the fields *reportSlotOffsetList* (without suffix), *reportSlotOffsetListDCI-0-1* (without suffix) and *reportSlotOffsetListDCI-0-2* (without suffix) for SCS 480 kHz and 960 kHz.

***resourcesForChannelMeasurement***

Resources for channel measurement. *csi-ResourceConfigId* of a *CSI-ResourceConfig* included in the configuration of the serving cell indicated with the field "carrier" above. The *CSI-ResourceConfig* indicated here contains only NZP-CSI-RS resources and/or SSB resources. This *CSI-ReportConfig* is associated with the DL BWP indicated by *bwp-Id* in that *CSI-ResourceConfig*.

***sharedCMR***

Enables sharing of channel measurement resources between different CSI measurement hypotheses when (1) *csi-ReportMode* is set to 'Mode1' and *numberOfSingleTRP-CSI-Mode1* is set to 1 or 2; or (2) *csi-ReportMode* is set to 'Mode2' (see TS 38.214 [19], clause 5.2.1.4.2).

***subbandSize***

Indicates one out of two possible BWP-dependent values for the subband size as indicated in TS 38.214 [19], table 5.2.1.4-2 . If *csi-ReportingBand* is absent, the UE shall ignore this field.

***timeRestrictionForChannelMeasurements***

Time domain measurement restriction for the channel (signal) measurements (see TS 38.214 [19], clause 5.2.1.1).

***timeRestrictionForInterferenceMeasurements***

Time domain measurement restriction for interference measurements (see TS 38.214 [19], clause 5.2.1.1).

| <b>CSI-ReportSubConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>codebookSubConfig</b>                      | Applicable codebook parameters for the ports indicated by <i>portSubsetIndicator</i> . Applicable value ranges for codebook subset restriction, rank restriction, N1, N2, and Ng and twoTX-CodebookSubsetRestriction follow existing specification according to the <i>codebookConfig</i> configured within the <i>CSI-ReportConfig</i> , and apply for the number of ports determined by <i>portSubsetIndicator</i> (see TS 38.214 [19], clause 5.2.1.4.2). In this field, the network always sets the <i>codebookType</i> to <i>type1</i> . When <i>reportQuantity</i> is set to ' <i>cri-RI-i1-CQI</i> ', the parameter <i>type1SinglePanel-codebookSubsetRestriction-i2</i> is mandatory to be configured in the <i>codebookSubConfig</i> for each sub-configuration that includes <i>portSubsetIndicator</i> . |
| <b>non-PMI-PortIndication</b>                 | Port indication for RI/CQI calculation applicable only for non-PMI feedback. The field shall be configured only if the <i>portSubsetIndicator-r18</i> is configured. For each CSI-RS resource in the linked <i>CSI-ResourceConfig</i> for channel measurement, a port indication for each rank R, indicating which R ports out of P ports to use within the sub-configuration. P corresponds to the number of bits with value 1 in the bitmap <i>portSubsetIndicator-r18</i> .                                                                                                                                                                                                                                                                                                                                      |
| <b>nzp-CSI-RS-ResourceList</b>                | List of NZP CSI RS resources for the sub-configuration that is a (sub)set of NZP CSI-RS resource(s) of the CSI-RS resource set for channel measurement associated with the sub-configuration in the CSI report configuration. Value 0 refers to the first NZP CSI RS resource of the CSI-RS resource set, value 1 refers to the second NZP CSI RS resource of the CSI-RS resource set, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>portSubsetIndicator</b>                    | Indicates the (sub)set of CSI-RS antenna ports used for CSI calculation of the sub-configuration. In the bit string, each bit corresponds to an antenna port. When a bit is set to 1, the corresponding port is enabled for CSI calculation corresponding to the sub-configuration. When the bit is set to zero, the corresponding port is not enabled for CSI calculation corresponding to the sub-configuration. The size of the bit string equals P bits, where P=2/4/8/12/16/24/32 represents the number of ports of the NZP CSI-RS resource(s) in the resource set for channel measurement associated with the <i>CSI-ReportConfig</i> .                                                                                                                                                                       |
| <b>powerOffset</b>                            | When <i>powerControlOffset</i> is configured in NZP CSI-RS resources in the resource set for channel measurement associated with the <i>CSI-ReportConfig</i> , the power offset of PDSCH EPRE to NZP CSI-RS EPRE is equal to <i>powerControlOffset</i> - <i>powerOffset</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>reportSubConfigParams</b>                  | Indicates the parameters to be used for the CSI report sub-configuration, which includes either <i>a1-parameters</i> that contain the antenna port subset and the associated parameters relevant to the sub-configuration or <i>a2-parameters</i> that contain the list of NZP CSI-RS resources for the sub-configuration (see TS 38.214 [19], clause 5.2.1.4.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>PortIndexFor8Ranks field descriptions</b> |                                                                                                                           |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>portIndex8</b>                            | Port-Index configuration for up to rank 8. If present, the network configures port indexes for at least one of the ranks. |
| <b>portIndex4</b>                            | Port-Index configuration for up to rank 4. If present, the network configures port indexes for at least one of the ranks. |
| <b>portIndex2</b>                            | Port-Index configuration for up to rank 2. If present, the network configures port indexes for at least one of the ranks. |
| <b>portIndex1</b>                            | Port-Index configuration for rank 1.                                                                                      |

| <b>TDCP field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>delayDSetofLengthY</b>      | Configures a set of Y delay values for TDCP reporting, see reference TS 38.214 clause 5.2.1.4. The <i>symb4</i> denotes 4 symbols, the <i>slot1</i> denotes 1 slot, the <i>slot2</i> denotes 2 slots and so on. The value <i>slot10</i> is applicable only to SCS >=30kHz. The parameter Y, see reference TS38.214 clause 5.2.1.4, is given by the length of the set of D values. |
| <b>phaseReporting</b>          | Configures the UE for phase reporting for TDCP reporting see reference TS 38.214 clause 5.2.1.4                                                                                                                                                                                                                                                                                   |

- ***CSI-ReportConfigId***

The IE *CSI-ReportConfigId* is used to identify one *CSI-ReportConfig*.

#### ***CSI-ReportConfigId* information element**

```
-- ASN1START
-- TAG-CSI-REPORTCONFIGID-START

CSI-ReportConfigId ::= INTEGER (0..maxNrofCSI-ReportConfigurations-1)

-- TAG-CSI-REPORTCONFIGID-STOP
-- ASN1STOP
```

- ***CSI-ReportPeriodicityAndOffset***

The IE *CSI-ReportPeriodicityAndOffset* is used to configure a periodicity and a corresponding offset. Both the periodicity and the offset are given in number of slots. The periodicity value *slots4* corresponds to 4 slots, value *slots5* corresponds to 5 slots, and so on.

#### ***CSI-ReportPeriodicityAndOffset* information element**

```
-- ASN1START
-- TAG-CSI-REPORTPERIODICITYANDOFFSET-START

CSI-ReportPeriodicityAndOffset ::= CHOICE {
 slots4 INTEGER(0..3),
 slots5 INTEGER(0..4),
 slots8 INTEGER(0..7),
 slots10 INTEGER(0..9),
 slots16 INTEGER(0..15),
 slots20 INTEGER(0..19),
 slots40 INTEGER(0..39),
 slots80 INTEGER(0..79),
 slots160 INTEGER(0..159),
 slots320 INTEGER(0..319)
}

-- TAG-CSI-REPORTPERIODICITYANDOFFSET-STOP
-- ASN1STOP
```

- ***CSI-ReportSubConfigId***

The IE *CSI-ReportSubConfigId* is used to indicate the index of one *CSI-ReportSubConfig* within a CSI report configuration.

### **CSI-ReportSubConfigId information element**

```
-- ASN1START
-- TAG-CSI-REPORTSUBCONFIGID-START

CSI-ReportSubConfigId-r18 ::= INTEGER (0..maxNrofCSI-ReportSubconfigPerCSI-ReportConfig-1-r18)

-- TAG-CSI-REPORTSUBCONFIGID-STOP
-- ASN1STOP
```

- **CSI-ReportSubConfigTriggerList**

The IE *CSI-ReportSubConfigTriggerList* is used to configure a list of sub-configuration ID(s) of N sub-configurations out of L configured sub-configurations within a CSI-ReportConfig associated with a triggering state for semi-persistent CSI reporting on PUSCH and aperiodic CSI reporting.

### **CSI-ReportSubConfigTriggerList information element**

```
-- ASN1START
-- TAG-CSI-REPORTSUBCONFIGTRIGGERLIST-START

CSI-ReportSubConfigTriggerList-r18 ::= SEQUENCE (SIZE(1..maxNrofCSI-ReportSubconfigPerCSI-ReportConfig-r18)) OF CSI-ReportSubConfigId-r18

-- TAG-CSI-REPORTSUBCONFIGTRIGGERLIST-STOP
-- ASN1STOP
```

- **CSI-ResourceConfig**

The IE *CSI-ResourceConfig* defines a group of one or more *NZP-CSI-RS-ResourceSet*, *CSI-IM-ResourceSet* and/or *CSI-SSB-ResourceSet*.

### **CSI-ResourceConfig information element**

```
-- ASN1START
-- TAG-CSI-RESOURCECONFIG-START

CSI-ResourceConfig ::= SEQUENCE {
 csi-ResourceConfigId CSI-ResourceConfigId,
 csi-RS-ResourceSetList CHOICE {
 nzp-CSI-RS-SSB SEQUENCE {
 nzp-CSI-RS-ResourceSetList SEQUENCE (SIZE (1..maxNrofNZP-CSI-RS-ResourceSetsPerConfig)) OF NZP-CSI-RS-ResourceId
 OPTIONAL, -- Need R
 csi-SSB-ResourceSetList SEQUENCE (SIZE (1..maxNrofCSI-SSB-ResourceSetsPerConfig)) OF CSI-SSB-ResourceId OPTIONAL -- Need R
 },
 csi-IM-ResourceSetList SEQUENCE (SIZE (1..maxNrofCSI-IM-ResourceSetsPerConfig)) OF CSI-IM-ResourceId
 },
 bwp-Id
 resourceType ENUMERATED { aperiodic, semiPersistent, periodic },
}
```

```

...
[[csi-SSB-ResourceSetListExt-r17 CSI-SSB-ResourceSetId
]]
}

-- TAG-CSI-RESOURCECONFIG-STOP
-- ASN1STOP

```

| <b><i>CSI-ResourceConfig</i> field descriptions</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bwp-Id</i></b>                                                     | The DL BWP which the CSI-RS associated with this <i>CSI-ResourceConfig</i> are located in (see TS 38.214 [19], clause 5.2.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>csi-IM-ResourceSetList</i></b>                                     | List of references to CSI-IM resources used for CSI measurement and reporting in a CSI-RS resource set. Contains up to <i>maxNrofCSI-IM-ResourceSetsPerConfig</i> resource sets if <i>resourceType</i> is 'aperiodic' and 1 otherwise (see TS 38.214 [19], clause 5.2.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>csi-ResourceConfigId</i></b>                                       | Used in <i>CSI-ReportConfig</i> to refer to an instance of <i>CSI-ResourceConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>csi-SSB-ResourceSetList</i>, <i>csi-SSB-ResourceSetListExt</i></b> | List of references to SSB resources used for CSI measurement and reporting in a CSI-RS resource set (see TS 38.214 [19], clause 5.2.1.2). The <i>csi-SSB-ResourceSetListExt</i> provides additional references and can only be configured if <i>csi-SSB-ResourceSetList</i> is configured and <i>groupBasedBeamReporting-v1710</i> is configured in the <i>CSI-ReportConfig</i> that indicates this <i>CSI-ResourceConfig</i> as <i>resourcesForChannelMeasurement</i> . If <i>groupBasedBeamReporting-v1710</i> is configured in the IE <i>CSI-ReportConfig</i> that indicates this <i>CSI-ResourceConfig</i> as <i>resourcesForChannelMeasurement</i> , the network configures 2 resource sets, which may be two CSI SSB resource sets (see TS 38.214 [19], clause 5.2.1.2 and 5.2.1.4.2). In this case, in TS 38.212 [17] Table 6.3.1.1.2-8B, the first resource set is indicated by a resource set indicator set to 0 and the second resource set by a resource set indicator set to 1.                                                                                                      |
| <b><i>nzp-CSI-RS-ResourceSetList</i></b>                                 | List of references to NZP CSI-RS resources used for beam measurement and reporting in a CSI-RS resource set.<br>If <i>resourceType</i> is set to 'aperiodic', the network configures up to <i>maxNrofNZP-CSI-RS-ResourceSetsPerConfig</i> resource sets. If <i>resourceType</i> is set to 'periodic' or 'semiPersistent' and <i>groupBasedBeamReporting-v1710</i> is not configured in IE <i>CSI-ReportConfig</i> , the network configures 1 resource set. If <i>resourceType</i> is set to 'periodic' or 'semiPersistent' and <i>groupBasedBeamReporting-v1710</i> is configured, the network configures 2 resource sets, which may be two NZP CSI-RS resource sets (see TS 38.214 [19], clause 5.2.1.2 and 5.2.1.4.2). In this case, in TS 38.212 [17] Table 6.3.1.1.2-8B, the first resource set is indicated by a resource set indicator set to 0 and the second resource set by a resource set indicator set to 1. If <i>resourceType</i> is set to 'periodic' and <i>reportQuantity</i> is set to 'TDCP', the network configures up to 3 resource sets, see TS 38.214 [19] clause 5.2.1.2. |
| <b><i>resourceType</i></b>                                               | Time domain behavior of resource configuration (see TS 38.214 [19], clause 5.2.1.2). It does not apply to resources provided in the <i>csi-SSB-ResourceSetList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## – *CSI-ResourceConfigId*

The IE *CSI-ResourceConfigId* is used to identify a *CSI-ResourceConfig*.

### ***CSI-ResourceConfigId* information element**

```

-- ASN1START
-- TAG-CSI-RESOURCECONFIGID-START

CSI-ResourceConfigId ::= INTEGER (0..maxNrofCSI-ResourceConfigurations-1)

```

```
-- TAG-CSI-RESOURCECONFIGID-STOP
-- ASN1STOP
```

## - *CSI-ResourcePeriodicityAndOffset*

The IE *CSI-ResourcePeriodicityAndOffset* is used to configure a periodicity and a corresponding offset for periodic and semi-persistent CSI resources, and for periodic and semi-persistent reporting on PUCCH. both, the periodicity and the offset are given in number of slots. The periodicity value *slots4* corresponds to 4 slots, value *slots5* corresponds to 5 slots, and so on.

### **CSI-ResourcePeriodicityAndOffset information element**

```
-- ASN1START
-- TAG-CSI-RESOURCEPERIODICITYANDOFFSET-START

CSI-ResourcePeriodicityAndOffset ::= CHOICE {
 slots4 INTEGER (0..3),
 slots5 INTEGER (0..4),
 slots8 INTEGER (0..7),

| <b>associatedSSB</b>                               | If this field is present, the UE may base the timing of the CSI-RS resource indicated in <i>CSI-RS-Resource-Mobility</i> on the timing of the cell indicated by the <i>cellId</i> in the <i>CSI-RS-CellMobility</i> . In this case, the UE is not required to monitor that CSI-RS resource if the UE cannot detect the SS/PBCH block indicated by this <i>associatedSSB</i> and <i>cellId</i> . If this field is absent, the UE shall base the timing of the CSI-RS resource indicated in <i>CSI-RS-Resource-Mobility</i> on the timing of the serving cell indicated by <i>refServCellIndex</i> . In this case, the UE is required to measure the CSI-RS resource even if SS/PBCH block(s) with <i>cellId</i> in the <i>CSI-RS-CellMobility</i> are not detected.<br>CSI-RS resources with and without <i>associatedSSB</i> may be configured in accordance with the rules in TS 38.214 [19], clause 5.1.6.1.3.                                                                                                                                                                                                                                                                          |
| <b>csi-RS-Index</b>                                | CSI-RS resource index associated to the CSI-RS resource to be measured (and used for reporting).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>firstOFDMSymbolInTimeDomain</b>                 | Time domain allocation within a physical resource block. The field indicates the first OFDM symbol in the PRB used for CSI-RS, see TS 38.211 [16], clause 7.4.1.5.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>frequencyDomainAllocation</b>                   | Frequency domain allocation within a physical resource block in accordance with TS 38.211 [16], clause 7.4.1.5.3 including table 7.4.1.5.2-1. The number of bits that may be set to one depend on the chosen row in that table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>isQuasiColocated</b>                            | Indicates that the CSI-RS resource is quasi co-located with the associated SS/PBCH block, see TS 38.214 [19], clause 5.1.6.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>sequenceGenerationConfig</b>                    | Scrambling ID for CSI-RS (see TS 38.211 [16], clause 7.4.1.5.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>slotConfig</b>                                  | Indicates the CSI-RS periodicity (in milliseconds) and for each periodicity the offset (in number of slots). When <i>subcarrierSpacing</i> is set to <i>kHz15</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 3/4/9/19/39 slots. When <i>subcarrierSpacing</i> is set to <i>kHz30</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 7/9/19/39/79 slots. When <i>subcarrierSpacing</i> is set to <i>kHz60</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 15/19/39/79/159 slots. When <i>subcarrierSpacing</i> is set to <i>kHz120</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 31/39/79/159/319 slots. When <i>subcarrierSpacing</i> is set to <i>kHz480</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 127/159/319/639/1279 slots. When <i>subcarrierSpacing</i> is set to <i>kHz960</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 255/319/639/1279/2559 slots. If <i>slotConfig-r17</i> is present, UE shall ignore the <i>slotConfig</i> (without suffix). |

## – *CSI-RS-ResourceMapping*

The IE *CSI-RS-ResourceMapping* is used to configure the resource element mapping of a CSI-RS resource in time- and frequency domain.

### **CSI-RS-ResourceMapping information element**

|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cdm-Type</i></b>                                  | CDM type (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>density</i></b>                                   | Density of CSI-RS resource measured in RE/port/PRB (see TS 38.211 [16], clause 7.4.1.5.3). Values 0.5 ( <i>dot5</i> ), 1 ( <i>one</i> ) and 3 ( <i>three</i> ) are allowed for X=1, values 0.5 ( <i>dot5</i> ) and 1 ( <i>one</i> ) are allowed for X=2, 16, 24 and 32, value 1 ( <i>one</i> ) is allowed for X=4, 8, 12. For density = 1/2, includes 1-bit indication for RB level comb offset indicating whether odd or even RBs are occupied by CSI-RS.                                                                                                                                                                                                                                 |
| <b><i>firstOFDMSymbollnTimeDomain2</i></b>              | Time domain allocation within a physical resource block. See TS 38.211 [16], clause 7.4.1.5.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>firstOFDMSymbollnTimeDomain</i></b>               | Time domain allocation within a physical resource block. The field indicates the first OFDM symbol in the PRB used for CSI-RS. See TS 38.211 [16], clause 7.4.1.5.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>freqBand</i></b>                                  | Wideband or partial band CSI-RS, (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>frequencyDomainAllocation</i></b>                 | Frequency domain allocation within a physical resource block in accordance with TS 38.211 [16], clause 7.4.1.5.3. The applicable row number in table 7.4.1.5.3-1 is determined by the <i>frequencyDomainAllocation</i> for rows 1, 2 and 4, and for other rows by matching the values in the column Ports, Density and CDMtype in table 7.4.1.5.3-1 with the values of <i>nrofPorts</i> , <i>cdm-Type</i> and <i>density</i> below and, when more than one row has the 3 values matching, by selecting the row where the column (k bar, l bar) in table 7.4.1.5.3-1 has indexes for k ranging from 0 to 2*n-1 where n is the number of bits set to 1 in <i>frequencyDomainAllocation</i> . |
| <b><i>nrofPorts</i></b>                                 | Number of ports (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## - ***CSI-SemiPersistentOnPUSCH-TriggerStateList***

The *CSI-SemiPersistentOnPUSCH-TriggerStateList* IE is used to configure the UE with list of trigger states for semi-persistent reporting of channel state information on L1. See also TS 38.214 [19], clause 5.2.

### ***CSI-SemiPersistentOnPUSCH-TriggerStateList* information element**

```

-- ASN1START
-- TAG-CSI-SEMPERSISTENTONPUSCHTRIGGERSTATELIST-START

| <b><i>csi-ReportSubConfigTriggerList</i></b>                                | A list of sub-configuration ID(s) of N sub-configurations out of L configured sub-configurations within a <i>CSI-ReportConfig</i> associated with a triggering state for semi-persistent CSI reporting on PUSCH.                                                               |
| <b><i>ltm-AssociatedReportConfigInfo</i></b>                                | This field configures semi-persistent CSI reports on PUSCH of LTM candidate cells. If <i>ltm-associatedReportConfigInfo</i> is configured the UE shall ignore the field <i>associatedReportConfigInfo</i> .                                                                    |
| <b><i>sp-CSI-MultiplexingMode</i></b>                                       | Indicates if the behavior of transmitting SP-CSI on the first PUSCH repetitions corresponding to two SRS resource sets configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' is enabled or not. |

## – **CSI-SSB-ResourceSet**

The IE *CSI-SSB-ResourceSet* is used to configure one SS/PBCH block resource set which refers to SS/PBCH as indicated in *ServingCellConfigCommon* and *ServingCellConfig*.

### ***CSI-SSB-ResourceSet* information element**

```

-- ASN1START
-- TAG-CSI-SSB-RESOURCESET-START

CSI-SSB-ResourceSet ::= SEQUENCE {
 csi-SSB-ResourceSetId,
 csi-SSB-ResourceList
 ...
 [
 servingAdditionalPCIList-r17 SEQUENCE (SIZE(1..maxNrofCSI-SSB-ResourcePerSet)) OF SSB-Index,
]
}

ServingAdditionalPCIIndex-r17 ::= INTEGER(0..maxNrofAdditionalPCI-r17)

-- TAG-CSI-SSB-RESOURCESET-STOP
-- ASN1STOP

```

| <b>CSI-SSB-ResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>servingAdditionalPCIList</b>               | Indicates the physical cell IDs (PCI) of the SSBs in the <i>csi-SSB-ResourceList</i> . If present, the list has the same number of entries as <i>csi-SSB-ResourceList</i> . The first entry of the list indicates the value of the PCI for the first entry of <i>csi-SSB-ResourceList</i> , the second entry of this list indicates the value of the PCI for the second entry of <i>csi-SSB-ResourceList</i> , and so on. For each entry, the following applies:<br>- If the value is zero, the PCI is the PCI of the serving cell in which this <i>CSI-SSB-ResourceSet</i> is defined;<br>- otherwise, the value is <i>additionalPCIIndex-r17</i> of an <i>SSB-MTC-AdditionalPCI-r17</i> configured using the <i>additionalPCI-ToAddModList-r17</i> in <i>ServingCellConfig</i> , and the PCI is the <i>additionalPCI-r17</i> in this <i>SSB-MTC-AdditionalPCI-r17</i> . |
| —                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### **CSI-SSB-ResourceSetId**

The IE *CSI-SSB-ResourceSetId* is used to identify one SS/PBCH block resource set.

#### **CSI-SSB-ResourceId information element**

```
-- ASN1START
-- TAG-CSI-SSB-RESOURCESETID-START
CSI-SSB-ResourceSetId ::= INTEGER (0..maxNrofCSI-SSB-ResourceSets-1)
-- TAG-CSI-SSB-RESOURCESETID-STOP
-- ASN1STOP
```

### **DedicatedNAS-Message**

The IE *DedicatedNAS-Message* is used to transfer UE specific NAS layer information between the 5GC CN and the UE. The RRC layer is transparent for this information.

#### **DedicatedNAS-Message information element**

```
-- ASN1START
-- TAG-DEDICATED-NAS-MESSAGE-START
DedicatedNAS-Message ::= OCTET STRING
-- TAG-DEDICATED-NAS-MESSAGE-STOP
-- ASN1STOP
```

– ***DL-PPW-PreConfig***

The IE *DL-PPW-PreConfig* provides configuration for a measurement window where a UE is expected to measure the DL PRS, if it is inside the active DL BWP and with the same numerology as the active DL BWP. Based upon the indication received in the configuration, the UE identifies whether the DL PRS priority is higher than that of the other DL signals or channels and accordingly determines, for example, the UE is expected to measure the DL PRS and is not expected to receive other DL signals and channels.

***DL-PPW-PreConfig* information element**

| <b>pucch-DMRS-Bundling</b>                          | Indicates whether DMRS bundling and time domain window for PUCCH are jointly enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>pucch-FrequencyHoppingInterval</b>               | Configures the number of consecutive slots for the UE to perform inter-slot frequency hopping with inter-slot bundling for PUCCH. When both inter-frequency hopping and DMRS bundling are enabled for PUCCH repetitions, the UE is expected to be configured with at least one <i>pucch-FrequencyHoppingInterval-r17</i> and <i>pucch-TimeDomainWindowLength-r17</i> . When DMRS bundling for PUCCH is enabled by <i>pucch-DMRS-Bundling-r17</i> , PUCCH frequency hopping interval is only determined by the configuration of PUCCH hopping interval if PUCCH hopping interval is configured. If the field is absent, the number of consecutive slots for the UE to perform inter-slot PUCCH frequency hopping is indicated by <i>pucch-TimeDomainWindowLength-r17</i> . |
| <b>pucch-TimeDomainWindowLength</b>                 | Configures the length of a nominal time domain window in slots for DMRS bundling for PUCCH. The value shall not exceed the maximum duration for DMRS bundling for PUCCH as specified in TS 38.306 [26]. If this field is absent, the UE shall apply the default value that is the minimum value in the unit of consecutive slots of the time duration for the transmission of all PUCCH repetitions and the maximum duration for DMRS bundling for PUCCH as specified in TS 38.306 [26].                                                                                                                                                                                                                                                                                  |
| <b>pucch-WindowRestart</b>                          | Indicates whether UE bundles PUCCH DMRS remaining in a nominal time domain window after event(s) triggered by DCI or MAC CE that violate power consistency and phase continuity requirements is enabled (see TS 38.214 [19], clause 6.1.7).<br>NOTE: Events, which are triggered by DCI or MAC CE, but do not require UE capability to resume maintaining power consistency and/or phase continuity as specified in clause 6.1.7 of TS 38.214 [19], are excluded.                                                                                                                                                                                                                                                                                                         |

## – *DMRS-BundlingPUSCH-Config*

The IE *DMRS-BundlingPUSCH-Config-r17* is used to configure DMRS bundling for PUSCH.

|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pusch-DMRS-Bundling</b>                          | Indicates whether DMRS bundling and time domain window for PUSCH are jointly enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>pusch-FrequencyHoppingInterval</b>               | Configures the number of consecutive slots for the UE to perform inter-slot frequency hopping with inter-slot bundling for PUSCH. When both inter-frequency hopping and DMRS bundling are enabled for PUSCH repetitions, the UE is expected to be configured with at least one <i>pusch-FrequencyHoppingInterval-r17</i> and <i>pusch-TimeDomainWindowLength-r17</i> . This parameter is shared for both DG-PUSCH and CG-PUSCH. When DMRS bundling for PUSCH is enabled by <i>pusch-DMRS-Bundling-r17</i> , PUSCH frequency hopping interval is only determined by the configuration of PUSCH hopping interval if PUSCH hopping interval is configured. If the field is absent, the number of consecutive slots for the UE to perform inter-slot PUSCH frequency hopping is indicated by <i>pusch-TimeDomainWindowLength-r17</i> .<br>Note: For unpaired spectrum, the UE is not expected to be configured the value of s6, s8, s12, s14 and s16. |
| <b>pusch-TimeDomainWindowLength</b>                 | Configures the length of a nominal time domain window in number of consecutive slots for DMRS bundling for PUSCH. The value shall not exceed the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26]. For PUSCH repetition type A/B, if this field is absent, the UE shall apply the default value that is the minimum value in the unit of consecutive slots of the time duration for the transmission of all PUSCH repetitions and the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26]. For TBoMS, if this field is absent, the UE shall apply the default value that is the minimum value in the unit of consecutive slots of the duration of TBoMS transmission (including repetition of TBoMS) and the maximum duration for DMRS bundling for PUSCH as specified in TS 38.306 [26].                                                                                                      |
| <b>pusch-WindowRestart</b>                          | Indicates whether UE bundles PUSCH DMRS remaining in a nominal time domain window after event(s) triggered by DCI or MAC CE that violate power consistency and phase continuity requirements is enabled (see TS 38.214 [19], clause 6.1.7).<br>NOTE: Events, which are triggered by DCI or MAC CE, but do not require UE capability to resume maintaining power consistency and/or phase continuity as specified in clause 6.1.7 of TS 38.214 [19], are excluded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### – *DMRS-DownlinkConfig*

The IE *DMRS-DownlinkConfig* is used to configure downlink demodulation reference signals for PDSCH.

| <b><i>DMRS-DownlinkConfig</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dmrs-AdditionalPosition</i></b>                | Position for additional DM-RS in DL, see Tables 7.4.1.1.2-3 and 7.4.1.1.2-4 in TS 38.211 [16]. If the field is absent, the UE applies the value pos2. See also clause 7.4.1.1.2 for additional constraints on how the network may set this field depending on the setting of other fields.                                                  |
| <b><i>dmrs-Downlink</i></b>                          | This field indicates whether low PAPR DMRS is used, as specified in TS38.211 [16], clause 7.4.1.1.1.                                                                                                                                                                                                                                        |
| <b><i>dmrs-Type</i></b>                              | Selection of the DMRS type to be used for DL (see TS 38.211 [16], clause 7.4.1.1.1). If the field is absent, the UE uses DMRS type 1.                                                                                                                                                                                                       |
| <b><i>dmrs-TypeEnh</i></b>                           | This field is used in TS 38.211 [16], clause 7.4.1.1.2.                                                                                                                                                                                                                                                                                     |
| <b><i>maxLength</i></b>                              | The maximum number of OFDM symbols for DL front loaded DMRS. <i>len1</i> corresponds to value 1. <i>len2</i> corresponds to value 2. If the field is absent, the UE applies value <i>len1</i> . If set to <i>len2</i> , the UE determines the actual number of DM-RS symbols by the associated DCI. (see TS 38.211 [16], clause 7.4.1.1.2). |
| <b><i>phaseTrackingRS</i></b>                        | Configures downlink PTRS. If the field is not configured, the UE assumes that downlink PTRS are absent. See TS 38.214 [19] clause 5.1.6.3.                                                                                                                                                                                                  |
| <b><i>scramblingID0</i></b>                          | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell.                                                                                                                                                             |
| <b><i>scramblingID1</i></b>                          | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell.                                                                                                                                                             |

## — *DMRS-UplinkConfig*

The IE *DMRS-UplinkConfig* is used to configure uplink demodulation reference signals for PUSCH.

| <b>DMRS-UplinkConfig field descriptions</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dmrs-AdditionalPosition</b>                      | Position for additional DM-RS in UL (see TS 38.211 [16], clause 6.4.1.1.3). If the field is absent, the UE applies the value pos2. See also clause 6.4.1.1.3 for additional constraints on how the network may set this field depending on the setting of other fields.                                                                                                                                                                                                            |
| <b>dmrs-Type</b>                                    | Selection of the DMRS type to be used for UL (see TS 38.211 [16], clause 6.4.1.1.3) If the field is absent, the UE uses DMRS type 1.                                                                                                                                                                                                                                                                                                                                               |
| <b>dmrs-TypeEnh</b>                                 | This field is used in TS 38.211 [16], clause 6.4.1.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>dmrs-Uplink</b>                                  | This field indicates whether low PAPR DMRS is used, as specified in TS38.211 [16], clause 6.4.1.1.1.1.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>dmrs-UplinkTransformPrecoding</b>                | This field indicates whether low PAPR DMRS is used for PUSCH with pi/2 BPSK modulation, as specified in TS38.211 [16], clause 6.4.1.1.1.2. The network configures this field only if <i>tp-pi2BPSK</i> is configured in <i>PUSCH-Config</i> .                                                                                                                                                                                                                                      |
| <b>maxLength</b>                                    | The maximum number of OFDM symbols for UL front loaded DMRS. <i>len1</i> corresponds to value 1. <i>len2</i> corresponds to value 2. If the field is absent, the UE applies value <i>len1</i> . If set to <i>len2</i> , the UE determines the actual number of DM-RS symbols by the associated DCI. (see TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                        |
| <b>nPUSCH-Identity</b>                              | Parameter: N_ID^(PUSCH) for DFT-s-OFDM DMRS. If the value is absent or released, the UE uses the value Physical cell ID ( <i>physCellId</i> ). See TS 38.211 [16].                                                                                                                                                                                                                                                                                                                 |
| <b>phaseTrackingRS</b>                              | Configures uplink PTRS (see TS 38.211 [16]).                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>pi2BPSK-ScramblingID0, pi2BPSK-ScramblingID1</b> | UL DMRS scrambling initialization for pi/2 BPSK DMRS for PUSCH (see TS 38.211 [16], Clause 6.4.1.1.2). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ) of the serving cell.                                                                                                                                                                                                                                                               |
| <b>scramblingID0</b>                                | UL DMRS scrambling initialization for CP-OFDM (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                  |
| <b>scramblingID1</b>                                | UL DMRS scrambling initialization for CP-OFDM. (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                 |
| <b>sequenceGroupHopping</b>                         | For DMRS transmission with transform precoder the NW may configure group hopping by the cell-specific parameter <i>groupHoppingEnabledTransformPrecoding</i> in <i>PUSCH-ConfigCommon</i> . In this case, the NW may include this UE specific field to disable group hopping for PUSCH transmission except for Msg3, i.e., to override the configuration in <i>PUSCH-ConfigCommon</i> (see TS 38.211 [16]). If the field is absent, the UE uses the same hopping mode as for Msg3. |
| <b>sequenceHopping</b>                              | Determines if sequence hopping is enabled for DMRS transmission with transform precoder for PUSCH transmission other than Msg3 (sequence hopping is always disabled for Msg3). If the field is absent, the UE uses the same hopping mode as for msg3. The network does not configure simultaneous group hopping and sequence hopping. See TS 38.211 [16], clause 6.4.1.1.1.2.                                                                                                      |
| <b>transformPrecodingDisabled</b>                   | DMRS related parameters for Cyclic Prefix OFDM.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>transformPrecodingEnabled</b>                    | DMRS related parameters for DFT-s-OFDM (Transform Precoding).                                                                                                                                                                                                                                                                                                                                                                                                                      |

### – *DownlinkConfigCommon*

The IE *DownlinkConfigCommon* provides common downlink parameters of a cell.

| <b><i>frequencyInfoDL-SIB</i></b>                        | Basic parameters of a downlink carrier and transmission thereon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>initialDownlinkBWP</i></b>                         | The initial downlink BWP configuration for a PCell. The network configures the <i>locationAndBandwidth</i> so that the initial downlink BWP contains the entire CORESET#0 of this serving cell in the frequency domain. The UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> .                                                                                                                                                                                                                                                                                                                            |
| <b><i>initialDownlinkBWP-RedCap</i></b>                  | If present, (e)RedCap UEs use this DL BWP instead of <i>initialDownlinkBWP</i> . If the <i>locationAndBandwidth</i> of this BWP contains the entire CORESET#0, the UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> . Otherwise, i.e., if the <i>locationAndBandwidth</i> of this BWP does not contain the entire CORESET#0, the UE uses this BWP for receiving DL messages during initial access (Msg2, MsgB, Msg4) and after initial access.<br>If absent, (e)RedCap UEs use <i>initialDownlinkBWP</i> provided that it does not exceed the (e)RedCap UE maximum bandwidth (see also clause 5.2.2.4.2). |
| <b><i>lastUsedCellOnly</i></b>                           | When present, the field indicates that the UE monitors PEI only if the latest received <i>RRCRelease</i> without <i>noLastCellUpdate</i> is from this cell. A PEI-capable UE stores its last used cell information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>pcch-Config</i></b>                                | The paging related configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>payloadSizeDCI-2-7</b><br>Payload size of PEI DCI, i.e., DCI format 2_7. The size is no larger than the payload size of paging DCI which has maximum of 41 bits and 43 bits for licensed and unlicensed spectrums, respectively.                                                                                                                                                             |  |
| <b>pei-FrameOffset</b><br>Offset, in number of frames from the start of a reference frame for PEI-O to the start of a first paging frame of the paging frames associated with the PEI-O, see TS 38.213 [13], clause 10.4A.                                                                                                                                                                      |  |
| <b>po-NumPerPEI</b><br>The number of PO(s) associated with one PEI monitoring occasion. It is a factor of the total PO number in a paging cycle, i.e $N \times Ns$ , as specified in TS 38.304 [20]. The maximum number of PF associated with one PEI monitoring occasion is 2. The number of PO mapping to one PEI should be multiple of $Ns$ when $\text{po-NumPerPEI}$ is larger than $Ns$ . |  |

| <b><i>SubgroupConfig</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>subgroupsNumPerPO</i></b>                 | Total number of subgroups per Paging Occasion (PO) for UE to read subgroups indication from physical-layer signaling. The field represents the sum of CN-assigned and UEID-based subgroups supported by the network. When <i>PEI-Config</i> is configured, there is always at least one subgroup (UEID-based subgroup or CN-assigned subgroup) configured.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>subgroupsNumForUEID</i></b>               | Number of subgroups per Paging Occasion (PO) for UE to read subgroups indication from physical-layer signaling, for UEID-based subgrouping method. When present, the field is set to an integer smaller than or equal to <i>subgroupsNumPerPO</i> . <i>subgroupsNumPerPO</i> equals to <i>subgroupsNumForUEID</i> when the network does not configure CN-assigned subgrouping. When <i>pei-Config</i> is configured, the field is absent when the network only configures CN-assigned subgrouping. Both this field and <i>subgroupsNumPerPO</i> are equal to 1 when the network does not configure subgrouping. When <i>pei-Config</i> is configured, if the field is absent, the UE uses subgrouping according to TS 38.304 [20], clause 7.3.0. |

| Conditional Presence   | Explanation                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <i>SharedSpectrum2</i> | The field is optional present, Need R, if this cell operates with shared spectrum channel access. Otherwise, it is absent, Need R. |

## – *DownlinkPreemption*

The IE *DownlinkPreemption* is used to configure the UE to monitor PDCCH for the INT-RNTI (interruption).

-- ASN1STOP
```

| <i>DownlinkPreemption</i> field descriptions |                                                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dci-PayloadSize</b>                       | Total length of the DCI payload scrambled with INT-RNTI (see TS 38.213 [13], clause 11.2).                                                           |
| <b>int-ConfigurationPerServingCell</b>       | Indicates (per serving cell) the position of the 14 bit INT values inside the DCI payload (see TS 38.213 [13], clause 11.2).                         |
| <b>int-RNTI</b>                              | RNTI used for indication pre-emption in DL (see TS 38.213 [13], clause 10).                                                                          |
| <b>timeFrequencySet</b>                      | Set selection for DL-preemption indication (see TS 38.213 [13], clause 11.2) The set determines how the UE interprets the DL preemption DCI payload. |

| <i>INT-ConfigurationPerServingCell</i> field descriptions |                                                                                                                                                                                                                 |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionInDCI</b>                                      | Starting position (in number of bit) of the 14 bit INT value applicable for this serving cell ( <i>servingCellId</i> ) within the DCI payload (see TS 38.213 [13], clause 11.2). Must be multiples of 14 (bit). |

### – *DRB-Identity*

The IE *DRB-Identity* is used to identify a DRB used by a UE.

| <b>drx-HARQ-RTT-TimerDL</b>               | Value in number of symbols of the BWP where the transport block was received. <i>drx-HARQ-RTT-TimerDL-r17</i> is only applicable for SCS 480 kHz and 960 kHz. If configured, the UE shall ignore <i>drx-HARQ-RTT-TimerDL</i> (without suffix) for SCS 480 kHz and 960 kHz.                                                                                                                                                                                                                                  |
| <b>drx-HARQ-RTT-TimerUL</b>               | Value in number of symbols of the BWP where the transport block was transmitted. <i>drx-HARQ-RTT-TimerUL-r17</i> is only applicable for SCS 480 kHz and 960 kHz. If configured, the UE shall ignore <i>drx-HARQ-RTT-TimerUL</i> (without suffix) for SCS 480 kHz and 960 kHz.                                                                                                                                                                                                                               |
| <b>drx-InactivityTimer</b>                | Value in multiple integers of 1 ms. <i>ms0</i> corresponds to 0, <i>ms1</i> corresponds to 1 ms, <i>ms2</i> corresponds to 2 ms, and so on.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>drx-LongCycleStartOffset</b>           | <i>drx-LongCycle</i> in ms and <i>drx-StartOffset</i> in multiples of 1 ms. If <i>drx-ShortCycle</i> is configured, the value of <i>drx-LongCycle</i> shall be a multiple of the <i>drx-ShortCycle</i> value.                                                                                                                                                                                                                                                                                               |
| <b>drx-NonIntegerLongCycleStartOffset</b> | <i>drx-NonIntegerLongCycle</i> in non-integer number of ms (e.g. <i>ms1001over240</i> corresponds to 1001/240 ms, <i>ms25over6</i> corresponds to 25/6 ms and so on) and <i>drx-StartOffset</i> in multiples of 1 ms. If <i>drx-NonIntegerShortCycle</i> is configured, the value of <i>drx-NonIntegerLongCycle</i> shall be a multiple of the <i>drx-NonIntegerShortCycle</i> value. If <i>drx-NonIntegerLongCycleStartOffset-r18</i> is configured, the UE shall ignore <i>drx-LongCycleStartOffset</i> . |
| <b>drx-NonIntegerShortCycle</b>           | Value in non-integer number of ms, e.g. <i>ms1001over240</i> corresponds to 1001/240 ms, <i>ms25over6</i> corresponds to 25/6 ms and so on.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>drx-onDurationTimer</b>                | Value in multiples of 1/32 ms (subMilliSeconds) or in ms (milliSecond). For the latter, value <i>ms1</i> corresponds to 1 ms, value <i>ms2</i> corresponds to 2 ms, and so on.                                                                                                                                                                                                                                                                                                                              |

## – *EphemerisInfo*

The IE *EphemerisInfo* provides satellite ephemeris. Ephemeris may be expressed either in format of position and velocity state vector in ECEF or in format of orbital parameters in ECI. Note: The ECI and ECEF coincide at *epochTime*, i.e., x,y,z axis in ECEF are aligned with x,y,z axis in ECI at *epochTime*.

| <b>positionX, positionY, positionZ</b>    | X, Y, Z coordinate of satellite position state vector in ECEF. Unit is meter.<br>Step of 1.3 m. Actual value = field value * 1.3.                                                                                                                                                          |
| <b>semiMajorAxis</b>                      | Satellite orbital parameter: semi major axis $\alpha$ , see NIMA TR 8350.2 [71]. Unit is meter.<br>Step of $4.249 \times 10^{-3}$ m. Actual value = $6500000 + \text{field value} \times (4.249 \times 10^{-3})$ .                                                                         |
| <b>velocityVX, velocityVY, velocityVZ</b> | X, Y, Z coordinate of satellite velocity state vector in ECEF. Unit is meter/second.<br>Step of 0.06 m/s. Actual value = field value * 0.06.                                                                                                                                               |

- ***EpochTime***

The IE *EpochTime* is used to indicate the epoch time for the NTN assistance information, and it is defined as the starting time of a DL sub-frame, indicated by a SFN and a sub-frame number signaled together with the assistance information. The reference point for *EpochTime* of the serving or neighbour NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the serving cell when this field is provided in an NTN cell and the gNB when this field is provided in a TN cell. In case of handover or conditional handover, the reference point for *EpochTime* of the target NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the target cell. In case of handover or conditional handover, *EpochTime* is based on the timing of the target cell, i.e. the SFN and sub-frame number indicated refers to the SFN and sub-frame of the target cell. Otherwise, *EpochTime* is used based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated refers to the SFN and sub-frame of the serving cell.

#### ***EpochTime* information element**

```
-- ASN1START
-- TAG-EPOCHTIME-START

EpochTime-r17 ::= SEQUENCE {
 sfn-r17 INTEGER(0..1023),
 subFrameNR-r17 INTEGER(0..9)
}

-- TAG-EPOCHTIME-STOP
-- ASN1STOP
```

#### ***EpochTime* field descriptions**

***sfn***

For serving cell, it indicates the current SFN or the next upcoming SFN after the frame where the message indicating the *epochTime* is received. For neighbour or target cell, it indicates the SFN nearest to the frame where the message indicating the *epochTime* is received.

- ***EUTRA-C-RNTI***

The IE *EUTRA-C-RNTI* identifies a UE having a RRC connection within an E-UTRA cell.

#### ***EUTRA-C-RNTI* information element**

```
-- ASN1START
-- TAG-EUTRACRNTI-START

EUTRA-C-RNTI ::= BIT STRING (SIZE (16))

-- TAG-EUTRACRNTI-STOP
-- ASN1STOP
```

- *FeatureCombination*

The IE *FeatureCombination* indicates a feature or a combination of features to be associated with a set of Random Access resources (i.e. an instance of *FeatureCombinationPreambles*).

#### ***FeatureCombination* information element**

```
-- ASN1START

- *FeatureCombinationPreambles*

The IE *FeatureCombinationPreambles* associates a set of preambles with a feature combination. For parameters which can be provided in this IE, the UE applies this field value when performing Random Access using a preamble in this *featureCombinationPreambles*, otherwise the UE applies the corresponding value as determined by applicable Need Code, e.g. Need S. On a specific BWP, there can be at most one set of preambles associated with a given feature combination per RA Type (i.e. 4-step RACH or 2-step RACH) per MSG1 repetition number.

| <b>FeatureCombinationPreambles field descriptions</b>                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>deltaPreamble</b>                                                                                                                                                                                                                        | Power offset between msg3 or msgA-PUSCH and RACH preamble transmission. If configured, this parameter overrides <i>msg3-DeltaPreamble</i> or <i>msgA-DeltaPreamble</i> , Actual value = field value * 2 [dB] (see TS 38.213 [13], clause 7.1). If <i>msgA-DeltaPreamble</i> is configured in <i>separateMsgA-PUSCH-Config-r17</i> , this field is absent. This field is set to the same value for all <i>FeatureCombinationPreambles</i> for MSG1 repetitions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>featureCombination</b>                                                                                                                                                                                                                   | Indicates which combination of features that the preambles indicated by this IE are associated with. Network ensures that at least one field within the <i>featureCombination</i> is configured. The UE ignores a RACH resource defined by this <i>FeatureCombinationPreambles</i> if any feature within the <i>featureCombination</i> is not supported by the UE or if any of the spare fields within the <i>featureCombination</i> is set to <i>true</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>messagePowerOffsetGroupB</b>                                                                                                                                                                                                             | Threshold for preamble selection. Value is in dB. Value <i>minusinfinity</i> corresponds to -infinity. Value <i>dB0</i> corresponds to 0 dB, <i>dB5</i> corresponds to 5 dB and so on (see TS 38.321 [3], clause 5.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>msg1-RepetitionNum</b>                                                                                                                                                                                                                   | Indicates which MSG1-repetition number that this <i>FeatureCombinationPreambles</i> is associated with.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>msg1-RepetitionTimeOffsetROGroup</b>                                                                                                                                                                                                     | Indicates a time offset of the starting ROs between two successive RO groups for a given repetition number (2, 4 or 8) associated with this <i>FeatureCombinationPreambles</i> for each frequency resource index within a time period (see TS 38.213 [13]). If this field is absent, the time offset is implicitly determined (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| For each MSG1 repetition number, the following values are applicable.                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>numberOfRA-PreamblesGroupA</b>                                                                                                                                                                                                           | It determines how many consecutive preambles per SSB are associated to Group A starting from the starting preamble(s). The remaining preambles associated to the Feature Combination are associated to Group B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ra-SizeGroupA</b>                                                                                                                                                                                                                        | Transport Blocks size threshold in bits below which the UE shall use a contention-based RA preamble of group A. (see TS 38.321 [3], clause 5.1.2). If this feature combination preambles are associated to a <i>RACH-ConfigCommon-twostepRA</i> , this field correspond to <i>ra-MsgA-SizeGroupA</i> , otherwise it corresponds to <i>ra-Msg3SizeGroupA</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>rsrp-ThresholdSSB</b>                                                                                                                                                                                                                    | UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]). If this parameter is included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommonTwoStepRA</i> , it corresponds to <i>msgA-RSRP-ThresholdSSB</i> , as defined in TS 38.321 [3]. If this parameter is included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommon</i> , it it corresponds to <i>rsrp-ThresholdSSB</i> , as defined in TS 38.321 [3]. If this parameter is not included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommon</i> , the UE applies <i>rsrp-ThresholdSSB</i> included in the <i>RACH-ConfigCommon</i> which includes this <i>FeatureCombinationPreambles</i> . If this parameter is not included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommonTwoStepRA</i> , the UE applies <i>msgA-RSRP-ThresholdSSB</i> included in the <i>RACH-ConfigCommonTwoStepRA</i> which includes this <i>FeatureCombinationPreambles</i> . |
| <b>separateMsgA-PUSCH-Config</b>                                                                                                                                                                                                            | If present, it specifies how the 2-step RACH preambles identified by this <i>FeatureCombinationPreambles</i> are mapped to a PUSCH slot separate from the one defined in <i>MsgA-ConfigCommon-r16</i> . If the field is absent, the UE should apply the corresponding parameter in the <i>RACH-ConfigCommonTwoStepRA</i> of the BWP which includes the <i>FeatureCombinationPreambles</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**ssb-SharedRO-MaskIndex**

Mask index (see TS 38.321 [3]).

Indicates a subset of ROs where preambles are allocated for this feature combination.

If this field is configured within *FeatureCombinationPreambles* which is included in *RACH-ConfigCommonTwoStepRA*:

- in case of separate ROs are configured for 4-step and 2-step random access, this field indicates a subset of ROs configured within this *RACH-ConfigCommonTwoStepRA*;
- in case shared ROs are used for 4-step and 2-step random access, it indicates the subset of ROs configured within *RACH-ConfigCommon*, which are the subset of ROs configured for 2-step random access.

This field is configured when there is more than one RO per SSB. If the field is absent, all ROs configured in *RACH-ConfigCommon* or *RACH-ConfigCommonTwoStepRA* containing this *FeatureCombinationPreambles* are shared. The network does not configure this field, if the field *msg1-RepetitionNum* is configured.

**startPreambleForThisPartition**

It defines the first preamble associated with the Feature Combination. If the UE is provided with a number N of SSB block indexes associated with one PRACH occasion, and N<1, the first preamble in each PRACH occasion is the one having the same index as indicated by this field. If N>=1, N blocks of preambles associated with the Feature

Combination are defined, each having start index  $\frac{n \cdot N + 1}{N} + startPreambleForThisPartition$ , where n refers to SSB block index (see TS 38.213 [13], clause 8.1).

| Conditional Presence    | Explanation                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>MsgAConfigCommon</i> | The field is optionally present, Need S, if <i>FeatureCombinationPreambles</i> is included in <i>RACH-ConfigCommonTwoStepRA</i> . Otherwise, it is absent. If the field is absent in <i>FeatureCombinationPreambles</i> included in <i>RACH-ConfigCommonTwoStepRA</i> , the UE applies <i>MsgA-PUSCH-Config</i> included in the corresponding <i>MsgA-ConfigCommon</i> . |
| <i>Msg1Rep2</i>         | The field is mandatory present, if <i>msg1-Repetitions</i> is included in <i>FeatureCombination</i> for this concerned <i>FeatureCombinationPreambles</i> . Otherwise, it is absent.                                                                                                                                                                                     |
| <i>Msg1Rep3</i>         | The field is optionally present, Need S, if <i>msg1-Repetitions</i> is included in <i>FeatureCombination</i> for this concerned <i>FeatureCombinationPreambles</i> . Otherwise, it is absent.                                                                                                                                                                            |

### – *FilterCoefficient*

The IE *FilterCoefficient* specifies the measurement filtering coefficient. Value *fc0* corresponds to k = 0, *fc1* corresponds to k = 1, and so on.

#### ***FilterCoefficient* information element**

```
-- ASN1START
-- TAG-FILTERCOEFFICIENT-START

FilterCoefficient ::= ENUMERATED { fc0, fc1, fc2, fc3, fc4, fc5, fc6, fc7, fc8, fc9, fc11, fc13, fc15, fc17, fc19, spare1, ... }

-- TAG-FILTERCOEFFICIENT-STOP
-- ASN1STOP
```

- ***FreqBandIndicatorNR***

The IE *FreqBandIndicatorNR* is used to convey an NR frequency band number as defined in TS 38.101-1 [15], TS 38.101-2 [39] and TS 38.101-5 [75].

#### ***FreqBandIndicatorNR* information element**

```
-- ASN1START
-- TAG-FREQBANDINDICATORNR-START

FreqBandIndicatorNR ::= INTEGER (1..1024)

-- TAG-FREQBANDINDICATORNR-STOP
-- ASN1STOP
```

- ***FreqPriorityListDedicatedSlicing***

The IE *FreqPriorityListDedicatedSlicing* provides dedicated cell reselection priorities for slicing in *RRCRelease*.

#### ***FreqPriorityListDedicatedSlicing* information element**

```
-- ASN1START
-- TAG-FREQPRIORITYLISTDEDICATEDSLICING-START

FreqPriorityListDedicatedSlicing-r17 ::= SEQUENCE (SIZE (1.. maxFreq)) OF FreqPriorityDedicatedSlicing-r17

FreqPriorityDedicatedSlicing-r17 ::= SEQUENCE {
 dl-ExplicitCarrierFreq-r17 ARFCN-ValueNR,
 sliceInfoListDedicated-r17 SliceInfoListDedicated-r17
} OPTIONAL -- Cond Mandatory

SliceInfoListDedicated-r17 ::= SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF SliceInfoDedicated-r17

SliceInfoDedicated-r17 ::= SEQUENCE {
 nsag-IdentityInfo-r17 NSAG-IdentityInfo-r17,
 nsag-CellReselectionPriority-r17 CellReselectionPriority
 nsag-CellReselectionSubPriority-r17 CellReselectionSubPriority
} OPTIONAL, -- Need R
 OPTIONAL -- Need R

-- TAG-FREQPRIORITYLISTDEDICATEDSLICING-STOP
-- ASN1STOP
```

#### ***FreqPriorityDedicatedSlicing* field descriptions**

***dl-ExplicitCarrierFreq***

Indicates the downlink carrier frequency to which *SliceInfoListDedicated* is associated.

| Conditional Presence | Explanation                     |
|----------------------|---------------------------------|
| Mandatory            | The field is mandatory present. |

### - *FreqPriorityListSlicing*

The IE *FreqPriorityListSlicing* indicates cell reselection priorities for slicing in SIB16.

#### ***FreqPriorityListSlicing* information element**

```
-- ASN1START
-- TAG-FREQPRIORITYLISTSLICING-START

FreqPriorityListSlicing-r17 ::= SEQUENCE (SIZE (1..maxFreqPlus1)) OF FreqPrioritySlicing-r17

FreqPrioritySlicing-r17 ::= SEQUENCE {
 dl-ImplicitCarrierFreq-r17 INTEGER (0..maxFreq),
 sliceInfoList-r17 SliceInfoList-r17
} OPTIONAL -- Cond Mandatory

SliceInfoList-r17 ::= SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF SliceInfo-r17

SliceInfo-r17 ::= SEQUENCE {
 nsag-IdentityInfo-r17 NSAG-IdentityInfo-r17,
 nsag-CellReselectionPriority-r17 CellReselectionPriority
 nsag-CellReselectionSubPriority-r17 CellReselectionSubPriority
 sliceCellListNR-r17 CHOICE {
 sliceAllowedCellListNR-r17 SliceCellListNR-r17,
 sliceExcludedCellListNR-r17 SliceCellListNR-r17
 } OPTIONAL -- Need R
} OPTIONAL -- Need R

SliceCellListNR-r17 ::= SEQUENCE (SIZE (1..maxCellSlice-r17)) OF PCI-Range

-- TAG-FREQPRIORITYLISTSLICING-STOP
-- ASN1STOP
```

#### ***FreqPriorityListSlicing* field descriptions**

##### ***dl-ImplicitCarrierFreq***

Indicates the downlink carrier frequency to which *sliceInfoList* is associated with. The frequency is signalled implicitly, value 0 corresponds to the serving frequency, value 1 corresponds to the first frequency indicated by the *InterFreqCarrierFreqList* in SIB4, and value 2 corresponds to the second frequency indicated by the *InterFreqCarrierFreqList* in SIB4, and so on.

| <b>SliceInfo field descriptions</b> |                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sliceAllowedCellListNR</b>       | List of allow-listed cells for slicing. If present, the cells listed in this list support the corresponding nsag-frequency pair, and the cells not listed in this list do not support the corresponding nsag-frequency pair, according to TS 38.304 [20], clause 5.2.4.11.   |
| <b>sliceCellListNR</b>              | Contains either the list of allow-listed or exclude-listed cells for slicing. If absent, it implies all the cells support the corresponding nsag-frequency pair, according to 38.304 [20], clause 5.2.4.11.                                                                  |
| <b>sliceExcludedCellListNR</b>      | List of exclude-listed cells for slicing. If present, the cells listed in this list do not support the corresponding nsag-frequency pair, and the cells not listed in this list support the corresponding nsag-frequency pair, according to TS 38.304 [20], clause 5.2.4.11. |

| Conditional Presence | Explanation                     |
|----------------------|---------------------------------|
| Mandatory            | The field is mandatory present. |

### – *FrequencyInfoDL*

The IE *FrequencyInfoDL* provides basic parameters of a downlink carrier and transmission thereon.

#### ***FrequencyInfoDL* information element**

```
-- ASN1START
-- TAG-FREQUENCYINFODL-START

 OPTIONAL -- Cond SSBlessSCell
}
```

| <b>FrequencyInfoDL field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absoluteFrequencyPointA</b>            | Absolute frequency position of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>absoluteFrequencySSB</b>               | Frequency of the SSB to be used for this serving cell. SSB related parameters (e.g. SSB index) provided for a serving cell refer to this SSB frequency unless mentioned otherwise. The CD-SSB of the PCell is always on the sync raster. Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15] or TS 38.101-5 [75]). If the field is absent, the SSB related parameters should be absent, e.g. <i>ssb-PositionsInBurst</i> , <i>ssb-periodicityServingCell</i> and <i>subcarrierSpacing</i> in <i>ServingCellConfigCommon</i> IE. If the field is absent, the UE obtains timing reference from the intra-band SpCell or intra-band SCell if applicable as described in TS 38.213 [13], clause 4.1, or from the SpCell or an SCell indicated by <i>referenceCell</i> , or from the reference serving cell defined in TS 38.133 [14]. This is supported in case the SCell for which the UE obtains the timing reference is in the same or different frequency band as the cell (i.e. the SpCell or the SCell, respectively) from which the UE obtains the timing reference.<br>For PCell, this field corresponds to the CD-SSB. |
| <b>frequencyBandList</b>                  | List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>referenceCell</b>                      | Indicates the reference cell, i.e. the cell which provides the timing reference and AGC source for the inter-band SSB-less SCell. If the reference cell is an SCell or PSCell, it should be an activated SCell or activated PSCell.<br>If this field is absent for an inter-band SSB-less SCell, the reference serving cell is defined in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>scs-SpecificCarrierList</b>            | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Conditional Presence | Explanation                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SpCellAdd</i>     | The field is mandatory present if this <i>FrequencyInfoDL</i> is for SpCell. Otherwise the field is optionally present, Need S.                                                  |
| <i>SSBlessSCell</i>  | The field is optionally present, Need S, if the inter-band SSB-less SCell is configured for this cell and <i>absoluteFrequencySSB</i> is absent. It is absent otherwise, Need R. |

## – FrequencyInfoDL-SIB

The IE *FrequencyInfoDL-SIB* provides basic parameters of a downlink carrier and transmission thereon.

|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>offsetToPointA</b>                         | Represents the offset to Point A as defined in TS 38.211 [16], clause 4.4.4.2.                                                                                                                                                                 |
| <b>frequencyBandList</b>                      | List of one or multiple frequency bands to which this carrier(s) belongs. If <i>frequencyBandList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>frequencyBandList</i> (without suffix). |
| <b>scs-SpecificCarrierList</b>                | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A (see TS 38.211 [16], clause 5.3). The network configures this for all SCSs that are used in DL BWPs in this serving cell.                   |

## – *FrequencyInfoUL*

The IE *FrequencyInfoUL* provides basic parameters of an uplink carrier and transmission thereon.

| <b>FrequencyInfoUL field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absoluteFrequencyPointA</b>            | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>additionalSpectrumEmission</b>         | The additional spectrum emission requirements to be applied by the UE on this uplink. If both <i>additionalSpectrumEmission</i> (without suffix) and <i>additionalSpectrumEmission-v1760</i> are absent, the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15], tables 6.2.3.1-1A, 6.2A.3.1.1-2 and 6.2A.3.1.2-2, TS 38.101-2 [39], tables 6.2.3.1-2 and 6.2A.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). Network configures the same value in <i>additionalSpectrumEmission</i> for all uplink carrier(s) of the same band with UL configured and if signalled, the same value in <i>additionalSpectrumEmission-v1760</i> for all uplink carrier(s) of the same band with UL configured, except for <i>additionalSpectrumEmission</i> value corresponding to NS_55/NS_57. If NS_55/NS_57 (see TS 38.101-1 [15], table 6.2.3.1-1) is applicable for at least one uplink carrier, the network may configure either NS_55/NS_57 or NS_01 for these uplink carriers, and NS_01 for the remaining uplink carrier(s) of band n77. The <i>additionalSpectrumEmission</i> is applicable for all uplink carriers of the same band with UL configured. |
| <b>additionalSpectrumEmissionAerial</b>   | The additional spectrum emission requirements to be applied by the aerial UE on this uplink (see TS 38.101-1 [15], clause 6.2K). If the field is absent, the aerial UE uses value indicated by the field <i>additionalSpectrumEmission/ additionalSpectrumEmission-v1760</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>frequencyBandList</b>                  | List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>frequencyShift7p5kHz</b>               | Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>p-Max</b>                              | Maximum transmit power allowed in this serving cell. The maximum transmit power that the UE may use on this serving cell may be additionally limited by <i>p-NR-FR1</i> (configured for the cell group) and by <i>p-UE-FR1</i> (configured total for all serving cells operating on FR1). If absent, the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if p-Max is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. Value in dBm. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emission requirements as specified in TS 38.106 [79].                                                                                                                                                                                                    |
| <b>scs-SpecificCarrierList</b>            | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Conditional Presence            | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL-OrEarlyUL-Sync</i> | The field is mandatory present if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ), if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL), or if this <i>FrequencyInfoUL</i> is configured within <i>EarlyUL-SyncConfig</i> . It is absent, Need R, otherwise.                                                                                                 |
| <i>FDD-TDD-OrSUL-Optional</i>   | The field is optionally present, Need R, if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ), or if this <i>FrequencyInfoUL</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL). It is absent, Need R, otherwise. |

### – FrequencyInfoUL-SIB

The IE *FrequencyInfoUL-SIB* provides basic parameters of an uplink carrier and transmission thereon.

| <b>FrequencyInfoUL-SIB field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absoluteFrequencyPointA</b>                | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>frequencyBandList</b>                      | Provides the frequency band indicator and a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values as defined in TS 38.101-1 [15], table 6.2.3.1-1, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1. The UE shall apply the first listed band which it supports in the <i>frequencyBandList</i> field. If <i>frequencyBandList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>frequencyBandList</i> (without suffix).                                                                                                                                                                                  |
| <b>frequencyBandListAerial</b>                | Provides the frequency band indicator and a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values for aerial UE as defined in TS 38.101-1 [15], clause 6.2K. If the field is present, the aerial UE shall apply the first listed band which it supports in the <i>frequencyBandListAerial</i> field. If the field is absent, <i>frequencyBandList</i> applies.                                                                                                                                                                                                                                                                                                                       |
| <b>frequencyShift7p5khz</b>                   | Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>p-Max</b>                                  | Value in dBm applicable for the cell. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if p-Max is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39] for FR2-1/2 or according to TS 38.101-5 [75] for FR2-NTN. This field is ignored by IAB-MT and NCR-MT. The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The NCR-MT applies output power and emission requirements as specified in TS 38.106 [79]. |
| <b>scs-SpecificCarrierList</b>                | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A (see TS 38.211 [16], clause 5.3). The network configures this for all SCSs that are used in UL BWPs configured in this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Conditional Presence          | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL</i>              | The field is mandatory present if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ) or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise (if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD)).                                                                                                                     |
| <i>FDD-TDD-OrSUL-Optional</i> | The field is optionally present, Need R, if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ), or if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise. |

### – *GapPriority*

The IE *GapPriority* is used to identify the priority of a gap configuration.

| If the field is present and UE supports <i>demodulationEnhancementCA-r17</i> , the UE shall apply the enhanced demodulation processing for HST-SFN joint transmission scheme with velocity up to 500km/h as specified in TS 38.101-4 [59]. This parameter only applies to SCell.                                                                                                                                                                                         |  |  |  |
| <b><i>highSpeedDemodFlag</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |  |  |
| If the field is present and UE supports <i>demodulationEnhancement-r16</i> , the UE shall apply the enhanced demodulation processing for HST-SFN joint transmission scheme with velocity up to 500km/h as specified in TS 38.101-4 [59]. This parameter only applies to SpCell.                                                                                                                                                                                          |  |  |  |
| <b><i>highSpeedDeploymentTypeFR2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |  |  |
| If the field is present, and field value is <i>unidirectional</i> , the UE shall assume uni-directional deployment or if field value is <i>birectional</i> the UE shall assume bidirectional deployment for FR2 up to 350km/h as specified in TS 38.133 [14].                                                                                                                                                                                                            |  |  |  |
| <b><i>highSpeedLargeOneStepUL-TimingFR2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |
| If the field is present, large one step UE autonomous uplink transmit timing adjustment for FR2 up to 350km/h as specified in TS 38.133 [14] is enabled.                                                                                                                                                                                                                                                                                                                 |  |  |  |
| <b><i>highSpeedMeasCA-Scell</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |  |  |
| If the field is present and UE supports <i>measurementEnhancementCA-r17</i> , the UE shall apply the enhanced RRM requirements to the serving frequency of SCell for carrier aggregation to support high speed up to 500 km/h as specified in TS 38.133 [14].                                                                                                                                                                                                            |  |  |  |
| <b><i>highSpeedMeasFlag</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |
| If the field is present and UE supports <i>measurementEnhancement-r16</i> , the UE shall apply the enhanced intra-NR and inter-RAT EUTRAN RRM requirements to support high speed up to 500 km/h as specified in TS 38.133 [14].                                                                                                                                                                                                                                          |  |  |  |
| If the field is present and UE supports <i>intraNR-MeasurementEnhancement-r16</i> , the UE shall apply enhanced intra-NR RRM requirement to support high speed up to 500 km/h as specified in TS 38.133 [14].                                                                                                                                                                                                                                                            |  |  |  |
| If the field is present and UE supports <i>interRAT-MeasurementEnhancement-r16</i> , the UE shall apply enhanced inter-RAT EUTRAN RRM requirement to support high speed up to 500 km/h as specified in TS 38.133 [14].                                                                                                                                                                                                                                                   |  |  |  |
| This parameter only applies to the serving frequency of SpCell.                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |
| <b><i>highSpeedMeasFlagFR2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |  |  |
| If the field is present and UE supports <i>ue-PowerClass-v1700</i> set to <i>pc6</i> , the UE shall apply enhanced intra-frequency RRM requirement to the serving frequency of SpCell to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14].                                                                                                                                                                                                       |  |  |  |
| If the field is present and the UE supports enhanced inter-frequency RRM requirements for FR2 HST in RRC_IDLE and RRC_INACTIVE, the UE shall apply enhanced inter-frequency RRM requirement to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC_IDLE and RRC_INACTIVE.                                                                                                                                                                    |  |  |  |
| If the field is present for SpCell and the UE supports <i>measEnhCAInterFreqFR2-r18</i> , the UE shall apply enhanced inter-frequency RRM requirement to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC_CONNECTED.                                                                                                                                                                                                                      |  |  |  |
| If the field is present for SCell(s) and the UE supports <i>measEnhCAInterFreqFR2-r18</i> , the UE shall apply enhanced intra-frequency RRM requirements to the serving frequency of the corresponding SCell to support high speed up to 350 km/h for FR2 as specified in TS 38.133 [14] in RRC_CONNECTED. If the UE is configured with intra-band CA and the field <i>highSpeedMeasFlagFR2</i> is present, the network configures the same value for all serving cells. |  |  |  |
| The field value, <i>set1</i> or <i>set2</i> , is applied as specified in TS38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |
| <b><i>highSpeedMeasInterFreq</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |  |  |
| If the field is present and UE supports <i>measurementEnhancementInterFreq-r17</i> , the UE shall apply the enhanced RRM requirements for inter-frequency measurement in RRC_CONNECTED to support high speed up to 500 km/h as specified in TS 38.133 [14].                                                                                                                                                                                                              |  |  |  |

| Conditional Presence | Explanation                                                                                                                                                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SCellOnly</i>     | The field is optionally present, Need R, in <i>ServingCellConfigCommon</i> of an SCell. It is absent otherwise.                                              |
| <i>SpCellOnly</i>    | The field is optionally present, Need R, in <i>ServingCellConfigCommonSIB</i> or in the <i>ServingCellConfigCommon</i> of an SpCell. It is absent otherwise. |
| <i>SpCellOnly2</i>   | The field is optionally present, Need R, in <i>ServingCellConfigCommon</i> of an SpCell. It is absent otherwise.                                             |

### – *Hysteresis*

The IE *Hysteresis* is a parameter used within the entry and leave condition of an event triggered reporting condition. The actual value is field value \* 0.5 dB.

#### ***Hysteresis* information element**

```
-- ASN1START
-- TAG-HYSTERESIS-START

Hysteresis ::= INTEGER (0..30)

-- TAG-HYSTERESIS-STOP
-- ASN1STOP
```

### – *HysteresisAltitude*

The IE *HysteresisAltitude* is a parameter used within the entry and leave condition of an altitude-based event triggered reporting condition and within altitude range based parameter configuration. The actual value is field value in meters.

#### ***HysteresisAltitude* information element**

```
-- ASN1START
-- TAG-HYSTERESISALTITUDE-START

HysteresisAltitude-r18 ::= INTEGER (0..64)

-- TAG-HYSTERESISALTITUDE-STOP
-- ASN1STOP
```

### – *HysteresisLocation*

The IE *HysteresisLocation* is a parameter used within entry and leave condition of a location based event triggered reporting condition. The actual value is field value \* 10 meters.

***HysteresisLocation* information element**

```
-- ASN1START
-- TAG-HYSTERESISLOCATION-START

HysteresisLocation-r17 ::= INTEGER (0..32768)

-- TAG-HYSTERESISLOCATION-STOP
-- ASN1STOP
```

***InvalidSymbolPattern***

The IE *InvalidSymbolPattern* is used to configure one invalid symbol pattern for PUSCH transmission repetition type B applicable for both DCI format 0\_1 and 0\_2, see TS 38.214 [19], clause 6.1.

***InvalidSymbolPattern* information element**

```
-- ASN1START
-- TAG-INVALIDSYMBOLPATTERN-START

InvalidSymbolPattern-r16 ::= SEQUENCE {
 symbols-r16 CHOICE {
 oneSlot BIT STRING (SIZE (14)),
 twoSlots BIT STRING (SIZE (28))
 },
 periodicityAndPattern-r16 CHOICE {
 n2 BIT STRING (SIZE (2)),
 n4 BIT STRING (SIZE (4)),
 n5 BIT STRING (SIZE (5)),
 n8 BIT STRING (SIZE (8)),
 n10 BIT STRING (SIZE (10)),
 n20 BIT STRING (SIZE (20)),
 n40 BIT STRING (SIZE (40))
 }
 ...
}

-- TAG-INVALIDSYMBOLPATTERN-STOP
-- ASN1STOP
```

|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ibt-FailureDetectionTimer</b>                    | Timer for consistent uplink LBT failure detection (see TS 38.321 [3]). Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms, and so on.                                                                             |
| <b>Ibt-FailureInstanceMaxCount</b>                  | This field determines after how many LBT failure indications received from the physical layer the UE triggers uplink LBT failure recovery (see TS 38.321 [3]). Value <i>n4</i> corresponds to 4, value <i>n8</i> corresponds to 8, and so on. |

## – *LocationInfo*

The IE *LocationInfo* is used to transfer available detailed location information, Bluetooth, WLAN and sensor available measurement results at the UE.

### ***LocationInfo* information element**

```
-- ASN1START
-- TAG-LOCATIONINFO-START

LocationInfo-r16 ::= SEQUENCE {
 commonLocationInfo-r16 CommonLocationInfo-r16 OPTIONAL,
 bt-LocationInfo-r16 LogMeasResultListBT-r16 OPTIONAL,

| <b><i>carrierFreq</i></b>                                | The EARFCN value of the carrier received from upper layers for which the UE needs to perform the inter-RAT RSTD measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>measPRS-Offset</i></b>                             | Indicates the requested gap offset for performing RSTD measurements towards E-UTRA. It is the smallest subframe offset from the beginning of subframe 0 of SFN=0 of the serving cell of the requested gap for measuring PRS positioning occasions in the carrier frequency <i>carrierFreq</i> for which the UE needs to perform the inter-RAT RSTD measurements. The PRS positioning occasion information is received from upper layers. The value of <i>measPRS-Offset</i> is obtained by mapping the starting subframe of the PRS positioning occasion in the measured cell onto the corresponding subframe in the serving cell and is calculated as the serving cell's number of subframes from SFN=0 mod 40.<br>The UE shall take into account any additional time required by the UE to start PRS measurements on the other carrier when it does this mapping for determining the <i>measPRS-Offset</i> .<br>NOTE: Figure 6.2.2-1 in TS 36.331[10] illustrates the <i>measPRS-Offset</i> field. |
| <b><i>dl-PRS-PointA</i></b>                              | The ARFCN value of the carrier received from upper layers for which the UE needs to perform the NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>nr-MeasPRS-RepetitionAndOffset</i></b>             | Indicates the gap periodicity in ms and offset in number of subframes of the requested measurement gap for performing NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>nr-MeasPRS-length</i></b>                          | Indicates measurement gap length in ms of the requested measurement gap for performing NR DL-PRS measurements. The measurement gap length is according to in Table 9.1.2-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <i>LogicalChannelConfig</i> field descriptions                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>allowedCG-List</i></b>                                  | This restriction applies only when the UL grant is a configured grant. If present, UL MAC SDUs from this logical channel can only be mapped to the indicated configured grant configuration. If the size of the sequence is zero, then UL MAC SDUs from this logical channel cannot be mapped to any configured grant configurations. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any configured grant configurations. If the field <i>configuredGrantType1Allowed</i> is present, only those configured grant type 1 configuration indicated in this sequence are allowed for use by this logical channel; otherwise, this sequence shall not include any configured grant type 1 configuration. Corresponds to "allowedCG-List" as specified in TS 38.321 [3]. This field is ignored when SDT procedure is ongoing. |
| <b><i>allowedHARQ-mode</i></b>                                | Indicates the allowed HARQ mode of a HARQ process mapped to this logical channel. If the parameter is absent, there is no restriction for HARQ mode for the mapping. This field applies to SRB1, SRB2, SRB4 and DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>allowedPHY-PriorityIndex</i></b>                        | This restriction applies only when the UL grant is a dynamic grant. If the field is present and the dynamic grant has a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to the dynamic grants indicating PHY-priority index equal to the values configured by this field. If the field is present and the dynamic grant does not have a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to this dynamic grant if the value of the field is <i>p0</i> , see TS 38.213 [13], clause 9. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any dynamic grants. Corresponds to "allowedPHY-PriorityIndex" as specified in TS 38.321 [3].                                                                                                                               |
| <b><i>allowedSCS-List</i></b>                                 | If present, UL MAC SDUs from this logical channel can only be mapped to the indicated numerology. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured numerology. Corresponds to 'allowedSCS-List' as specified in TS 38.321 [3].<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>allowedServingCells</i></b>                             | If present, UL MAC SDUs from this logical channel can only be mapped to the serving cells indicated in this list. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured serving cell of this cell group. Corresponds to 'allowedServingCells' in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>bitRateMultiplier</i></b>                               | Bit rate multiplier for recommended bit rate MAC CE as specified in TS 38.321 [3]. Value <i>x40</i> indicates bit rate multiplier 40, value <i>x70</i> indicates bit rate multiplier 70 and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>bitRateQueryProhibitTimer</i></b>                       | The timer is used for bit rate recommendation query in TS 38.321 [3], in seconds. Value <i>s0</i> means 0 s, <i>s0dot4</i> means 0.4 s and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>bucketSizeDuration</i></b>                              | Value in ms. <i>ms5</i> corresponds to 5 ms, value <i>ms10</i> corresponds to 10 ms, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>channelAccessPriority</i></b>                           | Indicates the Channel Access Priority Class (CAPC), as specified in TS 38.300 [2], to be used on uplink transmissions for operation with shared spectrum channel access in FR1. The network configures this field only for SRB2 and DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>configuredGrantType1Allowed</i></b>                     | If present, or if the capability <i>Icp-Restriction</i> as specified in TS 38.306 [26] is not supported, UL MAC SDUs from this logical channel can be transmitted on a configured grant type 1. Otherwise, UL MAC SDUs from this logical channel cannot be transmitted on a configured grant type 1. Corresponds to 'configuredGrantType1Allowed' in TS 38.321 [3]. This field is ignored when SDT procedure is ongoing.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>logicalChannelGroup, logicalChannelGroupIAB-Ext</i></b> | ID of the logical channel group, as specified in TS 38.321 [3], which the logical channel belongs to. The <i>logicalChannelGroupIAB-Ext</i> is only applicable to the IAB-MT. When <i>logicalChannelGroupIAB-Ext</i> is configured, <i>logicalChannelGroup</i> shall be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>logicalChannelSR-Mask</i></b>                           | Controls SR triggering when a configured uplink grant of <i>type1</i> or <i>type2</i> is configured. <i>true</i> indicates that SR masking is configured for this logical channel as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>logicalChannelSR-DelayTimerApplied</i></b>              | Indicates whether to apply the delay timer for SR transmission for this logical channel. Set to <i>false</i> if <i>logicalChannelSR-DelayTimer</i> is not included in <i>BSR-Config</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| If present, UL MAC SDUs from this logical channel can only be transmitted using uplink grants that result in a PUSCH duration shorter than or equal to the duration indicated by this field. Otherwise, UL MAC SDUs from this logical channel can be transmitted using an uplink grant resulting in any PUSCH duration. Corresponds to "maxPUSCH-Duration" in TS 38.321 [3]. The PUSCH duration is calculated based on the same length of all symbols, and the shortest length applies if the symbol lengths are different. |

|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PDCP-CADuplication</i> | The field is mandatory present if the DRB/SRB associated with this logical channel is configured with PDCP CA duplication in UL in the cell group in which this IE is included (i.e. the PDCP entity is associated with multiple RLC entities belonging to this cell group). Otherwise the field is optionally present, need R. |
| <i>UL</i>                 | The field is mandatory present for a logical channel with uplink if it serves DRB or multicast MRB. It is optionally present, Need R, for a logical channel with uplink if it serves an SRB. Otherwise it is absent.                                                                                                            |

### – *LogicalChannelIdentity*

The IE *LogicalChannelIdentity* is used to identify one logical channel (*LogicalChannelConfig*) and the corresponding RLC bearer (*RLC-BearerConfig*) or BH RLC channel (*BH-RLC-ChannelConfig*) or Uu Relay RLC channel (*Uu-RelayRLC-ChannelConfig*) or PC5 Relay RLC channel (*SL-RLC-ChannelConfigPC5*).

#### *LogicalChannelIdentity* information element

```

| <b>neighCarrierBandwidthDL</b>                         |  | Indicates the channel bandwidth of the neighbour LTE cell in number of PRBs. If the field is absent, the UE applies the value of <i>carrierBandwidthDL</i> indicated in <i>RateMatchPatternLTE-CRS</i> for this serving cell, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>neighCarrierFreqDL</b>                              |  | Indicates the downlink centre frequency of the neighbour LTE cell. If the field is absent, the UE applies the value of <i>carrierFreqDL</i> indicated in <i>RateMatchPatternLTE-CRS</i> for this serving cell, if configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>neighCellId</b>                                     |  | Indicates the physical cell ID of the neighbour LTE cell for which the other fields within the same <i>LTE-NeighCellsCRS-AssistInfo</i> apply.<br>If the IE <i>LTE-NeighCellsCRS-AssistInfoList</i> contains multiple list entries, either this field or <i>neighV-Shift</i> is included in each instance.<br>If the IE <i>LTE-NeighCellsCRS-AssistInfoList</i> contains multiple list entries, the entry with <i>neighV-Shift</i> is only used for neighbour LTE cells for which <i>neighCellId</i> is not provided (i.e. the entry with <i>neighCellId</i> takes precedence over the entry with <i>neighV-Shift</i> , if provided).<br>If the IE <i>LTE-NeighCellsCRS-AssistInfoList</i> contains one list entry with neither this field nor <i>neighV-Shift</i> , the information within the entry applies to all neighbour LTE cells. |
| <b>neighCRS-muting</b>                                 |  | Indicates whether the CRS interference mitigation is enabled in the neighbour LTE cell, as specified in TS 36.133 [40], clause 3.6.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>neighMBSFN-SubframeConfigList</b>                   |  | Indicates the MBSFN subframe configuration of the neighbour LTE cell. If <i>RateMatchPatternLTE-CRS</i> is configured for this serving cell and the field is absent, the UE applies the value of <i>mbsfn-SubframeConfigList</i> indicated in <i>RateMatchPatternLTE-CRS</i> for this serving cell if configured; otherwise, if the field is absent, the UE assumes MBSFN is not configured in the neighbour LTE cell.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>neighNrofCRS-Ports</b>                              |  | Indicates the CRS antenna ports number of the neighbour LTE cell. If the field is absent, the UE applies the value of <i>nrofCRS-Ports</i> indicated in <i>RateMatchPatternLTE-CRS</i> for this serving cell, if configured. If <i>RateMatchPatternLTE-CRS</i> is not configured for this serving cell and the field is absent, the UE applies the default value n4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>neighV-Shift</b>                                    |  | Indicates the shifting value v-shift of neighbour LTE cells for which the other fields within the same <i>LTE-NeighCellsCRS-AssistInfo</i> apply.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>MAC-CellGroupConfig field descriptions</b>    |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalBS-TableAllowed</b>                 | Indicates whether a UE is allowed to utilize the refined buffer size levels, as specified in TS 38.321 [3], for a certain Logical Channel Group. The leftmost bit corresponds to LCG ID=0, second leftmost bit to LCG ID=1 and so on. The UE is allowed to utilize the refined buffer size levels for a Logical Channel Group only when the corresponding bit is set to 1.                                                                       |
| <b>allowCSI-SRS-Tx-MulticastDRX-Active</b>       | Used to control the CSI/SRS transmission during MBS multicast DRX ActiveTime, see TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                 |
| <b>csi-Mask</b>                                  | If set to true, the UE limits CSI reports to the on-duration period of the DRX cycle, see TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                         |
| <b>dataInactivityTimer</b>                       | Releases the RRC connection upon data inactivity as specified in clause 5.3.8.5 and in TS 38.321 [3]. Value s1 corresponds to 1 second, value s2 corresponds to 2 seconds, and so on.                                                                                                                                                                                                                                                            |
| <b>drx-Config, drx-ConfigExt, drx-ConfigExt2</b> | Used to configure DRX as specified in TS 38.321 [3]. Network only configures <i>drx-ConfigExt</i> or <i>drx-ConfigExt2</i> when <i>drx-Config</i> is configured.                                                                                                                                                                                                                                                                                 |
| <b>drx-ConfigSecondaryGroup</b>                  | Used to configure DRX related parameters for the second DRX group as specified in TS 38.321 [3]. The network does not configure secondary DRX group with DCP simultaneously nor secondary DRX group with a dormant BWP simultaneously.                                                                                                                                                                                                           |
| <b>drx-ConfigSL</b>                              | Used to configure additional DRX parameters for the UE performing sidelink operation with resource allocation mode 1, as specified in TS 38.321 [3]. Network only configures this field if <i>sl-ScheduledConfig</i> is configured and <i>drx-Config</i> is configured.                                                                                                                                                                          |
| <b>drx-LastTransmissionUL</b>                    | If this field is present, the start of the <i>drx-HARQ-RTT-TimerUL</i> is after the last transmission within a bundle, see TS 38.321 [3].                                                                                                                                                                                                                                                                                                        |
| <b>dsr-ConfigToAddModList</b>                    | List of LCG-specific DSR configurations to add or modify.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dsr-ConfigToReleaseList</b>                   | List of LCG-specific DSR configurations to release.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>g-RNTI-ConfigToAddModList</b>                 | List of G-RNTI configurations to add or modify. Up to 8 G-RNTIs can be configured in total in this release based on the UE capability.                                                                                                                                                                                                                                                                                                           |
| <b>g-RNTI-ConfigToReleaseList</b>                | List of G-RNTI configurations to release.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>g-CS-RNTI-ConfigToAddModList</b>              | List of G-CS-RNTI configurations to add or modify. Up to 8 G-CS-RNTIs can be configured in total in this release based on the UE capability.                                                                                                                                                                                                                                                                                                     |
| <b>g-CS-RNTI-ConfigToReleaseList</b>             | List of G-CS-RNTI configurations to release.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>intraCG-Prioritization</b>                    | Used to enable HARQ process ID selection based on LCH-priority for one CG as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                         |
| <b>lch-BasedPrioritization</b>                   | If this field is present, the corresponding MAC entity of the UE is configured with prioritization between overlapping grants and between scheduling request and overlapping grants based on LCH priority, see TS 38.321 [3]. The network does not configure <i>lch-BasedPrioritization</i> with <i>enhancedSkipUplinkTxDynamic</i> simultaneously nor <i>lch-BasedPrioritization</i> with <i>enhancedSkipUplinkTxConfigured</i> simultaneously. |
| <b>posMG-Request</b>                             | Indicates whether UE is configured to send UL MAC CE for Positioning Measurement Gap Activation/Deactivation Request, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                             |
| <b>schedulingRequestId-BFR-SCell</b>             | Indicates the scheduling request configuration applicable for BFR on SCell, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                       |

It is absent otherwise.                                                                                                                                                                 |
| <i>MCG-Only</i>              | This field is optionally present, Need M, for the <i>MAC-CellGroupConfig</i> of the MCG. It is absent otherwise.                                                                                                                                                             |
| <i>LCH-PrioWithReTxTimer</i> | This field is optionally present, Need R, if <i>lch-BasedPrioritization-r16</i> is configured in this MAC entity and <i>cg-RetransmissionTimer-r16</i> is configured for any configured grant configuration associated with this MAC entity. It is absent otherwise, Need R. |

## – MeasConfig

The IE *MeasConfig* specifies measurements to be performed by the UE, and covers intra-frequency, inter-frequency and inter-RAT mobility as well as configuration of measurement gaps.

| <b>MeasConfig field descriptions</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>effectiveMeasWindowConfig</b>      | Used to setup and release effective measurement window in NR for E-UTRA measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interFrequencyConfig-NoGap-r16</b> | If the field is set to true, UE is configured to perform SSB based inter-frequency measurement without measurement gaps when the inter-frequency SSB is completely contained in the active DL BWP of the UE, as specified in TS 38.133 [14], clause 9.3. Otherwise, the SSB based inter-frequency measurement is performed within measurement gaps. In NR-DC, the field can only be configured in the <i>measConfig</i> associated with MCG, and when configured, it applies to all the inter-frequency measurements configured by MN and SN. |
| <b>measGapConfig</b>                  | Used to setup and release measurement gaps in NR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>measIdToAddModList</b>             | List of measurement identities to add and/or modify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>measIdToRemoveList</b>             | List of measurement identities to remove.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>measObjectToAddModList</b>         | List of measurement objects to add and/or modify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>measObjectToRemoveList</b>         | List of measurement objects to remove.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>reportConfigToAddModList</b>       | List of measurement reporting configurations to add and/or modify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>reportConfigToRemoveList</b>       | List of measurement reporting configurations to remove.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>s-MeasureConfig</b>                | Threshold for NR SpCell RSRP measurement controlling when the UE is required to perform measurements on non-serving cells. Choice of <i>ssb-RSRP</i> corresponds to cell RSRP based on SS/PBCH block and choice of <i>csi-RSRP</i> corresponds to cell RSRP of CSI-RS. This field is also applicable to L1 measurements configured with <i>l1m-CSI-ResourceConfigToAddModList-r18</i> . This field is not configured to a UE configured with event(s) related to the L2 U2N Relay UE.                                                         |
| <b>measGapSharingConfig</b>           | Specifies the measurement gap sharing scheme and controls setup/ release of measurement gap sharing.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### – *MeasGapConfig*

The IE *MeasGapConfig* specifies the measurement gap configuration and controls setup/release of measurement gaps.

| <b>MeasGapConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gapAssociationPRS</b>                | Indicates that PRS measurement is associated with this measurement gap. The network only includes this field for one per-UE gap or for one per-FR gap. If concurrent gap (i.e. one of the gap combination as defined in Table 9.1.8-1 in TS 38.133 [14]) is configured and no gap is configured with this field, the PRS measurement is associated with the gap configured via <i>GapConfig</i> (without suffix), if available. If both per-UE gap and per-FR gap are configured via <i>GapConfig</i> and/or <i>GapConfig-r17</i> , the PRS measurement is always associated with the per-UE gap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>gapFR1</b>                           | Indicates measurement gap configuration that applies to FR1 only. In (NG)EN-DC, <i>gapFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 measurement gap). In NE-DC, <i>gapFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap). In NR-DC, <i>gapFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR1</i> can not be configured together with <i>gapUE</i> . The applicability of the FR1 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>gapFR2</b>                           | Indicates measurement gap configuration applies to FR2 only. In (NG)EN-DC or NE-DC, <i>gapFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap). In NR-DC, <i>gapFR2</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR2</i> cannot be configured together with <i>gapUE</i> . The applicability of the FR2 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>gapOffset</b>                        | Value <i>gapOffset</i> is the gap offset of the gap pattern with MGRP indicated in the field <i>mgrp</i> . The value range is from 0 to <i>mgrp</i> -1. If <i>ncsglInd-r17</i> is present, this offset value refers to the starting point of VIL1 (the visible interruption length before the ML).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>gapPriority</b>                      | Indicates the priority of this measurement gap (see TS 38.133 [14]). Value 1 indicates highest priority, value 2 indicates second level priority, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>gapSharing</b>                       | Indicates the measurement gap sharing scheme that applies to this <i>GapConfig</i> . For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>gapToAddModList</b>                  | A list of measurement gap configuration to be added or modified. If more than one measurement gap is configured (i.e. concurrent measurement gap as specified in TS 38.133[14], clause 9.1.8 for TN or clause 9.1C.8 for NTN), the maximum number of configured measurement gap is limited by the gap combinations defined in Table 9.1.8-1 in TS 38.133 [14] for TN. For NTN the maximum number of configured measurement gap is limited by UE capability indicated in <i>parallelMeasurementGap</i> . In this version of the specification, the network configures this field only in NR standalone. This field is used only for a UE that supports pre-configured measurement gap, concurrent measurement gap, or NCSG. In this version of the specification, the network does not configure concurrent measurement gap together with preconfigured measurement gap for positioning. For the UE supporting the capability of <i>musim-GapPriorityPreference</i> , the network can configure concurrent measurement gap together with MUSIM gap. Otherwise, the network does not configure concurrent measurement gap together with MUSIM gap. |
| <b>gapToReleaseList</b>                 | A list of measurement gap configuration to be released.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>gapType</b>                          | Indicates the type of this measurement gap. Value <i>perUE</i> indicates that it is a per UE measurement gap, value <i>perFR1</i> indicates that it is an FR1 measurement gap, and value <i>perFR2</i> indicates that it is an FR2 measurement gap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>gapUE</b>                            | Indicates measurement gap configuration that applies to all frequencies (FR1 and FR2). In (NG)EN-DC, <i>gapUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE measurement gap). In NE-DC, <i>gapUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap). In NR-DC, <i>gapUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapUE</i> is configured, then neither <i>gapFR1</i> nor <i>gapFR2</i> can be configured. For TN, the applicability of the per UE measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 for non-RedCap UEs, and Table 9.1A.2-2 for RedCap UEs in TS 38.133 [14]. For NTN, the applicability of per UE measurement gap is according to subclause 9.1C.2 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                          |
| <b>measGapId</b>                        | The ID of this measurement gap configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mg1</b>                              | Value <i>mg1</i> is the measurement gap length in ms of the measurement gap. If <i>ncsglnd-r17</i> is not present, the measurement gap length is according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsglnd-r17</i> is present, this field indicates the measurement length (ML) in NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14]. Value <i>ms1dot5</i> corresponds to 1.5 ms, <i>ms3</i> corresponds to 3 ms and so on. If <i>mg1-r16</i> is present, UE shall ignore the <i>mg1</i> (without suffix). Value <i>ms1</i> , <i>ms2</i> , and <i>ms5</i> can only be configured if <i>ncsglnd</i> is present.                                                                                   |
| <b>mgp</b>                              | If <i>ncsglnd-r17</i> is not present, the <i>mgp</i> field indicates the measurement gap repetition period in (ms) of the measurement gap according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsglnd-r17</i> is present, the <i>mgp</i> field indicates the Visible Interruption Repetition Period (VIRP) of NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                   |
| <b>mgta</b>                             | Value <i>mgta</i> is the measurement gap timing advance in ms. The applicability of the measurement gap timing advance is according to clause 9.1.2 for non-RedCap UEs in TN, clause 9.1A.2 for RedCap UEs in TN, and clause 9.1C.2 for NTN of TS 38.133 [14], or according to clause 9.1.9 of TS 38.133 [14] if <i>ncsglnd</i> is present. Value <i>ms0</i> corresponds to 0 ms, <i>ms0dot25</i> corresponds to 0.25 ms, <i>ms0dot5</i> corresponds to 0.5 ms and <i>ms0dot75</i> corresponds to 0.75 ms. For FR2, the network only configures 0 ms and 0.25 ms if <i>ncsglnd</i> is not present. If <i>ncsglnd</i> is present, the network only configures 0ms for per-UE NCSG and FR1 NCSG and only configures 0ms or 0.75ms for FR2 NCSG. Value <i>ms0dot75</i> can only be configured if <i>ncsglnd</i> is present. |
| <b>ncsglnd</b>                          | Indicates that the measurement gap is a NCSG as specified in 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>posMeasGapPreConfigToAddModList</b>  | List of preconfigured measurement gap for positioning to add and/or modify. All the gaps configured are associated with the measurement of PRS for RSTD, UE-RxTx Time Difference, PRS-RSRP and PRS-RSRPP as defined in TS 38.215 [9]. In this version of the specification, the network does not configure preconfigured measurement gap for positioning together with concurrent measurement gap or MUSIM gap.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>posMeasGapPreConfigToReleaseList</b> | List of preconfigured measurement gap for positioning to release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>preConfigInd</b>                     | Indicates whether the measurement gap is a pre-configured measurement gap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>refFR2ServCellAsyncCA</b>            | Indicates the FR2 serving cell identifier whose SFN and subframe is used for FR2 gap calculation for this gap pattern with asynchronous CA involving FR2 carrier(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>refServCellIndicator</b>             | Indicates the serving cell whose SFN and subframe are used for gap calculation for this gap pattern. Value pCell corresponds to the PCell, pSCell corresponds to the PSCell, and mcg-FR2 corresponds to a serving cell on FR2 frequency in MCG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                 |

| <b>AsyncCA</b>       | This field is mandatory present when configuring and reconfiguring FR2 gap pattern to UE in:<br>- (NG)EN-DC or NR SA with asynchronous CA involving FR2 carrier(s);<br>- NE-DC or NR-DC with asynchronous CA involving FR2 carrier(s), if the field <i>refServCellIndicator</i> is set to <i>mcg-FR2</i> . Otherwise, it is absent, Need R. |
| <b>NEDCorNRDC</b>    | This field is mandatory present when configuring and reconfiguring gap pattern to UE in NE-DC or NR-DC. Otherwise, it is absent, Need R.                                                                                                                                                                                                    |
| <b>PRS</b>           | This field is optionally present, Need R, when configuring gap pattern to UE for measurements of DL-PRS configured via LPP (TS 37.355 [49]). Otherwise, it is absent.                                                                                                                                                                       |

### – MeasGapId

The IE *MeasGapId* used to identify a per UE or per FR measurement gap configuration.

***MeasGapId* information element**

```
-- ASN1START
-- TAG-MEASGAPID-START

MeasGapId-r17 ::= INTEGER (1..maxNrofGapId-r17)

-- TAG-MEASGAPID-STOP
-- ASN1STOP
```

- ***MeasGapSharingConfig***

The IE *MeasGapSharingConfig* specifies the measurement gap sharing scheme and controls setup/ release of measurement gap sharing.

***MeasGapSharingConfig* information element**

```
-- ASN1START
-- TAG-MEASGAPSHARINGCONFIG-START

MeasGapSharingConfig ::= SEQUENCE {
 gapSharingFR2 SetupRelease { MeasGapSharingScheme } OPTIONAL, -- Need M
 ...
 [[
 gapSharingFR1 SetupRelease { MeasGapSharingScheme } OPTIONAL, --Need M
 gapSharingUE SetupRelease { MeasGapSharingScheme } OPTIONAL, --Need M
]]
}

MeasGapSharingScheme ::= ENUMERATED {scheme00, scheme01, scheme10, scheme11}

-- TAG-MEASGAPSHARINGCONFIG-STOP
-- ASN1STOP
```

| <b><i>MeasGapSharingConfig</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>gapSharingFR1</i></b>                           | Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR1</i> . In (NG)EN-DC, <i>gapSharingFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 gap sharing). In NE-DC, <i>gapSharingFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap sharing). In NR-DC, <i>gapSharingFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapSharingFR1</i> can not be configured together with <i>gapSharingUE</i> . For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.                                        |
| <b><i>gapSharingFR2</i></b>                           | Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR2</i> . In (NG)EN-DC or NE-DC, <i>gapSharingFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap sharing). In NR-DC, <i>gapSharingFR2</i> can only be set up by MCG in the <i>measConfig</i> associated with MCG. <i>gapSharingFR2</i> cannot be configured together with <i>gapSharingUE</i> . For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.                                                                                                                                          |
| <b><i>gapSharingUE</i></b>                            | Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapUE</i> . In (NG)EN-DC, <i>gapSharingUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE gap sharing). In NE-DC, <i>gapSharingUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap sharing). In NR-DC, <i>gapSharingUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapSharingUE</i> is configured, then neither <i>gapSharingFR1</i> nor <i>gapSharingFR2</i> can be configured. For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on. |

## — ***MeasId***

The IE *MeasId* is used to identify a measurement configuration, i.e., linking of a measurement object and a reporting configuration.

### ***MeasId*** information element

```
-- ASN1START
-- TAG-MEASID-START

MeasId ::= INTEGER (1..maxNrofMeasId)

-- TAG-MEASID-STOP
-- ASN1STOP
```

## — ***MeasIdleConfig***

The IE *MeasIdleConfig* is used to convey information to UE about measurements requested to be done while in RRC\_IDLE or RRC\_INACTIVE.

### ***MeasIdleConfig*** information element

```

|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absThreshSS-BlocksConsolidation</b>                           | Threshold for consolidation of L1 measurements per RS index.                                                                                                                                                                                                                                                                                                                                 |
| <b>beamMeasConfigId</b>                                          | Indicates the beam level measurement configuration.                                                                                                                                                                                                                                                                                                                                          |
| <b>carrierFreq</b>                                               | Indicates the NR carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                              |
| <b>carrierFreqEUTRA</b>                                          | Indicates the E-UTRA carrier frequency to be used for measurements during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                          |
| <b>deriveSSB-IndexFromCell</b>                                   | This field indicates whether the UE may use the timing of any detected cell on that frequency to derive the SSB index of all neighbour cells on that frequency. If this field is set to true, the UE assumes SFN and frame boundary alignment across cells on the neighbor frequency as specified in TS 38.133 [14].                                                                         |
| <b>frequencyBandList</b>                                         | Indicates the list of frequency bands for which the NR idle/inactive measurement parameters apply. The UE shall select the first listed band which it supports in the frequencyBandList field to represent the NR neighbour carrier frequency.                                                                                                                                               |
| <b>includeBeamMeasurements</b>                                   | Indicates whether or not the UE shall include beam measurements in the NR idle/inactive measurement results.                                                                                                                                                                                                                                                                                 |
| <b>maxNrofRS-IndexesToReport</b>                                 | Max number of beam indices to include in the idle/inactive measurement result.                                                                                                                                                                                                                                                                                                               |
| <b>measCellListEUTRA</b>                                         | Indicates the list of E-UTRA cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                           |
| <b>measCellListNR</b>                                            | Indicates the list of NR cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                                                                               |
| <b>measIdleCarrierListEUTRA</b>                                  | Indicates the E-UTRA carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                |
| <b>measIdleCarrierListNR</b>                                     | Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                                                                                                    |
| <b>measIdleCarrierListNR-LessThan5MHz</b>                        | Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE for the cell(s) supporting 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Total number of MeasIdleCarrierNR included in measIdleCarrierListNR and measIdleCarrierListNR-LessThan5MHz does not exceed maxFreqIdle-r16.             |
| <b>measIdleDuration</b>                                          | Indicates the duration for performing idle/inactive measurements while in RRC_IDLE or RRC_INACTIVE. Value sec10 correspond to 10 seconds, value sec30 to 30 seconds and so on.                                                                                                                                                                                                               |
| <b>measIdleValidityDuration, measReselectionValidityDuration</b> | Indicates time values for UE to determine validity of reported idle/inactive and reselection measurements as defined in TS 38.133[14]. Value s5 correspond to 5 seconds, value s10 correspond to 10 seconds and so on.                                                                                                                                                                       |
| <b>measReselectionCarrierListNR</b>                              | Indicates the NR carriers for reselection measurement reporting.                                                                                                                                                                                                                                                                                                                             |
| <b>measReselectionCarrierListNR-LessThan5MHz</b>                 | Indicates the NR carriers for reselection measurement reporting for the cell(s) supporting 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Total number of MeasReselectionCarrierNR included in measReselectionCarrierListNR and measReselectionCarrierListNR-LessThan5MHz does not exceed maxFreqIdle-r16. |
| <b>nrofSS-BlocksToAverage</b>                                    | Number of SS blocks to average for cell measurement derivation.                                                                                                                                                                                                                                                                                                                              |

|                                 |                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>qualityThreshold</b>         | Indicates the quality thresholds for reporting the measured cells for idle/inactive NR measurements.                                                                                                 |
| <b>qualityThresholdEUTRA</b>    | Indicates the quality thresholds for reporting the measured cells for idle/inactive E-UTRA measurements.                                                                                             |
| <b>reportQuantities</b>         | Indicates which measurement quantities UE is requested to report in the idle/inactive measurement report.                                                                                            |
| <b>reportQuantitiesEUTRA</b>    | Indicates which E-UTRA measurement quantities the UE is requested to report in the idle/inactive measurement report.                                                                                 |
| <b>reportQuantityRS-Indexes</b> | Indicates which measurement information per beam index the UE shall include in the NR idle/inactive measurement results.                                                                             |
| <b>smtc</b>                     | Indicates the measurement timing configuration for inter-frequency measurement. If this field is absent in <i>VarMeasIdleConfig</i> , the UE assumes that SSB periodicity is 5 ms in this frequency. |
| <b>ssbSubcarrierSpacing</b>     | Indicates subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz       |
| <b>ssb&gt;ToMeasure</b>         | The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). When the field is absent in <i>VarMeasIdleConfig</i> , the UE measures on all SS-blocks.               |
| <b>ss-RSSI-Measurement</b>      | Indicates the SSB-based RSSI measurement configuration. If the field is absent in <i>VarMeasIdleConfig</i> , the UE behaviour is defined in TS 38.215 [89], clause 5.1.3.                            |
| <b>validityAreaList</b>         | Indicates the list of frequencies and optionally, for each frequency, a list of cells within which the UE is required to perform measurements while in RRC_IDLE and RRC_INACTIVE.                    |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LessThan5MHz</i>  | The field is mandatory present if the <i>carrierBandwidth</i> in SIB1 indicates UL or DL transmission bandwidth other than 15 PRB and the corresponding neighbour cell(s) support(s) 12 PRB, 15 PRB or 20 PRB transmission bandwidth configuration as defined in TS 38.101-1 [15], TS 38.211 [16] and TS 38.213 [13]. Otherwise, the field is optional, Need R. |

## – MeasIdToAddModList

The IE *MeasIdToAddModList* concerns a list of measurement identities to add or modify, with for each entry the *measId*, the associated *measObjectId* and the associated *reportConfigId*.

### **MeasIdToAddModList** information element

```
-- ASN1START
-- TAG-MEASIDTOADDMODLIST-START
```

```
MeasIdToAddModList ::= SEQUENCE (SIZE (1..maxNrofMeasId)) OF MeasIdToAddMod
```

```

MeasIdToAddMod ::= SEQUENCE {
 measId,
 measObjectId,
 reportConfigId
}

-- TAG-MEASIDTOADDMODLIST-STOP
-- ASN1STOP

```

## *MeasObjectCLI*

The IE *MeasObjectCLI* specifies information applicable for SRS-RSRP measurements and/or CLI-RSSI measurements.

### ***MeasObjectCLI* information element**

```

-- ASN1START
-- TAG-MEASOBJECTCLI-START

MeasObjectCLI-r16 ::= SEQUENCE {
 cli-ResourceConfig-r16
 ...
}

CLI-ResourceConfig-r16 ::= SEQUENCE {
 srs-ResourceConfig-r16
 rssi-ResourceConfig-r16
}
 OPTIONAL, -- Need M
 OPTIONAL -- Need M

SRS-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-SRS-Resources-r16)) OF SRS-ResourceConfigCLI-r16

RSSI-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-RSSI-Resources-r16)) OF RSSI-ResourceConfigCLI-r16

SRS-ResourceConfigCLI-r16 ::= SEQUENCE {
 srs-Resource-r16
 srs-SCS-r16
 refServCellIndex-r16
 refBWP-r16
 ...
}

RSSI-ResourceConfigCLI-r16 ::= SEQUENCE {
 rssi-ResourceId-r16,
 SubcarrierSpacing,
 INTEGER (0..2169),
 INTEGER (4..maxNrofPhysicalResourceBlocksPlus1),
 INTEGER (0..13),
 INTEGER (1..14),
 RSSI-PeriodicityAndOffset-r16,
 ServCellIndex
}
 OPTIONAL, -- Need S
 OPTIONAL -- Need S

```

```

}

RSSI-ResourceId-r16 ::= INTEGER (0.. maxNrofCLI-RSSI-Resources-1-r16)

RSSI-PeriodicityAndOffset-r16 ::= CHOICE {
 s110 INTEGER(0..9),
 s120 INTEGER(0..19),
 s140 INTEGER(0..39),
 s180 INTEGER(0..79),

 s1640 INTEGER(0..639),
 ...
}

-- TAG-MEASOBJECTCLI-STOP
-- ASN1STOP

```

| <b>CLI-ResourceConfig field descriptions</b> |                                                     |
|----------------------------------------------|-----------------------------------------------------|
| <b>srs-ResourceConfig</b>                    | SRS resources to be used for CLI measurements.      |
| <b>rssi-ResourceConfig</b>                   | CLI-RSSI resources to be used for CLI measurements. |

| <b>MeasObjectCLI field descriptions</b> |                                                                 |
|-----------------------------------------|-----------------------------------------------------------------|
| <b>cli-ResourceConfig</b>               | SRS and/or CLI-RSSI resource configuration for CLI measurement. |

| <b>SRS-ResourceConfigCLI field descriptions</b> |                                                                                                                                                                                           |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>refBWP</b>                                   | DL BWP id that is used to derive the reference point of the SRS resource (see TS 38.211[16], clause 6.4.1.4.3)                                                                            |
| <b>refServCellIndex</b>                         | The index of the reference serving cell that the <i>refBWP</i> belongs to. If this field is absent, the reference serving cell is PCell.                                                  |
| <b>srs-SCS</b>                                  | Subcarrier spacing for SRS.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz |

| RSSI-ResourceConfigCLI field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nrofPRBs</b>                           | Allowed size of the measurement BW. Only multiples of 4 are allowed. The smallest configurable number is the minimum of 4 and the width of the active DL BWP. If the configured value is larger than the width of the active DL BWP, the UE shall assume that the actual CLI-RSSI resource bandwidth is within the active DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>nrofSymbols</b>                        | Within a slot that is configured for CLI-RSSI measurement (see slotConfiguration), the UE measures the RSSI from <i>startPosition</i> to <i>startPosition</i> + <i>nrofSymbols</i> - 1. The configured CLI-RSSI resource does not exceed the slot boundary of the reference SCS. If the SCS of configured DL BWP(s) is larger than the reference SCS, network configures <i>startPosition</i> and <i>nrofSymbols</i> such that the configured CLI-RSSI resource not to exceed the slot boundary corresponding to the configured BWP SCS. If the reference SCS is larger than SCS of configured DL BWP(s), network ensures <i>startPosition</i> and <i>nrofSymbols</i> are integer multiple of reference SCS divided by configured BWP SCS. |
| <b>refServCellIndex</b>                   | The index of the reference serving cell. Frequency reference point of the RSSI resource is subcarrier 0 of CRB0 of the reference serving cell. If this field is absent, the reference serving cell is PCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>rssi-PeriodicityAndOffset</b>          | Periodicity and slot offset for this CLI-RSSI resource. All values are in "number of slots". Value s/1 corresponds to a periodicity of 1 slot, value s/2 corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>rssi-SCS</b>                           | Reference subcarrier spacing for CLI-RSSI measurement.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>UE performs CLI-RSSI measurement with the SCS of the active bandwidth part within the configured CLI-RSSI resource in the active BWP regardless of the reference SCS of the measurement resource.                                                                                                                                                                                                                                                                                                                  |
| <b>startPosition</b>                      | OFDM symbol location of the CLI-RSSI resource within a slot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>startPRB</b>                           | Starting PRB index of the measurement bandwidth. For the case where the reference subcarrier spacing is smaller than subcarrier spacing of active DL BWP(s), network configures startPRB and nrofPRBs as a multiple of active BW SCS divided by reference SCS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### *MeasObjectEUTRA*

The IE *MeasObjectEUTRA* specifies information applicable for E-UTRA cells.

|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>physicalCellId</b>                 | Physical cell identity of a cell in the cell list.                                                                                              |
| <b>cellIndividualOffset</b>           | Cell individual offset applicable to a specific cell. Value <i>dB</i> -24 corresponds to -24 dB, <i>dB</i> -22 corresponds to -22 dB and so on. |

| <b><i>MeasObjectEUTRA</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>allowedMeasBandwidth</i></b>               | The maximum allowed measurement bandwidth on a carrier frequency as defined by the parameter Transmission Bandwidth Configuration "N <sub>RB</sub> " TS 36.104 [33].                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>associatedMeasGap</i></b>                  | Indicates the associated measurement gap for measuring this EUTRA frequency. If this field is absent, the associated measurement gap is the gap configured via <i>gapFR1</i> or <i>gapUE</i> .                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>carrierFreq</i></b>                        | Identifies E-UTRA carrier frequency for which this configuration is valid. Network does not configure more than one <i>MeasObjectEUTRA</i> for the same physical frequency, regardless of the E-ARFCN used to indicate this.                                                                                                                                                                                                                                                                                                                                   |
| <b><i>cellsToAddModListEUTRAN</i></b>            | List of cells to add/ modify in the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>cellsToRemoveListEUTRAN</i></b>            | List of cells to remove from the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>eutra-PresenceAntennaPort1</i></b>         | When set to <i>true</i> , the UE may assume that at least two cell-specific antenna ports are used in all neighbouring cells.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>eutra-Q-OffsetRange</i></b>                | Used to indicate a cell, or frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value is in dB. Value <i>dB</i> -24 corresponds to -24 dB, value <i>dB</i> -22 corresponds to -22 dB and so on.                                                                                                                                                                                                                                                                                                       |
| <b><i>excludedCellsToAddModListEUTRAN</i></b>    | List of cells to add/ modify in the exclude-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>excludedCellsToRemoveListEUTRAN</i></b>    | List of cells to remove from the exclude-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>measSequence</i></b>                       | Indicates the recommended sequence for intra/inter-RAT intra/inter-frequency measurement. Value 1 means the corresponding frequency is measured firstly. Value 2 means the corresponding frequency is measured secondly and so on. If more than one frequency is configured with the same value, it means no recommended sequence among these frequencies. If not configured, it means there is no recommended sequence for the corresponding frequency. This field is only configured for NR standalone or if the <i>measObject</i> is associated to the MCG. |
| <b><i>widebandRSRQ-Meas</i></b>                  | If set to <i>true</i> , the UE shall, when performing RSRQ measurements, use a wider bandwidth in accordance with TS 36.133 [40]. The network may set the field to <i>true</i> if the measurement bandwidth indicated by <i>allowedMeasBandwidth</i> is 50 resource blocks or larger; otherwise the network sets this field to <i>false</i> .                                                                                                                                                                                                                  |

— ***MeasObjectI*d**

The IE *MeasObjectI*d used to identify a measurement object configuration.

***MeasObjectI*d information element**

-- ASN1START

-- TAG-MEASOBJECTID-START

MeasObjectI<sub>d</sub> ::= **INTEGER** (1..maxNrofObjectI<sub>d</sub>)

-- TAG-MEASOBJECTID-STOP

-- ASN1STOP

## — MeasObjectNR

The IE *MeasObjectNR* specifies information applicable for SS/PBCH block(s) intra/inter-frequency measurements and/or CSI-RS intra/inter-frequency measurements.

| <b><i>CellsToAddMod</i> field descriptions</b> |                                                                                                                                                                                                       |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cellIndividualOffset</i></b>             | Cell individual offsets applicable to a specific cell.                                                                                                                                                |
| <b><i>ntn-NeighbourCellInfo</i></b>            | Includes satellite assistance information of an NTN neighbour cell.                                                                                                                                   |
| <b><i>ntn-PolarizationDL</i></b>               | If present, this parameter indicates polarization information for downlink transmission on service link: including Right hand, Left hand circular polarizations (RHCP, LHCP) and Linear polarization. |
| <b><i>ntn-PolarizationUL</i></b>               | In this version of the specification, the network does not include this field.                                                                                                                        |
| <b><i>physCellId</i></b>                       | Physical cell identity of a cell in the cell list.                                                                                                                                                    |
| <b><i>referenceLocation</i></b>                | Reference location of a neighbor NTN Earth-moving cell for the evaluation of the trigger criteria of an associated <i>ReportConfig</i> which contains <i>EventD2</i> or <i>condEventD2</i> .          |

| <b>MeasObjectNR field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absThreshCSI-RS-Consolidation</b>   | Absolute threshold for the consolidation of measurement results per CSI-RS resource(s) from L1 filter(s). The field is used for the derivation of cell measurement results as described in 5.5.3.3 and the reporting of beam measurement information per CSI-RS resource as described in 5.5.5.2.                                                                                                                                                                                                                                      |
| <b>absThreshSS-BlocksConsolidation</b> | Absolute threshold for the consolidation of measurement results per SS/PBCH block(s) from L1 filter(s). The field is used for the derivation of cell measurement results as described in 5.5.3.3 and the reporting of beam measurement information per SS/PBCH block index as described in 5.5.5.2.                                                                                                                                                                                                                                    |
| <b>allowedCellsToAddModList</b>        | List of cells to add/modify in the allow-list of cells. It applies only to SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>allowedCellsToRemoveList</b>        | List of cells to remove from the allow-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>associatedMeasGapSSB</b>            | Indicates the associated measurement gap for SSB measuring identified by <i>ssb-ConfigMobility</i> in this measurement object. When multiple <i>MeasObjectNR</i> with the same SSB frequency are configured, the network configures the same measurement gap ID in this field for each <i>MeasObjectNR</i> . If this field is absent, the associated measurement gap is the gap configured via <i>gapFR1</i> , <i>gapFR2</i> , or <i>gapUE</i> .                                                                                       |
| <b>associatedMeasGapSSB2</b>           | Indicates the associated additional measurement gap for SSB measuring identified by <i>ssb-ConfigMobility</i> in this measurement object for NTN deployments. When multiple <i>MeasObjectNR</i> with the same SSB frequency are configured, the network configures the same measurement gap ID in this field for each <i>MeasObjectNR</i> . If this field is absent, the associated measurement gap is the gap indicated by <i>associatedMeasGapSSB</i> .                                                                              |
| <b>associatedMeasGapCSIRS</b>          | Indicates the associated measurement gap for CSI-RS measuring identified by <i>csi-rs-ResourceConfigMobility</i> in this measurement object. If this field is absent, the associated measurement gap is the gap configured via <i>gapFR1</i> , <i>gapFR2</i> , or <i>gapUE</i> .                                                                                                                                                                                                                                                       |
| <b>associatedMeasGapCSIRS2</b>         | Indicates the associated additional measurement gap for CSI-RS measuring identified by <i>csi-rs-ResourceConfigMobility</i> in this measurement object for NTN deployments. If this field is absent, the associated measurement gap is the gap indicated by <i>associatedMeasGapCSIRS</i> . In this release of the specification, this field is not configured for NTN deployments.                                                                                                                                                    |
| <b>cellsToAddModList</b>               | List of cells to add/modify in the cell list. If the network includes <i>cellsToAddModListExt-v1710</i> and/or <i>cellsToAddModListExt-v1800</i> , it contains the same number of entries listed in the same order as in <i>cellsToAddModList</i> (i.e without suffix).                                                                                                                                                                                                                                                                |
| <b>cellsToRemoveList</b>               | List of cells to remove from the cell list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>excludedCellsToAddModList</b>       | List of cells to add/modify in the exclude-list of cells. It applies only to SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>excludedCellsToRemoveList</b>       | List of cells to remove from the exclude-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>freqBandIndicatorNR</b>             | The frequency band in which the SSB and/or CSI-RS indicated in this <i>MeasObjectNR</i> are located and according to which the UE shall perform the RRM measurements. This field is always provided when the network configures measurements with this <i>MeasObjectNR</i> .                                                                                                                                                                                                                                                           |
| <b>measCyclePSCell</b>                 | The parameter is used only when the PSCell is configured on the frequency indicated by the <i>measObjectNR</i> and the SCG is deactivated, see TS 38.133 [14]. The field may also be configured when the PSCell is not configured on that frequency. The network always configures <i>measCyclePSCell</i> for the <i>measObjectNR</i> associated with the PSCell if <i>bfd-and-RLM</i> is set to <i>true</i> and the SCG is deactivated. Value <i>ms160</i> corresponds to 160 ms, value <i>ms256</i> corresponds to 256 ms and so on. |
| <b>measCycleSCell</b>                  | The parameter is used only when an SCell is configured on the frequency indicated by the <i>measObjectNR</i> and is in deactivated state, see TS 38.133 [14]. gNB configures the parameter whenever an SCell is configured on the frequency indicated by the <i>measObjectNR</i> , but the field may also be signalled when an SCell is not configured. Value <i>sf160</i> corresponds to 160 sub-frames, value <i>sf256</i> corresponds to 256 sub-frames and so on.                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>measSequence</b>                  | Indicates the recommended sequence for intra/inter-RAT intra/inter-frequency measurement. Value 1 means the corresponding frequency is measured firstly. Value 2 means the corresponding frequency is measured secondly and so on. If more than one frequency is configured with the same value, it means no recommended sequence among these frequencies. If not provided, it means there is no recommended sequence for the corresponding frequency. This field is only configured for NR standalone or if the <i>measObject</i> is associated to the MCG.                                                                                                                                                                                     |
| <b>nrofCSI-RS-ResourcesToAverage</b> | Indicates the maximum number of measurement results per beam based on CSI-RS resources to be averaged. The same value applies for each detected cell associated with this <i>MeasObjectNR</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nrofSS-BlocksToAverage</b>        | Indicates the maximum number of measurement results per beam based on SS/PBCH blocks to be averaged. The same value applies for each detected cell associated with this <i>MeasObject</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>offsetMO</b>                      | Offset values applicable to all measured cells with reference signal(s) indicated in this <i>MeasObjectNR</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>quantityConfigIndex</b>           | Indicates the n-th element of <i>quantityConfigNR-List</i> provided in <i>MeasConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>referenceSignalConfig</b>         | RS configuration for SS/PBCH block and CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>refFreqCSI-RS</b>                 | Point A which is used for mapping of CSI-RS to physical resources according to TS 38.211 [16] clause 7.4.1.5.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>smtc1</b>                         | Primary measurement timing configuration. (see clause 5.5.2.10).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>smtc2</b>                         | Secondary measurement timing configuration for SS corresponding to this <i>MeasObjectNR</i> with PCI listed in <i>pci-List</i> . For these SS, the periodicity is indicated by <i>periodicity</i> in <i>smtc2</i> and the timing offset is equal to the offset indicated in <i>periodicityAndOffset</i> modulo <i>periodicity</i> . <i>periodicity</i> in <i>smtc2</i> can only be set to a value strictly shorter than the periodicity indicated by <i>periodicityAndOffset</i> in <i>smtc1</i> (e.g. if <i>periodicityAndOffset</i> indicates sf10, <i>periodicity</i> can only be set of sf5, if <i>periodicityAndOffset</i> indicates sf5, <i>smtc2</i> cannot be configured). This field is not configured together with <i>smtc4list</i> . |
| <b>smtc3list</b>                     | Measurement timing configuration list for SS corresponding to IAB-MT. This is used for the IAB-node's discovery of other IAB-nodes and the IAB-Donor-DUs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>smtc4list</b>                     | Measurement timing configuration list for NTN deployments, see clause 5.5.2.10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ssbFrequency</b>                  | Indicates the frequency of the SS associated to this <i>MeasObjectNR</i> . For operation with shared spectrum channel access, this field is a k*30 kHz shift from the sync raster where k = 0,1,2, and so on if the <i>reportType</i> within the corresponding <i>ReportConfigNR</i> is set to reportCGI (see TS 38.211 [16], clause 7.4.3.1). Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15], or TS 38.101-5 [75]).                                                                                                                                                                                                                                                  |
| <b>ssb-PositionQCL-Common</b>        | Indicates the QCL relationship between SS/PBCH blocks for all measured cells as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ssbSubcarrierSpacing</b>          | Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>t312</b>                          | The value of timer T312. Value ms0 represents 0 ms, ms50 represents 50 ms and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>ReferenceSignalConfig field descriptions</b> |                                                                      |
|-------------------------------------------------|----------------------------------------------------------------------|
| <b>csi-rs-ResourceConfigMobility</b>            | CSI-RS resources to be used for CSI-RS based RRM measurements.       |
| <b>ssb-ConfigMobility</b>                       | SSB configuration for mobility (nominal SSBs, timing configuration). |

| <b>RMTC-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>measDurationSymbols</b>            | Number of consecutive symbols for which the Physical Layer reports samples of RSSI (see TS 38.215 [9], clause 5.1.21). Value <i>sym1</i> corresponds to one symbol, <i>sym14or12</i> corresponds to 14 symbols of the reference numerology for NCP and 12 symbols for ECP, and so on.<br>If <i>measDurationSymbols-v1700</i> is signalled, the UE ignores <i>measDurationSymbols-r16</i> .                                            |
| <b>ref-BWPId</b>                      | Indicates the reference BWP for the TCI state indicated in <i>tci-StateInfo</i> . Network includes this field if <i>tci-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                    |
| <b>ref-SCS-CP</b>                     | Indicates a reference subcarrier spacing and cyclic prefix to be used for RSSI measurements (see TS 38.215 [9]). Value kHz15 corresponds to 15kHz, kHz30 corresponds to 30 kHz, value kHz60-NCP corresponds to 60 kHz using normal cyclic prefix (NCP), and kHz60-ECP corresponds to 60 kHz using extended cyclic prefix (ECP).<br>If <i>ref-SCS-CP-v1700</i> is signalled, the UE ignores <i>ref-SCS-CP-r16</i> .                    |
| <b>ref-ServCellId</b>                 | Indicates the FR2-2 reference serving cell index for the TCI state. Network includes this field if <i>tci-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                                  |
| <b>rmtc-Bandwidth</b>                 | Indicates the bandwidth for the RSSI measurement (see TS 38.215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                                                  |
| <b>rmtc-Frequency</b>                 | Indicates the center frequency of the measured bandwidth for a frequency which operates with shared spectrum channel access (see TS 38.215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                       |
| <b>rmtc-Periodicity</b>               | Indicates the RSSI measurement timing configuration (RMTC) periodicity (see TS 38.215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                            |
| <b>rmtc-SubframeOffset</b>            | Indicates the RSSI measurement timing configuration (RMTC) subframe offset for this frequency (see TS 38.215 [9], clause 5.1.21). For inter-frequency measurements, this field is optional present and if it is not configured, the UE chooses a random value as <i>rmtc-SubframeOffset</i> for <i>measDurationSymbols</i> which shall be selected to be between 0 and the configured <i>rmtc-Periodicity</i> with equal probability. |
| <b>tci-StateId</b>                    | Indicates the TCI state to be used for RSSI measurements. This field is only applicable for shared spectrum channel access in FR2-2. Network does not configure this if the UE does not have any serving cells in FR2-2 and in such a case, it is up to UE implementation how to determine the spatial domain filter for the inter-frequency RSSI measurement in FR2-2.                                                               |

| <b>SSB-ConfigMobility field descriptions</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>cca-CellsToAddModList, cca-CellsToRemoveList</b> | Lists of cells to be added or removed from the list of neighbor cells that apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>deriveSSB-IndexFromCell</b>                      | If this field is set to <i>true</i> , UE assumes SFN and frame boundary alignment across cells on the same frequency carrier as specified in TS 38.133 [14]. Hence, if the UE is configured with a serving cell for which ( <i>absoluteFrequencySSB</i> , <i>subcarrierSpacing</i> ) in <i>ServingCellConfigCommon</i> is equal to ( <i>ssbFrequency</i> , <i>ssbSubcarrierSpacing</i> ) in this <i>MeasObjectNR</i> , this field indicates whether the UE can utilize the timing of this serving cell to derive the index of SS block transmitted by neighbour cell. Otherwise, this field indicates whether the UE may use the timing of any detected cell on that target frequency to derive the SSB index of all neighbour cells on that frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>deriveSSB-IndexFromCellInter</b>                 | If this field is present, UE assumes SFN and frame boundary alignment between the reference serving cell indicated by <i>ServCellIndex</i> and all neighbour cells in this <i>MeasObjectNR</i> as specified in TS 38.133 [14]. This field also indicates that the UE can utilize the timing of the reference serving cell indicated by <i>ServCellIndex</i> to derive the index of SS block transmitted by all inter-frequency neighbour cells on the frequency indicated by the <i>MeasObjectNR</i> . When this field is included, the network should set <i>deriveSSB-IndexFromCell</i> to <i>true</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ssb-ToMeasure</b>                                | The set of SS blocks to be measured within the SMTC measurement duration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not to be measured while value 1 indicates that the corresponding SS/PBCH block is to be measured (see TS 38.215 [9]). When the field is not configured the UE measures on all SS blocks. Regardless of the value of this field, SS/PBCH blocks outside of the applicable smtc are not to be measured. See TS 38.215 [9] clause 5.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ssb-ToMeasureAltitudeBasedList</b>               | List of altitude-dependent ssb-ToMeasure. When the UE is within an altitude range indicated by <i>altitudeRange</i> , it ignores the ssb-ToMeasure (without suffix), and applies the corresponding ssb-ToMeasure-r18 if present, otherwise (i.e., the UE is within an altitude range indicated by <i>altitudeRange</i> and ssb-ToMeasure-r18 is absent) it measures on all SS-blocks. When the UE is outside all the altitude ranges indicated by <i>altitudeRange</i> (if any), ssb-ToMeasure (without suffix) applies.<br>For each altitude range, <i>altitudeMin</i> indicates the minimum altitude in meters relative to sea level, <i>altitudeMax</i> indicates the maximum altitude in meters relative to sea level, and if included, <i>altitudeHyst</i> indicates hysteresis in meters for determination of the altitude range. I.e., when <i>altitudeHyst</i> is configured for an altitude range, the UE considers itself to have entered the range if $altitudeMin \leq \text{UE altitude} \leq altitudeMax$ and after entering the range considers itself to be in the range while $(altitudeMin - altitudeHyst) \leq \text{UE altitude} \leq (altitudeMax + altitudeHyst)$ .<br>For each <i>altitudeRange</i> , if <i>altitudeMin</i> is absent, value <i>minAltitude-r18</i> is used and if <i>altitudeMax</i> is absent, value <i>maxAltitude-r18</i> is used. |

| <b>SSB-PositionQCL-CellsToAddMod field descriptions</b> |                                                                                                                                                                                                                          |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>physCellId</b>                                       | Physical cell identity of a cell in the cell list.                                                                                                                                                                       |
| <b>ssb-PositionQCL</b>                                  | Indicates the QCL relation between SS/PBCH blocks for a specific cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the value signalled by <i>ssb-PositionQCL-Common</i> . |

| Conditional Presence       | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <i>SSBorAssociatedSSB2</i> | If the <i>measObject</i> is associated to an SCell with SSB, this field is mandatory present if <i>ssb-ConfigMobility</i> is configured or <i>associatedSSB</i> is configured in at least one cell.<br>If the <i>measObject</i> is associated to an SSB-less SCell, this field is optionally present, Need R, if <i>ssb-ConfigMobility</i> is configured or <i>associatedSSB</i> is configured in at least one cell.<br>If <i>ssb-ConfigMobility</i> is not configured and <i>associatedSSB</i> is not configured for any cell, the field is absent, Need R. |

### – MeasObjectNR-SL

The IE *MeasObjectNR-SL* concerns a measurement object including a list of transmission resource pool(s) for which CBR measurement is performed for NR sidelink communication/discovery.

#### MeasObjectNR-SL information element

```
-- ASN1START
-- TAG-MEASOBJECTNR-SL-START

MeasObjectNR-SL-r16 ::= SEQUENCE {
 tx-PoolMeasToRemoveList-r16 Tx-PoolMeasList-r16
 tx-PoolMeasToAddModList-r16 Tx-PoolMeasList-r16
}
 OPTIONAL, -- Need N
 OPTIONAL, -- Need N

MeasObjectNR-SL-r18 ::= SEQUENCE {
 sl-Frequency-r18 INTEGER (1..maxNrofFreqSL-r16),
 tx-PoolMeasToRemoveList-r18 Tx-PoolMeasList-r16
 tx-PoolMeasToAddModList-r18 Tx-PoolMeasList-r16
}
 OPTIONAL, -- Need N
 OPTIONAL, -- Need N

Tx-PoolMeasList-r16 ::= SEQUENCE (SIZE (1..maxNrofSL-PoolToMeasureNR-r16)) OF SL-ResourcePoolID-r16
```

```
-- TAG-MEASOBJECTNR-SL-STOP
-- ASN1STOP
```

#### ***MeasObjectNR-SL field descriptions***

***sl-Frequency***

Indicates the sidelink frequency associated to this *MeasObjectNR-SL*. The value 1 corresponds to the frequency of first entry in *sl-FreqInfoList* broadcast in *SIB12*, the value 2 corresponds to the frequency of first entry in *sl-FreqInfoListSizeExt* broadcast in *SIB12*, the value 3 corresponds to the frequency of second entry in *sl-FreqInfoListSizeExt* broadcast in *SIB12* and so on.

- ***MeasObjectRxTxDiff***

The IE *MeasObjectRxTxDiff* is used to configure the measurement object for UE Rx-Tx time difference measurement.

#### ***MeasObjectRxTxDiff information element***

```
-- ASN1START
-- TAG-MEASOBJECTRXTXDIFF-START
```

```
MeasObjectRxTxDiff-r17 ::= SEQUENCE {
 dl-Ref-r17 CHOICE {
 prs-Ref-r17 NULL,
 csi-RS-Ref-r17 NULL,
 ...
 } OPTIONAL, -- Need R
 ...
}

-- TAG-MEASOBJECTRXTXDIFF-STOP
-- ASN1STOP
```

#### ***MeasObjectRxTxDiff field descriptions***

***dl-Ref***

configures the DL references signals to measure Rx-Tx time difference. *prs-Ref-r17* indicates PRS is chosen, and *csi-RS-Ref-r17* indicates that CSI-RS for tracking is chosen. Only one PRS resource set is configured by the network. Only one *NZP-CSI-RS-ResourceSet* can be configured with *pdc-Info-r17* set to *true* and it is used for UE Rx-Tx time difference measurement. Only reference signals from the PCell of the MCG can be configured by the network.

- ***MeasObjectToAddModList***

The IE *MeasObjectToAddModList* concerns a list of measurement objects to add or modify.

***MeasObjectToAddModList* information element**

```
-- ASN1START
-- TAG-MEASOBJECTTOADDMODLIST-START

MeasObjectToAddModList ::= SEQUENCE (SIZE (1..maxNrofObjectId)) OF MeasObjectToAddMod

MeasObjectToAddMod ::= SEQUENCE {
 measObjectId,
 measObject
 measObjectNR
 ...
 measObjectEUTRA,
 measObjectUTRA-FDD-r16,
 measObjectNR-SL-r16,
 measObjectCLI-r16,
 measObjectRxTxDiff-r17,
 measObjectRelay-r17
 measObjectNR-SL-r18
}

-- TAG-MEASOBJECTTOADDMODLIST-STOP
-- ASN1STOP
```

***MeasObjectUTRA-FDD***

The IE *MeasObjectUTRA-FDD* specifies information applicable for inter-RAT UTRA-FDD neighbouring cells.

***MeasObjectUTRA-FDD* information element**

```
-- ASN1START
-- TAG-MEASOBJECTUTRA-FDD-START

MeasObjectUTRA-FDD-r16 ::= SEQUENCE {
 carrierFreq-r16
 ultra-FDD-Q-OffsetRange-r16
 cellsToRemoveList-r16
 cellsToAddModList-r16
 ...
}

CellsToAddModListUTRA-FDD-r16 ::= SEQUENCE (SIZE (1..maxCellMeasUTRA-FDD-r16)) OF CellsToAddModUTRA-FDD-r16

CellsToAddModUTRA-FDD-r16 ::= SEQUENCE {
 cellIndexUTRA-FDD-r16
 physCellId-r16
}

UTRA-FDD-CellIndexList-r16 ::= SEQUENCE (SIZE (1..maxCellMeasUTRA-FDD-r16)) OF UTRA-FDD-CellIndex-r16
```

```
UTRA-FDD-CellIndex-r16 ::= INTEGER (1..maxCellMeasUTRA-FDD-r16)
-- TAG-MEASOBJECTUTRA-FDD-STOP
-- ASN1STOP
```

| <b>MeasObjectUTRA-FDD field descriptions</b> |                                                                                                                                                                                                                    |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierFreq</b>                           | Identifies UTRA-FDD carrier frequency for which this configuration is valid. NR does not configure more than one measurement object for the same physical frequency regardless of the ARFCN used to indicate this. |
| <b>cellIndexUTRA-FDD</b>                     | Entry index in the neighbouring cell list.                                                                                                                                                                         |
| <b>cellsToAddModList</b>                     | List of UTRA-FDD cells to add/modify in the neighbouring cell list.                                                                                                                                                |
| <b>cellsToRemoveList</b>                     | List of cells to remove from the neighbouring cell list.                                                                                                                                                           |
| <b>utra-FDD-Q-OffsetRange</b>                | Used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value is in dB.                                                                    |

### — MeasResultCellListSFTD-NR

The IE *MeasResultCellListSFTD-NR* consists of SFN and radio frame boundary difference between the PCell and an NR cell as specified in TS 38.215 [9] and TS 38.133 [14].

#### **MeasResultCellListSFTD-NR information element**

```
-- ASN1START
-- TAG-MEASRESULTCELLLISTSFTD-NR-START

MeasResultCellListSFTD-NR ::= SEQUENCE (SIZE (1..maxCellsFTD)) OF MeasResultCellsFTD-NR

MeasResultCellsFTD-NR ::= SEQUENCE {
 physCellId,
 sfn-OffsetResult,
 frameBoundaryOffsetResult,
 rsrp-Result
}
}

-- TAG-MEASRESULTCELLLISTSFTD-NR-STOP
-- ASN1STOP
```

| <b>MeasResultCellsFTD-NR field descriptions</b> |                                                                                                                           |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>sfn-OffsetResult</b>                         | Indicates the SFN difference between the PCell and the NR cell as an integer value according to TS 38.215 [9].            |
| <b>frameBoundaryOffsetResult</b>                | Indicates the frame boundary difference between the PCell and the NR cell as an integer value according to TS 38.215 [9]. |

## – *MeasResultCellListSFTD-EUTRA*

The IE *MeasResultCellListSFTD-EUTRA* consists of SFN and radio frame boundary difference between the PCell and an E-UTRA PSCell.

### ***MeasResultCellListSFTD-EUTRA* information element**

```
-- ASN1START
-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-START

MeasResultCellListSFTD-EUTRA ::= SEQUENCE (SIZE (1..maxCellsFTD)) OF MeasResultSFTD-EUTRA

MeasResultSFTD-EUTRA ::= SEQUENCE {
 eutra-PhysCellId,
 sfn-OffsetResult,
 frameBoundaryOffsetResult
 rsrp-Result
}
 EUTRA-PhysCellId,
 INTEGER (0..1023),
 INTEGER (-30720..30719),
 RSRP-Range
 OPTIONAL

-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-STOP
-- ASN1STOP
```

| <b><i>MeasResultSFTD-EUTRA</i> field descriptions</b> |                                                                                                                               |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b><i>eutra-PhysCellId</i></b>                        | Identifies the physical cell identity of the E-UTRA cell for which the reporting is being performed.                          |
| <b><i>sfn-OffsetResult</i></b>                        | Indicates the SFN difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9].            |
| <b><i>frameBoundaryOffsetResult</i></b>               | Indicates the frame boundary difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9]. |

## – *MeasResults*

The IE *MeasResults* covers measured results for intra-frequency, inter-frequency, inter-RAT mobility and measured results for NR sidelink communication/discovery/positioning.

| <b>MeasResultNR field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>averageDelay</b>                    | Indicates average delay for the packets during the reporting period, as specified in TS 38.314 [53]. Value 0 corresponds to 0 millisecond, value 1 corresponds to 0.1 millisecond, value 2 corresponds to 0.2 millisecond, and so on.                                                                                                                                                                                                               |
| <b>cellResults</b>                     | Cell level measurement results.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>cellsMetReportOnLeaveList</b>       | This field indicates the list of cells which met the event leaving condition.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>choCandidate</b>                    | This field indicates whether the associated cell is a candidate target cell for conditional handover or conditional PSCell change or addition. This field may be included only in the <i>SuccessHO-Report</i> or <i>SuccessPSCell-Report</i> within <i>UEInformationResponse</i> message.                                                                                                                                                           |
| <b>choConfig</b>                       | If the associated cell is a candidate target cell for conditional handover, this field indicates the conditional handover execution condition for each <i>measId</i> within <i>condTriggerConfig</i> associated to the cell. This field may be included only in the <i>rlf-report</i> within <i>UEInformationResponse</i> message.                                                                                                                  |
| <b>drb-Id</b>                          | Indicates DRB value for which uplink PDCP delay ratio or value is provided, according to TS 38.314 [53].                                                                                                                                                                                                                                                                                                                                            |
| <b>entering</b>                        | This field indicates if the event entering condition for the cell is satisfied and the cell has been just added within <i>cellsTriggeredList</i> .                                                                                                                                                                                                                                                                                                  |
| <b>firstTriggeredEvent</b>             | This field is set to <i>condFirstEvent</i> if the execution condition associated to the first entry of <i>choConfig</i> was fulfilled first in time. This field is set to <i>condSecondEvent</i> if the execution condition associated to the second entry of <i>choConfig</i> was fulfilled first in time. This field may be included in <i>rlf-report</i> within <i>UEInformationResponse</i> message or in <i>SCGFailureInformation</i> message. |
| <b>locationInfo</b>                    | Positioning related information and measurements.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>physCellId</b>                      | The physical cell identity of the NR cell for which the reporting is being performed.                                                                                                                                                                                                                                                                                                                                                               |
| <b>resultsSSB-Cell</b>                 | Cell level measurement results based on SS/PBCH related measurements.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>resultsSSB-Indexes</b>              | Beam level measurement results based on SS/PBCH related measurements.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>resultsCSI-RS-Cell</b>              | Cell level measurement results based on CSI-RS related measurements.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>resultsCSI-RS-Indexes</b>           | Beam level measurement results based on CSI-RS related measurements.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>rsIndexResults</b>                  | Beam level measurement results.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>timeBetweenEvents</b>               | Indicates the time elapsed between fulfilling the conditional execution conditions included in <i>choConfig</i> . Value in milliseconds. The maximum value 1023 means 1023ms or longer. This field may be included in the reports associated to <i>UEInformationResponse</i> message, e.g., <i>rlf-Report</i> or in the <i>SCGFailureInformation</i> message.                                                                                       |

| <b>coarseLocationInfo</b>              | This field indicates the coarse location information reported by the UE. This field is coded as the <i>Ellipsoid-Point</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. The least significant bits of <i>degreesLatitude</i> and <i>degreesLongitude</i> are set to 0 to meet the accuracy requirement corresponds to a granularity of approximately 2 km.<br>It is up to UE implementation how many LSBs are set to 0 to meet the accuracy requirement                                                                                                         |
| <b>excessDelay</b>                     | Indicates the ratio of packets in UL per DRB exceeding the configured delay threshold among the UL PDCP SDUs, according to the UL PDCP Excess Packet Delay per DRB mapping table, as defined in TS 38.314 [53], Table 4.3.1.e-1.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measId</b>                          | Identifies the measurement identity for which the reporting is being performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>measQuantityResults</b>             | The value sinr is not included when it is used for <i>LogMeasReport-r16</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>measResultCellListSFTD-NR</b>       | SFTD measurement results between the PCell and the NR neighbour cell(s) in NR standalone.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>measResultCLI</b>                   | CLI measurement results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>measResultEUTRA</b>                 | Measured results of an E-UTRA cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>measResultForRSSI</b>               | Includes measured RSSI result in dBm (see TS 38.215 [9]) and <i>channelOccupancy</i> which is the percentage of samples when the RSSI was above the configured <i>channelOccupancyThreshold</i> for the associated <i>reportConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>measResultListEUTRA</b>             | List of measured results for the maximum number of reported best cells for an E-UTRA measurement identity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>measResultListNR</b>                | List of measured results for the maximum number of reported best cells for an NR measurement identity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>measResultListUTRA-FDD</b>          | List of measured results for the maximum number of reported best cells for a UTRA-FDD measurement identity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>measResultNR</b>                    | Measured results of an NR cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>measResultServFreqListEUTRA-SCG</b> | Measured results of the E-UTRA SCG serving frequencies: the measurement result of PSCell and each SCell, if any, and of the best neighbouring cell on each E-UTRA SCG serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>measResultServFreqListNR-SCG</b>    | Measured results of the NR SCG serving frequencies: the measurement result of PSCell and each SCell, if any, and of the best neighbouring cell on each NR SCG serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measResultServingMOList</b>         | Measured results of measured cells with reference signals indicated in the serving cell measurement objects including measurement results of SpCell, configured SCell(s) and best neighbouring cell within measured cells with reference signals indicated in on each serving cell measurement object. If the sending of the <i>MeasurementReport</i> message is triggered by a measurement configured by the field <i>sl-ConfigDedicatedForNR</i> received within an E-UTRA <i>RRCConnectionReconfiguration</i> message (i.e. CBR measurements), this field is not applicable and its contents is ignored by the network. |
| <b>measResultSFTD-EUTRA</b>            | SFTD measurement results between the PCell and the E-UTRA PScell in NE-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>measResultSFTD-NR</b>               | SFTD measurement results between the PCell and the NR PScell in NR-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>coarseLocationInfo</b>             | This field indicates the coarse location information reported by the UE. This field is coded as the <i>Ellipsoid-Point</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. The least significant bits of <i>degreesLatitude</i> and <i>degreesLongitude</i> are set to 0 to meet the accuracy requirement corresponds to a granularity of approximately 2 km.<br>It is up to UE implementation how many LSBs are set to 0 to meet the accuracy requirement |
| <b>excessDelay</b>                    | Indicates the ratio of packets in UL per DRB exceeding the configured delay threshold among the UL PDCP SDUs, according to the UL PDCP Excess Packet Delay per DRB mapping table, as defined in TS 38.314 [53], Table 4.3.1.e-1.                                                                                                                                                                                                                                                                                   |

| <b><i>measResultListCBR-DedicatedSL-PRS</i></b>  | CBR measurement results for NR sidelink positioning for dedicated SL PRS resource pool.                                                                                      |
| <b><i>measResultListCBR-NR</i></b>               | CBR measurement results for NR sidelink communication/discovery.                                                                                                             |
| <b><i>sl-poolReportIdentity</i></b>              | The identity of the transmission resource pool which is corresponding to the <i>sl-ResourcePoolID</i> configured in a resource pool for NR sidelink communication/discovery. |
| <b><i>sl-PRS-ResourcePoolID</i></b>              | The ID of the transmission resource pool which is corresponding to the <i>sl-PRS-ResourcePoolID</i> configured in a resource pool for NR sidelink positioning.               |

## – *MeasSequence*

The IE *MeasSequence* is used to configure a recommended sequence for intra/inter-RAT intra/inter-frequency measurement.

### ***MeasSequence* information element**

```

-- ASN1START
-- TAG-MEASSEQUENCE-START

```

```
MeasSequence-r18 ::= INTEGER (1..maxMeasSequence-r18)
-- TAG-MEASSEQUENCE-STOP
-- ASN1STOP
```

## – *MeasTriggerQuantityEUTRA*

The IE *MeasTriggerQuantityEUTRA* is used to configure the trigger quantity and reporting range for E-UTRA measurements. The RSRP, RSRQ and SINR ranges correspond to *RSRP-Range*, *RSRQ-Range* and *RS-SINR-Range* in TS 36.331 [10], respectively.

### ***MeasTriggerQuantityEUTRA* information element**

```
-- ASN1START
-- TAG-MEASTRIGGERQUANTITYEUTRA-START

MeasTriggerQuantityEUTRA ::= CHOICE {
 rsrp
 rsrq
 sinr
}
RSRP-RangeEUTRA ::= INTEGER (0..97)
RSRQ-RangeEUTRA ::= INTEGER (0..34)
SINR-RangeEUTRA ::= INTEGER (0..127)
-- TAG-MEASTRIGGERQUANTITYEUTRA-STOP
-- ASN1STOP
```

## – *MeasurementValidityDuration*

The IE *MeasurementValidityDuration* indicates time values for validation of reported idle/inactive and reselection measurements as defined in TS 38.133[14]. Value s5 correspond to 5 seconds, value s10 correspond to 10 seconds and so on.

### ***MeasurementValidityDuration* information element**

```
-- ASN1START
-- TAG-MEASUREMENTVALIDITYDURATION-START

MeasurementValidityDuration-r18 ::= ENUMERATED {s5, s10, s20, s50, s100, spare3, spare2, spare1}
-- TAG-MEASUREMENTVALIDITYDURATION-STOP
-- ASN1STOP
```

- ***MeasWindowConfig***

The IE *MeasWindowConfig* specifies the effective measurement window configuration for inter-RAT E-UTRA measurement.

#### ***MeasWindowConfig* information element**

```
-- ASN1START
-- TAG-MEASWINDOWCONFIG-START

MeasWindowConfig-r18 ::= SEQUENCE {
 windowOffsetPeriodicity-r18 CHOICE {
 periodicityMs40-r18 INTEGER (0..39),
 periodicityMs80-r18 INTEGER (0..79),
 ...
 },
 windowDuration-r18 ENUMERATED {ms2, ms5, ms5dot5, spare1},
 ...
}

-- TAG-MEASWINDOWCONFIG-STOP
-- ASN1STOP
```

| <b><i>MeasWindowConfig</i> field descriptions</b> |                                                                                                                                                                                                                                 |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>windowDuration</b>                             | Value <i>windowDuration</i> is the measurement window length in ms of effective measurement window. Value <i>ms2</i> corresponds to 2 ms, value <i>ms5</i> corresponds to 5 ms, and Value <i>ms5dot5</i> corresponds to 5.5 ms. |
| <b>windowOffsetPeriodicity</b>                    | Indicates the periodicity and offset of effective measurement window. The choice determines the periodicity (periodicityMs40 for 40ms and periodicityMs80 for 80 ms). The field value indicates the offset in ms.               |

- ***MobilityStateParameters***

The IE *MobilityStateParameters* contains parameters to determine UE mobility state.

#### ***MobilityStateParameters* information element**

```
-- ASN1START
-- TAG-MOBILITYSTATEPARAMETERS-START

MobilityStateParameters ::= SEQUENCE{
 t-Evaluation
 ENUMERATED {
 s30, s60, s120, s180, s240, spare3, spare2, spare1},
 t-HystNormal
 ENUMERATED {
 s30, s60, s120, s180, s240, spare3, spare2, spare1},
 n-CellChangeMedium
 n-CellChangeHigh
}
```

-- TAG-MOBILITYSTATEPARAMETERS-STOP  
 -- ASN1STOP

| <b><i>MobilityStateParameters</i></b> field descriptions |                                                                                                                                                                                                           |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>n-CellChangeHigh</i></b>                           | The number of cell changes to enter high mobility state. Corresponds to N <sub>CR_H</sub> in TS 38.304 [20].                                                                                              |
| <b><i>n-CellChangeMedium</i></b>                         | The number of cell changes to enter medium mobility state. Corresponds to N <sub>CR_M</sub> in TS 38.304 [20].                                                                                            |
| <b><i>t-Evaluation</i></b>                               | The duration for evaluating criteria to enter mobility states. Corresponds to T <sub>CRmax</sub> in TS 38.304 [20]. Value in seconds, s30 corresponds to 30 s and so on.                                  |
| <b><i>t-HystNormal</i></b>                               | The additional duration for evaluating criteria to enter normal mobility state. Corresponds to T <sub>CRmaxHyst</sub> in TS 38.304 [20]. Value in seconds, value s30 corresponds to 30 seconds and so on. |

### — *MRB-Identity*

The IE *MRB-Identity* is used to identify a multicast MRB used by a UE.

#### ***MRB-Identity* information element**

```
-- ASN1START
-- TAG-MRB-IDENTITY-START

MRB-Identity-r17 ::= INTEGER (1..512)

-- TAG-MRB-IDENTITY-STOP
-- ASN1STOP
```

### — *MsgA-ConfigCommon*

The IE *MsgA-ConfigCommon* is used to configure the PRACH and PUSCH resource for transmission of MsgA in 2-step random access type procedure.

```
-- ASN1START
-- TAG-MSGACONFIGCOMMON-START

MsgA-ConfigCommon-r16 ::= SEQUENCE {
 rach-ConfigCommonTwoStepRA-r16 RACH-ConfigCommonTwoStepRA-r16,
 msgA-PUSCH-Config-r16 OPTIONAL --Cond InitialBWPConfig
}
 }

-- TAG-MSGACONFIGCOMMON-STOP
-- ASN1STOP
```

|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msgA-DataScramblingIndex</b>             | Identifier used to initiate data scrambling (c_init) for msgA PUSCH. If the field is absent the UE applies the value Physical cell ID ( <i>physCellID</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>msgA-DeltaPreamble</b>                   | Power offset of msgA PUSCH relative to the preamble received target power. Actual value = field value * 2 [dB] (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>msgA-PUSCH-ResourceGroupA</b>            | MsgA PUSCH resources that the UE shall use when performing MsgA transmission using preambles group A. If field is not configured for the selected UL BWP, the UE shall use the MsgA PUSCH configuration for group A of initial UL BWP or RedCap-specific initial UL BWP (if configured) for (e)RedCap UEs.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>msgA-PUSCH-ResourceGroupB</b>            | MsgA PUSCH resources that the UE shall use when performing MsgA transmission using preambles group B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>msgA-TransformPrecoder</b>               | Enables or disables the transform precoder for MsgA transmission (see clause 6.1.3 of TS 38.214 [19]). If the field is absent in <i>MsgA-ConfigCommon</i> which is configured directly within a BWP (i.e., not within <i>AdditionalRACH-Config</i> ), the UE determines whether to enable the transform precoding according to the <i>msg3-transformPrecoder</i> in <i>RACH-ConfigCommon</i> in the configured BWP. If the field is absent in <i>MsgA-ConfigCommon</i> in <i>AdditionalRACH-Config</i> , the UE determines whether to enable the transform precoding according to the <i>msg3-transformPrecoder</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . |

| <b><i>MsgA-PUSCH-Resource field descriptions</i></b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>guardBandMsgA-PUSCH</i></b>                    | PRB-level guard band between FDMed PUSCH occasions (see TS 38.213 [13], clause 8.1A). If interlaced PUSCH is configured, value 0 is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>guardPeriodMsgA-PUSCH</i></b>                  | Guard period between PUSCH occasions in the unit of symbols (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>frequencyStartMsgA-PUSCH</i></b>               | Offset of lowest PUSCH occasion in frequency domain with respect to PRB 0 (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>interlaceIndexFirstPO-MsgA-PUSCH</i></b>       | Interlace index of the first PUSCH occasion in frequency domain if interlaced PUSCH is configured. For 30kHz SCS only the integers 1, 2, 3, 4, 5 are applicable (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>mappingTypeMsgA-PUSCH</i></b>                  | PUSCH mapping type A or B. If the field is absent, the UE shall use the parameter <i>msgA-PUSCH-TimeDomainAllocation</i> (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>msgA-Alpha</i></b>                             | Dedicated alpha value for MsgA PUSCH. If the field is absent, the UE shall use the value of <i>msg3-Alpha</i> if configured, else UE applies value 1 (see TS 38.213 [13], clause 7.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>msgA-DMRS-Config</i></b>                       | DMRS configuration for msgA PUSCH (see TS 38.213 [13], clause 8.1A and TS 38.214 [19] clause 6.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>msgA-HoppingBits</i></b>                       | Value of hopping bits to indicate which frequency offset to be used for second hop. See Table 8.3-1 in TS 38.213 [13].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>msgA-IntraSlotFrequencyHopping</i></b>         | Intra-slot frequency hopping per PUSCH occasion (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>msgA-MCS</i></b>                               | Indicates the MCS index for msgA PUSCH from the Table 6.1.4.1-1 for DFT-s-OFDM and Table 5.1.3.1-1 for CP-OFDM in TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>msgA-PUSCH-TimeDomainAllocation</i></b>        | Indicates a combination of start symbol and length and PUSCH mapping type from the TDRA table ( <i>PUSCH-TimeDomainResourceAllocationList</i> if provided in <i>PUSCH-ConfigCommon</i> , or else the default Table 6.1.2.1.1-2 in 38.214 [19] is used if <i>pusch-TimeDomainAllocationList</i> is not provided in <i>PUSCH-ConfigCommon</i> ). The parameter K2 in the table is not used for msgA PUSCH. The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>startSymbolAndLengthMsgA-PO</i> .            |
| <b><i>msgA-PUSCH-TimeDomainOffset</i></b>            | A single time offset with respect to the start of each PRACH slot (with at least one valid RO), counted as the number of slots (based on the numerology of active UL BWP). See TS 38.213 [13], clause 8.1A.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>nrofDMRS-Sequences</i></b>                     | Number of DMRS sequences for MsgA PUSCH for CP-OFDM. In case of single PUSCH configuration or if the DMRS symbols of multiple configurations are not overlapped, if the DMRS resources configured in one PUSCH occasion is no larger than 8 (for <i>len2</i> ) or 4 (for <i>len1</i> ), then only DMRS port is configured.                                                                                                                                                                                                                                                                                                                 |
| <b><i>nrofInterlacesPerMsgA-PO</i></b>               | Number of consecutive interlaces per PUSCH occasion if interlaced PUSCH is configured. For 30kHz SCS only the integers 1, 2, 3, 4, 5 are applicable (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>nrofMsgA-PO-FDM</i></b>                        | The number of msgA PUSCH occasions FDMed in one time instance (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>nrofMsgA-PO-PerSlot</i></b>                    | Number of time domain PUSCH occasions in each slot. PUSCH occasions including guard period are contiguous in time domain within a slot (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>nrofPRBs-PerMsgA-PO</i></b>                    | Number of PRBs per PUSCH occasion (see TS 38.213 [13], clause 8.1A). An eRedcap UE ignores the PRACH and PUSCH resource parameters for transmission of MsgA in 2-step random access type procedure if configured number of PRBs per PUSCH occasion for Preambles group A is larger than the maximum number of PRBs that can be configured per slot or per hop. If configured number of PRBs per PUSCH occasion for Preambles group B is larger than the maximum number of PRBs that can be configured per slot or per hop, an eRedCap UE ignores the PRACH and PUSCH resource parameters for transmission of MsgA using Preambles group B. |

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nrofSlotsMsgA-PUSCH</b>         | Number of slots (in active UL BWP numerology) containing one or multiple PUSCH occasions, each slot has the same time domain resource allocation (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>startSymbolAndLengthMsgA-PO</b> | An index giving valid combinations of start symbol, length and mapping type as start and length indicator (SLIV) for the first msgA PUSCH occasion, for RRC_CONNECTED UEs in non-initial BWP as described in TS 38.214 [19] clause 6.1.2. The network configures the field so that the allocation does not cross the slot boundary. The number of occupied symbols excludes the guard period. If the field is absent, the UE shall use the value in <i>msgA-PUSCH-TimeDomainAllocation</i> (see TS 38.213 [13], clause 8.1A). The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>msgA-PUSCH-TimeDomainAllocation</i> . |

| <b>MsgA-DMRS-Config field descriptions</b> |                                                                                                                                                                    |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msgA-DMRS-AdditionalPosition</b>        | Indicates the position for additional DM-RS. If the field is absent, the UE applies value <i>pos2</i> .                                                            |
| <b>msgA-MaxLength</b>                      | indicates single-symbol or double-symbol DMRS. If the field is absent, the UE applies value <i>len1</i> .                                                          |
| <b>msgA-PUSCH-DMRS-CDM-Group</b>           | 1-bit indication of indices of CDM group(s). If the field is absent, then both CDM groups are used.                                                                |
| <b>msgA-PUSCH-NrofPorts</b>                | 0 indicates 1 port per CDM group, 1 indicates 2 ports per CDM group. If the field is absent then 4 ports per CDM group are used (see TS 38.213 [13], clause 8.1A). |
| <b>msgA-ScramblingID0</b>                  | UL DMRS scrambling initialization for CP-OFDM. If the field is absent the UE applies the value Physical cell ID ( <i>physCellID</i> ).                             |
| <b>msgA-ScramblingID1</b>                  | UL DMRS scrambling initialization for CP-OFDM. If the field is absent the UE applies the value Physical cell ID ( <i>physCellID</i> ).                             |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                      |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FreqHopConfigured</i> | This field is mandatory present when the field <i>msgA-IntraSlotFrequencyHopping</i> is configured. Otherwise, the field is absent.                                                                                                                                                                              |
| <i>GroupBConfigured</i>  | The field is mandatory present if <i>groupB-ConfiguredTwoStepRA</i> is configured in <i>RACH-ConfigCommonTwoStepRA</i> , otherwise the field is absent.                                                                                                                                                          |
| <i>InitialBWPConfig</i>  | The field is mandatory present when <i>MsgA-ConfigCommon</i> is configured for the initial uplink BWP, or when <i>MsgA-ConfigCommon</i> is configured for a non-initial uplink BWP and <i>MsgA-ConfigCommon</i> is not configured for the initial uplink BWP, otherwise the field is optionally present, Need S. |

## – *MultiFrequencyBandListNR*

The IE *MultiFrequencyBandListNR* is used to configure a list of one or multiple NR frequency bands.

### ***MultiFrequencyBandListNR* information element**

```
-- ASN1START
-- TAG-MULTIFREQUENCYBANDLISTNR-START
```

```
MultiFrequencyBandListNR ::= SEQUENCE (SIZE (1..maxNrofMultiBands)) OF FreqBandIndicatorNR
```

```
-- TAG-MULTIFREQUENCYBANDLISTNR-STOP
-- ASN1STOP
```

## *MultiFrequencyBandListNR-SIB*

The IE *MultiFrequencyBandListNR-SIB* indicates the list of frequency bands, for which cell (re-)selection parameters are common, and a list of *additionalPmax* and *additionalSpectrumEmission*.

### ***MultiFrequencyBandListNR-SIB* information element**

```
-- ASN1START
-- TAG-MULTIFREQUENCYBANDLISTNR-SIB-START

| <b>freqBandIndicatorNR</b>                 | Provides an NR frequency band number as defined in TS 38.101-1 [15], TS 38.101-2 [39], table 5.2-1, and TS 38.101-5 [75], table 5.2.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>freqBandIndicatorNR-Aerial</b>          | Provides an NR frequency band number for aerial UE(s), as defined in TS 38.101-1 [15], TS 38.101-2 [39], table 5.2-1, and TS 38.101-5 [75], table 5.2.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>nr-NS-PmaxList</b>                      | Provides a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values. If the field is absent the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15] table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). This field is ignored by IAB-MT and wide area NCR-MT (see TS 38.106 [79]). The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The wide area NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79]. If <i>nr-NS-PmaxList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>nr-NS-PmaxList</i> (without suffix).                                                                                                                                                                                                                             |
| <b>nr-NS-PmaxListAerial</b>                | Provides a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values for aerial UE(s) as defined in TS 38.101-1 [15], clause 6.2K. If the field is absent, the value indicated by the corresponding field within <i>frequencyBandList</i> for the same NR frequency band number applies, if present. Otherwise (i.e. the field is not present for the same NR frequency band number in any of the <i>nr-NS-PmaxList</i> , <i>nr-NS-PmaxList-v1760</i> or <i>nr-NS-PmaxListAerial</i> ), the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15] table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). This field is ignored by IAB-MT and wide area NCR-MT (see TS 38.106 [79]). The IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. The wide area NCR-MT applies output power and emissions requirements as specified in TS 38.106 [79]. |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OptULNotSIB2</i>  | The field is absent for <i>SIB2</i> and is mandatory present if the parent IE is included in <i>SIB4</i> or <i>frequencyInfoDL-SIB</i> . Otherwise, if the field is absent in <i>frequencyInfoUL-SIB</i> in <i>UplinkConfigCommonSIB</i> , the UE will use the frequency band indicated in <i>frequencyInfoDL-SIB</i> in <i>DownlinkConfigCommonSIB</i> . |

## – *MUSIM-GapConfig*

The IE *MUSIM-GapConfig* specifies the MUSIM gap configuration and controls setup/release of MUSIM gaps.

| <b>MUSIM-GapConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>musim-AperiodicGap</i></b>          | Indicates the MUSIM aperiodic gap as specified in TS 38.133 [14] clause 9.1.10. If UE indicates the <i>musim-Starting-SFN-AndSubframe</i> when requesting aperiodic gap the network can only configure the aperiodic gap with the same start point or no aperiodic gap. If the field <i>musim-Starting-SFN-AndSubframe</i> is absent for aperiodic gap, network can configure any timing as the starting point for aperiodic gap or configure no aperiodic gap. |
| <b><i>musim-GapInfo</i></b>               | Indicates the values for <i>musim-GapLength</i> and <i>musim-GapRepetitionAndOffset</i> . When network provides periodic gap, network always signals the <i>musim-GapLength</i> and <i>musim-GapRepetitionAndOffset</i> as indicated by the UE's preferred MUSIM gap configuration.                                                                                                                                                                             |
| <b><i>musim-GapKeep</i></b>               | Indicates the UE is allowed to use "keep solution" for colliding MUSIM periodic/aperiodic gaps. If "keep solution" is not granted, collisions between MUSIM periodic gaps are resolved based on the assigned MUSIM gap priorities as specified in TS 38.133[14].                                                                                                                                                                                                |
| <b><i>musim-GapToAddModListExt</i></b>    | Indicates the priority of MUSIM periodic gap(s).<br>If the network includes <i>musim-GapToAddModListExt-v1820</i> , it includes the same number of entries, and listed in the same order, as in <i>musim-GapToAddModList-r17</i> .<br>For the priority of MUSIM aperiodic gap, the MUSIM aperiodic gap is always kept (not dropped) from UE perspective in case of collisions with other gaps (i.e. all gaps including MUSIM gaps, etc).                        |
| <b><i>musim-GapToAddModList</i></b>       | List of MUSIM periodic gap patterns to add or modify.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>musim-GapToReleaseList</i></b>      | List of MUSIM periodic gap patterns to release.                                                                                                                                                                                                                                                                                                                                                                                                                 |

## – ***MUSIM-GapId***

The IE *MUSIM-GapId* is used to identify UE periodic MUSIM gap(s) to add, modify or release.

|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>servCellId</b>                              | Indicates the serving cell which contains the target SSB (associated with the initial DL BWP) to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>gapIndicationIntra</b>                      | Indicates whether measurement gap is required for the UE to perform intra-frequency SSB based measurements on the concerned serving cell. Value <i>gap</i> indicates that a measurement gap is needed if any of the UE configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB) do not contain the frequency domain resources of the SSB associated to the initial DL BWP (CD-SSB). Value <i>no-gap</i> indicates a measurement gap is not needed to measure the SSB associated to the initial DL BWP (CD-SSB) for all configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB), no matter the SSB is within the configured BWP or not. This field shall be set to 'no-gap' for the serving cell(s) belonging to the corresponding band(s) where <i>bwOperationMeasWithoutInterrupt-r18</i> is supported by the UE. |

| <b>NeedForGapsNR field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bandNR</b>                           | Indicates the NR target band to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>gapIndication</b>                    | Indicates whether measurement gap is required for the UE to perform SSB based measurements on the concerned NR target band while NR-DC or NE-DC is not configured. The UE determines this information based on the resultant configuration of the <i>RRCReconfiguration</i> or <i>RRCResume</i> message that triggers this response. Value <i>gap</i> indicates that a measurement gap is needed, value <i>no-gap</i> indicates a measurement gap is not needed. |

- ***NeedForGapNCSG-ConfigEUTRA***

| <b><i>servCellId</i></b>                               | Indicates the serving cell which contains the target SSB (associated with the initial DL BWP) to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>gapIndicationIntra</i></b>                       | Indicates whether measurement gap or NCSG is required for the UE to perform intra-frequency SSB based measurements on the concerned serving cell. Value <i>gap</i> indicates that a measurement gap is needed if any of the UE configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB) do not contain the frequency domain resources of the SSB associated to the initial DL BWP (CD-SSB). Value <i>ncsg</i> indicates that a NCSG is needed if any of the UE configured BWPs do not contain the frequency domain resources of the SSB associated to the initial DL BWP. Value <i>nogap-noncsg</i> indicates that neither a measurement gap nor a NCSG is needed to measure the SSB associated to the initial DL BWP (CD-SSB) for all configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB), no matter the SSB is within the configured BWP or not. This field shall be set to ' <i>nogap-noncsg</i> ' for the serving cell cell(s) belonging to the corresponding band(s) where <i>bwOperationMeasWithoutInterrupt-r18</i> is supported by the UE. Value <i>nogap-noncsg</i> also indicates interruption is not needed. |

| <b><i>NeedForNCSG-NR</i></b> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bandNR</i></b>                            | Indicates the NR target band to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>gapIndication</i></b>                     | Indicates whether measurement gap or NCSG is required for the UE to perform SSB based measurements on the concerned NR target band while NR-DC or NE-DC is not configured. The UE determines this information based on the resultant configuration of the <i>RRCReconfiguration</i> or <i>RRCResume</i> message that triggers this response. Value <i>gap</i> indicates that a measurement gap is needed, value <i>ncsg</i> indicates that a NCSG is needed, and value <i>nogap-noncsg</i> indicates neither a measurement gap nor a NCSG is needed. Value <i>nogap-noncsg</i> also indicates interruption is not needed. |

### – *NeedForInterruptionInfoNR*

The IE *NeedForInterruptionInfoNR* indicates whether interruption is needed for the UE to perform SSB based measurements on an NR target band without measurement gap while NR-DC or NE-DC is not configured.

| <b>absoluteFrequencySSB</b>                  | Frequency of the NCD-SSB. The network configures this field so that the SSB is within the bandwidth of the BWP configured in <i>BWP-DownlinkCommon</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ssb-Periodicity</b>                       | The periodicity of this NCD-SSB. The network configures only periodicities that are larger than the periodicity of serving cell's CD-SSB. If the field is absent, the UE applies the SSB periodicity of the CD-SSB ( <i>ssb-periodicityServingCell</i> configured in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ssb-TimeOffset</b>                        | The time offset between CD-SSB of the serving cell and this NCD-SSB. Value <i>ms5</i> means the first burst of NCD-SSB is transmitted 5ms later than the first burst of CD-SSB transmitted after the first symbol of SFN=0 of the serving cell, value <i>ms10</i> means the first burst of NCD-SSB is transmitted 10ms later than the first burst of CD-SSB transmitted after the first symbol in SFN=0 of the serving cell, and so on. If the field is absent, UE considers that the time offset between the first burst of CD-SSB transmitted in the serving cell and the first burst of this NCD-SSB transmitted is zero. For UEs in TDD cells, the network configures this time offset to be an integer multiple of the periodicity of the serving cell's CD-SSB. |

## – *NPN-Identity*

The IE *NPN-Identity* includes either a list of CAG-IDs or a list of NIDs per PLMN Identity. Further information regarding how to set the IE is specified in TS 23.003 [21].

### *NPN-Identity* information element

```

-- ASN1START
-- TAG-NPN-IDENTITY-START

NPN-Identity-r16 ::= CHOICE {
 pni-npn-r16 SEQUENCE {
 PLMN-Identity,
 SEQUENCE (SIZE (1..maxNPN-r16)) OF CAG-IdentityInfo-r16
 },
 snpn-r16 SEQUENCE {
 PLMN-Identity,
 SEQUENCE (SIZE (1..maxNPN-r16)) OF NID-r16
 }
}

CAG-IdentityInfo-r16 ::= SEQUENCE {
 cag-Identity-r16 BIT STRING (SIZE (32)),
 manualCAGselectionAllowed-r16 ENUMERATED {true} OPTIONAL -- Need R
}

```

```
NID-r16 ::= BIT STRING (SIZE (44))
-- TAG-NPN-IDENTITY-STOP
-- ASN1STOP
```

| <b><i>NPN-Identity field descriptions</i></b> |                                                                                                                                                            |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cag-Identity</b>                           | A CAG-ID as specified in TS 23.003 [21]. The PLMN ID and a CAG ID in the <i>NPN-Identity</i> identifies a PNI-NPN.                                         |
| <b>cag-IdentityList</b>                       | The <i>cag-IdentityList</i> contains one or more CAG IDs. All CAG IDs associated to the same PLMN ID are listed in the same <i>cag-IdentityList</i> entry. |
| <b>manualCAGselectionAllowed</b>              | The <i>manualCAGselectionAllowed</i> indicates that the CAG ID can be selected manually even if it is outside the UE's allowed CAG list.                   |
| <b>NID</b>                                    | A NID as specified in TS 23.003 [21]. The PLMN ID and a NID in the <i>NPN-Identity</i> identifies a SNPN.                                                  |
| <b>nid-List</b>                               | The <i>nid-List</i> contains one or more <i>NID</i> .                                                                                                      |

## — *NPN-IdentityInfoList*

The IE *NPN-IdentityInfoList* includes a list of NPN identity information.

| <b>NPN-IdentityInfoList field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>iab-Support</b>                             | This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-nodes; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. |
| <b>gNB-ID-Length</b>                           | Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> . This field is always present if the <i>mobileIAB-Support</i> is broadcasted.                                                                                                                                                                                                                         |
| <b>mobileIAB-Support</b>                       | This field indicates the support of mobile IAB and whether the cell can be considered as a candidate for cell (re)selection for mobile IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. If the field is absent, the cell is barred for mobile IAB-node.                                                                                           |
| <b>NPN-IdentityInfo</b>                        | The <i>NPN-IdentityInfo</i> contains one or more NPN identities and additional information associated with those NPNs. Only the same type of NPNs (either SNPNs or PNI-NPNs) can be listed in a <i>NPN-IdentityInfo</i> element.                                                                                                                                                     |
| <b>npn-IdentityList</b>                        | The <i>npn-IdentityList</i> contains one or more NPN Identity elements.                                                                                                                                                                                                                                                                                                              |
| <b>trackingAreaCode</b>                        | Indicates the Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                                                                                                   |
| <b>ranac</b>                                   | Indicates the RAN Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                                                                                                        |
| <b>cellReservedForOperatorUse</b>              | Indicates whether the cell is reserved for operator use (for the NPN(s) identified in the <i>npn-IdentityList</i> ) as defined in TS 38.304 [20]. This field is ignored by NPN capable IAB-MT and NPN capable NCR-MT.                                                                                                                                                                |

|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-PRS-ResourceBandwidth</b>                     | This field specifies the number of PRBs allocated for all the DL-PRS Resource (allocated DL-PRS bandwidth) in multiples of 4 PRBs in this resource set. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same bandwidth. Integer value 1 corresponds to 24 PRBs, value 2 corresponds to 28 PRBs, value 3 corresponds to 32 PRBs and so on.       |
| <b>dl-PRS-StartPRB</b>                              | This field specifies the start PRB index defined as offset with respect to subcarrier 0 in common resource block 0 for the DL-PRS Resource. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same value of dl-PRS-StartPRB.                                                                                                                      |
| <b>numSymbols</b>                                   | This field specifies the number of symbols per DL-PRS Resource within a slot. The UE does not expect to be configured for PDC with a PRS with <i>numSymbols</i> equals to n1 unless an SSB index is provided as a <i>typeC</i> or <i>typeC-plus-typeD</i> QCL source, or another PRS resource with <i>numSymbols</i> more than n1 is provided as QCL source. |
| <b>periodicityAndOffset</b>                         | This field specifies the periodicity of DL-PRS allocation in slots and the slot offset with respect to SFN #0 slot #0 in the PCell where the DL-PRS-PDC Resource Set is configured (i.e., slot where the first DL-PRS Resource of DL-PRS-PDC Resource Set occurs).                                                                                           |
| <b>repFactorAndTimeGap</b>                          | If this field is absent, the value for <i>repetitionFactor</i> is 1 (i.e., no resource repetition).                                                                                                                                                                                                                                                          |

| <b>RepFactorAndTimeGap field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>repetitionFactor</b>                       | This field specifies how many times each DL-PRS Resource is repeated for a single instance of the DL-PRS Resource Set. It is applied to all resources of the DL-PRS Resource Set. Enumerated values n2, n4, n6, n8, n16, n32 correspond to 2, 4, 6, 8, 16, 32 resource repetitions, respectively.                                                                               |
| <b>timeGap</b>                                | This field specifies the offset in units of slots between two repeated instances of a DL-PRS Resource corresponding to the same DL-PRS Resource ID within a single instance of the DL-PRS Resource Set. The time duration spanned by one DL-PRS Resource Set containing repeated DL-PRS Resources should not exceed the periodicity configured by <i>periodicityAndOffset</i> . |

| <b>NR-DL-PRS-Resource field description</b> |                                                                                                                                                                                                            |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-PRS-ResourceSymbolOffset</b>          | This field specifies the starting symbol of the <i>DL-PRS Resource</i> within a slot. If <i>dl-PRS-ResourceSymbolOffset-v1800</i> is present, the UE shall ignore <i>dl-PRS-ResourceSymbolOffset-r17</i> . |

## – **NR-NS-PmaxList**

The IE *NR-NS-PmaxList* is used to configure a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 38.101-1 [15], table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A for a given frequency band.

### **NR-NS-PmaxList information element**

```
-- ASN1START
-- TAG-NR-NS-PMAXLIST-START

NR-NS-PmaxList ::= SEQUENCE (SIZE (1..maxNR-NS-Pmax)) OF NR-NS-PmaxValue
NR-NS-PmaxValue ::= SEQUENCE {
 additionalPmax P-Max OPTIONAL, -- Need N
 additionalSpectrumEmission AdditionalSpectrumEmission
}

NR-NS-PmaxList-v1760 ::= SEQUENCE (SIZE (1.. maxNR-NS-Pmax)) OF NR-NS-PmaxValue-v1760
NR-NS-PmaxValue-v1760 ::= SEQUENCE {
 additionalSpectrumEmission-v1760 AdditionalSpectrumEmission-v1760 OPTIONAL -- Need N
}

NR-NS-PmaxListAerial-r18 ::= SEQUENCE (SIZE (1..maxNR-NS-Pmax)) OF NR-NS-PmaxValueAerial-r18
NR-NS-PmaxValueAerial-r18 ::= SEQUENCE {
 additionalPmax-r18 P-Max OPTIONAL, -- Need N
 additionalSpectrumEmission-r18 AdditionalSpectrumEmission-r18
}

-- TAG-NR-NS-PMAXLIST-STOP
-- ASN1STOP
```

## – **NSAG-ID**

The IE *NSAG-ID* is used to identify an NSAG (TS 23.501 [32]) for slice-based cell reselection or slice-based random access.

### **NSAG-ID information element**

```
-- ASN1START
-- TAG-NSAG-ID-START
```

```
NSAG-ID-r17 ::= BIT STRING (SIZE (8))
-- TAG-NSAG-ID-STOP
-- ASN1STOP
```

## - *NSAG-IdentityInfo*

The IE *NSAG-IdentityInfo* is used to identify an NSAG (TS 23.501 [32]) for slice-based cell reselection.

### ***NSAG-IdentityInfo* information element**

```
-- ASN1START
-- TAG-NSAG-IDENTITYINFO-START

NSAG-IdentityInfo-r17 ::= SEQUENCE {
 nsag-ID-r17,
 trackingAreaCode-r17
} OPTIONAL -- Need R

-- TAG-NSAG-IDENTITYINFO-STOP
-- ASN1STOP
```

#### ***NSAG-IdentityInfo* field descriptions**

| <b><i>trackingAreaCode</i></b>                                         |
|------------------------------------------------------------------------|
| If absent, UE assumes the <i>trackingAreaCode</i> of the serving cell. |

## - *NTN-Config*

The IE *NTN-Config* provides parameters needed for the UE to access NR via NTN access.

### ***NTN-Config* information element**

```
-- ASN1START
-- TAG-NTN-CONFIG-START

NTN-Config-r17 ::= SEQUENCE {

```

| <b>NTN-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ephemerisInfo</b>                 | This field provides satellite ephemeris either in format of position and velocity state vector or in format of orbital parameters. This field is excluded when determining changes in system information, i.e. changes to <i>ephemerisInfo</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>epochTime</b>                     | If this field is absent for the NTN serving cell, the epoch time is the end of SI window where this <i>SIB19</i> is scheduled. This field is mandatory present when <i>ntn-Config</i> is provided in dedicated configuration. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> or <i>SatSwitchWithReSync</i> in an NTN cell, the UE uses epoch time of the serving cell, otherwise the field is based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the serving cell. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> in a TN cell, the epoch time is the end of SI window where this <i>SIB19</i> is scheduled. In case of satellite switch with resynchronization, this field is based on the timing of the cell served by the source satellite. This field is excluded when determining changes in system information, i.e. changes to <i>epochTime</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .                                                                                                                  |
| <b>cellSpecificKoffset</b>           | Scheduling offset used for the timing relationships that are modified for NTN (see TS 38.213 [13]). The unit of the field <i>K_offset</i> is number of slots for a given subcarrier spacing of 15 kHz. If the field is absent UE assumes value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>kmac</b>                          | Scheduling offset provided by network if downlink and uplink frame timing are not aligned at gNB. If the field is absent UE assumes value 0. The unit of <i>kmac</i> is number of slots for a given subcarrier spacing of 15 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ntn-PolarizationDL</b>            | If present, this parameter indicates polarization information for downlink transmission on service link: including Right hand, Left hand circular polarizations (RHCP, LHCP) and Linear polarization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ntn-PolarizationUL</b>            | If present, this parameter indicates Polarization information for uplink service link.<br>If not present and <i>ntn-PolarizationDL</i> is present, UE assumes the same polarization for UL and DL. If both <i>ntn-PolarizationUL</i> and <i>ntn-PolarizationDL</i> are not present, the UE releases any stored value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ntn-UISyncValidityDuration</b>    | A validity duration configured by the network for assistance information (i.e. Serving and/or neighbour satellite ephemeris and Common TA parameters) which indicates the maximum time duration (from <i>epochTime</i> ) during which the UE can apply assistance information without having acquired new assistance information.<br>The unit of <i>ntn-UISyncValidityDuration</i> is second. Value <i>s5</i> corresponds to 5 s, value <i>s10</i> indicate 10 s and so on. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> or <i>SatSwitchWithReSync</i> in an NTN cell, the UE uses validity duration from the serving cell assistance information. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> in a TN cell, how the UE sets the validity duration is left to UE implementation. This field is excluded when determining changes in system information, i.e. changes of <i>ntn-UISyncValidityDuration</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> . <i>ntn-UISyncValidityDuration</i> is only updated when at least one of <i>epochTime</i> , <i>ta-Info</i> , <i>ephemerisInfo</i> is updated. |
| <b>ta-Common</b>                     | Network-controlled common timing advanced value and it may include any timing offset considered necessary by the network. <i>ta-Common</i> with value of 0 is supported. The granularity of <i>ta-Common</i> is $4.072 \times 10^{-3}$ $\mu$ s. Values are given in unit of corresponding granularity. This field is excluded when determining changes in system information, i.e. changes of <i>ta-Common</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ta-CommonDrift</b>                | Indicate drift rate of the common TA. The granularity of <i>ta-CommonDrift</i> is $0.2 \times 10^{-3}$ $\mu$ s/s. Values are given in unit of corresponding granularity. This field is excluded when determining changes in system information, i.e. changes of <i>ta-CommonDrift</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ta-CommonDriftVariant</b>         | Indicate drift rate variation of the common TA. The granularity of <i>ta-CommonDriftVariant</i> is $0.2 \times 10^{-4}$ $\mu$ s/s <sup>2</sup> . Values are given in unit of corresponding granularity. This field is excluded when determining changes in system information, i.e. changes of <i>ta-CommonDriftVariant</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

***ta-Report***

When this field is included in *SIB19*, it indicates reporting of timing advanced is enabled during Random Access due to RRC connection establishment or RRC connection resume, and during RRC connection reestablishment. When this field is included in *ServingCellConfigCommon* within dedicated signalling, it indicates TA reporting is enabled during reconfiguration with sync (see TS 38.321 [3], clause 5.4.8).

| Conditional Presence | Explanation                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>SIB19</i>         | The field is mandatory present for the serving cell in <i>SIB19</i> . The field is optionally present, Need R, otherwise. |

## – *NZP-CSI-RS-Resource*

The IE *NZP-CSI-RS-Resource* is used to configure Non-Zero-Power (NZP) CSI-RS transmitted in the cell where the IE is included, which the UE may be configured to measure on (see TS 38.214 [19], clause 5.2.2.3.1). A change of configuration between periodic, semi-persistent or aperiodic for an *NZP-CSI-RS-Resource* is not supported without a release and add.

| <b>periodicityAndOffset</b>                   | Periodicity and slot offset s/1 corresponds to a periodicity of 1 slot, s/2 to a periodicity of two slots, and so on. The corresponding offset is also given in number of slots (see TS 38.214 [19], clause 5.2.2.3.1). Network always configures the UE with a value for this field for periodic and semi-persistent NZP-CSI-RS-Resource (as indicated in <i>CSI-ResourceConfig</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>powerControlOffset</b>                     | Power offset of PDSCH EPRE to NZP CSI-RS EPRE. Value in dB (see TS 38.214 [19], clauses 5.2.2.3.1 and 4.1). The UE shall ignore this field in case <i>NZP-CSI-RS-Resources</i> is received as part of an <i>LTM-Candidate IE</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>powerControlOffsetSS</b>                   | Power offset of NZP CSI-RS EPRE to SS/PBCH block EPRE. Value in dB (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>qcl-InfoPeriodicCSI-RS</b>                 | For a target periodic CSI-RS, contains a reference to one <i>TCI-State</i> in <i>TCI-States</i> for providing the QCL source and QCL type. For periodic CSI-RS, the source can be SSB or another periodic-CSI-RS. Refers to the <i>TCI-State</i> or <i>dl-OrJoint-TCI-State</i> which has this value for <i>tci-StateId</i> and is defined in <i>tci-StatesToAddModList</i> or in <i>dl-OrJointTCI-StateList</i> in the <i>PDSCH-Config</i> included in the <i>BWP-Downlink</i> corresponding to the serving cell and to the DL BWP to which the resource belongs to (see TS 38.214 [19], clause 5.2.2.3.1). In case <i>NZP-CSI-RS-Resources</i> is received as part of an <i>LTM-Candidate IE</i> , it refers to the TCI state identifier in <i>CandidateTCI-State</i> and is defined in <i>ltm-DL-OrJointTCI-StateToAddModList</i> within the <i>LTM-Candidate IE</i> . |
| <b>resourceMapping</b>                        | OFDM symbol location(s) in a slot and subcarrier occupancy in a PRB of the CSI-RS resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>scramblingID</b>                           | Scrambling ID (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Conditional Presence            | Explanation                                                                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LTM</i>                      | The field is optionally present, Need R, in an <i>LTM-Candidate IE</i> . Otherwise, the field is absent.                                                                           |
| <i>Periodic</i>                 | The field is optionally present, Need M, for periodic <i>NZP-CSI-RS-Resources</i> (as indicated in <i>CSI-ResourceConfig</i> ). The field is absent otherwise.                     |
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent <i>NZP-CSI-RS-Resources</i> (as indicated in <i>CSI-ResourceConfig</i> ). The field is absent otherwise. |

## – **NZP-CSI-RS-ResourceId**

The IE *NZP-CSI-RS-ResourceId* is used to identify one NZP-CSI-RS-Resource.

### **NZP-CSI-RS-ResourceId information element**

```
-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCEID-START
NZP-CSI-RS-ResourceId ::= INTEGER (0..maxNrofNZP-CSI-RS-Resources-1)
-- TAG-NZP-CSI-RS-RESOURCEID-STOP
-- ASN1STOP
```

## – NZP-CSI-RS-ResourceSet

The IE *NZP-CSI-RS-ResourceSet* is a set of Non-Zero-Power (NZP) CSI-RS resources (their IDs) and set-specific parameters.

### **NZP-CSI-RS-ResourceSet information element**

```

-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCESET-START

NZP-CSI-RS-ResourceSet ::= SEQUENCE {
 nzp-CSI-ResourceSetId,

| <b>NZP-CSI-RS-ResourceSet field descriptions</b>                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>aperiodicTriggeringOffset, aperiodicTriggeringOffset-r16, aperiodicTriggeringOffset-r17</i></b> | Offset X between the slot containing the DCI that triggers a set of aperiodic NZP CSI-RS resources and the slot in which the CSI-RS resource set is transmitted. For <i>aperiodicTriggeringOffset</i> , the value 0 corresponds to 0 slots, value 1 corresponds to 1 slot, value 2 corresponds to 2 slots, value 3 corresponds to 3 slots, value 4 corresponds to 4 slots, value 5 corresponds to 16 slots, value 6 corresponds to 24 slots. For <i>aperiodicTriggeringOffset-r16</i> and <i>aperiodicTriggeringOffset-r17</i> , the value indicates the number of slots. <i>aperiodicTriggeringOffset-r17</i> is applicable to SCS 480 kHz and 960 kHz, and only the values of integer multiples of 4 are valid, i.e. 0, 4, 8, and so on. The network configures only one of the fields. When neither field is included, the UE applies the value 0. This field is not present in case <i>NZP-CSI-RS-ResourcesSet</i> is received as part of an <i>LTM-Candidate IE</i> . |
| <b><i>aperiodicTriggeringOffsetL2</i></b>                                                             | Indicates triggering offset of aperiodic NZP CSI-RS resources used for fast activation of the SCell (see clause 5.2.1.5.3 of TS 38.214 [19]), when the NZP CSI-RS resources are activated by the MAC CE (see clause 5.9 of TS 38.321 [3]). The value indicates the number of slots. This field is not present in case <i>NZP-CSI-RS-ResourcesSet</i> is received as part of an <i>LTM-Candidate IE</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>cmrGroupingAndPairing</i></b>                                                                   | Configures CMR groups and pairs. The first <i>nrofResourcesGroup1</i> resources in the NZP-CSI-RS resource set belong to Group 1 and the remaining resources in the NZP-CSI-RS resource set belong to Group 2. <i>nrofResourcesGroup1</i> is $K_1$ and the number of remaining resources in the NZP-CSI-RS resource set belonging to Group 2 is $K_2$ as specified in TS 38.214 clause 5.2.1.4.1. Maximum total number in Group 1 and Group 2 is 8 (see TS 38.214 [19], clauses 5.2.1.4.1 and 5.2.1.4.2). This field is not present in case <i>NZP-CSI-RS-ResourcesSet</i> is received as part of an <i>LTM-Candidate IE</i> .                                                                                                                                                                                                                                                                                                                                             |
| <b><i>pair1OfNZP-CSI-RS, pair2OfNZP-CSI-RS</i></b>                                                    | A pair of NZP CSI-RS resources. In one pair, one resource shall belong to group 1 and the other resource shall belong to group 2 (see TS 38.214 [19], clause 5.2.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>nzp-CSI-RS-Resources</i></b>                                                                    | NZP-CSI-RS-Resources associated with this NZP-CSI-RS resource set (see TS 38.214 [19], clause 5.2). If the <i>NZP-CSI-RS-ResourceSet</i> is indicated in a <i>CSI-ResourceConfig</i> indicated by <i>resourcesForChannelMeasurement</i> in a <i>CSI-ReportConfig</i> , if the <i>codebookType</i> in the <i>codebookConfig</i> in the <i>CSI-ReportConfig</i> is <i>typell-Doppler-r18</i> or <i>typell-DopplerPortSelection-r18</i> , there are at most 1 periodic or semi-persistent NZP CSI-RS resource and 4, 8 or 12 aperiodic NZP CSI-RS resources and if the <i>codebookType</i> is <i>typell-CJT-r18</i> or <i>typell-CJT-PortSelection-r18</i> , there are 1, 2, 3, or 4 aperiodic, periodic or semi-persistent NZP-CSI-RS resources, see TS 38.214 [19], clause 5.2.1.4.                                                                                                                                                                                         |
| <b><i>nzp-CSI-RS-Resourceld1, nzp-CSI-RS-Resourceld2</i></b>                                          | The <i>nzp-CSI-RS-Resourceld1-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 1, and <i>nzp-CSI-RS-Resourceld2-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>pdc-Info</i></b>                                                                                | Indicates that this NZP-CSI-RS-ResourceSet, if configured also with <i>trs-Info</i> , is used for propagation delay compensation. The field can be present only if <i>trs-info</i> is present. The field can be present in only one <i>NZP-CSI-RS-ResourceSet</i> . If network configures this field for an <i>NZP-CSI-RS-ResourceSet</i> , the UE measures the UE Rx-Tx time difference based on resources configured in this resource set. This field is not present in case <i>NZP-CSI-RS-ResourcesSet</i> is received as part of an <i>LTM-Candidate IE</i> .                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>repetition</i></b>                                                                              | Indicates whether repetition is on/off. If the field is set to <i>off</i> or if the field is absent, the UE may not assume that the NZP-CSI-RS resources within the resource set are transmitted with the same downlink spatial domain transmission filter (see TS 38.214 [19], clauses 5.2.2.3.1 and 5.1.6.1.2). It can only be configured for CSI-RS resource sets which are associated with <i>CSI-ReportConfig</i> with report of L1 RSRP, L1 SINR or "no report". This field is not present in case <i>NZP-CSI-RS-ResourcesSet</i> is received as part of an <i>LTM-Candidate IE</i> .                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>resourceType</i></b>                                                                            | Time domain behavior of resource configuration (see TS 38.214 [19], clause 5.2.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>trs-Info</i></b>                                                                                | Indicates that the antenna port for all NZP-CSI-RS resources in the CSI-RS resource set is same. If the field is absent or released the UE applies the value <i>false</i> (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Conditional Presence | Explanation                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------|
| <i>LTM</i>           | The field is optionally present, Need R, in an <i>LTM-Candidate</i> IE. Otherwise, the field is absent. |

– ***NZP-CSI-RS-ResourceSetId***

The IE *NZP-CSI-RS-ResourceSetId* is used to identify one *NZP-CSI-RS-ResourceSet*.

***NZP-CSI-RS-ResourceSetId* information element**

```
-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCESETID-START

NZP-CSI-RS-ResourceSetId ::= INTEGER (0..maxNrofNZP-CSI-RS-ResourceSets-1)

-- TAG-NZP-CSI-RS-RESOURCESETID-STOP
-- ASN1STOP
```

– ***P-Max***

The IE *P-Max* is used to limit the UE's uplink transmission power on a carrier frequency, in TS 38.101-1 [15] and in TS 38.101-5 [75], and is used to calculate the parameter *Pcompensation* defined in TS 38.304 [20]. In ATG cell, actual value of P-Max = 9 + field value [dBm].

***P-Max* information element**

```
-- ASN1START
-- TAG-P-MAX-START

P-Max ::= INTEGER (-30..33)

-- TAG-P-MAX-STOP
-- ASN1STOP
```

– ***PathlossReferenceRS***

The IE *PathlossReferenceRS* is used to configure a Reference Signal (e.g. a CSI-RS config or a SS block) to be used for path loss estimation for PUSCH, PUCCH and SRS for unified TCI state operation.

***PathlossReferenceRS* information element**

```
-- ASN1START
-- TAG-PATHLOSSREFERENCERS-START

PathlossReferenceRS-r17 ::= SEQUENCE {
```

```

pathlossReferenceRS-Id-r17
referenceSignal-r17
 ssb-Index
 csi-RS-Index
},
additionalPCI-r17
}

-- TAG-PATHLOSSREFERENCERS-STOP
-- ASN1STOP

```

#### ***PathlossReferenceRS* field descriptions**

##### ***additionalPCI***

Indicates the physical cell ID (PCI) of the SSB for the referenceSignal.

| Conditional Presence | Explanation                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| RS-SSB               | The field is optionally present, Need R, if <i>ssb-Index</i> is configured for <i>referenceSignal</i> . Otherwise it is absent, Need R. |

#### – ***PathlossReferenceRS-Id***

The IE *PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUSCH, PUCCH and SRS pathloss reference RS for unified TCI state operation.

#### ***PathlossReferenceRS-Id* information element**

```

-- ASN1START
-- TAG-PATHLOSSREFERENCERS-ID-START

PathlossReferenceRS-Id-r17 ::= INTEGER (0..maxNrofPathlossReferenceRSs-1-r17)

-- TAG-PATHLOSSREFERENCERS-ID-STOP
-- ASN1STOP

```

#### – ***PCI-ARFCN-EUTRA***

The IE *PCI-ARFCN-EUTRA* is used to encode EUTRA PCI and ARFCN.

#### ***PCI-ARFCN-EUTRA* information element**

```

-- ASN1START
-- TAG-PCIARFCNEUTRA-START

PCI-ARFCN-EUTRA-r16 ::= SEQUENCE {
 physCellId-r16
 EUTRA-PhysCellId,
}
```

```

 carrierFreq-r16 ARFCN-ValueEUTRA
}
-- TAG-PCIARFCNEUTRA-STOP
-- ASN1STOP

```

## ***PCI-ARFCN-NR***

The IE *PCI-ARFCN-NR* is used to encode NR PCI and ARFCN.

### ***PCI-ARFCN-NR information element***

```

-- ASN1START
-- TAG-PCIARFCNNR-START

PCI-ARFCN-NR-r16 ::= SEQUENCE {
 physCellId-r16 PhysCellId,
 carrierFreq-r16 ARFCN-ValueNR
}
-- TAG-PCIARFCNNR-STOP
-- ASN1STOP

```

## ***PCI-List***

The IE *PCI-List* concerns a list of physical cell identities, which may be used for different purposes.

### ***PCI-List information element***

```

-- ASN1START
-- TAG-PCI-LIST-START

PCI-List ::= SEQUENCE (SIZE (1..maxNrofCellMeas)) OF PhysCellId
-- TAG-PCI-LIST-STOP
-- ASN1STOP

```

## – *PCI-Range*

The IE *PCI-Range* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *PCI-Range*, the Network may configure overlapping ranges of physical cell identities.

### **PCI-Range information element**

```
-- ASN1START
-- TAG-PCI-RANGE-START

PCI-Range ::= SEQUENCE {
 start
 range
 ENUMERATED {n4, n8, n12, n16, n24, n32, n48, n64, n84,
 n96, n128, n168, n252, n504, n1008, spare1}
 OPTIONAL -- Need S
}

-- TAG-PCI-RANGE-STOP
-- ASN1STOP
```

| <b>PCI-Range field descriptions</b> |                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>range</b>                        | Indicates the number of physical cell identities in the range (including <i>start</i> ). Value <i>n4</i> corresponds with 4, value <i>n8</i> corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical cell identity value indicated by <i>start</i> applies. |
| <b>start</b>                        | Indicates the lowest physical cell identity in the range.                                                                                                                                                                                                                                                                 |

## – *PCI-RangeElement*

The IE *PCI-RangeElement* is used to define a PCI-Range as part of a list (e.g. AddMod list).

### **PCI-RangeElement information element**

```
-- ASN1START
-- TAG-PCI-RANGEELEMENT-START

PCI-RangeElement ::= SEQUENCE {
 pci-RangeIndex
 pci-Range
}

-- TAG-PCI-RANGEELEMENT-STOP
-- ASN1STOP
```

| <b><i>PCI-RangeElement</i> field descriptions</b>                                         |  |
|-------------------------------------------------------------------------------------------|--|
| <b><i>pci-Range</i></b><br>Physical cell identity or a range of physical cell identities. |  |

- ***PCI-RangeIndex***

The IE *PCI-RangeIndex* identifies a physical cell id range, which may be used for different purposes.

#### ***PCI-RangeIndex* information element**

```
-- ASN1START
-- TAG-PCI-RANGEINDEX-START

PCI-RangeIndex ::= INTEGER (1..maxNrofPCI-Ranges)

-- TAG-PCI-RANGEINDEX-STOP
-- ASN1STOP
```

- ***PCI-RangeIndexList***

The IE *PCI-RangeIndexList* concerns a list of indexes of physical cell id ranges, which may be used for different purposes.

#### ***PCI-RangeIndexList* information element**

```
-- ASN1START
-- TAG-PCI-RANGEINDEXLIST-START

PCI-RangeIndexList ::= SEQUENCE (SIZE (1..maxNrofPCI-Ranges)) OF PCI-RangeIndex

-- TAG-PCI-RANGEINDEXLIST-STOP
-- ASN1STOP
```

- ***PDCCH-Config***

The IE *PDCCH-Config* is used to configure UE specific PDCCH parameters or MBS multicast PDCCH parameters such as control resource sets (CORESET), search spaces and additional parameters for acquiring the PDCCH. If this IE is used for the scheduled SCell in case of cross carrier scheduling, the fields other than *searchSpacesToAddModList* and *searchSpacesToReleaseList* are absent. If the IE is used for a dormant BWP, the fields other than *controlResourceSetToAddModList* and *controlResourceSetToReleaseList* are absent. If this IE is used for MBS CFR, the field *downlinkPreemption, tpc-PUSCH, tpc-SRS, uplinkCancellation, monitoringCapabilityConfig*, and *searchSpaceSwitchConfig* are absent.

#### ***PDCCH-Config* information element**

```
-- ASN1START
```

-- TAG-PDCCH-CONFIG-START

```

PDCCH-Config ::= SEQUENCE {
 controlResourceSetToAddModList SEQUENCE (SIZE (1..3)) OF ControlResourceSet
 controlResourceSetToReleaseList SEQUENCE (SIZE (1..3)) OF ControlResourceSetId

| <b>PDCCH-Config field descriptions</b>                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>controlResourceSetToAddModList, controlResourceSetToAddModListSizeExt</b>   | List of UE specifically configured Control Resource Sets (CORESETs) to be used by the UE. The network restrictions on configuration of CORESETs per DL BWP are specified in TS 38.213 [13], clause 10.1 and TS 38.306 [26]. The UE shall consider entries in <i>controlResourceSetToAddModList</i> and in <i>controlResourceSetToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>controlResourceSetToAddModList</i> can be modified using <i>controlResourceSetToAddModListSizeExt</i> (or deleted using <i>controlResourceSetToReleaseListSizeExt</i> ) and vice-versa. In case network reconfigures control resource set with the same <i>ControlResourceSetId</i> as used for <i>commonControlResourceSet</i> or <i>commonControlResourceSetExt</i> configured via <i>PDCCH-ConfigCommon</i> or via <i>SIB20</i> , the configuration from <i>PDCCH-Config</i> always takes precedence and should not be updated by the UE based on <i>servingCellConfigCommon</i> or based on <i>SIB20</i> .                      |
| <b>controlResourceSetToReleaseList, controlResourceSetToReleaseListSizeExt</b> | List of UE specifically configured Control Resource Sets (CORESETs) to be released by the UE. This field only applies to CORESETs configured by <i>controlResourceSetToAddModList</i> or <i>controlResourceSetToAddModListSizeExt</i> and does not release the field <i>commonControlResourceSet</i> configured by <i>PDCCH-ConfigCommon</i> and <i>commonControlResourceSetExt</i> configured by <i>SIB20</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>downlinkPreemption</b>                                                      | Configuration of downlink preemption indications to be monitored in this cell (see TS 38.213 [13], clause 11.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>monitoringCapabilityConfig</b>                                              | Configures either Rel-15 PDCCH monitoring capability, Rel-16 PDCCH monitoring capability or Rel-17 PDCCH monitoring capability for PDCCH monitoring on a serving cell (see TS 38.213 [13], clause 10.1). Value <i>r15monitoringcapability</i> enables the Rel-15 monitoring capability, and value <i>r16monitoringcapability</i> enables the Rel-16 PDCCH monitoring capability. <i>r17monitoringcapability</i> enables the Rel-17 PDCCH multi-slot monitoring capability. For 480 and 960 kHz SCS, only value <i>r17monitoringcapability</i> is applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>pdcch-MonitoringResumptionAfterNack</b>                                     | This field is used to enable UE PDCCH monitoring resumption after PDCCH skipping has started, if the UE transmits a NACK due to incorrectly decoding a PDSCH scheduled by a DCI format received from the serving cell (see TS 38.213 [13], clause 10.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>pdcch-SkippingDurationList</b>                                              | Provides one or more values to derive the skipping duration in unit of slots, as specified in TS 38.213 [13], clause 10.4. The DCI which schedules data indicates which of the values is to be applied (see TS 38.213 [13], clause 10.4). For the 15kHz SCS, for each entry, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, for each entry, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, for each entry, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, for each entry, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, for each entry, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, for each entry, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}. |
| <b>searchSpacesToAddModList, searchSpacesToAddModListExt</b>                   | List of UE specifically configured Search Spaces or MBS multicast Search Spaces. The network configures at most 10 Search Spaces per BWP per cell (including UE-specific and common Search Spaces). If the network includes <i>searchSpacesToAddModListExt</i> , it includes the same number of entries, and listed in the same order, as in <i>searchSpacesToAddModList</i> in each of them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>searchSpaceSwitchConfig</b>                                                 | Configuration to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. The network only configures either <i>searchSpaceSwitchConfig-r16</i> or <i>searchSpaceSwitchConfig-r17</i> for a UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>tpc-PUCCH</b>                                                               | Enable and configure reception of group TPC commands for PUCCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>tpc-PUSCH</b>                                                               | Enable and configure reception of group TPC commands for PUSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>tpc-SRS</b>                                                                 | Enable and configure reception of group TPC commands for SRS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>uplinkCancellation</b>                                                      | Configuration of uplink cancellation indications to be monitored in this cell (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>cellGroupsForSwitchList</b>                    | The list of serving cells which are bundled for the search space group switching purpose (see TS 38.213 [13], clause 10.4). A serving cell can belong to only one <i>CellGroupForSwitch</i> . The network configures the same list for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>searchSpaceSwitchDelay</b>                     | Indicates the value to be applied by a UE for Search Space Set Group switching; corresponds to the P value in TS 38.213 [13], clause 10.4. The network configures the same value for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> . For 120/480/960 kHz SCS, only values 40,41, ..., 52 are valid and the actual value = field value * SCS/120 kHz i.e. field value 40 corresponds to 40 with 120 kHz SCS, 160 with 480 kHz SCS and 320 with 960 kHz SCS, and so on.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>searchSpaceSwitchTimer</b>                     | Timer (in unit of slots) to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. For the 15kHz SCS, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}. |

## — *PDCCH-ConfigCommon*

The IE *PDCCH-ConfigCommon* is used to configure cell specific PDCCH parameters provided in SIB as well as in dedicated signalling.

| <b>PDCCH-ConfigCommon field descriptions</b>                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>applyIndicatedTCI-State</b>                                                    | This field indicates, for PDCCH reception in CORESET #0, if UE applies the first, the second, both or none of the "indicated" DL only TCI or joint TCI as specified in TS 38.213 [13], clause 10.1. Value <i>both</i> is not configured if the CORESET is associated with <i>searchSpaceZero</i> for Type 0/0A/2 common search space and can be configured only if <i>sfnSchemePDCCH</i> is configured in the serving cell.                                                                                                                                                                                                                                                                 |
| <b>commonControlResourceSet</b>                                                   | An additional common control resource set which may be configured and used for any common or UE-specific search space. If the network configures this field, it uses a <i>ControlResourceSetId</i> other than 0 for this <i>ControlResourceSet</i> . The network configures the <i>commonControlResourceSet</i> in <i>SIB1</i> so that it is contained in the bandwidth of CORESET#0. If the RedCap-specific initial downlink BWP does not contain the entire CORESET#0, the network configures the <i>commonControlResourceSet</i> in the RedCap-specific initial downlink BWP in <i>SIB1</i> for (e)RedCap such that it does not have to be contained in the bandwidth of CORESET#0.      |
| <b>commonSearchSpaceList, commonSearchSpaceListExt, commonSearchSpaceListExt2</b> | A list of additional common search spaces. If the network configures this field, it uses the <i>SearchSpaceId</i> s other than 0. If the field is included, it replaces any previous list, i.e. all the entries of the list are replaced and each of the <i>SearchSpace</i> entries is considered to be newly created and the conditions and Need codes for setup of the entry apply. If the network includes <i>commonSearchSpaceListExt</i> / <i>commonSearchSpaceListExt2</i> , it includes the same number of entries, and listed in the same order, as in <i>commonSearchSpaceList</i> .                                                                                               |
| <b>controlResourceSetZero</b>                                                     | Parameters of the common CORESET#0 which can be used in any common or UE-specific search spaces. The values are interpreted like the corresponding bits in <i>MIB_pdcch-ConfigSIB1</i> . Even though this field is only configured in the initial BWP (BWP#0) <i>controlResourceSetZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions defined in TS 38.213 [13], clause 10 are satisfied.                                                                                                                                                                                                                                        |
| <b>firstPDCCH-MonitoringOccasionOfPEI-O</b>                                       | Offset, in number of symbols, from the start of the reference frame for PEI-O to the start of the first PDCCH monitoring occasion of PEI-O on this BWP, see TS 38.213 [13], clause 10.4A. For the case <i>po-NumPerPEI</i> is smaller than <i>Ns</i> , UE applies the (floor( <i>i_s</i> /po-NumPerPEI)+1)-th value out of ( <i>N_s</i> /po-NumPerPEI) configured values in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset. When <i>po-NumPerPEI</i> is one or multiple of <i>Ns</i> , UE applies the first configured value in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset.                                                           |
| <b>firstPDCCH-MonitoringOccasionOfPO</b>                                          | Indicates the first PDCCH monitoring occasion of each PO of the PF on this BWP, see TS 38.304 [20]. The field <i>sCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i> , <i>sCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS120KHZZoneSixteenthT</i> can be applied for SCS 480kHz, corresponding to <i>sCS480KHZoneT-SCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i> , <i>sCS480KHZhalfT-SCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS480KHZquarterT-SCS120KHZZoneSixteenthT</i> in IE <i>DownlinkConfigCommonSIB</i> respectively.                                                                                                     |
| <b>followUnifiedTCI-State</b>                                                     | When set to enabled, for PDCCH reception in CORESET #0, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>pagingSearchSpace</b>                                                          | ID of the search space for paging (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive paging in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_INACTIVE while SDT procedure is ongoing and T319a is not running, if CG-SDT is selected and if extended CG-SDT periodicity is configured (i.e. <i>cg-SDT-PeriodicityExt</i> is configured), or an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing, shall monitor paging in the initial DL BWP that includes CORESET#0. |
| <b>pei-ConfigBWP</b>                                                              | Provides the configuration for PEI reception in this BWP. If the field is absent, the UE does not receive PEI in this BWP. For the <i>initialDownlinkBWP-RedCap</i> not including CD-SSB and the entire CORESET#0, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing monitors PEI in the <i>initialDownlinkBWP</i> that includes CORESET#0, if the <i>initialDownlinkBWP</i> is configured with <i>pei-ConfigBWP</i> .                                                                                                                                                                                                                                         |
| <b>pei-SearchSpace</b>                                                            | ID of dedicated search space for PEI. It can be configured to one of up to 4 common SS sets configured by <i>commonSearchSpaceList</i> with <i>SearchSpaceId</i> > 0. The CCE aggregation levels and maximum number of PDCCH candidates per CCE aggregation level follows Table 10.1-1 of TS38.213 [13]. <i>SearchSpaceId</i> = 0 can be configured for the case of SS/PBCH block and CORESET multiplexing pattern 2 or 3.                                                                                                                                                                                                                                                                  |
| <b>ra-SearchSpace</b>                                                             | ID of the Search space for random access procedure (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive RAR in this BWP. This field is mandatory present in the DL BWP(s) if the conditions described in TS 38.321 [3], clause 5.15 are met.                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sdt-SearchSpace</b>                   | Common search space for CG-SDT and RA-SDT (see TS 38.213 [13]). If an <i>existingSearchSpace</i> is used, the network only signals the search space ID of the <i>ra-SearchSpace</i> .                                                                                                                                                                                                                                                                                                                                                                          |
| <b>searchSpaceMCCH</b>                   | ID of the search space for MCCH. If the field is absent, the UE does not receive MCCH in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, the (e)RedCap UE in RRC_IDLE or RRC_INACTIVE may receive MCCH using <i>searchSpaceMCCH</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.                                                                                                                    |
| <b>searchSpaceMTCH</b>                   | ID of the search space for MTCH of MBS broadcast. If the field is absent, the UE applies <i>searchSpaceMCCH</i> also for MTCH, (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, the (e)RedCap UE in RRC_IDLE or RRC_INACTIVE may receive MTCH using <i>searchSpaceMTCH</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.                                                                                       |
| <b>searchSpaceMulticastMCCH</b>          | ID of the search space for multicast MCCH. If the field is absent, the UE does not receive multicast MCCH in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                                              |
| <b>searchSpaceMulticastMTCH</b>          | ID of the search space for multicast MTCH. If the field is absent, the UE applies <i>searchSpaceMulticastMCCH</i> also for multicast MTCH, (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                         |
| <b>searchSpaceOtherSystemInformation</b> | ID of the Search space for other system information, i.e., SIB2 and beyond (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive other system information in this BWP. This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive other system information using <i>searchSpaceOtherSystemInformation</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0. |
| <b>searchSpaceSIB1</b>                   | ID of the search space for SIB1 message. In the initial DL BWP of the UE's PCell, the network sets this field to 0. If the field is absent, the UE does not receive SIB1 in this BWP. (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, an (e)RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive SIB1 using <i>searchSpaceSIB1</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.                    |
| <b>searchSpaceZero</b>                   | Parameters of the common SearchSpace#0. The values are interpreted like the corresponding bits in <i>MIB pdcch-ConfigSIB1</i> . Even though this field is only configured in the initial BWP (BWP#0), <i>searchSpaceZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions described in TS 38.213 [13], clause 10, are satisfied.                                                                                                                                                                       |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FollowUTCI</i>        | The field is absent if the field <i>followUnifiedTCI-State</i> is present or if more than one value for the field <i>coresetPoolIndex</i> is configured in <i>controlResourceSet</i> for the same bandwidthpart. Otherwise, it is optionally present, Need R.                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>InitialBWP-Only</i>   | If SIB1 is broadcast the field is mandatory present in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> except it is the RedCap-specific initial BWP not including CD-SSB and the entire CORESET#0 in which case the field is absent, Need R; it is absent in other BWP(s) and when sent in system information. If SIB1 is not broadcast and there is an SSB associated to the cell, the field is optionally present, Need M, in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> (still with the same setting for all UEs). In other cases, the field is absent. |
| <i>InitialBWP-Paging</i> | This field is optionally present, Need R, if this BWP is the <i>initialDownlinkBWP</i> or <i>initialDownlinkBWP-RedCap</i> including CD-SSB and the entire CORESET#0, and <i>peI-Config</i> is configured in <i>DownlinkConfigCommonSIB</i> . Otherwise, this field is absent.                                                                                                                                                                                                                                                                                                                                                                        |
| <i>OtherBWP</i>          | This field is optionally present, Need R, if this BWP is not the <i>initialDownlinkBWP</i> and <i>pagingSearchSpace</i> is configured in this BWP. Otherwise this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

- **PDCCH-ConfigSIB1**

The IE *PDCCH-ConfigSIB1* is used to configure CORESET#0 and search space#0.

#### ***PDCCH-ConfigSIB1* information element**

| <b>PDCP-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cipheringDisabled</b>              | If included, ciphering is disabled for this DRB regardless of which ciphering algorithm is configured for the SRB/DRBs. The field may only be included if the UE is connected to 5GC. Otherwise the field is absent. The network configures all DRBs with the same PDU-session ID with same value for this field. The value for this field cannot be changed after the DRB is set up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>discardTimer</b>                   | Value in ms of <i>discardTimer</i> specified in TS 38.323 [5]. Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms and so on. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>discardTimerExt</b>                | Value in ms of <i>discardTimer</i> specified in TS 38.323 [5]. Value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms1</i> corresponds to 1ms and so on. If this field is present, the field <i>discardTimer</i> is ignored and <i>discardTimerExt</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>discardTimerExt2</b>               | Value in ms of <i>discardTimerExt</i> specified in TS 38.323 [5]. Value <i>ms2000</i> corresponds to 2000 ms. If this field is present, the field <i>discardTimer</i> and <i>discardTimerExt</i> are ignored and <i>discardTimerExt2</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>discardTimerForLowImportance</b>   | Value in ms of <i>discardTimerForLowImportance</i> specified in TS 38.323 [5]. Value <i>ms0</i> corresponds to 0 ms, value <i>ms2</i> corresponds to 2 ms and so on. The value of this timer for a PDCP entity is always configured shorter than <i>discardTimer</i> , <i>discardTimerExt</i> or <i>discardTimerExt2</i> , whichever is used for the PDCP entity. The presence of this field indicates that PSI-based SDU discard is configured for a DRB. The network configures at most 8 DRBs with <i>discardTimerForLowImportance</i> .                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>drb-ContinueROHC</b>               | Indicates whether the PDCP entity continues or resets the ROHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. This field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated. The network does not include the field if the bearer is configured as DAPS bearer. This field can be configured for both DRB and multicast MRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>duplicationState</b>               | This field indicates the uplink PDCP duplication state for the associated RLC entities at the time of receiving this IE. If set to <i>true</i> , the PDCP duplication state is activated for the associated RLC entity. The index for the indication is determined by ascending order of logical channel ID of all RLC entities other than the primary RLC entity indicated by <i>primaryPath</i> in the order of MCG and SCG, as in clause 6.1.3.32 of TS 38.321 [3]. For MP, the index for the indication is determined by ascending order of direct path (where i is ascending order of logical channel ID of secondary RLC entities) and indirect path, as in clause 6.1.3.32 of TS 38.321 [3]. If the number of associated RLC entities other than the primary RLC entity is two, UE ignores the value in the largest index of this field. If the field is absent, the PDCP duplication states are deactivated for all associated RLC entities. |
| <b>etherHeaderCompression</b>         | This fields configures Ethernet Header Compression. This field can only be configured for a bi-directional DRB or a bi-directional multicast MRB. The network reconfigures <i>etherHeaderCompression</i> only upon reconfiguration involving PDCP re-establishment and with neither <i>drb-ContinueEHC-DL</i> nor <i>drb-ContinueEHC-UL</i> configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>headerCompression</b>              | If rohc is configured, the UE shall apply the configured ROHC profile(s) in both uplink and downlink. If <i>uplinkOnlyROHC</i> is configured, the UE shall apply the configured ROHC profile(s) in uplink (there is no header compression in downlink). ROHC can be configured for any bearer type. ROHC and EHC can be both configured simultaneously for a DRB or a multicast MRB. The network reconfigures <i>headerCompression</i> only upon reconfiguration involving PDCP re-establishment or involving PDCP entity reconfiguration to configure DAPS bearer(s), and without any <i>drb-ContinueROHC</i> . Network configures <i>headerCompression</i> to <i>notUsed</i> when <i>outOfOrderDelivery</i> is configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured.                                                                                                                                 |
| <b>initialRX-DELIV</b>                | Indicates the initial value of RX_DELIV during PDCP window initialization for multicast MRB as specified in TS 38.323 [5]. The first/leftmost bit of the bit string contains the most significant bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>integrityProtection</b>            | Indicates whether or not integrity protection is configured for this radio bearer. The network configures all DRBs with the same PDU-session ID with same value for this field. The value for this field cannot be changed after the DRB is set up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>PDCP-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>maxCID</b>                         | Indicates the value of the MAX_CID parameter as specified in TS 38.323 [5]. The total value of MAX_CIDs across all bearers for the UE should be less than or equal to the value of <i>maxNumberROHC-ContextSessions</i> parameter as indicated by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>moreThanOneRLC</b>                 | This field configures UL data transmission when more than one RLC entity is associated with the PDCP entity. This field is not present if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>moreThanTwoRLC-DRB</b>             | This field configures UL data transmission when more than two RLC entities are associated with the PDCP entity for DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>outOfOrderDelivery</b>             | Indicates whether or not <i>OutOfOrderDelivery</i> specified in TS 38.323 [5] is configured. This field should be either always present or always absent, after the radio bearer is established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pdcp-Duplication</b>               | Indicates whether or not uplink duplication status at the time of receiving this IE is configured and activated as specified in TS 38.323 [5]. The presence of this field indicates that duplication is configured. PDCP duplication is not configured for CA packet duplication of LTE RLC bearer. The value of this field, when the field is present, indicates the state of the duplication at the time of receiving this IE. If set to <i>true</i> , duplication is activated. The value of this field is always <i>true</i> , when configured for a SRB. For PDCP entity with more than two associated RLC entities for UL transmission, this field is always present. If the field <i>moreThanTwoRLC-DRB</i> is present, the value of this field is ignored and the state of the duplication is indicated by <i>duplicationState</i> . For PDCP entity with more than two associated RLC entities, only NR RLC bearer is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>pdcp-SN-SizeDL</b>                 | PDCP sequence number size for downlink, 12 or 18 bits, as specified in TS 38.323 [5]. For SRBs only the value <i>len12bits</i> is applicable. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>pdcp-SN-SizeUL</b>                 | PDCP sequence number size for uplink, 12 or 18 bits, as specified in TS 38.323 [5]. For SRBs only the value <i>len12bits</i> is applicable. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>pdu-SetDiscard</b>                 | If set to true, the UE shall perform PDU Set based discarding for this PDCP entity, as specified in TS 38.323 [5]. This field is only configured for a DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>primaryPath</b>                    | Indicates the cell group ID and LCID of the primary RLC entity as specified in TS 38.323 [5], clause 5.2.1 for UL data transmission when more than one RLC entity is associated with the PDCP entity. In this version of the specification, only cell group ID corresponding to MCG is supported for SRBs, except for the split SRB2 of the IAB-MT, and except when the UE is required to set the <i>primaryPath</i> to refer to the SCG or indirect path as specified in clause 5.7.3b.4. In this last case, if the network sends an <i>RRCReconfiguration</i> message (in NR-DC) or an EUTRA <i>RRCCConnectionReconfiguration</i> message (in (NG)EN-DC) keeping SRB1 as split SRB, the network explicitly configures the <i>primaryPath</i> for the PDCP entity of SRB1 to refer to the MCG. In this version of the specification, only cell group ID corresponding to MCG is supported for DRBs when the SCG is deactivated. In MR-DC, the NW indicates <i>cellGroup</i> for split bearers using logical channels in different cell groups. The NW always indicates <i>logicalChannel</i> if CA based PDCP duplication is configured in the cell group indicated by <i>cellGroup</i> of this field. This field is also used for configuring Multi-path Primary Path defined in [5] for MP operation. In MP, when the primary path is indirect path, the field <i>cellGroup</i> and <i>logicalChannel</i> are absent, and the field <i>primaryPathOnIndirectPath</i> is set to true. |
| <b>primaryPathOnIndirectPath</b>      | Indicates that the primary path is SL indirect path, or primary path is associated with the N3C indirect path, for DRB when MP is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>sn-GapReport</b>                   | Indicates whether the PDCP entity is configured to send a PDCP SN gap report in the uplink, as specified in TS 38.323 [5]. This field is only configured for DRBs. This field can be included only if <i>OutOfOrderDelivery</i> is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>splitSecondaryPath</b>             | Indicates the LCID of the split secondary RLC entity as specified in TS 38.323 [5] for fallback to split bearer operation when UL data transmission with more than two RLC entities is associated with the PDCP entity. This RLC entity belongs to a cell group that is different from the cell group indicated by <i>cellGroup</i> in the field <i>primaryPath</i> . This RLC entity belongs to the cell group of the direct path if <i>primaryPathOnIndirectPath</i> is set to <i>true</i> in MP case.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>PDCP-Config field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>statusReportRequired</b>           | For AM DRBs, AM MRBs and DAPS UM DRBs, indicates whether the DRB or the multicast MRB is configured to send a PDCP status report in the uplink, as specified in TS 38.323 [5]. For DAPS AM DRBs, it also indicates whether the DRB is configured to send a second PDCP status report in the uplink, as specified in TS 38.323 [5].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>survivalTimeStateSupport</b>       | Indicates whether the DRB associated with this PDCP entity has survival time state support. If this field is configured to be true, all associated RLC entities are activated for PDCP duplication upon reception of a retransmission grant addressed to CS-RNTI, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>t-Reordering</b>                   | Value in ms of t-Reordering specified in TS 38.323 [5]. Value <i>ms0</i> corresponds to 0 ms, value <i>ms20</i> corresponds to 20 ms, value <i>ms40</i> corresponds to 40 ms, and so on. When the field is absent the UE applies the value <i>infinity</i> . The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ul-DataSplitThreshold</b>          | Parameter specified in TS 38.323 [5]. Value <i>b0</i> corresponds to 0 bytes, value <i>b100</i> corresponds to 100 bytes, value <i>b200</i> corresponds to 200 bytes, and so on. The network sets this field to <i>infinity</i> for UEs not supporting <i>splitDRB-withUL-Both-MCG-SCG</i> and when the SCG is deactivated or for multi-path U2N Remote UEs not supporting <i>splitDRB-WithUL-BothDirectIndirect</i> . If the field is absent when the split bearer is configured for the radio bearer first time, then the default value <i>infinity</i> is applied.                                                                                                                                                                                                                                                                                                               |
| <b>uplinkDataCompression</b>          | Indicates the UDC configuration that the UE shall apply. Network does not configure <i>uplinkDataCompression</i> for a DRB, if <i>headerCompression</i> or <i>ethernetHeaderCompression</i> is already configured or <i>outOfOrderDelivery</i> or DAPS is configured for the DRB. The maximum number of DRBs where <i>uplinkDataCompression</i> can be applied is two. The network reconfigures <i>uplinkDataCompression</i> only upon reconfiguration involving PDCP re-establishment. If the field is set to <i>drb-ContinueUDC</i> , the PDCP entity continues the uplink data compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is set to <i>drb-ContinueUDC</i> only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated. |

| <b>EthernetHeaderCompression field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>drb-ContinueEHC-DL</b>                           | Indicates whether the PDCP entity continues or resets the downlink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                   |
| <b>drb-ContinueEHC-UL</b>                           | Indicates whether the PDCP entity continues or resets the uplink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.                                     |
| <b>ehc-CID-Length</b>                               | Indicates the length of the CID field for EHC packet. The value <i>bits7</i> indicates the length is 7 bits, and the value <i>bits15</i> indicates the length is 15 bits. Once the field <i>ethernetHeaderCompression-r16</i> is configured for a DRB or a multicast MRB, the value of the field <i>ehc-CID-Length</i> for this DRB or multicast MRB is not reconfigured to a different value. |
| <b>ehc-Common</b>                                   | Indicates the configurations that apply for both downlink and uplink.                                                                                                                                                                                                                                                                                                                          |
| <b>ehc-Downlink</b>                                 | Indicates the configurations that apply for only downlink. If the field is configured, then Ethernet header compression is configured for downlink. Otherwise, it is not configured for downlink.                                                                                                                                                                                              |
| <b>ehc-Uplink</b>                                   | Indicates the configurations that apply for only uplink. If the field is configured, then Ethernet header compression is configured for uplink. Otherwise, it is not configured for uplink.                                                                                                                                                                                                    |
| <b>maxCID-EHC-UL</b>                                | Indicates the value of the MAX_CID_EHC_UL parameter as specified in TS 38.323 [5]. The total value of MAX_CID_EHC_UL across all bearers for the UE should be less than or equal to the value of <i>maxNumberEHC-Contexts</i> parameter as indicated by the UE.                                                                                                                                 |

| <i>UplinkDataCompression field descriptions</i> |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bufferSize</b>                               | This field indicates the buffer size applied for UDC as specified in TS 38.323 [5]. Value <i>kbyte2</i> means 2048 bytes, <i>kbyte4</i> means 4096 bytes and so on.                                                                                                                                                                        |
| <b>dictionary</b>                               | This field indicates which pre-defined dictionary is used for UDC as specified in TS 38.323 [5]. The value <i>sip-SDP</i> means that UE shall prefill the buffer with standard dictionary for SIP and SDP defined in TS 38.323 [5], and the value <i>operator</i> means that UE shall prefill the buffer with operator-defined dictionary. |

| Conditional presence      | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>DRB</i>                | This field is mandatory present when the corresponding DRB/multicast MRB is being set up, absent for SRBs. Otherwise this field is optionally present, need M.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>DRB2</i>               | This field is optionally present in case of DRB, need M. Otherwise, it is absent for SRBs and MRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Drb-Duplication</i>    | For SRBs, this field is absent. For DRBs, this field is absent if duplication is not configured. Otherwise, this field is optional, need R.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>MoreThanOneRLC</i>     | This field is mandatory present upon RRC reconfiguration with setup of a PDCP entity for a radio bearer (except for multicast MRB) with more than one associated logical channel and upon RRC reconfiguration with the association of additional logical channels to the PDCP entity.<br>The field is also mandatory present in case the field <i>moreThanTwoRLC-DRB</i> is included in <i>PDCP-Config</i> .<br>Upon RRC reconfiguration when a PDCP entity is associated with multiple logical channels, this field is optionally present need M.<br>Otherwise, this field is absent. Need R. |
| <i>MoreThanTwoRLC-DRB</i> | For SRBs, this field is absent.<br>For DRBs, this field is mandatory present upon RRC reconfiguration with setup of a PDCP entity for a radio bearer with more than two associated logical channels and upon RRC reconfiguration with the association of one or more additional logical channel(s) to the PDCP entity so that the PDCP entity has more than two associated logical channels.<br>Upon RRC reconfiguration when a PDCP entity is associated with more than two logical channels, this field is optionally present, Need M.<br>Otherwise, the field is absent, Need R.            |
| <i>Rlc-AM</i>             | For RLC AM, the field is optionally present, need M. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>Rlc-AM-UM</i>          | In case of DRB, for RLC UM (if the UE supports DAPS handover) or RLC AM, the field is optionally present, need R. In case of multicast MRB, if multicast MRB is associated with at least one RLC AM entity, the field is optionally present, need R. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                           |
| <i>Setup</i>              | The field is mandatory present in case of DRB setup. Otherwise the field is optionally present, need M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>SplitBearer</i>        | The field is absent for SRBs. Otherwise, the field is optional present, need M, in case of radio bearer with more than one associated RLC mapped to different cell groups.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>SplitBearer2</i>       | The field is mandatory present, in case of a split bearer except MP split bearer with primary path on direct path. Otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>SplitBearerMP</i>      | The field is absent for SRBs. Otherwise, the field is optionally present, need R, when MP is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>ConnectedTo5GC</i>     | The field is optionally present, need R, if the UE is connected to 5GC. Otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>ConnectedTo5GC1</i>    | The field is optionally present, need R, if the UE is connected to NR/5GC or if the UE supports user plane integrity protection when connected to E-UTRA/EPC (as specified in TS 33.401 [30]). Otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                  |
| <i>Setup1</i>             | This field is mandatory present in case of DRB setup for RLC-AM and RLC-UM. Otherwise, this field is absent, Need M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>Setup2</i>             | This field is mandatory present in case for radio bearer setup for RLC-AM and RLC-UM. Otherwise, this field is absent, Need M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>MRB-Initialization</i> | This field is mandatory present in case of multicast MRB setup or in case UE configured with multicast reception in RRC_INACTIVE resumes the RRC connection. In case of PDCP re-establishment for multicast MRB, this field is optionally present, Need N. Otherwise, this field is absent, Need N.                                                                                                                                                                                                                                                                                            |

## — PDSCH-Config

The *PDSCH-Config* IE is used to configure the UE specific PDSCH parameters. If this IE is used for MBS CFR, the following fields shall be absent: *tci-StatesToAddModList*, *tci-StatesToReleaseList*, *zp-CSI-RS-ResourceToAddModList*, *minimumSchedulingOffsetK0*, *antennaPortsFieldPresenceDCI-1-2*, *aperiodicZP-CSI-RS-ResourceSetsToAddModListDCI-1-2*, *aperiodicZP-CSI-RS-ResourceSetsToReleaseListDCI-1-2*, *dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2*, *dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2*, *dmrs-SequenceInitializationDCI-1-2*, *harq-ProcessNumberSizeDCI-1-2*, *mcs-TableDCI-1-2*, *numberOfBitsForRV-DCI-1-2*, *pdsch-AggregationFactor*, *pdsch-TimeDomainAllocationListDCI-1-2*, *prb-BundlingTypeDCI-1-2*, *priorityIndicatorDCI-1-2*, *rateMatchPatternGroup1DCI-1-2*, *rateMatchPatternGroup2DCI-1-2*, *resourceAllocationType1GranularityDCI-1-2*, *vrb-ToPRB-InterleaverDCI-1-2*, *referenceOfSLIVDCI-1-2*, *resourceAllocationDCI-1-2*, *dataScramblingIdentityPDSCH2-r16*, *repetitionSchemeConfig*, *pdsch-ConfigDCI-1-3*.

When the field is configured, then the "Antenna ports" field is present in DCI format 1_2. Otherwise, the field size is set to 0 for DCI format 1_2 (See TS 38.212 [17], clause 7.3.1.1.3). If neither <i>dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</i> nor <i>dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2</i> is configured, this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList, aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</b> | AddMod/Release lists for configuring aperiodically triggered zero-power CSI-RS resource sets. Each set contains a ZP-CSI-RS-ResourceSetId and the IDs of one or more ZP-CSI-RS-Resources (the actual resources are defined in the <i>zp-CSI-RS-ResourceToAddModList</i> ). The network configures the UE with at most 3 aperiodic ZP-CSI-RS-ResourceSets and it uses only the ZP-CSI-RS-ResourceSetId 1 to 3. The network triggers a set by indicating its ZP-CSI-RS-ResourceSetId in the DCI payload. The DCI codepoint '01' triggers the resource set with ZP-CSI-RS-ResourceSetId 1, the DCI codepoint '10' triggers the resource set with ZP-CSI-RS-ResourceSetId 2, and the DCI codepoint '11' triggers the resource set with ZP-CSI-RS-ResourceSetId 3 (see TS 38.214 [19], clause 5.1.4.2). The field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList</i> applies to DCI format 1_1 and the field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.2 and TS 38.212 [17] clause 7.3.1). |
| <b>beamAppTime</b>                                                                                       | Indicates the first slot to apply the unified TCI indicated by DCI as specified in TS 38.214 Clause 5.1.5. The value n1 means 1 symbol, n2 two symbols and so on. The first slot is at least Y symbols indicated by beamAppTime parameter after the last symbol of the acknowledgment of the joint or separate DL/UL beam indication. The same value shall be configured for all serving cells in any one of the <i>simultaneousU-TCI-UpdateListN</i> configured in IE <i>CellGroupConfig</i> based on the smallest SCS of the active BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>dataScramblingIdentityPDSCH, dataScramblingIdentityPDSCH2</b>                                         | Identifier(s) used to initialize data scrambling ( <i>c_init</i> ) for PDSCH as specified in TS 38.211 [16], clause 7.3.1.1. The <i>dataScramblingIdentityPDSCH2</i> is configured if <i>coresetPoolIndex</i> is configured with 1 for at least one CORESET in the same BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dl-OrJointTCI-StateToAddModList</b>                                                                   | A list of Transmission Configuration Indicator (TCI) states indicating a transmission configuration which includes QCL-relationships between the DL RSs in one RS set and the PDSCH DMRS ports, PDCCH DMRS ports, and CSI-RS, and in case of joint mode, also the PUSCH, PUCCH and SRS (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>dmrs-DownlinkForPDSCH-MappingTypeA, dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</b>                    | DMRS configuration for PDSCH transmissions using PDSCH mapping type A (chosen dynamically via <i>PDSCH-TimeDomainResourceAllocation</i> ). Only the fields <i>dmrs-Type</i> , <i>dmrs-AdditionalPosition</i> and <i>maxLength</i> may be set differently for mapping type A and B. If the field <i>pdsch-TimeDomainAllocationListDCI-1-2</i> is configured, it applies to DCI format 1_2 (see table 5.1.2.1.1-1A in TS 38.214 [19]). The field <i>pdsch-TimeDomainAllocationListForMultiPDSCH</i> applies to DCI format 1_1.<br>The network does not configure the <i>pdsch-TimeDomainAllocationList-r16</i> simultaneously with the <i>pdsch-TimeDomainAllocationList</i> (without suffix) in the same <i>PDSCH-Config</i> . |
| <b>prb-BundlingType, prb-BundlingTypeDCI-1-2</b>                                                                          | Indicates the PRB bundle type and bundle size(s) (see TS 38.214 [19], clause 5.1.2.3). If <i>dynamic</i> is chosen, the actual <i>bundleSizeSet1</i> or <i>bundleSizeSet2</i> to use is indicated via DCI. Constraints on <i>bundleSize(Set)</i> setting depending on <i>vrb-ToPRB-Interleaver</i> and <i>rbg-Size</i> settings are described in TS 38.214 [19], clause 5.1.2.3. If a <i>bundleSize(Set)</i> value is absent, the UE applies the value <i>n2</i> . The field <i>prb-BundlingType</i> applies to DCI formats 1_1 and 1_3, and the field <i>prb-BundlingTypeDCI-1-2</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.2.3).                                                                                                                        |

***priorityIndicatorDCI-1-1, priorityIndicatorDCI-1-2, priorityIndicatorDCI-4-2***

Configure the presence of "priority indicator" in DCI format 1\_1/1\_2/4\_2. When the field is absent in the IE, then 0 bit for "priority indicator" in DCI format 1\_1/1\_2/4\_2. The field *priorityIndicatorDCI-1-1* applies to DCI format 1\_1, the field *priorityIndicatorDCI-1-2* applies to DCI format 1\_2 and the field *priorityIndicatorDCI-4-2* applies to DCI format 4\_2, respectively (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9).

***pucch-sSCellDynDCI-1-2***

When configured, PUCCH cell switching based on dynamic indication in DCI format 1\_2 is enabled (see TS 38.213 [13], clause 9.A).

***p-ZP-CSI-RS-ResourceSet***

A set of periodically occurring ZP-CSI-RS-Resources (the actual resources are defined in the *zp-CSI-RS-ResourceToAddModList*). The network uses the ZP-CSI-RS-ResourceSetId=0 for this set.

If *p-ZP-CSI-RS-ResourceSet* is configured in both *PDSCH-Config* for MBS CFR and *PDSCH-Config* for the associated BWP, it is subject to UE capability whether the *p-ZP-CSI-RS-ResourceSet* configured in *PDSCH-Config* for MBS CFR can be different from the *p-ZP-CSI-RS-ResourceSet* configured in *PDSCH-Config* for the associated BWP.

***rateMatchPatternGroup1, rateMatchPatternGroup1DCI-1-2***

The IDs of a first group of *RateMatchPatterns* defined in *PDSCH-Config->rateMatchPatternToAddModList* (BWP level) or in *ServingCellConfig->rateMatchPatternToAddModList* (cell level). These patterns can be activated dynamically by DCI (see TS 38.214 [19], clause 5.1.4.1). The field *rateMatchPatternGroup1* applies to DCI formats 1\_1 and 1\_3, and the field *rateMatchPatternGroup1DCI-1-2* applies to DCI format 1\_2 (see TS 38.214 [19], clause 5.1.4.1).

***rateMatchPatternGroup2, rateMatchPatternGroup2DCI-1-2***

The IDs of a second group of *RateMatchPatterns* defined in *PDSCH-Config->rateMatchPatternToAddModList* (BWP level) or in *ServingCellConfig->rateMatchPatternToAddModList* (cell level). These patterns can be activated dynamically by DCI (see TS 38.214 [19], clause 5.1.4.1). The field *rateMatchPatternGroup2* applies to DCI formats 1\_1 and 1\_3, and the field *rateMatchPatternGroup2DCI-1-2* applies to DCI format 1\_2 (see TS 38.214 [19], clause 5.1.4.1).

***rateMatchPatternToAddModList***

Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns (see TS 38.214 [19], clause 5.1.4.1). If a *RateMatchPattern* with the same *RateMatchPatternId* is configured in both MBS CFR and its associated BWP, the entire *RateMatchPattern* configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].

***rbg-Size***

Selection between config 1 and config 2 for RBG size for PDSCH except PDSCH scheduled by DCI format 1\_3. The UE ignores this field if *resourceAllocation* is set to *resourceAllocationType1* (see TS 38.214 [19], clause 5.1.2.2.1).

***referenceOfSLIVDCI-1-2***

Enable using the starting symbol of the PDCCH monitoring occasion in which the DL assignment is detected as the reference of the SLIV for DCI format 1\_2. When the RRC parameter enables the utilization of the new reference, the new reference is applied for TDRA entries with K0=0. For other entries (if any) in the same TDRA table, the reference is slot boundary as in Rel-15. PDSCH mapping type A is not supported with the new reference. The new reference of SLIV is not configured for a serving cell configured to be scheduled by cross-carrier scheduling on a scheduling cell with different numerology (see TS 38.212 [17] clause 7.3.1 and TS 38.214 [19] clause 5.1.2.1).

***repetitionSchemeConfig***

Configure the UE with repetition schemes. The network does not configure *repetitionSchemeConfig-r16* and *repetitionSchemeConfig-v1630* simultaneously to *setup* in the same *PDSCH-Config*. The network does not configure this parameter and *sfnSchemePDSCH* in *MIMOParam-r17* simultaneously in the same serving cell.

***resourceAllocation, resourceAllocationDCI-1-2***

Configuration of resource allocation type 0 and resource allocation type 1 for non-fallback DCI (see TS 38.214 [19], clause 5.1.2.2). The field *resourceAllocation* applies to DCI format 1\_1, and the field *resourceAllocationDCI-1-2* applies to DCI format 1\_2 (see TS 38.214 [19], clause 5.1.2.2).

***resourceAllocationType1GranularityDCI-1-2***

Configure the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 1\_2. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 5.1.2.2.2).

***sizeDCI-4-2***

Indicates the size of DCI format 4-2 (see TS 38.213 [13], clause 10.1).

***sp-ZP-CSI-RS-ResourceSetsToAddModList***

AddMod/Release lists for configuring semi-persistent zero-power CSI-RS resource sets. Each set contains a *ZP-CSI-RS-ResourceSetId* and the IDs of one or more *ZP-CSI-RS-Resources* (the actual resources are defined in the *zp-CSI-RS-ResourceToAddModList*) (see TS 38.214 [19], clause 5.1.4.2).

|                                                            |                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tci-StatesToAddModList</b>                              | A list of Transmission Configuration Indicator (TCI) states indicating a transmission configuration which includes QCL-relationships between the DL RSs in one RS set and the PDSCH DMRS ports (see TS 38.214 [19], clause 5.1.5). If <i>unifiedTCI-StateType</i> is configured for the serving cell, no element in this list is configured.                                                     |
| <b>unifiedTCI-StateRef</b>                                 | Provides the serving cell and BWP where the configuration for <i>dl-OrJointTCI-StateToAddModList-r17</i> are defined. When this field is present, <i>dl-OrJointTCI-StateToAddModList</i> and <i>dl-OrJointTCI-StateToReleaseList</i> are not present. The value of <i>unifiedTCI-StateType</i> of current serving cell is the same in the serving cell indicated by <i>unifiedTCI-StateRef</i> . |
| <b>vrb-ToPRB-Interleaver, vrb-ToPRB-InterleaverDCI-1-2</b> | Interleaving unit configurable between 2 and 4 PRBs (see TS 38.211 [16], clause 7.3.1.6). When the field is absent, the UE performs non-interleaved VRB-to-PRB mapping.                                                                                                                                                                                                                          |
| <b>xOverheadMulticast</b>                                  | Accounts for an overhead from CSI-RS, CORESET etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19]).                                                                                                                                                                                                                                                                       |
| <b>zp-CSI-RS-ResourceToAddModList</b>                      | A list of Zero-Power (ZP) CSI-RS resources used for PDSCH rate-matching. Each resource in this list may be referred to from only one type of resource set, i.e., aperiodic, semi-persistent or periodic (see TS 38.214 [19]).                                                                                                                                                                    |

| <b>PDSCH-ConfigDCI-1-3 field descriptions</b>    |                                                                                                                                                                                                                                               |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enabledDefaultBeamForMultiCellScheduling</b>  | This field indicates whether default beam selection for DCI format 1_3 scheduled PDSCH or aperiodic CSI-RS is enabled (see TS 38.214 [19], clause 5.1.5 and clause 5.2.1.5).                                                                  |
| <b>harq-ProcessNumberSizeDCI-1-3</b>             | Configure the number of bits for the field "HARQ process number" in DCI format 1_3 (see TS 38.212 [17], clause 7.3.1).                                                                                                                        |
| <b>numberOfBitsForRV-DCI-1-3</b>                 | Configures the number of bits for "Redundancy version" in the DCI format 1_3 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.2.1).                                                                                           |
| <b>rbg-SizeDCI-1-3</b>                           | Selection among config 1, config 2 and config 3 for RBG size for PDSCH scheduled by DCI format 1_3. The UE ignores this field if resourceAllocationDCI-1-3 is set to resourceAllocationType1. (see TS 38.214 [19], clause 5.1.2.2.1).         |
| <b>resourceAllocationDCI-1-3</b>                 | Configuration of resource allocation type 0 and resource allocation type 1 for DCI format 1_3 (see TS 38.214 [19], clause 5.1.2.2).                                                                                                           |
| <b>resourceAllocationType1GranularityDCI-1-3</b> | Configure the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 1_3. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 5.1.2.2.2). |

| Conditional Presence | Explanation                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <i>DCI-1-3</i>       | This field is mandatory present when <i>ScheduledCellListDCI-1-3</i> is configured to the serving cell. Otherwise, it is absent, Need R. |

## – *PDSCH-ConfigCommon*

The IE *PDSCH-ConfigCommon* is used to configure cell specific PDSCH parameters.

### *PDSCH-ConfigCommon* information element

-- ASN1START  
-- TAG-PDSCH-CONFIGCOMMON-START

```

PDSCH-ConfigCommon ::= SEQUENCE {
 pdsch-TimeDomainAllocationList PDSCH-TimeDomainResourceAllocationList OPTIONAL, -- Need R
 ...
}

| <b>PDSCH-CodeBlockGroupTransmission field descriptions</b> |                                                                                                                                     |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>codeBlockGroupFlushIndicator</b>                        | Indicates whether CBGFI for CBG based (re)transmission in DL is enabled (true). (see TS 38.212 [17], clause 7.3.1.2.2).             |
| <b>maxCodeBlockGroupsPerTransportBlock</b>                 | Maximum number of code-block-groups (CBGs) per TB. In case of multiple CW, the maximum CBG is 4 (see TS 38.213 [13], clause 9.1.1). |

| <b>PDSCH-ServingCellConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>codeBlockGroupTransmission</b>                 | Enables and configures code-block-group (CBG) based transmission (see TS 38.213 [13], clause 9.1.1). Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.<br>The network does not configure this field if <ul style="list-style-type: none"><li>- the SCS of at least one DL BWP configured in the cell is 480 or 960 kHz</li><li>- Type-1 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for this serving cell contains <i>pdsch-AllocationList</i> with multiple entries (multiple PDSCH)</li><li>- Type-2 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for any cell in the same PUCCH cell group associated with this serving cell contains <i>pdsch-AllocationList</i> with multiple entries (multiple PDSCH)</li></ul> |
| <b>downlinkHARQ-FeedbackDisabled</b>              | Used to disable the DL HARQ feedback, sent in the uplink, per HARQ process ID. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. The bit(s) set to one identify HARQ processes with disabled DL HARQ feedback and the bit(s) set to zero identify HARQ processes with enabled DL HARQ feedback.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>maxMIMO-Layers</b>                             | Indicates the maximum number of MIMO layers to be used for PDSCH in all BWPs of this serving cell. (see TS 38.212 [17], clause 5.4.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nrofHARQ-ProceduresForPDSCH</b>                | The number of HARQ procedures to be used on the PDSCH of a serving cell. Value <i>n2</i> corresponds to 2 HARQ procedures, value <i>n4</i> to 4 HARQ procedures, and so on. If both <i>nrofHARQ-ProceduresForPDSCH</i> and <i>nrofHARQ-ProceduresForPDSCH-v1700</i> are absent, the UE uses 8 HARQ procedures (see TS 38.214 [19], clause 5.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>pdsch-CodeBlockGroupTransmissionList</b>       | A list of configurations for up to two simultaneously constructed HARQ-ACK codebooks (see TS 38.213 [13], clause 9.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>processingType2Enabled</b>                     | Enables configuration of advanced processing time capability 2 for PDSCH (see 38.214 [19], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pucch-Cell</b>                                 | The ID of the serving cell (of the same cell group) to use for PUCCH. If the field is absent, the UE sends the HARQ feedback on the PUCCH of the SpCell of this cell group, or on this serving cell if it is a PUCCH SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>xOverhead</b>                                  | Accounts for overhead from CSI-RS, CORESET, etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19], clause 5.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Conditional Presence | Explanation                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SCellAddOnly</i>  | It is optionally present, Need S, for (non-PUCCH) SCells when adding a new SCell. The field is absent, Need M, when reconfiguring SCells. The field is also absent for the SpCells as well as for a PUCCH SCell. |

– *PDSCH-TimeDomainResourceAllocationList*

The IE *PDSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PDSCH. The *PDSCH-TimeDomainResourceAllocationList* contains one or more of such *PDSCH-TimeDomainResourceAllocations*. The network indicates in the DL assignment which of the configured time domain allocations the UE shall apply for that DL assignment. The UE determines the bit width of the DCI field based on the number of entries in the *PDSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

| <i>PDSCH-TimeDomainResourceAllocation</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>k0</b>                                                    | Slot offset between DCI and its scheduled PDSCH (see TS 38.214 [19], clause 5.1.2.1). <i>k0-v1710</i> is only applicable for PDSCH SCS of 480 kHz and 960 kHz. If multiple PDSCHs are configured per PDCCH, the network always configures this field. Otherwise, when the field is absent and only one PDSCH is configured per PDCCH, the UE applies the value 0. |
| <b>mappingType</b>                                           | PDSCH mapping type (see TS 38.214 [19], clause 5.3).                                                                                                                                                                                                                                                                                                              |
| <b>repetitionNumber</b>                                      | Indicates the number of PDSCH transmission occasions for slot-based repetition scheme in IE <i>RepetitionSchemeConfig</i> . The parameter is used as specified in 38.214 [19].                                                                                                                                                                                    |
| <b>startSymbolAndLength</b>                                  | An index giving valid combinations of start symbol and length (jointly encoded) as start and length indicator (SLIV). The network configures the field so that the allocation does not cross the slot boundary (see TS 38.214 [19], clause 5.1.2.1).                                                                                                              |

| <i>MultiPDSCH-TimeDomainResourceAllocation</i> field descriptions |                                                                                                                   |

|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dpc-Reporting-FR1</b>             | Indicates if the delta power class (DPC) is reported, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                     |
| <b>dummy</b>                         | This field is not used in this version of the specification and the UE ignores the received value.                                                                                                                                                                                                                                                                                                                                       |
| <b>mpe-ProhibitTimer</b>             | Value in number of subframes for MPE reporting, as specified in TS 38.321 [3]. Value sf10 corresponds to 10 subframes, and so on.                                                                                                                                                                                                                                                                                                        |
| <b>mpe-Reporting-FR2</b>             | Indicates whether the UE shall report MPE P-MPR in the PHR MAC control element, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                           |
| <b>mpe-Threshold</b>                 | Value of the P-MPR threshold in dB for reporting MPE P-MPR when FR2 is configured, as specified in TS 38.321 [3]. The same value applies for each serving cell (although the associated functionality is performed independently for each cell).                                                                                                                                                                                         |
| <b>multiplePHR</b>                   | Indicates if power headroom shall be reported using the Single Entry PHR MAC control element or Multiple Entry PHR MAC control element defined in TS 38.321 [3]. True means to use Multiple Entry PHR MAC control element and False means to use the Single Entry PHR MAC control element defined in TS 38.321 [3]. The network configures this field to <i>true</i> for MR-DC and UL CA for NR, and to <i>false</i> in all other cases. |
| <b>numberOfN</b>                     | Number of reported P-MPR values in a PHR MAC CE.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>phr-AssumedPUSCH-Reporting</b>    | Indicates if the PHR with an assumed PUSCH is reported, as specified in TS 38.321 [3]. The network ensures <i>phr-AssumedPUSCH-Reporting-r18</i> and <i>twoPHRMode-r17</i> are not configured at the same time for a UE.                                                                                                                                                                                                                 |
| <b>phr-ModeOtherCG</b>               | Indicates the mode (i.e. real or virtual) used for the PHR of the activated cells that are part of the other Cell Group (i.e. MCG or SCG), when DC is configured. If the UE is configured with only one cell group (no DC), it ignores the field.                                                                                                                                                                                        |
| <b>phr-PeriodicTimer</b>             | Value in number of subframes for PHR reporting as specified in TS 38.321 [3]. Value sf10 corresponds to 10 subframes, value sf20 corresponds to 20 subframes, and so on.                                                                                                                                                                                                                                                                 |
| <b>phr-ProhibitTimer</b>             | Value in number of subframes for PHR reporting as specified in TS 38.321 [3]. Value sf0 corresponds to 0 subframe, value sf10 corresponds to 10 subframes, value sf20 corresponds to 20 subframes, and so on.                                                                                                                                                                                                                            |
| <b>phr-Tx-PowerFactorChange</b>      | Value in dB for PHR reporting as specified in TS 38.321 [3]. Value dB1 corresponds to 1 dB, dB3 corresponds to 3 dB and so on. The same value applies for each serving cell (although the associated functionality is performed independently for each cell).                                                                                                                                                                            |
| <b>phr-Type2OtherCell</b>            | If set to true, the UE shall report a PHR type 2 for the SpCell of the other MAC entity. See TS 38.321 [3], clause 5.4.6. Network sets this field to <i>false</i> if the UE is not configured with an E-UTRA MAC entity.                                                                                                                                                                                                                 |
| <b>twoPHRMode</b>                    | Indicates if the power headroom shall be reported as two PHRs (each PHR associated with a SRS resource set) is enabled or not. The network ensures <i>phr-AssumedPUSCH-Reporting-r18</i> and <i>twoPHRMode-r17</i> are not configured at the same time for a UE.                                                                                                                                                                         |

| <b><i>ackNackFeedbackMode</i></b>                                  | Indicates which among the joint and separate ACK/NACK feedback modes to use within a slot as specified in TS 38.213 [13] (clause 9).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>bdFactorR</i></b>                                            | Parameter for determining and distributing the maximum numbers of BD/CCE for mPDCCH based mPDSCH transmission as specified in TS 38.213 [13] Clause 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>cs-RNTI</i></b>                                              | RNTI value for downlink SPS (see <i>SPS-Config</i> ) and uplink configured grant (see <i>ConfiguredGrantConfig</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>downlinkAssignmentIndexDCI-0-2</i></b>                       | Indicates if "Downlink assignment index" is present or absent in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is absent, then 0 bit for "Downlink assignment index" in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is present, then the bitwidth of "Downlink assignment index" in DCI format 0_2 is defined in the same was as that in DCI format 0_1 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                                                                                         |
| <b><i>downlinkAssignmentIndexDCI-1-2</i></b>                       | Configures the number of bits for "Downlink assignment index" in DCI format 1_2. If the field is absent, then 0 bit is applied for "Downlink assignment index" in DCI format 1_2. Note that 1 bit and 2 bits are applied if only one serving cell is configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> . 4 bits is applied if more than one serving cell are configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                        |
| <b><i>enableDiffCB-Size</i></b>                                    | This field indicates whether a different codebook size from the size determined based on HARQ-ACK information associated with PDSCH reception(s) scheduled before a UL grant, is determined or not to include HARQ-ACK information associated with PDSCH reception(s) scheduled after a UL grant scheduling a PUSCH transmission with repetitions and the HARQ-ACK information are multiplexed on a repetition of the PUSCH transmission other than a first repetition. If enabled, a different HARQ codebook size might be determined. See clause 9 in TS 38.213 [13].                                                                                                                |
| <b><i>enableDiffPUCCH-Resource</i></b>                             | This field indicates whether a different PUCCH resource in time domain in a slot from the PUCCH resource indicated by the last DCI format before a UL grant in the slot, is determined or not to include HARQ-ACK information associated with PDSCH reception(s) scheduled after a UL grant scheduling a PUSCH transmission with repetitions and the HARQ-ACK information are multiplexed on a repetition of the PUSCH transmission other than a first repetition in the same slot. If enabled, a different PUCCH resource in time domain might be determined. See clause 9 in TS 38.213 [13].                                                                                         |
| <b><i>enableType1HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b> | If enabled, UE multiplexes Type-1 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                                          |
| <b><i>enableType2HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b> | If enabled, UE multiplexes Type-2 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                                          |
| <b><i>enableType3HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b> | If enabled, UE multiplexes Type-3 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                                          |
| <b><i>harq-ACK-SpatialBundlingPUCCH</i></b>                        | Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUCCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUCCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clause 9.1.2.1). If the field <i>harq-ACK SpatialBundlingPUCCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUCCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group. |
| <b><i>harq-ACK-SpatialBundlingPUCCH-secondaryPUCCHgroup</i></b>    | Indicates whether spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clause 9.1.2.1). When the field is absent, the use of spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUCCH</i> . See TS 38.213 [13], clause 9.1.2.1. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                             |

|                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>harq-ACK-SpatialBundlingPUSCH</i></b>                                                             | Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUSCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUSCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). If the field <i>harq-ACK SpatialBundlingPUSCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUSCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                                                                                                                                         |
| <b><i>harq-ACK-SpatialBundlingPUSCH-secondaryPUCCHgroup</i></b>                                         | Indicates whether spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). When the field is absent, the use of spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUSCH</i> . See TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                                                                                                                                                                                                                                        |
| <b><i>intraBandNC-PRACH-simulTx</i></b>                                                                 | Enables parallel PRACH and SRS/PUCCH/PUSCH transmissions across CCs in intra-band non-contiguous CA (see TS 38.213 [13], clause 8.1 and TS 38.214 [19], clause 6.2.1). This field is absent in the IE <i>CellGroupConfig</i> when provided as part of <i>RRCSetup</i> message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>mcs-C-RNTI</i></b>                                                                                | RNTI to indicate use of <i>qam64LowSE</i> for grant-based transmissions. When the <i>mcs-C-RNTI</i> is configured, RNTI scrambling of DCI CRC is used to choose the corresponding MCS table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b><i>nfi-TotalDAI-Included</i></b>                                                                     | Indicates whether the NFI and total DAI fields of the non-scheduled PDSCH group is included in the non-fallback DL grant DCI (see TS 38.212 [17], clause 7.3.1). The network configures this only when enhanced dynamic codebook is configured ( <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>enhancedDynamic</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>nrdc-PCmode-FR1</i></b>                                                                           | Indicates the uplink power sharing mode that the UE uses in NR-DC in frequency range 1 (FR1) (see TS 38.213 [13], clause 7.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>nrdc-PCmode-FR2</i></b>                                                                           | Indicates the uplink power sharing mode that the UE uses in NR-DC in frequency range 2 (FR2) (see TS 38.213 [13], clause 7.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>pdcch-BlindDetection, pdcch-BlindDetection2, pdcch-BlindDetection3, pdcch-BlindDetection4</i></b> | Indicates the reference number of cells for PDCCH blind detection for the CG. Network configures the field for each CG when the UE is in NR DC and sets the value in accordance with the constraints specified in TS 38.213 [13]. The network configures <i>pdcch-BlindDetection</i> only if the UE is in NR-DC. The network configures <i>pdcch-BlindDetection2</i> only if the UE is in NR-DC with at least one downlink cell using Rel-16 PDCCH monitoring capability. The network configures <i>pdcch-BlindDetection3</i> only if the UE is in NR-DC with at least one downlink cell using Rel-15 PDCCH monitoring capability. The network configures <i>pdcch-BlindDetection4</i> only if the UE is in NR-DC with at least one downlink cell using Rel-17 PDCCH monitoring capability.                                                                                                                                 |
| <b><i>pdcch-BlindDetectionCA-CombIndicator</i></b>                                                      | Configure one combination of <i>pdcch-BlindDetectionCA1</i> (for R15) and <i>pdcch-BlindDetectionCA2</i> (for R16) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdcch-BlindDetectionCA1</i> and <i>pdcch-BlindDetectionCA2</i> as UE capability. The combination of <i>pdcch-BlindDetectionCA1</i> and <i>pdcch-BlindDetectionCA2</i> configured by <i>pdcch-BlindDetectionCA-CombIndicator</i> is from the more than one combination of <i>pdcch-BlindDetectionCA1</i> and <i>pdcch-BlindDetectionCA2</i> reported by UE (see TS 38.213 [13], clause 10).                                                                                                                                                                                                             |
| <b><i>pdcch-BlindDetectionCA-CombIndicator-r17</i></b>                                                  | <i>pdcch-BlindDetectionCA-CombIndicator-r17</i> is used to configure one combination of <i>pdcch-BlindDetectionCA1</i> (for R15), <i>pdcch-BlindDetectionCA2</i> (for R16) and <i>pdcch-BlindDetectionCA3</i> (for R17) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdcch-BlindDetectionCA1</i> , <i>pdcch-BlindDetectionCA2</i> and <i>pdcch-BlindDetectionCA3</i> as UE capability. The combination of <i>pdcch-BlindDetectionCA1</i> , <i>pdcch-BlindDetectionCA2</i> and <i>pdcch-BlindDetectionCA3</i> configured by <i>pdcch-BlindDetectionCA-CombIndicator-r17</i> is from the more than one combination of <i>pdcch-BlindDetectionCA1</i> , <i>pdcch-BlindDetectionCA2</i> and <i>pdcch-BlindDetectionCA3</i> reported by UE (see TS 38.213 [13], clause 10). |
|                                                                                                         | <i>pdcch-BlindDetectionCA-CombIndicator-r16</i> and <i>pdcch-BlindDetectionCA-CombIndicator-r17</i> are not configured simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

***pdsch-HARQ-ACK-Codebook***

The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to both CA and non-CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). If *pdsch-HARQ-ACK-Codebook-r16* is signalled, UE shall ignore the *pdsch-HARQ-ACK-Codebook* (without suffix). For the HARQ-ACK for sidelink, if *pdsch-HARQ-ACK-Codebook-r16* is signalled, the UE uses *pdsch-HARQ-ACK-Codebook* (without suffix) and ignores *pdsch-HARQ-ACK-Codebook-r16*. If the field *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup* is present, *pdsch-HARQ-ACK-Codebook* is applied to primary PUCCH group. Otherwise, this field is applied to the cell group (i.e. for all the cells within the cell group). For the HARQ-ACK for sidelink, if the field *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup* is present, *pdsch-HARQ-ACK-Codebook* is applied to primary and secondary PUCCH group and the UE ignores *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup*.

***pdsch-HARQ-ACK-CodebookList***

A list of configurations for one or two HARQ-ACK codebooks. Each configuration in the list is defined in the same way as *pdsch-HARQ-ACK-Codebook* (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field *pdsch-HARQ-ACK-Codebook* is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured). For the HARQ-ACK for sidelink, the UE uses *pdsch-HARQ-ACK-Codebook* and ignores *pdsch-HARQ-ACK-CodebookList* if this field is present.

***pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup***

The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). It is configured for secondary PUCCH group.

***pdsch-HARQ-ACK-EnhType3DCI-Field, pdsch-HARQ-ACK-EnhType3DCI-FieldSecondaryPUCCHgroup***

Indicates the enhanced Type 3 codebook through a new DCI field to indicate the enhanced Type 3 HARQ-ACK codebook in the primary PUCCH group if the more than one enhanced Type 3 HARQ-ACK codebook is configured for the primary PUCCH group, or in the secondary PUCCH group if the more than one enhanced Type 3 HARQ-ACK code is configured for the secondary PUCCH group, respectively.

***pdsch-HARQ-ACK-EnhType3ToAddModList, pdsch-HARQ-ACK-EnhType3SecondaryToAddModList***

Configure the list of enhanced Type 3 HARQ-ACK codebooks for the primary PUCCH group and the secondary PUCCH group, respectively. When configured, DCI format 1\_1 can request the UE to report A/N for one of the configured enhanced Type 3 HARQ-ACK codebooks in the corresponding PUCCH group (see TS 38.213 [13], clause 9.1.4). The network can configure *pdsch-HARQ-ACK-EnhType3SecondaryToAddModList* only if secondary PUCCH group is configured.

***pdsch-HARQ-ACK-OneShotFeedback***

When configured, the DCI format 1\_1 can request the UE to report A/N for all HARQ processes and all CCs configured in the PUCCH group (see TS 38.212 [17], clause 7.3.1).

***pdsch-HARQ-ACK-OneShotFeedbackCBG***

When configured, the DCI format 1\_1 can request the UE to include CBG level A/N for each CC with CBG level transmission configured. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC. The network configures this only when *pdsch-HARQ-ACK-OneShotFeedback* is configured.

***pdsch-HARQ-ACK-OneShotFeedbackNDI***

When configured, the DCI format 1\_1 can request the UE to include NDI for each A/N reported. The network configures this only when *pdsch-HARQ-ACK-OneShotFeedback* is configured.

***pdsch-HARQ-ACK-Retx, pdsch-HARQ-ACK-RetxSecondaryPUCCHgroup***

When configured, the DCI format 1\_1 can request the UE to perform a HARQ-ACK re-transmission on a PUCCH resource in the primary PUCCH group and the secondary PUCCH group, respectively (see TS 38.213 [13], clause 9.1.5).

***prioLowDG-HighCG***

Enable PHY prioritization for the case where low-priority dynamic grant-PUSCH collides with high-priority configured grant-PUSCH on a BWP of a serving cell (see TS 38.213 [13], clause 9), when the UE has generated transport blocks for both DG-PUSCH and CG-PUSCH as described in TS 38.321 [3].

***prioHighDG-LowCG***

Enable PHY prioritization for the case where high-priority dynamic grant PUSCH collides with low-priority configured grant PUSCH on a BWP of a serving cell (see TS 38.213 [13], clause 9), when the UE has generated transport blocks for both DG-PUSCH and CG-PUSCH as described in TS 38.321 [3].

***ps-RNTI***

RNTI value for scrambling CRC of DCI format 2\_6 used for power saving (see TS 38.213 [13], clause 10.1).

***ps-Offset***

The start of the search-time of DCI format 2\_6 with CRC scrambled by PS-RNTI relative to the start of the *drx-onDurationTimer* of Long DRX (see TS 38.213 [13], clause 10.3). Value in multiples of 0.125ms (milliseconds). 1 corresponds to 0.125 ms, 2 corresponds to 0.25 ms, 3 corresponds to 0.375 ms and so on.

|                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

The maximum transmit power that the UE may use may be additionally limited by <i>p-Max</i> (configured in <i>FrequencyInfoUL</i> ) and by <i>p-NR-FR2</i> (configured for the cell group). A UE does not expect to be configured with this parameter in this release of the specification.                                                            |
| <b><i>simultaneousPUCCH-PUSCH, simultaneousPUCCH-PUSCH-SecondaryPUCCHgroup</i></b>                           | Enables simultaneous PUCCH and PUSCH transmissions with different priorities for the primary PUCCH group and the secondary PUCCH group, respectively.                                                                                                                                                                                                                                                                                                                                   |
| <b><i>simultaneousPUCCH-PUSCH-SamePriority, simultaneousPUCCH-PUSCH-SamePriority-SecondaryPUCCHgroup</i></b> | Enables simultaneous PUCCH and PUSCH transmissions on different cells in different bands with same priority for the primary PUCCH group and the secondary PUCCH group, respectively, as specified in clause 9 of TS 38.213 [13].                                                                                                                                                                                                                                                        |
| <b><i>simultaneousSR-PUSCH-diffPUCCH-Groups</i></b>                                                          | Enables simultaneous SR and PUSCH transmissions in different PUCCH groups (see TS 38.321 [3], clause 5.4.1, clause 5.4.4).                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>sizeDCI-2-6</i></b>                                                                                    | Size of DCI format 2_6 (see TS 38.213 [13], clause 10.3).                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>sp-CSI-RNTI</i></b>                                                                                    | RNTI for Semi-Persistent CSI reporting on PUSCH (see <i>CSI-ReportConfig</i> ) (see TS 38.214 [19], clause 5.2.1.5.2). Network always configures the UE with a value for this field when at least one <i>CSI-ReportConfig</i> with <i>reportConfigType</i> set to <i>semiPersistentOnPUSCH</i> is configured.                                                                                                                                                                           |

|                                                                     |                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tpc-PUCCH-RNTI</b>                                               | RNTI used for PUCCH TPC commands on DCI (see TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                         |
| <b>tpc-PUSCH-RNTI</b>                                               | RNTI used for PUSCH TPC commands on DCI (see TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                         |
| <b>tpc-SRS-RNTI</b>                                                 | RNTI used for SRS TPC commands on DCI (see TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                           |
| <b>twoQCL-TypeD-ForMultiDCI</b>                                     | Indicates whether a UE is expected to identify and monitor two QCL-TypeD properties for multiple overlapping CORESETS, where the first QCL-TypeD is associated with <i>coresetPoolIndex</i> value 0, and the second QCL-TypeD is associated with <i>coresetPoolIndex</i> value 1. (See TS 38.213 [13], clause 10). |
| <b>twoQCLTypeDforPDCCHRepetition</b>                                | Indicates whether a UE is expected UE to identify and monitor two QCL-TypeD properties for multiple overlapping CORESETS in the case of PDCCH repetition.                                                                                                                                                          |
| <b>uci-MuxWithDiffPrio, uci-MuxWithDiffPrio-secondaryPUCCHgroup</b> | When configured, enables multiplexing a high-priority (HP) HARQ-ACK UCI and a low-priority (LP) HARQ-ACK UCI into a PUCCH or PUSCH for the primary PUCCH group and the secondary PUCCH group, respectively.                                                                                                        |
| <b>ul-TotalDAI-Included</b>                                         | Indicates whether the total DAI fields of the additional PDSCH group is included in the non-fallback UL grant DCI (see TS 38.212 [17], clause 7.3.1). The network configures this only when enhanced dynamic codebook is configured ( <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>enhancedDynamic</i> ).           |
| <b>xScale</b>                                                       | The UE is allowed to drop NR only if the power scaling applied to NR results in a difference between scaled and unscaled NR UL of more than <i>xScale</i> dB (see TS 38.213 [13]). If the value is not configured for dynamic power sharing, the UE assumes default value of 6 dB.                                 |

| <b>MulticastConfig field descriptions</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pdsch-HARQ-ACK-CodebookListMulticast</b> | A list of configurations for one or two HARQ-ACK codebooks for MBS multicast. Each configuration in the list is defined in the same way as <i>pdsch-HARQ-ACK-Codebook</i> (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field <i>pdsch-HARQ-ACK-Codebook</i> is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured). |
| <b>type1CodebookGenerationMode</b>          | Indicates the mode of Type-1 HARQ-ACK codebook generation, as specified in TS 38.213 [13]. Mode 1 is based on the k1 values that are in the intersection of K1 set for unicast and K1 set for multicast. Mode 2 is based on the k1 values that are in the union of K1 set for unicast and K1 set for multicast.                                                                                                                                                                                |

| <b>PDSCH-HARQ-ACK-EnhType3 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pdsch-HARQ-ACK-EnhType3CBG</b>                 | When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include CBG level A/N for each CC with CBG level transmission configured of the enhanced Type 3 HARQ-ACK codebook. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC.                                |
| <b>pdsch-HARQ-ACK-EnhType3NDI</b>                 | When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include NDI for each A/N reported of the enhanced Type 3 HARQ-ACK codebook.                                                                                                                                                                                   |
| <b>perCC</b>                                      | Configures enhanced Type 3 HARQ-ACK codebook using per CC configuration.                                                                                                                                                                                                                                                                  |
| <b>perHARQ, perHARQ-Ext</b>                       | Configures enhanced Type 3 HARQ-ACK codebook using per HARQ process and CC configuration. <i>perHARQ-Ext</i> is present only when <i>nrofHARQ-ProcessesForPDSCH-v1700</i> is present in <i>pdsch-ServingCellConfig</i> of at least one serving cell in the PUCCH group. If <i>perHARQ-Ext</i> is present, the UE ignores <i>perHARQ</i> . |

| CellIDTRX-DCI-config field descriptions |                                                                                                                                                     |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellIDTRX-RNTI</b>                   | The RNTI value for scrambling CRC of DCI format 2_9 for activating and/or deactivating Cell DTX and/or Cell DRX and/or NES mode for CHO indication. |
| <b>sizeDCI-2-9</b>                      | The size of DCI format 2_9.                                                                                                                         |

| Conditional Presence | Explanation                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>MCG-Only</i>      | This field is optionally present, Need R, in the <i>PhysicalCellGroupConfig</i> of the MCG. It is absent otherwise.                                           |
| <i>NCR</i>           | This field is optionally present, Need M for NCR-MT. It is absent otherwise.                                                                                  |
| <i>SCG-Only</i>      | This field is optionally present, Need S, in the <i>PhysicalCellGroupConfig</i> of the SCG in (NG)EN-DC as defined in TS 38.213 [13]. It is absent otherwise. |
| <i>twoPUCCHgroup</i> | This field is optionally present, Need R, if secondary PUCCH group is configured. It is absent otherwise, Need R.                                             |

## – PLMN-Identity

The IE *PLMN-Identity* identifies a Public Land Mobile Network. Further information regarding how to set the IE is specified in TS 23.003 [21].

### PLMN-Identity information element

```
-- ASN1START
-- TAG-PLMN-IDENTITY-START

PLMN-Identity ::= SEQUENCE {
 mcc OPTIONAL,
 mnc OPTIONAL,
} -- Cond MCC

MCC ::= SEQUENCE (SIZE (3)) OF MCC-MNC-Digit
MNC ::= SEQUENCE (SIZE (2..3)) OF MCC-MNC-Digit
MCC-MNC-Digit ::= INTEGER (0..9)

-- TAG-PLMN-IDENTITY-STOP
-- ASN1STOP
```

| PLMN-Identity field descriptions |                                                                                                                                                                                                                                         |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mcc</b>                       | The first element contains the first MCC digit, the second element the second MCC digit and so on. If the field is absent, it takes the same value as the <i>mcc</i> of the immediately preceding IE PLMN-Identity. See TS 23.003 [21]. |
| <b>mnc</b>                       | The first element contains the first MNC digit, the second element the second MNC digit and so on. See TS 23.003 [21].                                                                                                                  |

| Conditional Presence | Explanation                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCC                  | This field is mandatory present when PLMN-Identity is not used in a list or if it is the first entry of PLMN-Identity in a list. Otherwise it is optionally present, Need S. |

– *PLMN-IdentityInfoList*

The IE *PLMN-IdentityInfoList* includes a list of PLMN identity information.

***PLMN-IdentityInfoList* information element**

```
-- ASN1START
-- TAG-PLMN-IDENTITYINLIST-START

PLMN-IdentityInfoList ::= SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::= SEQUENCE {
 plmn-IdentityList SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-Identity,
 trackingAreaCode TrackingAreaCode OPTIONAL, -- Need R
 ranac RAN-AreaCode OPTIONAL, -- Need R
 cellIdentity CellIdentity,
 cellReservedForOperatorUse ENUMERATED {reserved, notReserved},
 ...
 [
 iab-Support-r16 ENUMERATED {true} OPTIONAL, -- Need S
],
 [
 trackingAreaList-r17 SEQUENCE (SIZE (1..maxTAC-r17)) OF TrackingAreaCode
 gNB-ID-Length-r17 INTEGER (22..32) OPTIONAL, -- Need R
],
 [
 mobileIAB-Support-r18 ENUMERATED {true} OPTIONAL, -- Need S
]
}
-- TAG-PLMN-IDENTITYINLIST-STOP
-- ASN1STOP
```

| <b><i>PLMN-IdentityInfo</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cellReservedForOperatorUse</i></b>           | Indicates whether the cell is reserved for operator use (per PLMN), as defined in TS 38.304 [20]. This field is ignored by IAB-MT and NCR-MT.                                                                                                                                                                                                                                       |
| <b><i>gNB-ID-Length</i></b>                        | Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> . This field is always present if the <i>mobileIAB-Support</i> is broadcasted.                                                                                                                                                                                                                        |
| <b><i>iab-Support</i></b>                          | This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-node; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. |
| <b><i>mobileIAB-Support</i></b>                    | This field indicates the support of mobile IAB and whether the cell can be considered as a candidate for cell (re)selection for mobile IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. If the field is absent, the cell is barred for mobile IAB-node.                                                                                          |
| <b><i>trackingAreaCode</i></b>                     | Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs. The absence of the field indicates that the cell only supports PSCell/SCell functionality (per PLMN) or is an NTN cell.                                                                                                                                                              |
| <b><i>trackingAreaList</i></b>                     | List of Tracking Areas to which the cell indicated by <i>cellIdentity</i> field belongs. If this field is present, network does not configure <i>trackingAreaCode</i> . Total number of different TACs across different <i>PLMN-IdentityInfos</i> shall not exceed <i>maxTAC</i> . This field is only present in an NTN cell.                                                       |

| Conditional Presence | Explanation                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>eventID-TSS</i>   | If <i>eventID-TSS</i> is present in SIB9, this field is mandatory present in the <i>PLMN-IdentityInfo</i> IE of <i>PLMN-IdentityInfoList</i> in <i>SIB1</i> . Otherwise, the field is optionally present, Need R. |

## — *PLMN-IdentityList2*

Includes a list of PLMN identities.

### ***PLMN-IdentityList2* information element**

```
-- ASN1START
-- TAG-PLMNIDENTITYLIST2-START
```

```
PLMN-IdentityList2-r16 ::= SEQUENCE (SIZE (1..16)) OF PLMN-Identity
```

```
-- TAG-PLMNIDENTITYLIST2-STOP
-- ASN1STOP
```

## — *PRB-Id*

The IE *PRB-Id* identifies a Physical Resource Block (PRB) position within a carrier.

***PRB-Id* information element**

```
-- ASN1START
-- TAG-PRB-ID-START

PRB-Id ::= INTEGER (0..maxNrofPhysicalResourceBlocks-1)

-- TAG-PRB-ID-STOP
-- ASN1STOP
```

***PTRS-DownlinkConfig***

The IE *PTRS-DownlinkConfig* is used to configure downlink phase tracking reference signals (PTRS) (see TS 38.214 [19] clause 5.1.6.3)

***PTRS-DownlinkConfig* information element**

```
-- ASN1START
-- TAG-PTRS-DOWNLINKCONFIG-START

PTRS-DownlinkConfig ::= SEQUENCE {
 frequencyDensity OPTIONAL, -- Need S
 timeDensity OPTIONAL, -- Need S
 epre-Ratio OPTIONAL, -- Need S
 resourceElementOffset OPTIONAL, -- Need S
 ...
 [[
 maxNrofPorts-r16 OPTIONAL -- Need R
]]
}
```

-- TAG-PTRS-DOWNLINKCONFIG-STOP
-- ASN1STOP

| <b><i>PTRS-DownlinkConfig</i> field descriptions</b> |                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>epre-Ratio</i></b>                             | EPRE ratio between PTRS and PDSCH. Value 0 corresponds to the codepoint "00" in tables 4.1-2 and 4.1-2A. Value 1 corresponds to codepoint "01", and so on. If the field is not provided, the UE applies value 0 (see TS 38.214 [19], clause 4.1).                                                                                           |
| <b><i>frequencyDensity</i></b>                       | Presence and frequency density of DL PT-RS as a function of Scheduled BW. If the field is absent, the UE uses K_PT-RS = 2 (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-2).                                                                                                                                                            |
| <b><i>maxNrofPorts</i></b>                           | The maximum number of DL PTRS ports specified in TS 38.214 [19] (clause 5.1.6.3). 2 PT-RS ports can only be configured for a DL BWP that is configured, as specified in TS 38.214 [19] clause 5.1, with a mode where a single PDSCH has association between the DM-RS ports and the TCI states as defined in TS 38.214 [19] clause 5.1.6.2. |
| <b><i>resourceElementOffset</i></b>                  | Indicates the subcarrier offset for DL PTRS. If the field is absent, the UE applies the value offset00 (see TS 38.211 [16], clause 7.4.1.2.2).                                                                                                                                                                                              |
| <b><i>timeDensity</i></b>                            | Presence and time density of DL PT-RS as a function of MCS. The value 29 is only applicable for MCS Table 5.1.3.1-1 (TS 38.214 [19]). If the field is absent, the UE uses L_PT-RS = 1 (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-1).                                                                                                |

## – *PTRS-UplinkConfig*

The IE *PTRS-UplinkConfig* is used to configure uplink Phase-Tracking-Reference-Signals (PTRS).

### ***PTRS-UplinkConfig* information element**

```
-- ASN1START
-- TAG-PTRS-UPLINKCONFIG-START

PTRS-UplinkConfig ::= SEQUENCE {
 transformPrecoderDisabled SEQUENCE {

 timeDensity SEQUENCE (SIZE (3)) OF INTEGER (0..29) OPTIONAL, -- Need S
 maxNrofPorts ENUMERATED {n1, n2}, OPTIONAL, -- Need S
 resourceElementOffset ENUMERATED {offset01, offset10, offset11} OPTIONAL, -- Need S
 ptrs-Power ENUMERATED {p00, p01, p10, p11} OPTIONAL, -- Need R
 }
 transformPrecoderEnabled SEQUENCE {
 sampleDensity SEQUENCE (SIZE (5)) OF INTEGER (1..276), OPTIONAL, -- Need S
 timeDensityTransformPrecoding ENUMERATED {d2} OPTIONAL, -- Need R
 }
 ...
 [[
 maxNrofPorts-SDM-r18 ENUMERATED {n1, n2} OPTIONAL, -- Need R
]]
}

-- TAG-PTRS-UPLINKCONFIG-STOP
-- ASN1STOP
```

| <b>PTRS-UplinkConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>frequencyDensity</b>                     | Presence and frequency density of UL PT-RS for CP-OFDM waveform as a function of scheduled BW If the field is absent, the UE uses K_PT-RS = 2 (see TS 38.214 [19], clause 6.1).                                                                                                                         |
| <b>maxNrofPorts, maxNrofPorts-SDM</b>       | The maximum number of UL PTRS ports for CP-OFDM (see TS 38.214 [19], clause 6.2.3.1).                                                                                                                                                                                                                   |
| <b>ptrs-Power</b>                           | UL PTRS power boosting factor per PTRS port (see TS 38.214 [19], clause 6.1, table 6.2.3.1.3).                                                                                                                                                                                                          |
| <b>resourceElementOffset</b>                | Indicates the subcarrier offset for UL PTRS for CP-OFDM. If the field is absent, the UE applies the value offset00 (see TS 38.211 [16], clause 6.4.1.2.2).                                                                                                                                              |
| <b>sampleDensity</b>                        | Sample density of PT-RS for DFT-s-OFDM, pre-DFT, indicating a set of thresholds T={NRBn, n=0,1,2,3,4}, that indicates dependency between presence of PT-RS and scheduled BW and the values of X and K the UE should use depending on the scheduled BW, see TS 38.214 [19], clause 6.1, table 6.2.3.2-1. |
| <b>timeDensity</b>                          | Presence and time density of UL PT-RS for CP-OFDM waveform as a function of MCS If the field is absent, the UE uses L_PT-RS = 1 (see TS 38.214 [19], clause 6.1).                                                                                                                                       |
| <b>timeDensityTransformPrecoding</b>        | Time density (OFDM symbol level) of PT-RS for DFT-s-OFDM. If the field is absent, the UE applies value d1 (see TS 38.214 [19], clause 6.1).                                                                                                                                                             |
| <b>transformPrecoderDisabled</b>            | Configuration of UL PTRS without transform precoder (with CP-OFDM).                                                                                                                                                                                                                                     |
| <b>transformPrecoderEnabled</b>             | Configuration of UL PTRS with transform precoder (DFT-S-OFDM).                                                                                                                                                                                                                                          |

## – PUCCH-Config

The IE *PUCCH-Config* is used to configure UE specific PUCCH parameters (per BWP).

### **PUCCH-Config** information element

```
-- ASN1START
-- TAG-PUCCH-CONFIG-START

PUCCH-Config ::= SEQUENCE {
 resourceSetToAddModList SEQUENCE (SIZE (1..maxNrofPUCCH-ResourceSets)) OF PUCCH-ResourceSet OPTIONAL, -- Need N

| <b><i>dl-DataToUL-ACK, dl-DataToUL-ACK-DCI-1-2</i></b>                             | List of timing for given PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK</i> applies to DCI format 1_1 and the field <i>dl-DataToUL-ACK-DCI-1-2</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3). The <i>dl-DataToUL-ACK-v1700</i> is applicable for NTN and <i>dl-DataToUL-ACK-r17</i> is applicable for FR2-2. The <i>dl-DataToUL-ACK-r18</i> is applicable for ATG. If <i>dl-DataToUL-ACK-r16</i> or <i>dl-DataToUL-ACK-r17</i> or <i>dl-DataToUL-ACK-v1700</i> or <i>dl-DataToUL-ACK-r18</i> is signalled, UE shall ignore the <i>dl-DataToUL-ACK</i> (without suffix). The value -1 corresponds to "inapplicable value" for the case where the A/N feedback timing is not explicitly included at the time of scheduling PDSCH. The fields <i>dl-DataToUL-ACK-r17</i> and <i>dl-DataToUL-ACK-DCI-1-2-r17</i> are only applicable for SCS of 480 kHz or 960 kHz. The field <i>dl-DataToUL-ACK-r18</i> applies to DCI format 1_1 and the field <i>dl-DataToUL-ACK-DCI-1-2-r18</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3). |
| <b><i>dl-DataToUL-ACK-MulticastDCI-Format4-1</i></b>                               | List of timing for given group-common PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK-MulticastDciFormat4-1</i> applies to DCI format 4_1 for MBS multicast (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>dmrs-BundlingPUCCH-Config</i></b>                                            | Configuration of the parameters for DMRS bundling for PUCCH (see TS 38.214 [19], clause 6.1.7). DMRS bundling for PUCCH is not supported for PUCCH format 0/2. In this release, this is not applicable to FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

This field is not configured if <i>ul-powerControl</i> is configured in the <i>BWP-UplinkDedicated</i> in which the <i>PUCCH-Config</i> is included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>pucch-PowerControl</i></b>                                                   | Configures power control parameters PUCCH transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>resourceGroupToAddModList, resourceGroupToReleaseList</i></b>                | Lists for adding and releasing groups of PUCCH resources that can be updated simultaneously for spatial relations with a MAC CE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>resourceSetToAddModList, resourceSetToReleaseList</i></b>                    | Lists for adding and releasing PUCCH resource sets (see TS 38.213 [13], clause 9.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>resourceToAddModList, resourceToAddModListExt, resourceToReleaseList</i></b> | Lists for adding and releasing PUCCH resources applicable for the UL BWP and serving cell in which the <i>PUCCH-Config</i> is defined. The resources defined herein are referred to from other parts of the configuration to determine which resource the UE shall use for which report. If the network includes of <i>resourceToAddModListExt</i> , it includes the same number of entries, and listed in the same order, as in <i>resourceToAddModList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

***secondTPCFieldDCI-1-1, secondTPCFieldDCI-1-2***

A second TPC field can be configured via RRC for DCI-1-1 and DCI-1-2. Each TPC field is for each closed-loop index value respectively (i.e., 1st /2nd TPC fields correspond to "closedLoopIndex" value = 0 and 1).

***spatialRelationInfoToAddModList, spatialRelationInfoToAddModListSizeExt, spatialRelationInfoToAddModListExt***

Configuration of the spatial relation between a reference RS and PUCCH. Reference RS can be SSB/CSI-RS/SRS. If the list has more than one element, MAC-CE selects a single element (see TS 38.321 [3], clause 5.18.8 and TS 38.213 [13], clause 9.2.2). The UE shall consider entries in *spatialRelationInfoToAddModList* and in *spatialRelationInfoToAddModListSizeExt* as a single list, i.e. an entry created using *spatialRelationInfoToAddModList* can be modified using *spatialRelationInfoToAddModListSizeExt* (or deleted using *spatialRelationInfoToReleaseListSizeExt*) and vice-versa. If the network includes *spatialRelationInfoToAddModListExt*, it includes the same number of entries, and listed in the same order, as in the concatenation of *spatialRelationInfoToAddModList* and of *spatialRelationInfoToAddModListSizeExt*. If *unifiedTCI-StateType* is configured for the serving cell, no element in this list is configured.

***spatialRelationInfoToReleaseList, spatialRelationInfoToReleaseListSizeExt, spatialRelationInfoToReleaseListExt***

Lists of spatial relation configurations between a reference RS and PUCCH to be released by the UE.

***sps-PUCCH-AN-List***

Indicates a list of PUCCH resources for DL SPS HARQ ACK. The field *maxPayloadSize* is absent for the first and the last *SPS-PUCCH-AN* in the list. If configured, this overrides *n1PUCCH-AN* in *SPS-config*.

***sps-PUCCH-AN-ListMulticast***

The field is used to configure the list of PUCCH resources per HARQ ACK codebook for MBS multicast.

***subslotLengthForPUCCH***

Indicates the sub-slot length for sub-slot based PUCCH feedback in number of symbols (see TS 38.213 [13], clause 9). Value *n2* corresponds to 2 symbols, value *n6* corresponds to 6 symbols, value *n7* corresponds to 7 symbols. For normal CP, the value is either *n2* or *n7*. For extended CP, the value is either *n2* or *n6*.

***ul-AccessConfigListDCI-1-1, ul-AccessConfigListDCI-1-2***

List of the combinations of cyclic prefix extension and UL channel access type (see TS 38.212 [17], clause 7.3.1) applicable, respectively, to DCI format 1\_1 and DCI format 1\_2. The fields *ul-AccessConfigListDCI-1-1-r16* and *ul-AccessConfigListDCI-1-2-r17* are only applicable for FR1 (see TS 38.212 [17], Table 7.3.1.2.2-6). The field *ul-AccessConfigListDCI-1-1-r17* indicates a list which only contains UL channel access types and is only applicable for FR2-2 (see TS 38.212 [17], Table 7.3.1.2.2-6A).

***PUCCH-format3 field descriptions******nrofPRBs***

The supported values are 1,2,3,4,5,6,8,9,10,12,15 and 16. The UE shall ignore this field when *format-v1610* is configured.

| <b>PUCCH-FormatConfig, PUCCH-FormatConfigExt field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalDMRS</b>                                               | If the field is present, the UE enables 2 DMRS symbols per hop of a PUCCH Format 3 or 4 if both hops are more than X symbols when FH is enabled (X=4). And it enables 4 DMRS symbols for a PUCCH Format 3 or 4 with more than 2X+1 symbols when FH is disabled (X=4). The field is not applicable for format 0, 1 and 2. See TS 38.213 [13], clause 9.2.2.                                                                                                |
| <b>interslotFrequencyHopping</b>                                    | If the field is present, the UE enables inter-slot frequency hopping when PUCCH Format 0, 1, 2, 3 or 4 is repeated over multiple slots. For a PUCCH over multiple slots, the intra and inter slot frequency hopping cannot be enabled at the same time for a UE. See TS 38.213 [13], clause 9.2.6.                                                                                                                                                        |
| <b>maxCodeRate</b>                                                  | Max coding rate to determine how to feedback UCI on PUCCH for format 2, 3 or 4. The field is not applicable for format 0 and 1. See TS 38.213 [13], clause 9.2.5.                                                                                                                                                                                                                                                                                         |
| <b>maxCodeRateLP</b>                                                | Max coding rate to determine how to feedback UCI on PUCCH for format 2, 3 or 4. The field is not applicable for format 0 and 1. This field configures additional max code rate in the second entry of <i>PUCCH-ConfigurationList-r16</i> for multiplexing low-priority (LP) HARQ-ACK and high-priority (HP) UCI in a PUCCH as described Clause 9.2.5.3 of TS 38.213 [13]. The field is absent for the first entry of <i>PUCCH-ConfigurationList-r16</i> . |
| <b>nrofSlots</b>                                                    | Number of slots with the same PUCCH. When the field is absent the UE applies the value <i>n1</i> . See TS 38.213 [13], clause 9.2.6.                                                                                                                                                                                                                                                                                                                      |
| <b>pi2BPSK</b>                                                      | If the field is present, the UE uses pi/2 BPSK for UCI symbols instead of QPSK for PUCCH. The field is not applicable for format 0, 1 and 2. See TS 38.213 [13], clause 9.2.5.                                                                                                                                                                                                                                                                            |
| <b>rb-SetIndex</b>                                                  | Indicates the RB set where PUCCH resource is allocated.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>simultaneousHARQ-ACK-CSI</b>                                     | If the field is present, the UE uses simultaneous transmission of CSI and HARQ-ACK feedback with or without SR with PUCCH Format 2, 3 or 4. See TS 38.213 [13], clause 9.2.5. When the field is absent the UE applies the value <i>off</i> . The field is not applicable for format 0 and 1.                                                                                                                                                              |

| <b>PUCCH-Resource, PUCCH-ResourceExt field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>applyIndicatedTCI-State</b>                              | This field indicates, for PUCCH transmission(s) corresponding to this PUCCH resource, if UE applies the first, the second or both "indicated" UL only TCI or joint TCI as specified in TS 38.213 9.2.2. For PUCCH resources belonging to a PUCCH group, network configures same value.                                                                                                                                                                                                                                                                                  |
| <b>format</b>                                               | Selection of the PUCCH format (format 0 – 4) and format-specific parameters, see TS 38.213 [13], clause 9.2. <i>format0</i> and <i>format1</i> are only allowed for a resource in a first PUCCH resource set. <i>format2</i> , <i>format3</i> and <i>format4</i> are only allowed for a resource in non-first PUCCH resource set. The network can only configure <i>format-v1610</i> when format is set to <i>format2</i> or <i>format3</i> . The network only configures <i>format-v1700</i> when format is set to <i>format0</i> , <i>format1</i> or <i>format4</i> . |
| <b>interlace0</b>                                           | This is the only interlace of interlaced PUCCH Format 0 and 1 and the first interlace for interlaced PUCCH Format 2 and 3.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interlace1</b>                                           | A second interlace, in addition to interlace 0, as specified in TS 38.213 [13], clause 9.2.1. For 15kHz SCS, values {0..9} are applicable; for 30kHz SCS, values {0..4} are applicable. For 15kHz SCS, the values of <i>interlace1</i> shall satisfy <i>interlace1</i> =mod( <i>interlace0</i> +X,10) where X=1, -1, or 5.                                                                                                                                                                                                                                              |
| <b>intraSlotFrequencyHopping</b>                            | Enabling intra-slot frequency hopping, applicable for all types of PUCCH formats. For long PUCCH over multiple slots, the intra and inter slot frequency hopping cannot be enabled at the same time for a UE. See TS 38.213 [13], clause 9.2.1.                                                                                                                                                                                                                                                                                                                         |
| <b>nrofPRBs</b>                                             | Indicates the number of PRBs used per PUCCH resource for the PUCCH format, see TS 38.213 [13], clause 9.2.1. This field is applicable for PUCCH <i>format0</i> , <i>format1</i> , and <i>format4</i> in FR2-2. The supported values for <i>format4</i> are 1,2,3,4,5,6,8,9,10,12,15 and 16.                                                                                                                                                                                                                                                                             |
| <b>multipaneISFN-Scheme</b>                                 | Parameter to configure multiple panel simultaneous uplink transmission SFN scheme for PUCCH resources, see TS 38.214 [19] clause 6.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>occ-Index</b>                                            | Indicates the orthogonal cover code index (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>occ-Length</b>                                           | Indicates the orthogonal cover code length (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>pucch-RepetitionNrofSlots</b>                            | Configuration of PUCCH repetition factor per PUCCH resource with associated scheduling DCI corresponding to Rel-17 dynamic PUCCH repetition. For a PUCCH resource, if both the field <i>pucch-RepetitionNrofSlots</i> and the field <i>nrofSlots</i> are present, the field <i>nrofSlots</i> is ignored and apply the value of <i>pucch-RepetitionNrofSlots</i> corresponding to Rel-17 dynamic PUCCH repetition. If this field is absent in a PUCCH resource with associated scheduling DCI, the UE applies the value of field <i>nrofSlots</i> .                      |
| <b>pucch-ResourceId</b>                                     | Identifier of the PUCCH resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>secondHopPRB</b>                                         | Index of first PRB after frequency hopping of PUCCH. This value is applicable for intra-slot frequency hopping (see TS 38.213 [13], clause 9.2.1) or inter-slot frequency hopping (see TS 38.213 [13], clause 9.2.6).                                                                                                                                                                                                                                                                                                                                                   |

| <b>PUCCH-ResourceSet field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxPayloadSize</b>                       | Maximum number of UCI information bits that the UE may transmit using this PUCCH resource set (see TS 38.213 [13], clause 9.2.1). In a PUCCH occurrence, the UE chooses the first of its <i>PUCCH-ResourceSet</i> which supports the number of bits that the UE wants to transmit. The field is absent in the first set (Set0) and in the last configured set since the UE derives the maximum number of UCI information bits as specified in TS 38.213 [13], clause 9.2.1. This field can take integer values that are multiples of 4.                                                                                                                                              |
| <b>resourceList</b>                         | PUCCH resources of <i>format0</i> and <i>format1</i> are only allowed in the first PUCCH resource set, i.e., in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> = 0. This set may contain between 1 and 32 resources. PUCCH resources of <i>format2</i> , <i>format3</i> and <i>format4</i> are only allowed in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> > 0. If present, these sets contain between 1 and 8 resources each. The UE chooses a <i>PUCCH-Resource</i> from this list as specified in TS 38.213 [13], clause 9.2.3. Note that this list contains only a list of resource IDs. The actual resources are configured in <i>PUCCH-Config</i> . |

| Conditional Presence | Explanation                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Pi2-BPSK</i>      | The field is optionally present, Need R, if <i>format3</i> and/or <i>format4</i> are configured and <i>pi2BPSK</i> is configured in each of them. It is absent, Need R otherwise. |

## – *PUCCH-ConfigCommon*

The IE *PUCCH-ConfigCommon* is used to configure the cell specific PUCCH parameters.

| <b>PUCCH-ConfigCommon field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalPRBOffset</b>                   | When intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is disabled, each common PUCCH resource is mapped to a single PRB on one side of the UL BWP. This parameter determines an additional PRB offset in the PRB mapping for the PUCCH resource. If the field is not configured, the UE shall assume an additional PRB offset of zero.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>hoppingId</b>                             | Cell-specific scrambling ID for group hopping and sequence hopping if enabled, see TS 38.211 [16], clause 6.3.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>intra-SlotFH-r17</b>                      | In case a separate initial UL BWP is configured for (e)RedCap UEs, the presence of this parameter indicates whether intra-slot PUCCH frequency hopping within the separate initial UL BWP in the common PUCCH resource is enabled for (e)RedCap UEs. If this field is absent, intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is enabled. If this field is present, intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is disabled and each PUCCH resource is mapped to a single PRB on one side of the UL BWP and this parameter determines whether the PRB index in the PRB mapping is counted in increasing order from the lower edge or in decreasing order from the upper edge of the UL BWP. |
| <b>nrofPRBs</b>                              | Indicates the number of PRBs used per PUCCH resource for PUCCH format 0 and format 1 in FR2-2, see TS 38.213 [13], clause 9.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>p0-nominal</b>                            | Power control parameter P0 for PUCCH transmissions. Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pucch-GroupHopping</b>                    | Configuration of group- and sequence hopping for all the PUCCH formats 0, 1, 3 and 4. Value <i>neither</i> implies neither group or sequence hopping is enabled. Value <i>enable</i> enables group hopping and disables sequence hopping. Value <i>disable</i> disables group hopping and enables sequence hopping (see TS 38.211 [16], clause 6.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>pucch-ResourceCommon</b>                  | An entry into a 16-row table where each row configures a set of cell-specific PUCCH resources/parameters. The UE uses those PUCCH resources until it is provided with a dedicated <i>PUCCH-Config</i> (e.g. during initial access) on the initial uplink BWP. Once the network provides a dedicated <i>PUCCH-Config</i> for that bandwidth part the UE applies that one instead of the one provided in this field (see TS 38.213 [13], clause 9.2).                                                                                                                                                                                                                                                                                               |
| <b>pucch-ResourceCommonRedCap</b>            | An entry into a 16-row table where each row configures a set of cell-specific PUCCH resources/parameters for (e)RedCap UEs. The UE uses those PUCCH resources until it is provided with a dedicated <i>PUCCH-Config</i> (e.g. during initial access) on the initial uplink BWP. Once the network provides a dedicated <i>PUCCH-Config</i> for that bandwidth part the UE applies that one instead of the one provided in this field (see TS 38.213 [13], clause 9.2).                                                                                                                                                                                                                                                                             |

| Conditional Presence         | Explanation                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InitialBWP-Only</i>       | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the initial BWP (BWP#0) in SIB1. It is absent in other BWPs including the RedCap-specific initial uplink BWP, if configured.                                                             |
| <i>InitialBWP-RedCap</i>     | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is optional present, Need R, in the <i>PUCCH-ConfigCommon</i> of the initial BWP configured by <i>initialUplinkBWP</i> . It is absent in other BWPs. |
| <i>InitialBWP-RedCapOnly</i> | The field is optional present, Need S, in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is absent in other BWPs.                                                                                                                     |

## – *PUCCH-ConfigurationList*

The IE *PUCCH-ConfigurationList* is used to configure UE specific PUCCH parameters (per BWP) for two simultaneously constructed HARQ-ACK codebooks. See TS 38.213 [13], clause 9.1.

### PUCCH-ConfigurationList information element

```
-- ASN1START
-- TAG-PUCCH-CONFIGURATIONLIST-START

PUCCH-ConfigurationList-r16 ::= SEQUENCE (SIZE (1..2)) OF PUCCH-Config

-- TAG-PUCCH-CONFIGURATIONLIST-STOP
-- ASN1STOP
```

- **PUCCH-CSI-Resource**

The IE *PUCCH-CSI-Resource* is used to indicate a PUCCH resource to use for reporting on PUCCH.

### PUCCH-CSI-Resource information element

```
-- ASN1START
-- TAG-PUCCH-CSI-RESOURCE-START

PUCCH-CSI-Resource ::= SEQUENCE {
 uplinkBandwidthPartId,
 pucch-Resource
}

-- TAG-PUCCH-CSI-RESOURCE-STOP
-- ASN1STOP
```

| <b>PUCCH-CSI-Resource field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pucch-Resource</b>                        | PUCCH resource for the associated uplink BWP. Only PUCCH-Resource of format 2, 3 and 4 is supported. The actual PUCCH-Resource is configured in <i>PUCCH-Config</i> and referred to by its ID. When two <i>PUCCH-Config</i> are configured within <i>PUCCH-ConfigurationList</i> , <i>PUCCH-ResourceId</i> in a <i>PUCCH-CSI-Resource</i> refers to a PUCCH-Resource in the <i>PUCCH-Config</i> used for HARQ-ACK with low priority. |

- **PUCCH-PathlossReferenceRS-Id**

The IE *PUCCH-PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUCCH pathloss reference (see TS 38.213 [13], clause 7.2).

### PUCCH-PathlossReferenceRS-Id information element

```
-- ASN1START
-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-START

PUCCH-PathlossReferenceRS-Id ::= INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1)
PUCCH-PathlossReferencRS-Id-v1610 ::= INTEGER (maxNrofPUCCH-PathlossReferenceRSs..maxNrofPUCCH-PathlossReferenceRSs-1-r16)
```

```
PUCCH-PathlossReferenceRS-Id-r17 ::= INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1-r17)
-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-STOP
-- ASN1STOP
```

## - *PUCCH-PowerControl*

The IE *PUCCH-PowerControl* is used to configure UE-specific parameters for the power control of PUCCH.

### ***PUCCH-PowerControl* information element**

```
-- ASN1START
-- TAG-PUCCH-POWERCONTROL-START
PUCCH-PowerControl ::= SEQUENCE {
 deltaF-PUCCH-f0 OPTIONAL, -- Need R
 deltaF-PUCCH-f1 OPTIONAL, -- Need R
 deltaF-PUCCH-f2 OPTIONAL, -- Need R
 deltaF-PUCCH-f3 OPTIONAL, -- Need R
 deltaF-PUCCH-f4 OPTIONAL, -- Need R
 p0-Set OPTIONAL, -- Need M
 pathlossReferenceRSs OPTIONAL, -- Need M
 twoPUCCH-PC-AdjustmentStates ENUMERATED {twoStates} OPTIONAL, -- Need S
 ...
 [
 pathlossReferenceRSs-v1610 SetupRelease { PathlossReferenceRSs-v1610 } OPTIONAL -- Need M
]
}

P0-PUCCH ::= SEQUENCE {
 p0-PUCCH-Id,
 p0-PUCCH-Value
}

P0-PUCCH-Id ::= INTEGER (1..8)

PathlossReferenceRSs-v1610 ::= SEQUENCE (SIZE (1..maxNrofPUCCH-PathlossReferenceRSsDiff-r16)) OF PUCCH-PathlossReferenceRS-r16

PUCCH-PathlossReferenceRS ::= SEQUENCE {
 pucch-PathlossReferenceRS-Id,
 referenceSignal,
 ssb-Index,
 csi-RS-Index
}

PUCCH-PathlossReferenceRS-r16 ::= SEQUENCE {
 pucch-PathlossReferenceRS-Id-r16,
 referenceSignal-r16,
 ssb-Index-r16
}
```

```

 csi-RS-Index-r16
}
}

PUCCH-PowerControlSetInfo-r17 ::= SEQUENCE {
 pucch-PowerControlSetInfoId-r17,
 p0-PUCCH-Id-r17,
 pucch-ClosedLoopIndex-r17
 pucch-PathlossReferenceRS-Id-r17
}

PUCCH-PowerControlSetInfoId-r17 ::= INTEGER (1.. maxNrofPowerControlSetInfos-r17)

-- TAG-PUCCH-POWERCONTROL-STOP

| <b>deltaF-PUCCH-f4</b>                                  | deltaF for PUCCH format 4 with 1dB step size (see TS 38.213 [13], clause 7.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>p0-Set</b>                                           | A set with dedicated P0 values for PUCCH, i.e., {P01, P02,... } (see TS 38.213 [13], clause 7.2). This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pathlossReferenceRSs, pathlossReferenceRSs-v1610</b> | A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUCCH pathloss estimation. Up to <i>maxNrofPUCCH-PathlossReference-RSs</i> may be configured. If the field is not configured, the UE uses the SSB as reference signal (see TS 38.213 [13], clause 7.2). The set includes Reference Signals indicated in <i>pathlossReferenceRSs</i> (without suffix) and in <i>pathlossReferenceRSs-v1610</i> . The UE maintains <i>pathlossReferenceRSs</i> and <i>pathlossReferenceRSs-v1610</i> separately: Receiving <i>pathlossReferenceRSs-v1610</i> set to <i>release</i> releases only the entries that were configured by <i>pathlossReferenceRSs-v1610</i> , and receiving <i>pathlossReferenceRSs-v1610</i> set to <i>setup</i> replaces only the entries that were configured by <i>pathlossReferenceRSs-v1610</i> with the newly signalled entries. Neither the field <i>pathlossReferenceRSs</i> (without suffix) nor <i>pathlossReferenceRSs-v1610</i> are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell. |
| <b>twoPUCCH-PC-AdjustmentStates</b>                     | Number of PUCCH power control adjustment states maintained by the UE (i.e., g(i)). If the field is present (n2) the UE maintains two power control states (i.e., g(i,0) and g(i,1)). If the field is absent, it maintains one power control state (i.e., g(i,0)) (see TS 38.213 [13], clause 7.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

– *PUCCH-SpatialRelationInfo*

The IE *PUCCH-SpatialRelationInfo* is used to configure the spatial setting for PUCCH transmission and the parameters for PUCCH power control, see TS 38.213, [13], clause 9.2.2.

***PUCCH-SpatialRelationInfo* information element**

```
-- ASN1START
-- TAG-PUCCH-SPATIALRELATIONINFO-START

PUCCH-SpatialRelationInfo ::= SEQUENCE {
 pucch-SpatialRelationInfoId,
 servingCellId
 CHOICE {
 SSB-Index,
 NZP-CSI-RS-ResourceId,
 PUCCH-SRS
 },
 pucch-PathlossReferenceRS-Id
 PUCCH-PathlossReferenceRS-Id,
 P0-PUCCH-Id,
 closedLoopIndex
 }
}

PUCCH-SpatialRelationInfoExt-r16 ::= SEQUENCE {
 pucch-SpatialRelationInfoId-v1610
 pucch-PathlossReferenceRS-Id-v1610
 ...
}

PUCCH-SRS ::= SEQUENCE {
 resource
 uplinkBWP
}

-- TAG-PUCCH-SPATIALRELATIONINFO-STOP
-- ASN1STOP
```

***PUCCH-SpatialRelationInfo* field descriptions**

***pucch-PathLossReferenceRS-Id***

When *pucch-PathLossReferenceRS-Id-v1610* is configured, the UE shall ignore *pucch-PathLossReferenceRS-Id* (without suffix).

***pucch-SpatialRelationInfoId***

When *pucch-SpatialRelationInfoId-v1610* is configured, the UE shall ignore *pucch-SpatialRelationInfoId* (without suffix). If *pucch-SpatialRelationInfoId-v1610* is absent, the UE shall use the *pucch-SpatialRelationInfoId* (without suffix).

***servingCellId***

If the field is absent, the UE applies the *ServCellId* of the serving cell in which this *PUCCH-SpatialRelationInfo* is configured

- **PUCCH-SpatialRelationInfo-Id**

The IE *PUCCH-SpatialRelationInfo-Id* is used to identify a *PUCCH-SpatialRelationInfo*

#### ***PUCCH-SpatialRelationInfo-Id* information element**

```
-- ASN1START
-- TAG-PUCCH-SPATIALRELATIONINFO-START

PUCCH-SpatialRelationInfoId ::= INTEGER (1..maxNrofSpatialRelationInfos)
PUCCH-SpatialRelationInfoId-r16 ::= INTEGER (1..maxNrofSpatialRelationInfos-r16)
PUCCH-SpatialRelationInfoId-v1610 ::= INTEGER (maxNrofSpatialRelationInfos-plus-1..maxNrofSpatialRelationInfos-r16)

-- TAG-PUCCH-SPATIALRELATIONINFO-STOP
-- ASN1STOP
```

- **PUCCH-TPC-CommandConfig**

The IE *PUCCH-TPC-CommandConfig* is used to configure the UE for extracting TPC commands for PUCCH from a group-TPC messages on DCI.

#### ***PUCCH-TPC-CommandConfig* information element**

| <b>frequencyHopping</b>                                                           | The value <i>intraSlot</i> enables 'Intra-slot frequency hopping' and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. If the field is absent, frequency hopping is not configured for 'pusch-RepTypeA' (see TS 38.214 [19], clause 6.3). The field <i>frequencyHopping</i> applies to DCI formats 0_0, 0_1 and 0_3 for 'pusch-RepTypeA'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>frequencyHoppingDCI-0-1</b>                                                    | Indicates the frequency hopping scheme for DCI format 0_1 when <i>pusch-RepTypeIndicatorDCI-0-1</i> is set to 'pusch-RepTypeB', The value <i>interRepetition</i> enables 'Inter-repetition frequency hopping', and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. If the field is absent, frequency hopping is not configured for DCI format 0_1 for 'pusch-RepTypeB' (see TS 38.214 [19], clause 6.1).                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>frequencyHoppingDCI-0-2</b>                                                    | Indicate the frequency hopping scheme for DCI format 0_2. The value <i>intraSlot</i> enables 'intra-slot frequency hopping', and the value <i>interRepetition</i> enables 'Inter-repetition frequency hopping', and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. When <i>pusch-RepTypeIndicatorDCI-0-2</i> is not set to 'pusch-RepTypeB', the frequency hopping scheme can be chosen between 'intra-slot frequency hopping and 'inter-slot frequency hopping' if enabled. When <i>pusch-RepTypeIndicatorDCI-0-2</i> is set to 'pusch-RepTypeB', the frequency hopping scheme can be chosen between 'inter-repetition frequency hopping' and 'inter-slot frequency hopping' if enabled. If the field is absent, frequency hopping is not configured for DCI format 0_2 (see TS 38.214 [19], clause 6.3). |
| <b>frequencyHoppingOffsetLists, frequencyHoppingOffsetListsDCI-0-2</b>            | Set of frequency hopping offsets used when frequency hopping is enabled for granted transmission (not msg3) and type 2 configured grant activation (see TS 38.214 [19], clause 6.3). The field <i>frequencyHoppingOffsetLists</i> applies to DCI formats 0_0, 0_1 and 0_3, and the field <i>frequencyHoppingOffsetListsDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.3).                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>harq-ProcessNumberSizeDCI-0-2</b>                                              | Configure the number of bits for the field "HARQ process number" in DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>invalidSymbolPattern</b>                                                       | Indicates one pattern for invalid symbols for PUSCH transmission repetition type B applicable to both DCI format 0_1 and 0_2. If <i>InvalidSymbolPattern</i> is not configured, semi-static flexible symbols are used for PUSCH. Segmentation occurs only around semi-static DL symbols (see TS 38.214 [19] clause 6.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>invalidSymbolPatternIndicatorDCI-0-1, invalidSymbolPatternIndicatorDCI-0-2</b> | Indicates the presence of an additional bit in the DCI format 0_1/0_2. If <i>invalidSymbolPattern</i> is absent, then both <i>invalidSymbolPatternIndicatorDCI-0-1</i> and <i>invalidSymbolPatternIndicatorDCI-0-2</i> are absent. The field <i>invalidSymbolPatternIndicatorDCI-0-1</i> applies to the DCI format 0_1 and the field <i>invalidSymbolPatternIndicatorDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19] clause 6.1). If the field is absent, the UE behaviour is specified in TS 38.214 [19], clause 6.1.2.1.                                                                                                                                                                                                                                                                                           |
| <b>mappingPattern</b>                                                             | Indicates whether the UE should follow Cyclical mapping pattern or Sequential mapping pattern for when two SRS resource sets are configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' for PUSCH transmission and the PUSCH transmission occasions are associated with both SRS resource sets.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>maxRank, maxRankDCI-0-2</b>                                                    | Subset of PMIs addressed by TRIs from 1 to ULmaxRank (see TS 38.214 [19], clause 6.1.1.1). The field <i>maxRank</i> applies to DCI formats 0_1 and 0_3, and the field <i>maxRankDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.1.1). If network configures <i>maxRank-v1810</i> UE ignores <i>maxRank</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>mcs-Table, mcs-TableFormat0-2</b>                                              | Indicates which MCS table the UE shall use for PUSCH without transform precoder (see TS 38.214 [19], clause 6.1.4.1). If the field is absent the UE applies the value 64QAM. The field <i>mcs-Table</i> applies to DCI formats 0_0, 0_1 and 0_3, and the field <i>mcs-TableDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>mcs-TableTransformPrecoder, mcs-TableTransformPrecoderDCI-0-2</b>              | Indicates which MCS table the UE shall use for PUSCH with transform precoding (see TS 38.214 [19], clause 6.1.4.1) If the field is absent the UE applies the value 64QAM. The field <i>mcs-TableTransformPrecoder</i> applies to DCI formats 0_0, 0_1 and 0_3, and the field <i>mcs-TableTransformPrecoderDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>minimumSchedulingOffsetK2</b>                                                  | List of minimum K2 values. Minimum K2 parameter denotes minimum applicable value(s) for the <i>Time domain resource assignment table</i> for PUSCH (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

***mpe-ResourcePoolToAddModList***

List of SSB/CSI-RS resources for P-MPR reporting. Each resource is configured with serving cell index where the resource is configured for the UE. The *additionalPCI* is configured only if the resource is SSB. For each resource, if neither *cell* nor *additionalPCI* is present, the SSB/CSI-RS resource is from the serving cell where the *PUSCH-Config* is configured.

***multipanelSchemeSDM***

Configures UE with a multiple panel simultaneous uplink transmission SDM scheme for PUSCH, as specified in TS 38.214 [19], clause 6.1. Network does not configure *multipanelSchemeSDM* with *multipanelSchemeSFN*. When this parameter is configured, two SRS resource sets with *usage* for *codebook* or *noncodebook* are configured in *srs-ResourceSetToAddModList* or *srs-ResourceSetToAddModListDCI-0-2*.

***multipanelSchemeSFN***

Configures UE with a multiple panel simultaneous uplink transmission SFN scheme for PUSCH, as specified in TS 38.214 [19], clause 6.1. Network does not configure *multipanelSchemeSFN* with *multipanelSchemeSDM*. When this parameter is configured, two SRS resource sets with *usage* for *codebook* or *noncodebook* are configured in *srs-ResourceSetToAddModList* or *srs-ResourceSetToAddModListDCI-0-2*.

***numberOfBitsForRV-DCI-0-2***

Configures the number of bits for "Redundancy version" in the DCI format 0\_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 6.1.2.1).

***numberOfInvalidSymbolsForDL-UL-Switching***

Indicates the number of symbols after the last semi-static DL symbol that are invalid symbols for PUSCH repetition Type B. If it is absent, no symbol is explicitly defined for DL-to-UL switching (see TS 38.214 [19], clause 6.1).

***priorityIndicatorDCI-0-1, priorityIndicatorDCI-0-2***

Configures the presence of "priority indicator" in DCI format 0\_1/0\_2. When the field is absent in the IE, then the UE shall apply 0 bit for "Priority indicator" in DCI format 0\_1/0\_2. The field *priorityIndicatorDCI-0-1* applies to DCI format 0\_1 and the field *priorityIndicatorDCI-0-2* applies to DCI format 0\_2 (see TS 38.212 [17] clause 7.3.1 and TS 38.213 [13] clause 9).

***pusch-AggregationFactor***

Number of repetitions for data (see TS 38.214 [19], clause 6.1.2.1). If the field is absent the UE applies the value 1.

***pusch-PowerControl***

Configures power control parameters PUSCH transmission.

***pusch-RepTypeIndicatorDCI-0-1, pusch-RepTypeIndicatorDCI-0-2***

Indicates whether UE follows the behavior for "PUSCH repetition type A" or the behavior for "PUSCH repetition type B" for the PUSCH scheduled by DCI format 0\_1/0\_2 and for Type 2 CG associated with the activating DCI format 0\_1/0\_2. The value *pusch-RepTypeA* enables the 'PUSCH repetition type A' and the value *pusch-RepTypeB* enables the 'PUSCH repetition type B'. The field *pusch-RepTypeIndicatorDCI-0-1* applies to DCI format 0\_1 and the field *pusch-RepTypeIndicatorDCI-0-2* applies to DCI format 0\_2 (see TS 38.214 [19], clause 6.1.2.1).

***pusch-TimeDomainAllocationList***

List of time domain allocations for timing of UL assignment to UL data (see TS 38.214 [19], table 6.1.2.1.1-1). The field *pusch-TimeDomainAllocationList* applies to DCI format 0\_0, or DCI formats 0\_1 and 0\_3 when the field *pusch-TimeDomainAllocationListDCI-0-1* is not configured (see TS 38.214 [19], table 6.1.2.1.1-1 and tables 6.1.2.1.1-1A and 6.1.2.1.1-1C). The network does not configure the *pusch-TimeDomainAllocationList* (without suffix) simultaneously with the *pusch-TimeDomainAllocationListDCI-0-2-r16* or *pusch-TimeDomainAllocationListDCI-0-1-r16* or *pusch-TimeDomainAllocationListForMultiPUSCH-r16*.

***pusch-TimeDomainAllocationListDCI-0-1***

Configuration of the time domain resource allocation (TDRA) table for DCI formats 0\_1 and 0\_3 (see TS 38.214 [19], clause 6.1, tables 6.1.2.1.1-1A and 6.1.2.1.1-1C).

***pusch-TimeDomainAllocationListDCI-0-2***

Configuration of the time domain resource allocation (TDRA) table for DCI format 0\_2 (see TS 38.214 [19], clause 6.1.2, table 6.1.2.1.1-1B).

***pusch-TimeDomainAllocationListForMultiPUSCH***

Configuration of the time domain resource allocation (TDRA) table for multiple PUSCH (see TS 38.214 [19], clause 6.1.2). The network configures at most 64 rows in this TDRA table in *PUSCH-TimeDomainResourceAllocationList-r16* configured by this field. This field is not configured simultaneously with *pusch-AggregationFactor* if *extendedK2* is not configured. The network does not configure the *pusch-TimeDomainAllocationListForMultiPUSCH-r16* simultaneously with the *pusch-TimeDomainAllocationListDCI-0-1-r16*. The network does not configure the *pusch-TimeDomainAllocationListForMultiPUSCH-r16* simultaneously with the *numberOfSlotsTBoMS-r16*.

***rbg-Size***

Selection between configuration 1 and configuration 2 for RBG size for PUSCH except PUSCH scheduled by DCI format 0\_3. The UE does not apply this field if *resourceAllocation* is set to *resourceAllocationType1*. Otherwise, the UE applies the value *config1* when the field is absent (see TS 38.214 [19], clause 6.1.2.2.1).

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Whether UE uses codebook based or non-codebook based transmission (see TS 38.214 [19], clause 6.1.1). If the field is absent, the UE transmits PUSCH on one antenna port, see TS 38.214 [19], clause 6.1.1.                                                                                                                                                                                                                                                                                                                                                           |
| <b>uci-OnPUSCH-ListDCI-0-1, uci-OnPUSCH-ListDCI-0-2</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Configuration for up to 2 HARQ-ACK codebooks specific to DCI format 0_1/0_2. The field <i>uci-OnPUSCH-ListDCI-0-1</i> applies to DCI format 0_1 and the field <i>uci-OnPUSCH-ListDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9.3).                                                                                                                                                                                                                                                                              |
| <b>ul-AccessConfigListDCI-0-1, ul-AccessConfigListDCI-0-2</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| List of the combinations of cyclic prefix extension, channel access priority class (CAPC), and UL channel access type (see TS 38.212 [17], clause 7.3.1) applicable for DCI format 0_1 and DCI format 0_2, respectively. The fields <i>ul-AccessConfigListDCI-0-1-r16</i> and <i>ul-AccessConfigListDCI-0-2-r17</i> are only applicable for FR1 (see TS 38.212 [17], Table 7.3.1.1.2-35). The field <i>ul-AccessConfigListDCI-0-1-r17</i> only contains a list of UL channel access types and is only applicable for FR2-2 (see TS 38.212 [17], Table 7.3.1.1.2-35A). |
| <b>ul-FullPowerTransmission</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Configures the UE with UL full power transmission mode as specified in TS 38.213 [13]. This field is not configured if <i>ul-powerControl</i> is configured in the <i>BWP-UplinkDedicated</i> in which the <i>PUCCH-Config</i> is included.                                                                                                                                                                                                                                                                                                                           |

| <b>PUSCH-ConfigDCI-0-3 field descriptions</b>    |                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>harq-ProcessNumberSizeDCI-0-3</b>             | Configure the number of bits for the field "HARQ process number" in DCI format 0_3 (see TS 38.212 [17], clause 7.3.1).                                                                                                                                                                                                                                       |
| <b>numberOfBitsForRV-DCI-0-3</b>                 | Configures the number of bits for "Redundancy version" in the DCI format 0_3 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                          |
| <b>rbg-SizeDCI-0-3</b>                           | Selection among configuration 1, configuration 2 and configuration 3 for RBG size for PUSCH scheduled by DCI format 0_3. The UE does not apply this field if <i>resourceAllocationDCI-0-3</i> is set to <i>resourceAllocationType1</i> . Otherwise, the UE applies the value <i>config1</i> when the field is absent (see TS 38.214 [19], clause 6.1.2.2.1). |
| <b>resourceAllocationDCI-0-3</b>                 | Configuration of resource allocation type 0 and resource allocation type 1 for DCI format 0_3 (see TS 38.214 [19], clause 6.1.2).                                                                                                                                                                                                                            |
| <b>resourceAllocationType1GranularityDCI-0-3</b> | Configures the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 0_3. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 6.1.2.2.2).                                                                                                               |
| <b>uci-OnPUSCH-ListDCI-0-3</b>                   | Configuration for up to 2 HARQ-ACK codebooks specific to DCI format 0_3 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9.3).                                                                                                                                                                                                                    |

| <b>SDM-Scheme field descriptions</b>  |                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxRankSDM, maxRankSDM-DCI-0-2</b> | configure maximal number of MIMO layers of each panel in SDM scheme for codebook based PUSCH or for DCI 0_2 for codebook based PUSCH. |

| <b>SFN-Scheme field descriptions</b>  |                                                                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxRankSFN, maxRankSFN-DCI-0-2</b> | configure maximal number of MIMO layers of each panel in SFN scheme for codebook based PUSCH or for DCI 0_2 for codebook based PUSCH. |

| <b>UCI-OnPUSCH field descriptions</b> |                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>betaOffsets</b>                    | Selection between and configuration of dynamic and semi-static beta-offset for DCI formats other than DCI format 0_2. If the field is not configured, the UE applies the value 'semiStatic' (see TS 38.213 [13], clause 9.3).                                                                                                                |
| <b>scaling</b>                        | Indicates a scaling factor to limit the number of resource elements assigned to UCI on PUSCH for DCI formats other than DCI format 0_2. Value <i>f0p5</i> corresponds to 0.5, value <i>f0p65</i> corresponds to 0.65, and so on. The value configured herein is applicable for PUSCH with configured grant (see TS 38.212 [17], clause 6.3). |

| <b>UCI-OnPUSCH-DCI-0-2 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>betaOffsetsDCI-0-2</i></b>              | Configuration of beta-offset for DCI format 0_2. If semiStaticDCI-0-2 is chosen, the UE shall apply the value of 0 bit for the field of beta offset indicator in DCI format 0_2. If dynamicDCI-0-2 is chosen, the UE shall apply the value of 1 bit or 2 bits for the field of beta offset indicator in DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9.3). |
| <b><i>dynamicDCI-0-2</i></b>                  | Indicates the UE applies the value 'dynamic' for DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.3).                                                                                                                                                                                                                                                       |
| <b><i>semiStaticDCI-0-2</i></b>               | Indicates the UE applies the value 'semiStatic' for DCI format 0_2. (see TS 38.212 [17], clause 7.3.1 and see TS 38.213 [13], clause 9.3).                                                                                                                                                                                                                                               |
| <b><i>scalingDCI-0-2</i></b>                  | Indicates a scaling factor to limit the number of resource elements assigned to UCI on PUSCH for DCI format 0_2. Value f0p5 corresponds to 0.5, value f0p65 corresponds to 0.65, and so on (see TS 38.212 [17], clause 6.3).                                                                                                                                                             |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>codebookBased</i> | The field is mandatory present if <i>txConfig</i> is set to codebook and absent otherwise.                                                                                                                                                                                                                                             |
| <i>RepTypeB</i>      | The field is optionally present, Need S, if <i>pusch-RepTypeIndicatorDCI-0-1</i> is set to <i>pusch-RepTypeB</i> . It is absent otherwise.                                                                                                                                                                                             |
| <i>RepTypeB2</i>     | The field is optionally present, Need S, if <i>pusch-RepTypeIndicatorDCI-0-1</i> or <i>pusch-RepTypeIndicatorDCI-0-2</i> is set to <i>pusch-RepTypeB</i> . It is absent otherwise.                                                                                                                                                     |
| <i>SRSsets</i>       | This field is mandatory present when UE is configured with two SRS sets in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage codebook or non-codebook and none of <i>multipanelSchemeSDM</i> or <i>multipanelSchemeSFN</i> or <i>sTx-2Panel</i> is configured. It is absent otherwise. |

## – *PUSCH-ConfigCommon*

The IE *PUSCH-ConfigCommon* is used to configure the cell specific PUSCH parameters.

### ***PUSCH-ConfigCommon* information element**

```
-- ASN1START
-- TAG-PUSCH-CONFIGCOMMON-START

PUSCH-ConfigCommon ::= SEQUENCE {
 groupHoppingEnabledTransformPrecoding ENUMERATED {enabled}
 pusch-TimeDomainAllocationList PUSCH-TimeDomainResourceAllocationList

When the field is absent the UE applies the value 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>olpc-ParameterSetDCI-0-1, olpc-ParameterSetDCI-0-2</b>                        | Configures the number of bits for Open-loop power control parameter set indication for DCI format 0_1/0_2 in case SRI is not configured in the DCI. 2 bits is applicable only if SRI is not present in the DCI format 0_1. The field <i>olpc-ParameterSetDCI-0-1</i> applies to DCI format 0_1 and the field <i>olpc-ParameterSetDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 11).                                                                                                                                                              |
| <b>p0-AlphaSets</b>                                                              | Configuration {p0-pusch, alpha} sets for PUSCH (except msg3 and msgA PUSCH), i.e., { {p0,alpha,index1}, {p0,alpha,index2},... } (see TS 38.213 [13], clause 7.1). When no set is configured, the UE uses the P0-nominal for msg3/msgA PUSCH, P0-UE is set to 0 and alpha is set according to either msg3-Alpha or msgA-Alpha (see TS 38.213 [13], clause 7.1). This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                        |
| <b>p0-NominalWithoutGrant</b>                                                    | P0 value for UL grant-free/SPS based PUSCH. Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>p0-PUSCH-SetList</b>                                                          | Configure one additional <i>P0-PUSCH-Set</i> per SRI. If present, the one bit or 2 bits in the DCI is used to dynamically indicate among the P0 value from the existing <i>P0-PUSCH-AlphaSet</i> and the P0 value(s) from the <i>P0-PUSCH-Set</i> (See TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 17).                                                                                                                                                                                                                                                                                   |
| <b>p0-PUSCH-SetList2</b>                                                         | For indicating per-TRP OLPC set in DCI format 0_1/0_2 with the open-loop power control parameter set indication field, a second <i>p0-PUSCH-SetList-r16</i> is used. When this field is present the <i>p0-PUSCH-SetList-r16</i> corresponds to the first SRS resource set (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                       |
| <b>pathlossReferenceRSToAddModList, pathlossReferenceRSToAddModListSizeExt</b>   | A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUSCH path loss estimation. The set consists of Reference Signals configured using <i>pathLossReferenceRSToAddModList</i> and Reference Signals configured using <i>pathlossReferenceRSToAddModListSizeExt</i> . Up to <i>maxNrofPUSCH-PathlossReferenceRSS</i> may be configured (see TS 38.213 [13], clause 7.1). No elements in the list <i>pathLossReferenceRSToAddModList</i> nor <i>pathlossReferenceRSToAddModListSizeExt</i> are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell. |
| <b>pathlossReferenceRSToReleaseList, pathlossReferenceRSToReleaseListSizeExt</b> | Lists of reference signals for PUSCH path loss estimation to be released by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>sri-PUSCH-MappingToAddModList</b>                                             | A list of <i>SRI-PUSCH-PowerControl</i> elements among which one is selected by the SRI field in DCI (see TS 38.213 [13], clause 7.1). No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                     |
| <b>sri-PUSCH-MappingToAddModList2</b>                                            | A list of <i>SRI-PUSCH-PowerControl</i> elements for second SRS-resource set, among which one is selected by the SRI field in DCI (see TS 38.213 [13], clause 7.1). When this field is present the <i>sri-PUSCH-MappingToAddModList</i> corresponds to the first SRS resource set for PUSCH. No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                               |
| <b>tpc-Accumulation</b>                                                          | If enabled, UE applies TPC commands via accumulation. If not enabled, UE applies the TPC command without accumulation. If the field is absent, TPC accumulation is enabled (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>twoPUSCH-PC-AdjustmentStates</b>                                              | Number of PUSCH power control adjustment states maintained by the UE (i.e., $fc(i)$ ). If the field is present ( $n2$ ) the UE maintains two power control states (i.e., $fc(i,0)$ and $fc(i,1)$ ). If the field is absent, it maintains one power control state (i.e., $fc(i,0)$ ) (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                 |

| <b>SRI-PUSCH-PowerControl field descriptions</b> |  |                                                                                                                                       |
|--------------------------------------------------|--|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>sri-P0-PUSCH-AlphaSetId</b>                   |  | The ID of a <i>P0-PUSCH-AlphaSet</i> as configured in <i>p0-AlphaSets</i> in <i>PUSCH-PowerControl</i> .                              |
| <b>sri-PUSCH-ClosedLoopIndex</b>                 |  | The index of the closed power control loop associated with this <i>SRI-PUSCH-PowerControl</i> .                                       |
| <b>sri-PUSCH-PathlossReferenceRS-Id</b>          |  | The ID of <i>PUSCH-PathlossReferenceRS</i> as configured in the <i>pathlossReferenceRSToAddModList</i> in <i>PUSCH-PowerControl</i> . |
| <b>sri-PUSCH-PowerControlId</b>                  |  | The ID of this <i>SRI-PUSCH-PowerControl</i> configuration. It is used as the codepoint (payload) in the SRI DCI field.               |

## – *PUSCH-ServingCellConfig*

The IE *PUSCH-ServingCellConfig* is used to configure UE specific PUSCH parameters that are common across the UE's BWPs of one serving cell.

### *PUSCH-ServingCellConfig* information element

```

|------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>maxCodeBlockGroupsPerTransportBlock</b>                 | Maximum number of code-block-groups (CBGs) per TB (see TS 38.213 [13], clause 9.1). |

| <b>PUSCH-ServingCellConfig field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>codeBlockGroupTransmission</b>                 | Enables and configures code-block-group (CBG) based transmission (see TS 38.214 [19], clause 6.1.5).<br>The network does not configure this field if the SCS of at least one UL BWP configured in the cell is 480 or 960 kHz.                                                                                                                                                                                                            |
| <b>maxMIMO-Layers</b>                             | Indicates the maximum MIMO layer to be used for PUSCH in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets <i>maxRank</i> to the same value. The field <i>maxMIMO-Layers</i> refers to DCI format 0_1. If network configures <i>maxMIMO-Layers-v1810</i> the UE ignores <i>maxMIMO-Layers</i> (without suffix).                                                   |
| <b>maxMIMO-LayersforSDM</b>                       | Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SDM scheme for NCB PUSCH                                                                                                                                                                                                                                                                                                                                |
| <b>maxMIMO-LayersforSDM-DCI-0-2</b>               | Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SDM scheme for DCI format 0_2 for NCB PUSCH                                                                                                                                                                                                                                                                                                             |
| <b>maxMIMO-LayersforSFN</b>                       | Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SFN scheme for NCB PUSCH                                                                                                                                                                                                                                                                                                                                |
| <b>maxMIMO-LayersforSFN-DCI-0-2</b>               | Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SFN scheme for DCI format 0_2 for NCB PUSCH                                                                                                                                                                                                                                                                                                             |
| <b>nrofHARQ-ProcessesForPUSCH</b>                 | The number of HARQ processes to be used on the PUSCH of a serving cell. Value <i>n32</i> corresponds to 32 HARQ processes. If the field is absent, the UE uses 16 HARQ processes (see TS 38.214 [19], clause 6.1).                                                                                                                                                                                                                       |
| <b>processingType2Enabled</b>                     | Enables configuration of advanced processing time capability 2 for PUSCH (see 38.214 [19], clause 6.4).                                                                                                                                                                                                                                                                                                                                  |
| <b>rateMatching</b>                               | Enables LBRM (Limited buffer rate-matching). When the field is absent the UE applies FBRM (Full buffer rate-matchingLBRM) (see TS 38.212 [17], clause 5.4.2).                                                                                                                                                                                                                                                                            |
| <b>xOverhead</b>                                  | If the field is absent, the UE applies the value 0 (see TS 38.214 [19], clause 6.1.4.2).                                                                                                                                                                                                                                                                                                                                                 |
| <b>maxMIMO-LayersDCI-0-2</b>                      | Indicates the maximum MIMO layer to be used for PUSCH for DCI format 0_2 in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets <i>maxRankDCI-0-2</i> to the same value.                                                                                                                                                                                            |
| <b>uplinkHARQ-mode</b>                            | Used to set the HARQ mode per HARQ process ID, see TS 38.321 [3]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. A bit set to one identifies a HARQ process with <i>HARQmodeA</i> and a bit set to zero identifies a HARQ process with <i>HARQ modeB</i> . This field applies for SRBs and DRBs. |

– **PUSCH-TimeDomainResourceAllocationList**

The IE *PUSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PUSCH. *PUSCH-TimeDomainResourceAllocationList* contains one or more of such *PUSCH-TimeDomainResourceAllocations*. The network indicates in the UL grant which of the configured time domain allocations the UE shall apply for that UL grant. The UE determines the bit width of the DCI field based on the number of entries in the *PUSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>extendedK2</i></b>                                         | Corresponds to L1 parameter 'K2' (see TS 38.214 [19], clause 6.1.2.1) configurable per PUSCH allocation. Only values {0..32} are applicable for PUSCH SCS of 120 kHz and for FR1.<br>When the field is absent for the first PUSCH if multiple PUSCH are configured per PDCCH and <i>k2-r16</i> is absent, or when the field is absent and only one PUSCH is configured per PDCCH and <i>k2-r16</i> is absent, the UE applies the value 1 when PUSCH SCS is 15/30 kHz; the value 2 when PUSCH SCS is 60 kHz, the value 3 when PUSCH SCS is 120 kHz, the value 11 when PUSCH SCS is 480 kHz, and the value 21 when PUSCH SCS is 960 kHz. If multiple contiguous PUSCHs are configured per PDCCH, when the field <i>extendedK2(n)</i> corresponding to <i>k2</i> of the PUSCH(s) in the n-th slot ( <i>n&gt;1</i> ), or of the PUSCH(s) except the first PUSCH in the first slot ( <i>n=1</i> ), is absent, the UE applies <i>k2</i> of the first PUSCH plus <i>n-1</i> . |
| <b><i>k2</i></b>                                                 | Corresponds to L1 parameter 'K2' (see TS 38.214 [19], clause 6.1.2.1). When the field is absent the UE applies the value 1 when PUSCH SCS is 15/30 kHz; the value 2 when PUSCH SCS is 60 kHz, and the value 3 when PUSCH SCS is 120 kHz. <i>k2</i> is absent/ignored if <i>extendedK2</i> is present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>length</i></b>                                             | Indicates the length allocated for PUSCH for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>mappingType</i></b>                                        | Mapping type (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>numberOfRepetitions</i></b>                                | Number of repetitions for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1). When <i>numberOfSlotsTBoMS-r17</i> is set to 2, 4 or 8 (i.e. TB processing over multi-slot (TBoMS) PUSCH is enabled), it indicates the number of repetitions of a single TBoMS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>numberOfRepetitionsExt</i></b>                             | Number of repetitions for DCI format 0_1/0_2 if <i>pusch-RepTypeIndicatorDCI-0-1/pusch-RepTypeIndicatorDCI-0-2</i> is not set to <i>pusch-RepTypeB</i> (see TS 38.214 [19], clause 6.1.2.1). If this field is present, the field <i>numberOfRepetitions-r16</i> is ignored for PUSCH repetition Type A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>numberOfSlotsTBoMS</i></b>                                 | Number of slots allocated for TB processing over multi-slot PUSCH for DCI format 0_1/0_2. If a number of repetitions K is configured by <i>numberOfRepetitions</i> or <i>numberOfRepetitionsExt</i> , the network configures <i>numberOfSlotsTBoMS</i> (N) and K such that $N \times K \leq 32$ (see TS 38.214 [19], clause 6.1.2.1). The network does not configure the <i>numberOfSlotsTBoMS-r17</i> simultaneously with the <i>pusch-TimeDomainAllocationListForMultiPUSCH-r16</i> . The network does not configure <i>numberOfSlotsTBoMS-r17</i> together with <i>enhancedSkipUplinkTxDynamic</i> or <i>enhancedSkipUplinkTxConfigured</i> with value <i>true</i> .                                                                                                                                                                                                                                                                                                |
| <b><i>puschAllocationList</i></b>                                | The field <i>puschAllocationList-r16</i> indicates one or multiple PUSCH continuous in time domain which share a common <i>k2</i> (see TS 38.214 [19], clause 6.1.2.1). In this release, this field configures one or multiple PUSCH that may be in consecutive or non-consecutive slots (see TS 38.214 [19], clause 6.1.2.1). The <i>puschAllocationList-r16</i> only has one element in <i>pusch-TimeDomainAllocationListDCI-0-1-r16</i> and in <i>pusch-TimeDomainAllocationListDCI-0-2-r16</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>startSymbol</i></b>                                        | Indicates the index of start symbol for PUSCH for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>startSymbolAndLength</i></b>                               | An index giving valid combinations of start symbol and length (jointly encoded) as start and length indicator (SLIV). The network configures the field so that the allocation does not cross the slot boundary. (see TS 38.214 [19], clause 6.1.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Otherwise, it is optionally present, Need S.                                                                                                                                                                                                                                 |

## – *PUSCH-TPC-CommandConfig*

The IE *PUSCH-TPC-CommandConfig* is used to configure the UE for extracting TPC commands for PUSCH from a group-TPC messages on DCI.

| <b>PUSCH-TPC-CommandConfig field descriptions</b> |                                                                                                                                                                                                   |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>targetCell</b>                                 | The serving cell to which the acquired power control commands are applicable. If the value is absent, the UE applies the TPC commands to the serving cell on which the command has been received. |
| <b>tpc-Index</b>                                  | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |
| <b>tpc-IndexSUL</b>                               | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |

| Conditional Presence | Explanation                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| SUL-Only             | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured within <i>ServingCellConfig</i> . It is absent otherwise.            |
| SUL                  | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured within <i>ServingCellConfig</i> . It is mandatory present otherwise. |

## — *QFI*

The IE *QFI* is used to indicate the QoS Flow Identifier.

### ***QFI* information element**

```
-- ASN1START
-- TAG-QFI-START

QFI ::= INTEGER (0..maxQFI)

-- TAG-QFI-STOP
-- ASN1STOP
```

## — *Q-OffsetRange*

The IE *Q-OffsetRange* is used to indicate a cell, beam or measurement object specific offset to be applied when evaluating candidates for cell re-selection or when evaluating triggering conditions for measurement reporting. The value is in dB. Value *dB*-24 corresponds to -24 dB, *dB*-22 corresponds to -22 dB and so on.

### ***Q-OffsetRange* information element**

```
-- ASN1START
-- TAG-Q-OFFSETRANGE-START

Q-OffsetRange ::= ENUMERATED {
 dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
 dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
 dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
 dB6, dB8, dB10, dB12, dB14, dB16, dB18,
 dB20, dB22, dB24}
```

```
-- TAG-Q-OFFSETRANGE-STOP
-- ASN1STOP
```

### – *Q-QualMin*

The IE *Q-QualMin* is used to indicate for cell selection/ re-selection the required minimum received RSRQ level in the (NR) cell. Corresponds to parameter  $Q_{\text{qualmin}}$  in TS 38.304 [20]. Actual value  $Q_{\text{qualmin}} = \text{field value} [\text{dB}]$ .

#### ***Q-QualMin* information element**

```
-- ASN1START
-- TAG-Q-QUALMIN-START

Q-QualMin ::= INTEGER (-43..-12)

-- TAG-Q-QUALMIN-STOP
-- ASN1STOP
```

### – *Q-RxLevMin*

The IE *Q-RxLevMin* is used to indicate for cell selection/ re-selection the required minimum received RSRP level in the (NR) cell. Corresponds to parameter  $Q_{\text{rxlevmin}}$  in TS 38.304 [20]. Actual value  $Q_{\text{rxlevmin}} = \text{field value} * 2 [\text{dBm}]$ .

#### ***Q-RxLevMin* information element**

```
-- ASN1START
-- TAG-Q-RXLEVMIN-START

Q-RxLevMin ::= INTEGER (-70..-22)

-- TAG-Q-RXLEVMIN-STOP
-- ASN1STOP
```

### – *QuantityConfig*

The IE *QuantityConfig* specifies the measurement quantities and layer 3 filtering coefficients for NR and inter-RAT measurements.

#### ***QuantityConfig* information element**

```
-- ASN1START
-- TAG-QUANTITYCONFIG-START
```

```

QuantityConfig ::= SEQUENCE {

|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>featureCombinationPreamblesList</b>      | Specifies a series of preamble partitions each associated to a combination of features and 4-step RA. The network does not configure this list to have more than 16 entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>messagePowerOffsetGroupB</b>             | Threshold for preamble selection. Value is in dB. Value <i>minusinfinity</i> corresponds to -infinity. Value <i>dB0</i> corresponds to 0 dB, <i>dB5</i> corresponds to 5 dB and so on (see TS 38.321 [3], clause 5.1.2). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>msg1-SubcarrierSpacing</b>               | Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>If absent, the UE applies the SCS as derived from the <i>prach-ConfigurationIndex</i> in <i>RACH-ConfigGeneric</i> (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]). The value also applies to contention free random access ( <i>RACH-ConfigDedicated</i> ), to SI-request and to contention-based beam failure recovery (CB-BFR). But it does not apply for contention free beam failure recovery (CF-BFR) (see <i>BeamFailureRecoveryConfig</i> ). |
| <b>msg3-transformPrecoder</b>               | Enables the transform precoder for Msg3 transmission according to clause 6.1.3 of TS 38.214 [19]. If the field is absent, the UE disables the transformer precoder (see TS 38.213 [13], clause 8.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>numberOfRA-PreamblesGroupA</b>           | The number of CB preambles per SSB in group A. This determines implicitly the number of CB preambles per SSB available in group B. (see TS 38.321 [3], clause 5.1.1). The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>prach-RootSequenceIndex</b>              | PRACH root sequence index (see TS 38.211 [16], clause 6.3.3.1). The value range depends on whether L=839 or L=139 or L=571 or L=1151. The length of the root sequence corresponding with the index indicated in this IE should be consistent with the one indicated in <i>prach-ConfigurationIndex</i> in the <i>RACH-ConfigDedicated</i> (if configured). If <i>prach-RootSequenceIndex-r16</i> is signalled, UE shall ignore the <i>prach-RootSequenceIndex</i> (without suffix).<br>For FR2-2, only the following values are applicable depending on the used subcarrier spacing:<br>120 kHz: L=139, L=571, and L=1151<br>480 kHz: L=139, and L=571<br>960 kHz: L=139                                                                    |
| <b>ra-ContentionResolutionTimer</b>         | The initial value for the contention resolution timer (see TS 38.321 [3], clause 5.1.5). Value <i>sf8</i> corresponds to 8 subframes, value <i>sf16</i> corresponds to 16 subframes, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ra-Msg3SizeGroupA</b>                    | Transport Blocks size threshold in bits below which the UE shall use a contention-based RA preamble of group A (see TS 38.321 [3], clause 5.1.2). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ra-Prioritization</b>                    | Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ra-PrioritizationForAI</b>               | Indicates whether the field <i>ra-Prioritization-r16</i> applies for Access Identities. The first/leftmost bit corresponds to Access Identity 1, the next bit corresponds to Access Identity 2. Value 1 indicates that the field <i>ra-Prioritization-r16</i> applies otherwise the field does not apply (see TS 23.501 [32]).                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ra-PrioritizationForSlicing</b>          | Parameters which apply to configure prioritized CBRA 4-step random access type for slicing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>rach-ConfigGeneric</b>                   | RACH parameters for both regular random access and beam failure recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>restrictedSetConfig</b>                  | Configuration of an unrestricted set or one of two types of restricted sets, see TS 38.211 [16], clause 6.3.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rsrp-ThresholdSSB</b>                         | UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>rsrp-ThresholdSSB-SUL</b>                     | The UE selects SUL carrier to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). The value applies to all the BWPs and all RACH configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</b> | The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEighth</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB</i> * max(1, <i>SSB-per-rach-occasion</i> ). See TS 38.213 [13]. |
| <b>totalNumberOfRA-Preambles</b>                 | Total number of preambles used for contention based and contention free 4-step or 2-step random access in the RACH resources defined in <i>RACH-ConfigCommon</i> , excluding preambles used for other purposes (e.g. for SI request). If the field is absent, all 64 preambles are available for RA. The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> , i.e. it should be a multiple of the number of SSBs per RACH occasion.                                                                                                                                                                                                            |

| Conditional Presence   | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>AdditionalRACH</i>  | The field is mandatory present if the <i>RACH-ConfigCommon</i> is included in an <i>AdditionalRACH-Config</i> . When included in <i>initialUplinkBWP-RedCap</i> to indicate other feature(s) than <i>redcap</i> and <i>eRedCap</i> , this field is mandatory present with at least <i>FeatureCombinationPreambles</i> list entries: the list entry/entries indicating only <i>redcap</i> or <i>eRedCap</i> and the other(s) indicating both <i>redcap</i> or <i>eRedCap</i> and one or multiple other feature(s) (e.g., <i>smallData</i> , <i>nsag</i> or <i>msg3-Repetitions</i> ). When included in <i>initialUplinkBWP-RedCap</i> to indicate <i>eRedCap</i> and <i>RedCap</i> separately, this field is mandatory present with at least two <i>FeatureCombinationPreambles</i> list entries: one list entry indicating only <i>redcap</i> and the other list entry indicating only <i>eRedCap</i> . Otherwise, it is optional, Need R. |
| <i>InitialBWP-Only</i> | This field is optionally present, Need R, if this BWP is the initial BWP of SpCell. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>featureCombinationPreamblesList</b>                | Specifies a series of preamble partitions each associated to a combination of features and 2-step RA. The network does not configure this list to have more than 16 entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>groupB-ConfiguredTwoStepRA</b>                     | Preamble grouping for 2-step random access type. If the field is absent then there is only one preamble group configured and only one msgA PUSCH configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>msgA-CB-PreamblesPerSSB-PerSharedRO</b>            | Number of contention-based preambles used for 2-step RA type from the non-CBRA 4-step type preambles associated with each SSB for RO shared with 4-step type RA. The number of preambles for 2-step RA type shall not exceed the number of preambles per SSB minus the number of contention-based preambles per SSB for 4-step type RA. The possible value range for this parameter needs to be aligned with value range for the configured SSBs per RACH occasion in <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> . The field is only applicable for the case of shared ROs with 4-step type random access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>msgA-PRACH-RootSequenceIndex</b>                   | PRACH root sequence index. If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e., not within <i>AdditionalRACH-Config</i> ), the UE applies the value in field <i>prach-RootSequenceIndex</i> in <i>RACH-ConfigCommon</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE applies the corresponding value of <i>prach-RootSequenceIndex</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . When both 2-step and 4-step type random access is configured, this field is only configured for the case of separate ROs between 2-step and 4-step type random access.<br>For FR2-2, only the following values are applicable depending on the used subcarrier spacing:<br>120 KHz: L=139, L=571, and L=1151<br>480 KHz: L=139, and L=571<br>960 KHz: L=139                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>msgA-RestrictedSetConfig</b>                       | Configuration of an unrestricted set or one of two types of restricted sets for 2-step random access type preamble. If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ), the UE applies the value in field <i>restrictedSetConfig</i> in <i>RACH-ConfigCommon</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE applies the value of <i>restrictedSetConfig</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . When both 2-step and 4-step type random access is configured, this field is only configured for the case of separate ROs between 2-step and 4-step type random access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>msgA-RSRP-Threshold</b>                            | The UE selects 2-step random access type to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). This field is only present if both 2-step and 4-step RA type are configured for the BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>msgA-RSRP-ThresholdSSB</b>                         | UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>msgA-SSB-PerRACH-OccasionAndCB-PreamblesPerSSB</b> | The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEight</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB * max(1, SSB-per-rach-occasion)</i> . If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ) and both 2-step and 4-step are configured for the BWP, the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> . If the field is not configured in <i>AdditionalRACH-Config</i> and both 2-step and 4-step are configured in <i>AdditionalRACH-Config</i> , the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . The field is not present when RACH occasions are shared between 2-step and 4-step type random access in the BWP. |
| <b>msgA-SSB-SharedRO-MaskIndex</b>                    | Indicates the subset of 4-step type ROs shared with 2-step random access type for each SSB. This field is configured when there is more than one RO per SSB. If the field is absent, and 4-step and 2-step has shared ROs, then all ROs are shared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

***msgA-SubcarrierSpacing***

Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).

Only the following values are applicable depending on the used frequency:

FR1: 15 or 30 kHz

FR2-1/FR2-NTN: 60 or 120 kHz

FR2-2: 120, 480, or 960 kHz.

If the field is absent, the UE applies the SCS as derived from the *msgA-PRACH-ConfigurationIndex* in *RACH-ConfigGenericTwoStepRA* (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]) in case of 2-step only BWP, otherwise the UE applies the same SCS as Msg1 derived from *RACH-ConfigCommon*. The value also applies to contention free 2-step random access type (*RACH-ConfigDedicated*).

***msgA-TotalNumberOfRA-Preambles***

Indicates the total number of preambles used for contention-based and contention-free 2-step random access type when ROs for 2-step are not shared with 4-step. If the field is absent, and 2-step and 4-step does not have shared ROs, all 64 preambles are available for 2-step random access type.

***msgA-TransMax***

Max number of MsgA preamble transmissions performed before switching to 4-step random access (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when 2-step and 4-step RA type are configured and switching to 4-step type RA is supported. If the field is absent, switching from 2-step RA type to 4-step RA type is not allowed.

***ra-ContentionResolutionTimer***

The initial value for the contention resolution timer for fallback RAR in case no 4-step random access type is configured (see TS 38.321 [3], clause 5.1.5). Value *sf8* corresponds to 8 subframes, value *sf16* corresponds to 16 subframes, and so on. If both 2-step and 4-step random access type resources are configured on the BWP, then this field is absent. If the field is absent in *RACH-ConfigCommonTwoStepRA* in *AdditionalRACH-Config*, the UE shall apply the corresponding value in *RACH-ConfigCommon* in the same *AdditionalRACH-Config*.

***ra-Prioritization***

Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).

***ra-PrioritizationForAI***

Indicates whether the field *ra-Prioritization-r16* applies for Access Identities. The first/leftmost bit corresponds to Access Identity 1, the next bit corresponds to Access Identity 2. Value 1 for an Access Identity indicates that the field *ra-Prioritization-r16* applies, otherwise the field does not apply.

***ra-PrioritizationForSlicingTwoStep***

Parameters which apply to configure prioritized CBRA 2-step random access type for slicing.

***rach-ConfigGenericTwoStepRA***

2-step random access type parameters for both regular random access and beam failure recovery.

***GroupB-ConfiguredTwoStepRA* field descriptions*****messagePowerOffsetGroupB***

Threshold for preamble selection. Value is in dB. Value *minusinfinity* corresponds to -infinity. Value *dB0* corresponds to 0 dB, *dB5* corresponds to 5 dB and so on. (see TS 38.321 [3], clause 5.1.1).

***numberOfRA-PreamblesGroupA***

The number of CB preambles per SSB in group A for idle/inactive or connected mode. The setting of the number of preambles for each group should be consistent with *msgA-SSB-PerRACH-OccasionAndCB-PreamblesPerSSB* or *msgA-CB-PreamblesPerSSB-PerSharedRO* if configured.

***ra-MsgA-SizeGroupA***

Transport block size threshold in bits below which the UE shall use a contention-based RA preamble of group A. (see TS 38.321 [3], clause 5.1.1).

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>csi-RS</b>                                 | The ID of a CSI-RS resource defined in the measurement object associated with this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ra-OccasionList</b>                        | RA occasions that the UE shall use when performing CF-RA upon selecting the candidate beam identified by this CSI-RS. The network ensures that the RA occasion indexes provided herein are also configured by prach-ConfigurationIndex and msg1-FDM. Each RACH occasion is sequentially numbered, first, in increasing order of frequency resource indexes for frequency multiplexed PRACH occasions; second, in increasing order of time resource indexes for time multiplexed PRACH occasions within a PRACH slot and Third, in increasing order of indexes for PRACH slots. |
| <b>ra-PreambleIndex</b>                       | The RA preamble index to use in the RA occasions associated with this CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>CFRA field descriptions</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msg1-RepetitionNum</b>        | Indicates the MSG1 repetition number used for contention free 4-step random access type in TS 38.321 [3]. If this field is absent, the UE performs contention free 4-step random access without MSG1-Repetitions.                                                                                                                                                                                                                                                    |
| <b>occasions</b>                 | RA occasions for contention free random access. If the field is absent, the UE uses the RA occasions configured in <i>RACH-ConfigCommon</i> in the first active UL BWP.                                                                                                                                                                                                                                                                                              |
| <b>ra-ssb-OccasionMaskIndex</b>  | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources signalled in <i>ssb-ResourceList</i> . The UE shall ignore this field if the field <i>msg1-RepetitionNum</i> included in <i>CFRA</i> is configured.                                                                                                                                                                                        |
| <b>rach-ConfigGeneric</b>        | Configuration of contention free random access occasions for CFRA. The UE shall ignore <i>preambleReceivedTargetPower</i> , <i>preambleTransMax</i> , <i>powerRampingStep</i> , <i>ra-ResponseWindow</i> signaled within this field and use the corresponding values provided in <i>RACH-ConfigCommon</i> .                                                                                                                                                          |
| <b>ssb-perRACH-Occasion</b>      | Number of SSBs per RACH occasion.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>totalNumberOfRA-Preambles</b> | Total number of preambles used for contention free random access in the RACH resources defined in CFRA, excluding preambles used for other purposes (e.g. for SI request). If the field is absent but the field <i>occasions</i> is present, the UE may assume all the 64 preambles are for RA. The setting should be consistent with the setting of <i>ssb-perRACH-Occasion</i> , if present, i.e. it should be a multiple of the number of SSBs per RACH occasion. |

| <b>CFRA-SSB-Resource field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msgA-PUSCH-Resource-Index</b>            | Identifies the index of the PUSCH resource used for MSGA CFRA. The PUSCH resource index indicates a valid PUSCH occasion (as specified in TS 38.213 [13], clause 8.1A) and the associated DMRS resources corresponding to a PRACH slot. The PUSCH resource indexes are sequentially numbered and are mapped to valid PUSCH occasions corresponding to a PRACH slot which are ordered, first, in increasing order of frequency resource indexes for frequency multiplexed PUSCH occasions; second, in increasing order of DMRS resource indexes within a PUSCH occasion, where a <i>DMRS<sub>id</sub></i> resource index is determined first in an ascending order of a DMRS port index and then in an ascending order of a DMRS sequence index, third in increasing order of time resource indexes for time multiplexed PUSCH occasions within a PUSCH slot and fourth, in increasing order of indexes for PUSCH slots. For the case of contention free 2-step random access type, if this field is absent, the UE shall use the value 0. |
| <b>ra-PreambleIndex</b>                     | The preamble index that the UE shall use when performing CF-RA upon selecting the candidate beams identified by this SSB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ssb</b>                                  | The ID of an SSB transmitted by this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>CFRA-TwoStep field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msgA-CFRA-PUSCH</b>                 | PUSCH resource configuration(s) for msgA CFRA.                                                                                                                                                                                                                                                                                                                                  |
| <b>msgA-TransMax</b>                   | Max number of MsgA preamble transmissions performed before switching to 4-step type random access (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when 2-step and 4-step RA type are configured and switching to 4-step type RA is supported. If the field is absent in <i>cfra-TwoStep</i> , switching from 2-step RA type to 4-step RA type is not allowed. |
| <b>occasionsTwoStepRA</b>              | RA occasions for contention free random access. If the field is absent, the UE uses the RA occasions configured in <i>RACH-ConfigCommonTwoStepRA</i> in the first active UL BWP.                                                                                                                                                                                                |
| <b>ra-SSB-OccasionMaskIndex</b>        | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources signalled in <i>ssb-ResourceList</i> .                                                                                                                                                                                                                |
| <b>rach-ConfigGenericTwoStepRA</b>     | Configuration of contention free random access occasions for CFRA 2-step random access type.                                                                                                                                                                                                                                                                                    |
| <b>ssb-PerRACH-OccasionTwoStep</b>     | Number of SSBs per RACH occasion for 2-step random access type.                                                                                                                                                                                                                                                                                                                 |

| <b>RACH-ConfigDedicated field descriptions</b> |                                                                                                                                                                                                                                                                          |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cfra</b>                                    | Parameters for contention free random access to a given target cell. If this field and <i>cfra-TwoStep</i> are absent, the UE performs contention based random access.                                                                                                   |
| <b>cfra-TwoStep</b>                            | Parameters for contention free 2-step random access type to a given target cell. Network ensures that <i>cfra</i> and <i>cfra-TwoStep</i> are not configured at the same time. If this field and <i>cfra</i> are absent, the UE performs contention based random access. |
| <b>ra-prioritization</b>                       | Parameters which apply for prioritized random access procedure to a given target cell (see TS 38.321 [3], clause 5.1.1).                                                                                                                                                 |
| <b>ra-PrioritizationTwoStep</b>                | Parameters which apply for prioritized 2-step random access type procedure to a given target cell (see TS 38.321 [3], clause 5.1.1).                                                                                                                                     |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
